When gas storage operations are initiated in an oil or gas reservoir, there is an initial gas content in the reservoir prior to injection. Initial gas content is generally composed of both free gas and solution gas. Additional gas is added to the initial gas content by injection, and the combination comprises the Total Storage Volume. This volume is categorized as follows:

2.1. **Cushion Gas**

The volume of gas which is required in underground storage field to maintain minimum field pressure.

2.2. **Recoverable Cushion Gas**

This is defined as the volume of gas that can be economically recovered from the reservoir below the base gas pressure. This volume varies, depending upon economic conditions.

2.3. **Non-Recoverable "Cushion Gas"**

This is the volume of gas left in the reservoir after all recoverable gas volumes are removed and is not considered a part of Total Storage Inventory. This gas is capitalized and depreciated over the life of the project.

2.4. **Working Gas**

Volume of gas present in an underground storage field, which is available for withdrawal, although not all of the working gas may be utilized in a given year due to cycle volume constraints. This volume is in addition to the cushion gas volume.

AC_CPUC_SED_DR_17_0000165

Confidential and Protected Materials Pursuant to PUC Section 583, GO 66-D, and D.17-09-023

2.5. **Effective Working Gas**

This volume is defined as the working gas which is withdrawn and re-injected in a complete injection and withdrawal cycle. Ideally, the effective working gas volume is synonymous with the working gas volume. However, limitations by wells, compression facilities, or gas availability may limit effective working gas volume.

2.6. **Total Storage Inventory**

This is the sum of both the working and recoverable cushion gas volumes.

3. RESPONSIBILITY

The responsibilities for shut-ins, along with analyzing data, verifying gas inventory, and reporting changes or losses are specified in **Standard 224.0020,** *Gas Inventory Verification – Shut-In.*

3.1. At least once every two years the validity of the reported inventory for each storage field is evaluated using the methodologies outlined in this gas standard. A report is prepared that verifies that the reported inventory is within the range that would be expected from the reservoir analysis. Corrective action is taken if necessary. The report is prepared under the direction of the Storage Engineering Manager and approved by the Director of Storage. The report is directed to the **Director – Customer Billing Operations** and copied to the **Measurement Data Operations Manager** and the **Director – Transmission & System Operations**.

4. PROCEDURE

4.1. MONITORING

4.1.1. Monitoring of the storage reservoir ensure the reservoir functions, according to expectations, and integrity tests verify the gas inventory is present and available for delivery. Effective monitoring requires a thorough understanding of the reservoir system. This system is defined as the reservoir rock and wellbores, which respond to pressure changes as a result of gas injection and withdrawal.

4.1.2. Monitoring of the reservoir system is conducted in both storage and non-storage zone wells and at surface observation points.

4.1.2.1. Storage Zone Wells – Performance reviews utilize information collected during individual well and reservoir tests. Parameters such as back pressure curve shifts, changes in deliverability and field performance are investigated.

SED SUR_REPLY_001289
AC_CPUC_SED_DR_17_0000166

Confidential and Protected Materials Pursuant to PUC Section 583, GO 66-D, and D.17-09-023

4.1.2.1.1. Surface pressures on each well are measured and recorded weekly using a calibrated test gauge. These include tubing pressure, casing pressure, annuli pressures, and, if applicable, safety valve control line pressures. The mode of well operation (injection, withdrawal or shut-in) at the time of pressure measurement is also recorded. Note that the ***C.D.O.G.G.R. (California Division Of Oil, Gas, and Geothermal Resources)*** requires a monthly average casing and tubing pressure be submitted as part of the monthly production report.

4.1.2.1.2. A plot of the weekly surface casing and the innerstring annuli pressures versus time is maintained for each well. Hardcopy plots are created, marked and filed when an abnormal pressure is encountered. A pressure is considered abnormal when it may be large enough to force gas into a normally pressured water sand, either at the surface casing shoe or through any other known casing holes or leak-paths.

4.1.2.1.3. When abnormally high annular pressures are detected, diagnostic steps are taken to determine the source of pressure build up. This includes tests to eliminate surface valves and downhole tubing as possible sources of leakage. Zero pressure is abnormal in a well that has had a history of annular pressure and is investigated for the possibility of a closed valve.

4.1.2.1.4. All wells with continuing zero pressure readings are checked quarterly for closed valves and noted on the pressure plot. Blowdowns are also noted when they occur.

4.1.2.1.5. Wellhead inspections are performed on a monthly basis. Any leaks from wellhead flanges and valves are reported and corrected.

SED SUR_REPLY_001290
AC_CPUC_SED_DR_17_0000167

Confidential and Protected Materials Pursuant to PUC Section 583, GO 66-D, and D.17-09-023

4.1.2.1.6. Subsurface temperature surveys are conducted on each well in according to the following schedule: semi-annually in La Goleta and Playa del Rey storage fields and annually in the Aliso Canyon and Honor Rancho storage fields.

4.1.2.1.7. Surveys are done in accordance with CDOGGR regulations. Wells that have been killed are not exempt from this requirement and must be surveyed according to the schedule. Results of surveys are reported according to **Standard 224.001**, *Standardized Well Activities Reporting.*

4.1.2.1.8. Additional surveys will be run without regard to this schedule at the first indication of unusual or abnormal well conditions, i.e., anomalous pressure, surface gas emissions or other indications of well problems.

4.1.2.1.9. Wireline retrievable tubing obstructions such as tubing plugs, subsurface safety valves, subsurface chokes or tubing stops are removed once each year to perform a temperature survey of the casing shoe and cap rock seal. Ideally, this is done at high reservoir pressure when shoe leaks are most noticeable on temperature surveys. Under certain conditions it may not be possible or advisable to remove the wireline retrievable obstruction.

4.1.2.1.10. Subsurface surveys using wireline conductor cable equipment are made to investigate anomalies discovered by temperature surveys. Conductor cable surveys include temperature surveys, noise logs, spinner surveys, and radioactive tracer surveys.

4.1.2.1.11. In the case of well casing leaks above the shoe, radioactive tracer surveys are typically used to verify the location of gas movement through the leak. In the case of shoe or cap rock leaks, these additional surveys are used to verify that a leak exists and to qualitatively estimate a leakage rate.

SED SUR_REPLY_001291
AC_CPUC_SED_DR_17_0000168

Confidential and Protected Materials Pursuant to PUC Section 583, GO 66-D, and D.17-09-023

4.1.2.1.12. Gas cap observation wells are used to monitor reservoir pressure. If possible one or more wells completed in the gas cap are selected for observation purposes. These wells are not used for injection and are put on withdrawal only for peak load conditions. Surface pressure measurements on the tubing and casing of each gas cap observation well are made and recorded weekly.

4.1.2.1.13. A plot of these pressures versus inventory is kept in the office of the **Storage Field Engineer** and is updated weekly. Anomalous well pressures or behavior are reported to Storage Engineering Staff.

4.1.2.1.14. Reservoir shut-ins are generally on a schedule stated in **Standard 224.0020,** *Gas Inventory Verification – Shut-In* or when determined as necessary by the Storage Field Engineer.

4.1.2.2. Non-storage Zone Wells

Non-storage zone wells monitored include both Company wells and wells owned by others in overlying and underlying zones and in other fields within two miles of the storage reservoir boundary, where applicable. These wells are categorized as follows:

4.1.2.2.1. Pressure observation wells are located in overlying and underlying permeable formations, or adjacent to the storage reservoir but across assumed confining boundaries, such as faults, permeability pinchouts, below the gas-liquid contact or beyond the spill point of the storage zone's confining structure. Although normally static, these wells may have artificial lift mechanisms for removal of gas and fluids.

4.1.2.2.2. Gas collection wells are located where known gas migration from the storage zone is intercepted and collected. These wells are normally equipped with operating artificial lift mechanisms so that both liquids and gas can be produced, causing a pressure sink in the reservoir near the wellbore.

4.1.2.2.3. In some fields, shallow water observation wells have been drilled into aquifer zones existing in the first permeable sand above the shoe of the surface casing.

Copyright ©2010, 2012, 2014 Southern California Gas Company. All rights reserved.

SED SUR_REPLY_001292
AC_CPUC_SED_DR_17_0000169

Confidential and Protected Materials Pursuant to PUC Section 583, GO 66-D, and D.17-09-023

These wells are shut-in at the surface and gas concentrations in the wellbore are measured weekly.

4.1.2.2.4. If gas loss is expected, performance reviews of wells operated by other producers in either overlying zones or in adjacent fields may be made by reviewing production reports from these operators.

4.1.2.2.5. Performance of Company-owned observation and collection wells are also closely monitored. Wellhead inspections and temperature surveys are performed on the pressure observation wells and the gas collection wells.

4.1.2.2.6. Pressure observation wells

- Surface pressures on all tubing and casing strings are measured weekly using a calibrated test gauge.
- A plot of pressure versus time for each well is kept by the Storage Field Engineer. Bottom-hole pressure surveys are run as needed on pressure observation wells.
- If a substantial increase in reservoir pressure is noted or a significant gas buildup occurs, an attempt may be made to produce the well. Produced gas is sampled and analyzed for both hydrocarbon and helium content.

4.1.2.2.7. Gas collection wells

- Surface pressures on all casing strings and safety valve control lines are recorded weekly using a calibrated test gauge. The mode of well operation (producing, shut-in) at the time of pressure measurement is also recorded.
- A plot of pressure vs. time for each surface casing and innerstring annulus is generated and kept by the **Storage Field Engineer**.
- Bottom-hole pressure surveys are run on gas collection wells as needed. These surveys follow a shut-in period to allow pressure

stabilization after production. If the well is equipped with a standing valve, the valve is pulled prior to the bottom-hole pressure survey and is reinstalled upon completion of the survey.

- The Storage Field Engineer develops production schedules. The Storage Field Engineer maintains plots of bottomhole pressure versus time and records of produced gas, oil and water.

4.1.2.2.8. Shallow water observation wells

- Shallow water observation wells are closed-in at the surface and gas concentrations in the wellbore is measured periodically.

4.1.2.2.9. Surface Observations

- Surface observations are conducted by Station Personnel under the direction of local management and the resident Storage Field Engineer assigned to each Facility.

- Frequency and type of observations are determined and prescribed by local O&M procedures based on conditions particular to each Facility.

- In the event of major seismic activity or the occurrence of a significant gas loss or migration problem as identified by the Storage Field Engineer, local management with the assistance of the Storage Engineering Group will conduct inspections of certain well cellars, surrounding surface locations and previously abandoned wellbores as deemed necessary.

4.2. BOTTOM-HOLE PRESSURE DETERMINATION

4.2.1. Each of the three major methods used to verify gas storage inventory, as explained in Section 5, requires the determination of bottom-hole pressures. The method used to determine bottom-hole pressure must be consistent from year to year. The most accurate method to determine bottom-hole pressure is to measure the pressure with a pressure bomb. In certain applications the bottom-hole pressure can be calculated from the shut-in wellhead pressure. For wells completed in the gas cap and having full gas columns, the bottom-hole pressure is calculated from the equation:

$$P_{BHP} = P_{WH} \exp\left(\frac{0.01875 \times SG \times D}{Z_{avg} T_{avg}}\right)$$

Where:

P_{BHP} = Bottom-hole pressure, psia.

P_{WH} = Wellhead pressure, psia.

SG = Gas specific gravity.

D = True vertical depth in feet.

T_{avg} = Average wellbore temperature between surface and bottom-hole, degrees Rankine.

Z_{avg} = Average gas compressibility factor from charts, tables or computer programs (dependent on P_{avg}, T_{avg} and gas gravity).

P_{avg} = Average pressure between surface and bottom-hole, psia or $P_{avg} = (P_{BHP} + P_{WH}) / 2$

NOTE: The above equation could yield incorrect results if the well exhibits a significant fluid level.

4.3. INVENTORY VERIFICATION – SHUT IN

4.3.1. Three primary methods for inventory verification of gas storage fields are referenced and summarized below:

4.3.1.1. Calculation of gas content based on volumetric data and average reservoir pressure; Volumetric Determination is explained in

Copyright ©2010, 2012, 2014 Southern California Gas Company. All rights reserved.

SED SUR_REPLY_001295
AC_CPUC_SED_DR_17_0000172

Applied Petroleum Reservoir Engineering; by Craft, B. C. and Hawkins, M. F.; Englewood Cliffs, N.J.: Prentice- Hall, 1959.

4.3.1.2. Calculation of effective gas content using the simple gas material balance, hysteresis curve, and P/Z curve methods; Material Balance is explained in Natural Gas Engineering by Ikoku, C. V.; Tulsa, Oklahoma: Penn Well Publishing, 1980.

4.3.1.3. Verification of storage inventory by comparing measured reservoir pressures with calculated pressures obtained using the single cell material balance or reservoir simulation methods; Numerical Simulation or Reservoir Modeling is explained in Modern Reservoir Engineering —A Simulation Approach by Crichlow, H. B.; Englewood Cliffs, N.J.: Prentice- Hall, 1977 and the Intercomp Beta II User Manual.

4.3.2. The most common inventory verification method used in mature gas storage projects that are known to have effective geologic closure is the hysteresis curve or P/Z versus inventory plot. Typically, it is adjusted annually for known gas losses and liquid production. Any shift between points plotted at similar pressures following a shut-in is further investigated.

4.3.2.1. Tracking known gas losses and transfers as they occur assist with inventory verification.

4.3.2.2. Recommended shut-in time durations for effective reservoir stabilization are listed below

4.3.2.2.1. Aliso Canyon -14 days

4.3.2.2.2. Honor Rancho -12 days

4.3.2.2.3. Goleta- 5 days

4.3.2.2.4. Playa del Rey – 4 days

4.3.3. Data collected during a shut-in period includes accurate measurements of reservoir pressure on each available well. Bottom-hole pressures can be calculated from surface pressures or measured directly. Gas gravity is determined using gas samples from individual, representative wells.

4.3.4. The **Storage Field Engineer** chooses the type and frequency of data to be collected during shut-ins.

4.3.5. Calculation of gas content based on volumetric data and average reservoir pressure from shut-in.

Copyright ©2010, 2012, 2014 Southern California Gas Company. All rights reserved.

SED SUR_REPLY_001296

4.3.5.1. Average reservoir pressures used in this calculation are obtained during shut-in periods required for reservoir pressure stabilization. Reservoir pore volumes available for gas storage are calculated from either geologic information, material balances using production and pressure information obtained during primary field production, or in some cases from pressure and production data obtained during gas storage operations. Elements of these calculations are described below:

4.3.5.2. Average reservoir pressures are calculated in an appropriate way for each storage reservoir. To be reliable, the method for each field should stay consistent for all years. Various methods of calculation include the following:

4.3.5.2.1. The average reservoir pressure for Honor Rancho, La Goleta, and Playa del Rey are determined by calculating the arithmetic average of the bottom-hole pressure in the gas cap wells. In these fields the pressure of each well is measured or computed at a specified subsea datum approximately at the midpoint of the zone. The datum and reservoir temperature used for these fields are as follows:

- Honor Rancho - 8,300 feet subsea, 190°F
- La Goleta - 4,200 feet subsea, 150°F
- Playa del Rey - 6,100 feet subsea, 210°F
- A volumetrically weighted average reservoir pressure is used for Aliso Canyon. The pressures in this field are computed at a specified subsea depth approximately at the midpoint of the zone. The datum depth for this field and the reservoir temperature are as follows:
    - Aliso Canyon - 5,400 feet subsea, 180°F

4.3.6. Reservoir pore volume calculated from geologic information uses data obtained during the drilling and completion of the well, such as electric logs or core information to calculate the total pore volume of the reservoir. These calculations are based on the following equations:

4.3.6.1. Gas reservoirs

Copyright ©2010, 2012, 2014 Southern California Gas Company. All rights reserved.

SED SUR_REPLY_001297
AC_CPUC_SED_DR_17_0000174

Confidential and Protected Materials Pursuant to PUC Section 583, GO 66-D, and D.17-09-023

4.3.6.1.1. Equation: $V = Ah\phi (1-S_w)$

Where:

V = Reservoir gas pore volume in cubic feet

A = Gas zone area in square feet

h = Average gas zone thickness in feet determined from electric logs or cores

ø = Porosity fraction determined from porosity logs or core analysis

S_w = Water saturation from log, core analysis

4.3.6.2. Oil reservoirs

4.3.6.2.1. Equation: $V = Ah\phi(1-S_w) + A_1h_1\phi (1- S_{1w}-s_o)$

Where:

A = Primary gas cap area in square feet

A_1 = Secondary gas cap area in square feet

h_1 = Average secondary gas zone thickness in feet

s_o = Residual oil saturation

4.3.6.2.2. In most portions of an oil zone storage reservoir, oil saturation is determined from core analysis or can be considered equivalent to residual oil saturation and can be estimated from the 16" normal resistivity curve using the following relationships.

Equation: Residual oil saturation = $(1-s_{xo})$

$$s_{xo} = \sqrt{\frac{Rmf}{R_{xo}\phi 2}}$$

Where:

Copyright ©2010, 2012, 2014 Southern California Gas Company. All rights reserved.

AC_CPUC_SED_DR_17_0000175

Confidential and Protected Materials Pursuant to PUC Section 583, GO 66-D, and D.17-09-023

R_{xo} = Resistivity of 16" normal or resistivity of flushed zone.

S_{xo} = Water saturation of mud filtrate within the flushed zone.

ø = Porosity

Rmf = Resistivity of mud filtrate.

4.3.6.3. Gas reservoir pore volume calculated using material balance equations:

These calculations utilize production and pressure data in the following equations:

4.3.6.3.1. Equation for constant volume gas reservoirs using primary production:

$$V = \frac{P_{SC} G_P T}{T_{SC}} \left(\frac{1}{P_i / Z_i - P_f / Z_F} \right)$$

Where water production and influx are assumed negligible and where:

V = Gas pore volume in reservoir cubic feet.

P_{sc} = 14.7 psia

G_p = Gas produced in standard cubic feet.

T = Reservoir temperature in degrees Rankin (°R).

R_{sc} = 520°R

P_i = Initial pressure, psia.

P_f = Final pressure, psia.

Z_i = Initial gas compressibility factor.

Z_f = Final gas compressibility factor.

Copyright ©2010, 2012, 2014 Southern California Gas Company. All rights reserved.

AC_CPUC_SED_DR_17_0000176

Confidential and Protected Materials Pursuant to PUC Section 583, GO 66-D, and D.17-09-023

4.3.6.3.2. Equation for constant volume gas reservoirs using storage production

$$V = \frac{P_{SC} G_P T}{T_{SP}} \left(\frac{1}{P_1 / Z_1 - P_2 / Z_2} \right)$$

Where water production and influx are assumed negligible

G_p = SCF of gas produced or injected between pressure points P1 and P2.

P1 and P2 = The first and second stabilized average reservoir pressures bounding the production or injection period considered.

Z1 and Z2 = Gas compressibility factors for P1 and P2.

T = Reservoir temperature in degrees Rankine

4.3.6.4. Oil reservoirs pore volume calculations

4.3.6.4.1. Equation: The 'Reservoir Gas Pore Volume' is equal to the 'Original Gas Cap Pore Volume' plus the 'Secondary Gas Cap Pore Volume' plus the 'Space created by Water Production'.

Or:

$$V = GB_{gi} = \left(NB_{oi} - \left(N - N_p \right) B_o \right) + W_p B_w$$

Where:

G = Original gas pore volume, standard cubic feet (determined from either geologic data or an appropriate form of the material balance equation).

B_{gi} = Gas formation volume factor in reservoir cubic feet per standard cubic feet at discovery pressure.

Copyright ©2010, 2012, 2014 Southern California Gas Company. All rights reserved.

SED SUR_REPLY_001300
AC_CPUC_SED_DR_17_0000177

Confidential and Protected Materials Pursuant to PUC Section 583, GO 66-D, and D.17-09-023

N = Initial oil in place in stock tank barrels (determined from either geologic data or an appropriated form of the material balance equation).

N_p = Cumulative oil production in stock tank barrels.

B_{oi} = Oil formation volume factor in reservoir cubic feet per stock tank barrel at discovery pressure.

Bo = Oil formation volume factor at existing pressure in reservoir cubic feet per stock tank barrel.

W_p = Water production in stock tank barrels.

B_w = Water formation volume factor, reservoir cubic feet per stock tank barrel (approximates 5.615).

4.3.6.4.2. Simplifying assumptions used in the above equation are that no storage gas goes into solution in the oil and that there is no water influx into the storage reservoir. These simplifying assumptions are seldom true. However, the equation can be modified based on a judgment of the volume of gas which may go into solution in the reservoir oil and a judgment of aquifer activity surrounding the storage reservoir. When modified by these judgment factors, the equation provides a method for approximating a limit for the reservoir gas pore volume available for storage operations. An upper limit is established when it is assumed that all the residual oil is re-saturated with gas. Generally, only a fraction of the oil becomes saturated and so the calculation has little usage beyond setting limits.

4.3.6.4.3. The values of G and N are not generally expected to be obtained with an accuracy greater than +/- 20%. However, this is not a major drawback since the methods are used to establish guidelines and set limits.

4.3.6.5. Calculation of gas content.

Copyright ©2010, 2012, 2014 Southern California Gas Company. All rights reserved.

SED SUR_REPLY_001301
AC_CPUC_SED_DR_17_0000178

Confidential and Protected Materials Pursuant to PUC Section 583, GO 66-D, and D.17-09-023

4.3.6.5.1. After the gas pore volume has been calculated, or approximated, by one of the methods indicated above, the gas content at the measured reservoir pressure is determined using the gas law as follows:

PV = ZNRT

Where:

P = Average reservoir pressure, psia

V = Gas pore volume in reservoir cubic feet

T = Temperature of reservoir, (°F + 460) degrees Rankine

Z = Compressibility factor, dependent on P, T, and gas gravity, from charts or tables.

N = pound moles (where one pound mole =379.41 cubic feet @ 60°F and 14.7 psia).

R = 10.735 universal gas constant for above units.

Solving for gas content;

$$Volume(mscf) = \frac{(0.03533)PV}{ZT}$$

4.3.7. Calculation of effective gas content using the simple gas material balance and hysteresis curve (P/Z curve) methods.

4.3.7.1. Pressure changes, with rapid gas injection or withdrawal during selected operating periods, can show the relationship between effective gas content and the storage inventory. Effective gas content is the gas which, within a given time, causes a measurable pressure response to injection or withdrawal operations. Not all gas in the reservoir yields such a response within the given time interval. The difference between effective gas content at a given pressure (P_1) and the metered inventory is non-effective gas. Part of this non-effective gas can be due to the lack of pressure equilibrium within the reservoir. Any gas migration out of the storage reservoir also contributes to the non-effective gas. Either one of the two equations, or the graphical solutions presented below are used to calculate the effective gas content.

Copyright ©2010, 2012, 2014 Southern California Gas Company. All rights reserved.

SED SUR_REPLY_001302
AC_CPUC_SED_DR_17_0000179

Confidential and Protected Materials Pursuant to PUC Section 583, GO 66-D, and D.17-09-023

4.3.7.1.1. Calculations with negligible water movement are made using the following equation:

$$\text{Effective Gas Content at P1, Q1} = \left(\frac{\Delta Q}{\frac{P_1}{Z_1} - \frac{P_2}{Z_2}} \right) \left(\frac{P_1}{Z_1} \right)$$

Where:

P_1 = Pressure at the first operational point considered.

P_2 = Pressure at the second operational point considered.

Q_1 = Net storage volume at the first operational point considered.

ΔQ = The net change in gas inventory between the two operational points considered.

4.3.7.1.2. Calculations with significant water movement of a known rate are made using the following equations:

$$Q_1 = \left(\Delta Q - \left(We \times \frac{P_2}{14.7} \times \frac{520}{T_R} \times \frac{1}{Z_R} \right) \right) \frac{\frac{P_1}{Z_1}}{\left(\frac{P_1}{Z_1} - \frac{P_2}{Z_2} \right)}$$

Where terms are defined as above, and where:

We = Water influx in cubic feet.

T_R = Reservoir temperature, degrees Rankine.

Z_R = Z at T_R and P_2.

Copyright ©2010, 2012, 2014 Southern California Gas Company. All rights reserved.

SED SUR_REPLY_001303
AC_CPUC_SED_DR_17_0000180

Confidential and Protected Materials Pursuant to PUC Section 583, GO 66-D, and D.17-09-023

4.3.8. Graphical solutions

4.3.8.1. The hysteresis curve is a plot of reservoir pressure versus storage inventory. This curve utilizes the compressibility factor of non-ideal gas. It is most effective in a constant volume reservoir since it assumes no water movement into or away from the storage reservoir; and no movement of gas into or out of solution in the reservoir oil. Actually, after sufficient storage history, the hysteresis curve becomes a qualitative/quantitative tool for inventory when a storage field is operated in a consistent manner and storage cycle volumes are relatively consistent over time. Under these conditions, aquifer movement and movement of gas into and out of solution is relatively constant and effectively drops from the equation.

4.4. REPORTING GAS INVENTORY LOSSES

4.4.1. Calculated operational losses

4.4.1.1. Gas losses due to compressor, piping system or well blowdowns and wireline surveys are calculated by Storage Operations personnel and reported to Measurement monthly. These reports are reviewed by the Storage Field Engineer.

4.4.1.2. Estimates of losses related to workovers and well blowdowns are prepared by the Storage Field Engineer after a well has been killed. These estimated losses are reported monthly to Gas Measurement.

4.4.2. Losses from known well and surface facility leaks

4.4.2.1. Some small losses from valves, compressors, field piping, threaded well casing connections and well casing mechanical devices such as cementing stage collars, and some small casing leaks are inherent to **Storage Field Operations**. These leaks are estimated and reported as follows:

4.4.2.1.1. Minor surface facility leakage is surveyed in each storage field periodically. Leakage surveys include wellhead valves and fittings, instrumentation, well piping, field piping, surface production facilities and the compressor station. Surveys are made more frequently if facility modifications are made which might change leakage rates.

4.4.2.1.2. During these surveys, measurements are obtained on representative minor atmospheric leaks and then

SED SUR_REPLY_001304
AC_CPUC_SED_DR_17_0000181

Confidential and Protected Materials Pursuant to PUC Section 583, GO 66-D, and D.17-09-023

extrapolated to an estimated annual leakage rate for the field.

4.4.2.1.3. Subsurface leakage from wells is estimated by the **Storage Field Engineer** and reported to **Storage Engineering Staff.**

4.4.2.1.4. Leakage from well casings is estimated by establishing a leakage rate using the radioactive tracer survey. The number of days of leakage is estimated by using subsurface temperature survey data. Casing shoe or Water Shut-Off (WSO) leakage is estimated by reviewing temperature, noise and radioactive tracer surveys, pressure draw-down and the overlying wells' gas production during the time of the leak.

4.4.2.1.5. In cases where leakage rates are not quantifiable, an average rate of 30 Mcf/d may be used. Engineering judgment is then applied and an average daily loss rate selected. The number of days the leak was occurring is determined by taking one-half the difference in the number of days between the last normal and the first abnormal temperature survey.

4.4.2.2. Surface facility leakage and subsurface leakage are quantified annually by the **Storage Field Engineer** who reports the results to the **Storage Engineering Manager** and **Measurement Data Operations**.

4.4.3. Reservoir losses

4.4.3.1. Reservoir losses are categorized as those associated with Company-operated wells completed in the storage reservoir and general reservoir losses.

4.4.3.1.1. Losses associated with the Company-operated wells include losses through failures in the cement between the cap rock and well casing. These losses are also known as "shoe leaks," "WSO" leaks and "stage collar" leaks.

AC_CPUC_SED_DR_17_0000182

Confidential and Protected Materials Pursuant to PUC Section 583, GO 66-D, and D.17-09-023

4.4.3.1.2. General reservoir losses include losses through abandoned wells or breakdown of some portion of the trapping mechanism. This type of loss is not directly detected by surveys of Company-operated wells in the storage zone.

4.4.3.1.3. Quantification of reservoir losses utilizes industry accepted methods of inventory verification.

4.4.4. Reservoir losses are quantified annually by the **Storage Field Engineer** who reports results to the **Storage Engineering Manager** and **Measurement Data Operations.**

4.4.5. Gas storage field measurement audits

4.4.5.1. When Storage Engineering identifies a consistent discrepancy in the pressure or P/Z versus Inventory relationship of 1 Bcf or 3% of the working inventory volume, whichever is less, at a storage field that cannot be explained by known leaks such as gas vented to the atmosphere, liquid production or other reservoir changes, they request an audit of the gas measurement systems at the storage field by the Measurement, Regulation and Control (MRC) group of Gas Engineering.

4.4.5.2. MRC investigates the following parameters with assistance from Storage personnel.

4.4.5.2.1. MRC Design Team obtains the most current drawings and block flow diagrams for the storage field.

4.4.5.2.2. MRC Design and Storage Field personnel inspect the facility to determine the accuracy of current drawings.

4.4.5.2.3 MRC Design and Storage Field personnel identify any changes in metering or gas processes that have occurred since the drawings were last issued.

4.4.5.3 MRC reviews Storage Field Ledger calculations in order to verify they agree with updated drawings and block flow diagrams. MRC documents any errors found in the Ledger formulas and advised MDO of any required Ledger formula revisions.

4.4.5.4 MRC in conjunction with the drawing confirmation prepares a list of the meters, instrument configuration and associated transducer ranges.

4.4.5.4.1 MRC compares this listing to information in the Measurement Collection System (MCS) for those sites that MCS re-calculates the volumes and notes any discrepancies and impact of those discrepancies on measurement accuracy.

4.4.5.4.2 MRC compares information in the Instrument Configuration for those site where the Scada Pack calculates the volumes and notes any discrepancies and impact of those discrepancies on measurement accuracy.

4.4.5.5 MRC Measurement Technology reviews Storage Field calibration and meter inspection results to insure adherence to the Gas Standards and System Instructions listed below. Any discrepancies or errors will be documented and impact on measurement noted.

- **Standard 223.0360** Instrument Maintenance – Storage Field and Transmission Facilities
- **Standard 185.0455** Flow Measuring Devices – Field Maintenance
- **Standard 185.0475** Orifice Meters and Orifice Plates - Field Inspection and Maintenance
- **Form 4682-B** Orifice Meter Order
- **Standard 185.0452** Daniel Ultrasonic Meter - Operation and Maintenance
- **Standard 185.0425** Rotary Meters - Field Maintenance, Inspection and Repair
- **Standard 185.0530** Turbine Meters - Operation, Maintenance and Spin Test
- **Standard 185.0474** Control Microsystems SCADAPACK
- **Standard 185.0457** Totalflow Inspection and Calibration Requirements for 6610, 6413, 6713 & X-Series
- **Standard 185.0458** Totalflow Inspection and Calibration Requirements for 6611, 6414, 6714 & X-Series
- **Standard 185.0461** Galvanic Gas Micro - Installation and Field Maintenance
- **Standard 185.0515** Temperature Devices – Maintenance

SED SUR_REPLY_001307
AC_CPUC_SED_DR_17_0000184

Confidential and Protected Materials Pursuant to PUC Section 583, GO 66-D, and D.17-09-023

4.4.5.6 Storage Field Orifice Meter or Ultrasonic Meter (USM) inspections will be witnessed by MRC Measurement Technology to confirm conformance to applicable Gas Standards listed in Section 4.4.5.5. A borescope inspection may be recommended if metering inspection results warrant further investigation.

4.4.5.7 MRC Measurement Technology to review the last 12 months of MCS Hourly data for each Storage Field Meter on the Ledger to verify meters are operating within their minimum and maximum ranges.

4.4.5.7.1 Verify operating Orifice Differential Pressure (DP) are 9" w.c. or greater on average, Beta ratio within the range of 0.2 to 0.6 and orifice plate thickness and bevels in accordance with AGA 3

4.4.5.7.2 MRC Measurement Technology will also review borescope inspection results. Impact on measurement accuracy will be noted for any negative findings.

4.4.5.8 MRC Technology to issue final report to Storage Field, MRC and MDO summarizing all findings, quantifying all measurement errors and detailing any revisions required to MCS Ledgers or Company Drawings.

4.4.5.8.1 Report will also recommend any follow-up actions required by Storage Field, MRC Design or MDO.

4.4.5.9 The final report results are reviewed and signed off on by:

- Director of Storage
- Storage Engineering Manager
- Storage Operations Manager
- Measurement Regulation and Control (MRC) Manager
- Contract and Compliance Manager - Measurement Data Operations (MDO)
- Storage Technical Services Manager (TSM)

5. RECORDS

5.1. Surface Pressure Taken during Shut-in., P/Z Calculations and Plots are maintained as records. Retention of all records is in accordance with Sempra Energy's company policy.

Subject: Fwd: Aliso Canyon - Standard Sesnon 25 - Wellhead Leak - Brief Summary
Attachments: SS-25Wellschematic.pdf; ATT00001.htm

Bret, we are having an issue with a well leak on SS 25 at Aliso. We tried to kill the well earlier today but were unsuccessful. Todd is calling out some additional expertise as described below. I am heading back home from Lee"s to better monitor the situation. Please call me on my cell or Todd directly for more information.

Scott has been informed all along.

Subject: Aliso Canyon - Standard Sesnon 25 - Wellhead Leak - Brief Summary
Hi Phil,

Here's the current overview/summary of the work accomplished to date (it's a bit of a blur but here it is as best I can do at the moment and I'm sorry if this is too wordy):

10/23/15 (late afternoon): Ops notified/Storage Engineering of a well that was possibly leaking at the SS-25 site. Ops had been on injection that afternoon and they were shutting in. The ops noticed that SS-25 sounded like it was still flowing after being shut-in after injection and they noticed a gas odor on the east side of the well pad along the road at the location. The SS-25 well had no anomalous pressure readings tubing/casing or surface casing prior to that day. No wells in the vicinity of the SS-25 wellsite or the other two wells on the SS-25 site (SS-25A and SS-25B) are currently or were showing elevated surface casing pressures or any unusual pressures from the previous days.

10/23/15 (evening) Met with Ops and Storage Engineering to discuss a plan of attack. The initial plan was to gather the equipment, Halliburton pump truck and brine to plan on killing the well. All of that equipment ultimately arrived on location by 11:00am today (10/24/15).

In the meantime, we suspected the wellhead seals were leaking (as in a top down leak) based on the sounds at the wellhead, a cool to the touch wellhead and a slightly elevated surface casing pressure (140 psig). Cameron wellhead was called out this morning to test and verify the wellhead seal integrity. The primary and secondary wellhead seals were pressure tested to 1600 psig and they bled to 600 psig. Injected plastic packing into the primary seal void and pressure tested the seals to 2200 psig and it held at 1800 psig. There was still audible noise at the wellhead with all the wellhead valves closed.

Well Kill Activity (today): The plan was to pump a polymer pill down the tubing to kill the reservoir and then perform a standard brine well kill. The well currently has an old disabled Camco subsurface safety valve system in the 2-7/8" tubing string place and a Gas lift mandrel above it in the tubing string.

Current Kill Job summary:

SS-25 Well Pressures Prior to Kill: 11-3/4" surface casing: 140 psig / 7" production casing: 290 psig / 2-7/8" completion tubing: 1700 psig

Activity during the well kill: Pumped 11 bbl of 10 ppg XC polymer pill down the 2-7/8" tubing. The tubing pressured up to 3500 psig surface pressure. Shut down the pump. The 7" casing pressure remained at 290 psig surface pressure indicating no communication between the 2-7/8" tubing and the 7" casing annulus.

Decided to perform a "Pump and Bleed" kill procedure on the 7" production casing annulus to fill the tubing/casing annulus. Began pumping @ 3 bbl/min w/ the casing pressure at 290 psig. Pressure on the 7" casing began to drop with 45 bbl of 8.6 ppg brine away. The pressure on the 7" production casing dropped to 250 psig surface pressure. Increased the pump rate to 4 bbl/min. Inspected the wellhead – noise and vibration stopped. Inspected the well location looking for any brine communication to the surface (none seen). Continued to pump and at 89 bbl of brine pumped into the annulus and additional gas flow was noted in cracks in the ground. Immediately shut the pump down – Monitored well pressures and the location.

SS-25 Well Pressures After Kill Attempt (10-24-15-Monitoring):

Time	11-3/4"	7"	2-7/8"
4pm	398 psig	280 psig	100 psig
4:30pm	401 psig	296 psig	140 psig
5pm		306 psig	185 psig
5:30pm		307 psig	200 psig

We currently have the Baker tank, and the Halliburton pump truck parked next to the remote kill header on the location.

At this time, It appears that we had a wellhead seal leak and/or a very shallow 7" production casing leak. While on injection, the leak(s) possibly charged up the 11-3/4" surface casing annulus. The well pad has various spots with venting cracks which are probably allowing the gas bubble in the 11-3/4" surface casing and/or the 7" production casing to vent. We stopped pumping brine into the well in order to allow the gas bubble to subside and to not take the chance of increasing the surface pressure any further. At the moment we are monitoring the location to see if we see a decrease in the venting gas. In the meantime, I would like to get another opinion from Boots and Coots and have them review the situation to see if there are any additional recommendations to remedy the situation. As the well is acting very odd at the moment, I do not want to aggravate the situation....

Todd R. Van de Putte

SS25 Well Pressures

Ref #	Date	Time	Casing Pressure	Tubing Pressure	Surface Csg	Events	Notes
1	Normal Operation		2700	2700	Should be Zero	Well normally operates on casing injection and casing WD. It may be operated on dual flow	Well on injection - heard noise in wellhead
2	Friday, October 23, 2015	4:00 PM	270	1700	140	Ops noticed leaking Annulus fitting on well. They responded by closing 2 inch surface annulus valve and noticed 140 psi on gauge	When Ops closed injection header valve, the WKM SSV on casing closed almost immediately by low pressure pilot (setpoint is 270-300 psi). It was at that time Ops noticed sound of gas flow in wellhead.
3	Friday, October 23, 2015	4:10 PM	270	1700	140	Well shut-in by Ops	We initially suspected an up/down wellhead seal leak between the 7 inch casing and he 11-3/4 surface casing - Called Cameron
	Saturday, October 24, 2015	6:00 AM	270	1700	140	Cameron began repairing wellhead seals	Cameron initially tested both seals to 1200 psi, both bled down to 600. They then pumped 14 tubes of plastic into primary seal cavity.
4	Saturday, October 24, 2015	12:27 PM	290	1700	140	Haliburton circulating down tubing	Pumped 11.8 barrels of 10# polymer brine. Pressure on tubing rose to 3500. Shut down. 7 inch casing pressure remained at 290. Surface casing remained at 140. Monitored tubing pressure for 20 minutes. Tubing pressure bled to 2700.
	Saturday, October 24, 2015	2:00 PM	290	2700		Decided to pump and bleed down 7 inch casing to fill casing using 8.6# lease water.	
	Saturday, October 24, 2015	1:20 PM				Shut in tubing with 2700 psi on it	
	Saturday, October 24, 2015	1:30 PM		50		Put the well on Tubing flow to frac tank for few mintues and bled tubing down to 50 psi	
5	Saturday, October 24, 2015	2:07 PM	290	50	140	Haliburton began pumping 8.6 lb lease water down 7 inch casing	Started pumping 8.6# lease waster at a rate of 1.5 b/m. At 20 barrels increased rate to 2.5 b/m , at 33 barrels increase to 3.5 b/m, Began monitoring location for gas. Inspected the wellhead, noticed the noise and vibraton had subsided. Continuted pumped. At 89 barrels gas broke through surface at location and surrounding location. Continuted Monitoring
	Saturday, October 24, 2015	2:30 AM	400			When we shut down after 89 barrels and gas came to surface and we shut down, 7 inch casing pressure increased to 400 psi	
6	Saturday, October 24, 2015						
7	Saturday, October 24, 2015	5:00 PM	306	177			
8	Saturday, October 24, 2015	5:23 PM	307	200			
9	Saturday, October 24, 2015	5:30 PM	309	210			
	Saturday, October 24, 2015	5:40 PM	310	218			
	Saturday, October 24, 2015	5:50 PM	311	226			
	Saturday, October 24, 2015	6:00 PM	312	232			
	Saturday, October 24, 2015	6:10 PM	314	239			
	Saturday, October 24, 2015	6:30 PM	316	251			
	Saturday, October 24, 2015	7:00 PM	318	262			
	Saturday, October 24, 2015	7:30 PM	322	274

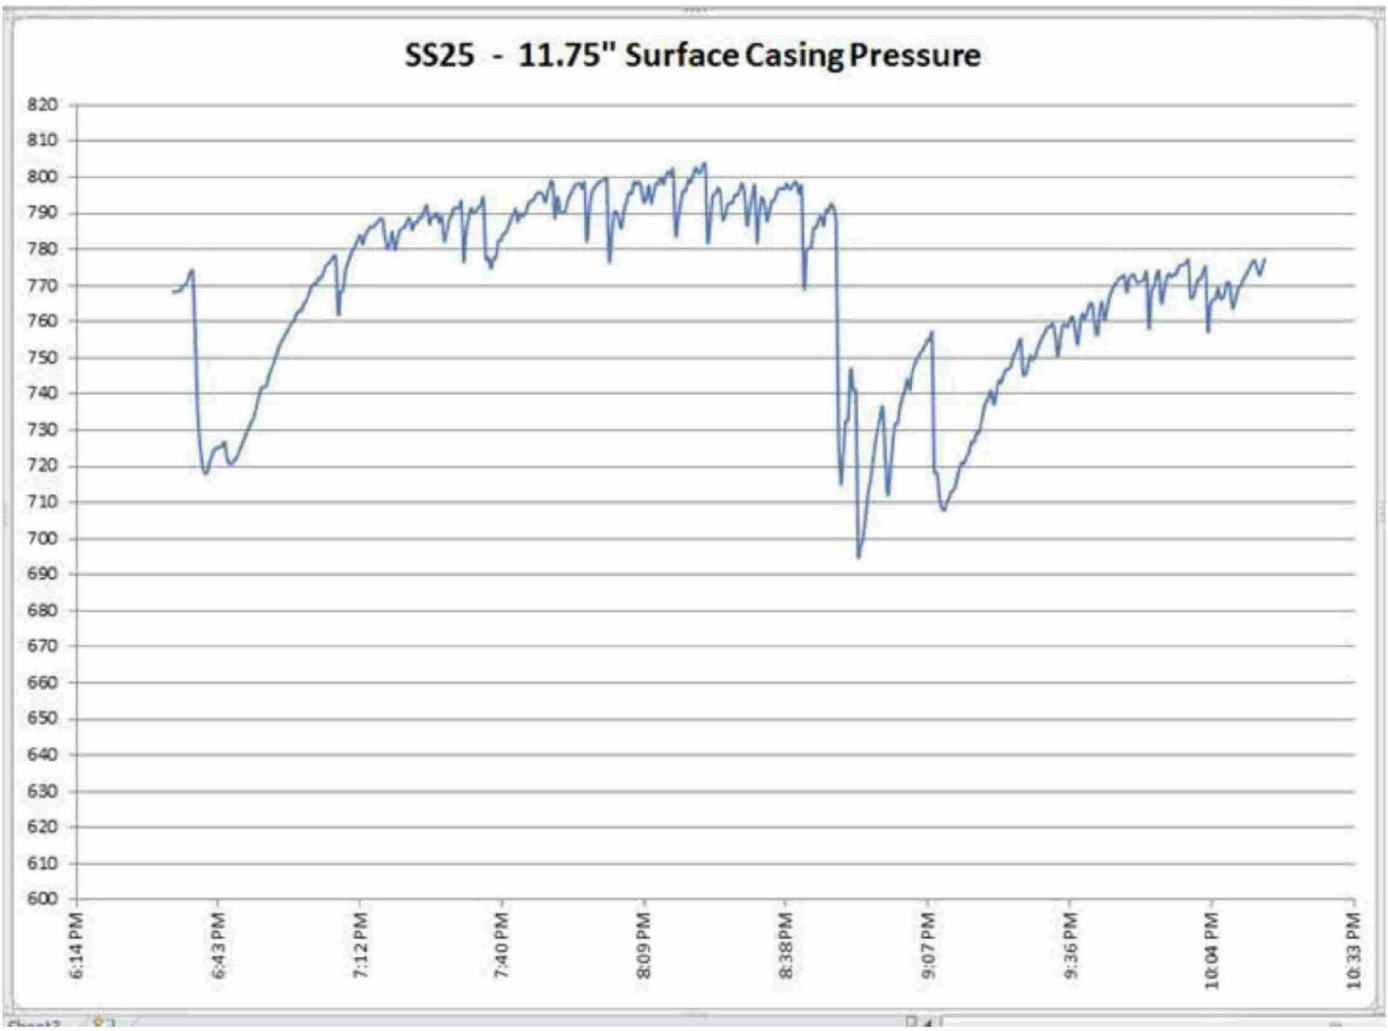
Subject: Surface Casing Pressure trend

The pressure transmitter was activated at 6:30 pm. Since then, the surface casing pressure appears to be regulating itself between 700 & 800 psi.

I'll continue to keep an eye on it.



Thomas Egbert

Hi Todd,

I worked 5hrs OT today, 10/30/15 from 3-8pm on installing wireless transmitters and repeater batteries and remounted gateway antenna @ Sesnon FW Pump location with JT.

SS-25 is online and in Pi !

Thx,

Russell Miller

SAN DIEGO GAS AND ELECTRIC COMPANY
SOUTHERN CALIFORNIA GAS COMPANY
2009 BIENNIAL COST ALLOCATION PROCEEDING (A.08-02-001)
28th DATA REQUEST FROM SOCAL GENERATION COALITION (SCGC-28)

QUESTION 28.1:

28.1. Regarding the Southern System Reliability Request for Offers ("RFO") dated December 1, 2008:

28.1.1. Did SoCalGas receive any proposals by the December 19, 2008 deadline? If so, how many?
28.1.2. Did SoCalGas notify "short-listed" bidders and begin negotiating binding offers and final agreements on January 9, 2009? If so, how many "short-listed" bidders are there?
28.1.3. Does SoCalGas anticipate that it will be able to meet the February 2, 2009 target date for filing an advice letter for approval of Southern System minimum flow agreements?
28.1.4. Offers were to be sent to Gwoon Tom. Is Mr. Tom also involved in the sale of unbundled storage services under Schedule G-TBS?

RESPONSE 28.1.1:

Yes. We have received responses from 11 different parties.

RESPONSE 28.1.2:

Yes. We short-listed all bidders.

RESPONSE 28.1.3:

Our current plan is to file by February 2. However, depending on negotiations and final contracts, that date could be delayed.

RESPONSE 28.1.4:

Yes.

QUESTION 28.2:

28.2. Regarding the sale of System Operator HUB services:

28.2.1. By what date does SoCalGas expect to start commencing the sale of such services?
28.2.2. Will Mr. Tom be involved in the sale of the HUB services in addition to the sale of the unbundled storage services under Schedule G-TBS?
28.2.3. Does SoCalGas regard the sale of unbundled storage services to be a System Operator function?
28.2.4. Does SoCalGas regard the sale of HUB services to be a System Operator function?

RESPONSE 28.2.1:

The SoCalGas advice Letter 3818-A which included the G-PAL tariff was approved by the Commission on June 18th and SoCalGas began offering G-PAL services in July 2008. (Response to SCGC Data Request 22.7)

RESPONSE 28.2.2

Yes.

RESPONSE 28.2.3:

The term System Operator is the same as "Utility System Operator" that was used during the proceedings that resulted in D.07-12-019., and was intended to separate for discussion purposes, the various functions within SoCalGas that provided service to customers, specifically excluding the Utility Gas Procurement function. The shorten term "System Operator" that many parties seem to use, should not be used as a literal term. The term "Utility System Operator" is defined in SoCalGas Rule 1 (approved within Advice Letter 3818-A) reads as follows:

> Utility System Operator: The applicable departments within Southern California Gas Company and San Diego Gas & Electric Company that are responsible for the physical and commercial operation of the pipeline and storage systems specifically excluding the Utility Gas Procurement Department.

Therefore, based on this definition, Storage and Hub Products sales are within the definition of Utility System Operator. To make it clear, the daily (24/7) system operations of the SDG&E/SoCalGas transmission pipelines is solely the responsibility of the Utility's Gas Control Department.

RESPONSE 28.2.4:

See response 28.2.3.

QUESTION 28.3:

28.3. By what date will the System Operator assume Southern System reliability responsibility from the Gas Acquisition Department?

RESPONSE 28.3:

As defined in SoCalGas' approved Advice Letter 3818-A, April 1, 2009. (Response to SCGC Data Request 21.5.6)

QUESTION 28.4:

28.4. By what date will the SRMA become effective?

RESPONSE 28.4:

Please see response 28.3.

QUESTION 28.5:

28.5. By what date will SoCalGas implement the core balancing rules approved in D.07-12-019, including the monthly imbalance tolerance?

RESPONSE 28.5:

Please see response 28.3.

QUESTION 28.6:

28.6. By what date will SoCalGas implement the fifth nomination cycle approved in D.07-12-019?

RESPONSE 28.6:

April 1, 2009.

QUESTION 28.7:

28.7. Please provide organization diagrams that specifically identify all SDG&E/SoCalGas departments that are included in the Utility System Operator and identify their function within the System Operator.

RESPONSE 28.7:

The "System Operator" term should be considered in the same context as the defined term Utility System Operator and is not meant to describe a separate function within the Utility. Therefore all departments have been defined to be in the Utility System Operator, except the Gas Procurement Department.

SoCalGas objects to this question because it seeks confidential and proprietary trade secrets of SoCalGas. It would cause substantial harm to SoCalGas and its customers, and potentially compromise the security of the SoCalGas system, if this information were to be publicly disclosed. Without waiving these objections, and subject thereto, SoCalGas responds as follows: The daily overall physical transmission and storage system reliability operations within the Utility System Operator are conducted by the existing Gas System Operations under Ms. Gina Orozco-Mejia. Other departments assist in ensuring the operational reliability of the pipeline system of which many are located in the Gas Operations Organization under Mr. Lee Stewart. The activities involved in obtaining any physical flowing gas supplies needs determined by the Gas System Operations would be conducted in the Storage and Hub Products group within the Energy Markets and Capacity Products department under Mr. Rodger Schwecke. The Energy Markets and Capacity Products department is located in the Customer Services Organization under Mr. Rick Morrow.

QUESTION 28.8:

28.8. Are the following descriptions of the System Operator that were provided in response to data requests SCGC-06 and SCGC-07 in A.06-08-026 still accurate? If not, please make any corrections that are necessary to make the descriptions accurate.

Question 6.1

In response to SCGC Data Request Question 3.3.3, which asked: "Please identify the group(s) within SDG&E/SoCalGas that would be identified as the System Operator," SDG&E/SoCalGas responded: "Please see SoCalGas filed "Rule 1, Definitions" which is attached to A.06-08-026 as Appendix T."

Rule 1 defines the Utility System Operator as "The applicable departments within Southern California Gas Company that are responsible for the physical and commercial operation of the pipeline and storage systems specifically excluding the Utility Gas Procurement Department."

6.6.1. Please provide organization diagrams that specifically identify all SDG&E/SoCalGas departments who are members of the Utility System Operator.

RESPONSE 6.1.1:

SoCalGas objects to this question because it seeks confidential and proprietary trade secrets of SoCalGas. It would cause substantial harm to SoCalGas and its customers, and potentially compromise the security of the SoCalGas system, if this information were to be publicly disclosed. Without waiving these objections, and subject thereto, SoCalGas responds as follows: The daily overall physical transmission and storage system reliability operations within the System Operator are conducted by the existing Pipeline System and Planning Department under Mr. John Dagg. Other departments assist in ensuring the operational reliability of the pipeline system of which many are located in the Gas Operations Organization under Mr. Lee Stewart. The activities in support of maintaining physical flowing gas supplies as discussed by Mr. Schwecke would be conducted in concert between the Pipeline System and Planning Department and the Capacity Products Department of Customer Services - Major Markets Organization under Mr. Rick Morrow.

QUESTION 7.1:

In response to SCGC Data Request Question 6.1.1, SDG&E/SoCalGas responded:

The daily overall physical transmission and storage system reliability operations within the System Operator are conducted by the existing Pipeline System and

Planning Department under Mr. John Dagg. Other departments assist in ensuring the operational reliability of the pipeline system of which many are located in the Gas Operations Organization under Mr. Lee Stewart. The activities in support of maintaining physical flowing gas supplies as discussed by Mr. Schwecke would be conducted in concert between the Pipeline System and Planning Department and the Capacity Products Department of Customer Services - Major Markets Organization under Mr. Rick Morrow.

7.1.1 Please provide the name of each major organization unit making up the Pipeline System and Planning Department that conducts activities considered to be those of the System Operator. (A major organizational unit is one that is large enough to require a supervisor dedicated to the organizational unit.)

7.1.2 Please provide a description of the activities regularly conducted by each of the organizational units identified in the response to the previous question.

7.1.3 Please provide the name of each department in the Gas Operations Organization that conducts activities considered to be those of the System Operator.

7.1.4 For each of the departments identified in the response to the previous question, please provide the name of each major organization unit that conducts activities considered to be those of the System Operator.

7.1.5 Please provide a description of the activities regularly conducted by each of the organizational units identified in the response to the previous question.

7.1.6 Please provide the name of each major organization unit making up the Capacity Products Department that conducts activities considered to be those of the System Operator.

7.1.7 Please provide a description of the activities regularly conducted by each of the organizational units identified in the response to the previous question.

7.1.8 SDG&E/SoCalGas states: “activities in support of maintaining physical flowing gas supplies as discussed by Mr. Schwecke would be conducted in concert between the Pipeline System and Planning Department and the Capacity Products Department.”

7.1.8.1 Please specify the “activities in support of maintaining physical flowing gas supplies as discussed by Mr. Schwecke” that the statement refers to.

7.1.8.2 Please explain in detail how such activities would be conducted.

7.1.8.3 Would either department have lead responsibility to ensure completion of the tasks identified or would that responsibility fall to a different organizational unit?

7.1.8.4 For each major task or set of tasks, please name the organization unit responsible.

RESPONSE 7.1.1:

SCADA - Maintain the primary data acquisition & control (SCADA) System for the SDG&E/SoCalGas gas transmission and storage system.

Gas Control - Control and monitor day to day/hour to hour physical gas deliveries into and throughout Southern California for the SDG&E/SoCalGas gas transmission system.

Gas Scheduling - Operate the day to day systems and control that allow customers to schedule gas supply into SDG&E/SoCalGas

Gas Transmission Planning - Long term planning & design of the SDG&E/SoCalGas gas transmission system.

RESPONSE 7.1.2:
Please refer to response 7.1.1.

RESPONSE 7.1.3:

Gas Transmission & Distribution (Pipeline Integrity- Transmission, Field Operations, Technical Services, Gas Operations Services, Gas Operations – Northern Region, Gas Operations – Pacific Coast Region, and Gas Operations – South Inland Region, Storage Operations (Storage Engineering, Storage Operations – Honor Rancho, Storage Operations – Goleta, Storage Operations – Aliso Canyon, Storage Operations Play Del Rey, Technical Services)): Field operations that maintain the gas transmission system to ensure its operations availability and performance while complying with all regulatory and environmental requirements addressed in four primary areas of responsibilities; Field Operations, Field Technical Services, and Technical Training. Field Operations is responsible for the day to day operation and maintenance of gas transmission facilities and infrastructure including operating and maintaining equipment at compressor stations, pipeline receipt points, valve control stations, major customer delivery custody-transfer points, all associated monitoring, metering, and control facilities, odorization equipment, and real-time operating data telemetry communications between gas facilities and SoCalGas' Gas Control Field Operations also performs annual leak surveys of all transmission pipeline facilities, operates and maintains the cathodic protection systems, conducts surveillance of third party construction activities around the vicinity of buried pipeline facilities, and performs mark and locate services to identify the location of buried facilities. Also provides 24 hour emergency response to any operating and/or control issue related such items as earthquakes, wildfires, dig-ins, etc. in order to minimize the potential for danger

to the public and/or to minimize impact to system reliability. Field Technical Services includes the activities of design engineering, instrumentation and control, project support, and environmental services in support of the day to day operations and maintenance of the Gas Transmission system. Responsibilities include: right of way maintenance, providing on-site technical expertise to field personnel, and troubleshooting technical issues for both capital and O&M projects. Technical Training provides specialized training for the various jobs existing in Field Operations. This training includes instrumentation for measurement, control, local data acquisition, gas quality monitoring, pressure and flow, and for pipeline locate and mark, cathodic protection, welding, compressor and associated equipment maintenance, and operator qualification. Maintains the gas distribution system split into three regions to ensure its operations availability and performance while complying with all regulatory requirements including leakage surveys, leak repairs, maintenance on mains and services, application of corrosion control measures, valve and regulator station maintenance, monitoring meter accuracy, checking for odorant, and locating and marking buried pipes to avoid damage caused from digging by others. In addition, there is a variety of supporting work necessary such as maintaining pipeline maps and related gas system location information, administering and implementing city permitting and traffic control requirements, and the maintenance of engineering models of system flows and pressures. Operates four underground storage fields, in compliance with all regulatory and environmental requirements, as an integrated part of the energy infrastructure required to provide gas service through the design, operations and maintenance of the storage fields and related and provides the design, planning, and supervision of well drilling and workovers to maintain or increase storage capacity and oil production.

Gas Engineering (Measurement, Regulation and Control, Operations Technology, Planning and Project Development, Geographic Services, Engineering Design, Engineering Analysis Center, Pipeline Integrity, and Project and Construction Management) - Engineering and technical services that are performed in support of distribution, transmission and storage operations including Pipeline Integrity Management, Gas Measurement, Control and Pressure Regulation, Pipeline and Gas Facilities Engineering Design and Support, and Gas Infrastructure Project Management and Construction

Pipeline System Control & Planning – Please refer to Response 7.1.1

RESPONSE 7.1.4:
Please refer to response 7.1.3.

RESPONSE 7.1.5:
Please refer to response 7.1.3.

RESPONSE 7.1.6:

Pipeline Products – Negotiate and administer interconnect agreements and relationships with upstream suppliers. Manage the contractual arrangements for any receipt point services and pipeline services to customers including potential expansions. Maintain and develops the gas nominations/scheduling procedures and the EBB functionality.

Storage Products – Negotiate and administer unbundled storage agreements with customers including potential expansions.

Capacity Products Staff – Support the activities of the Pipeline and Storage Products groups.

RESPONSE 7.1.6:
Please refer to response 7.1.5.

RESPONSE 7.1.8.1:
Please refer to the direct and Supplemental testimony of Mr. Schwecke.

RESPONSE 7.1.8.2:
Please refer to the direct and Supplemental testimony of Mr. Schwecke.

RESPONSE 7.1.8.3:
Yes.

RESPONSE 7.1.8.4:
Actual detailed responsibility has not been determined.

RESPONSE 28.8:
The above descriptions of the departments within the Utility System Operator are still accurate. A few changes have occurred.

- The name of the "Pipeline System Control & Planning" organization is now "Gas System Operations".
- Gina Orozco-Mejia has replaced John Dagg as Director of that organization.
- Activities listed for Storage Products now includes the Operational Hub product sales as defined in SoCalGas G-PAL tariff.
- "Customer Services – Major Markets" name has changed to "Customer Services"

Confidential and Protected Materials Pursuant to PUC Section 583, GO 66-D, and D.17-09-023

Subject: Pressure Transmitter on SS5

John Thompson has arranged to install a pressure transmitter on SS5 today. It will provide real time data to the PI system. It should be operational by this afternoon.

He has three other transmitters available. Can you think of any other wells it might help us to have a transmitter? Porter 66 already has one.

Thomas Egbert

Senior UGS Engineer.

1 Background

The Legal Division of the California Public Utilities Commission issued a Data Request to Blade Energy Partners (Blade) on April 10, 2020. Data Request No: SED 72 is related the Preliminary Investigation of Southern California Gas Company's Aliso Canyon Storage Facility.

The CPUC questions (from file: "I1906016 SED Data Request 72 Final.pdf") are included verbatim followed by the Blade responses to the questions.

The questions are related to the document titled: *Chapter I, Prepared Reply Testimony of Tim Hower and Charlie Stinson of MHA Petroleum Consultants on behalf of Southern California Gas Company (U 904 G)* (file name: "1_Ch. I - MHA - Hower and Stinson (A Final).pdf").

2 Questions and Responses

2.1 Question 1

1. Please refer to page 22, which states, "Knowledge of the hydrogeology and groundwater is only relevant for the design and implementation of the surface casing."

2.1.1 Blade Responses

a. Does Blade agree with this?

No.

b. If not, why not?

The SS-25 well was completed with a single-barrier architecture, which relied on the pressure integrity of the production casing. In single-barrier wells, the failure of the production casing will necessarily result in the loss of integrity of the well, as happened in the 2015 SS-25 incident. The corrosion resulting from groundwater outside the production casing represented a threat to the integrity of the production casing. In addition, many of the Aliso Canyon wells had uncemented production casing in the vicinity of the groundwater. It is therefore essential for the operator to have a knowledge and understanding of the groundwater regime.

c. Does Blade accept as true that knowledge of hydrogeology and groundwater is irrelevant for operations and maintenance of:

a. The production casing that is at the same depth and covered by the surface casing?

No.

Since the surface casing cannot be relied on (or independently inspected) to maintain its integrity, it cannot be relied on to exclude groundwater from the outside of the production casing. Therefore, knowledge of groundwater behavior is essential for the production casing above the surface casing shoe as described in the response to Question 1 b. above.

b. The production casing that is at lower depths and not covered by the surface casing?

No.

In this case, production casing is adjacent to any groundwater and annulus fluid below the surface casing shoe, and the knowledge of the groundwater regime is essential as described in the response to Question 1 b. above. If cement is absent, then the groundwater and production casing are in direct contact.

c. Explain.

Explanations are included the previous responses to Questions 1.

2.2 Question 2

2. Please refer to the Section entitled, "Cathodic Protection is not Industry Standard and Was Not Necessary for SS-25." on pages 25 through 27.

2.2.1 Blade Responses

a. In particular, does Blade agree with SoCalGas's conclusion in this section that states, "Thus, an independent corrosion protection mechanism like cathodic protection would not have been useful in this case, contrary to the suggestions made in SED testimony."

   Yes. Blade agrees with the conclusion.

   Cathodic protection could have prevented the surface casing corrosion that provided additional pathways for the gas. However, cathodic protection could not have prevented the 7 in. external corrosion and subsequent rupture. This is discussed in Page 215 of the Blade Main report.

b. Why or why not?

   The production casing inside the surface casing from surface to 990 feet in SS-25, could not be protected with cathodic protection. The production casing is inside the surface casing in this region, consequently any cathodic currents would have been shielded by the surface casing and not reached the production casing. A cathodic protection system would have impressed a current and ensured that the surface casing that was exposed to the soil and surface formations, would have been protected while acting as a cathode. The 7 in. casing was inside the 11 3/4 in. casing and would not act as the cathode in such a system.

c. Provide reference to text as necessary to support the answer to questions 2a and 2b.

   This is discussed in Page 215 of the Blade Main report.

d. In Blade's view, could cathodic protection have helped protect the surface casing and production casing of well SS-25?

   No, only the surface casing could be protected and the corrosion mitigated using a cathodic protection system. The production casing inside the surface casing cannot be protected using a cathodic protection system.

e. Why or why not?

   See response to Question 2 b.

f. Provide reference to text as necessary to support the answer to questions 2a and 2b.

   The surface casing cathodic protection is discussed in Page 233 of the Blade Main Report.

g. Provide any additional context Blade deems necessary to support the answers provided.

   NACE International provides guidance on the application of cathodic protection for external surfaces of steel well casings [1]. The standard applies only to well casing exteriors and not to internal corrosion.

1 Background

The Legal Division of the California Public Utilities Commission issued a Data Request to Blade Energy Partners (Blade) on March 30, 2020. Data Request No: SED 58 related the Preliminary Investigation of Southern California Gas Company's Aliso Canyon Storage Facility.

The CPUC statements (from file: "I1906016 SED DR 58 Final.pdf") are included verbatim followed by the Blade answers to the questions.

The page numbers and figure numbers in the verbatim statements refer to a document titled: Chapter II, Prepared Reply Testimony of Robert A. Carnahan, P.E. on behalf of Southern California Gas Company (U 904 G). File name: "2_Ch. II - Exponent - Carnahan (A Final).pdf".

2 Statements and Responses

2.1 Statement 1

Pages 1 and 2: "[Public Advocates Office's] allegations presuppose that the Vertilog technology at that time [1988] was reliable and accurate. That is not the case."

2.1.1 Blade Response

1. Does Blade Energy Partners agree or disagree with the statement?

   Disagree.

2. If Blade disagrees with any portion of the statement, why?

   The Vertilog or equivalent technology that existed in 1988 was capable of detecting and discriminating metal loss features, with only its sizing and characterization capabilities being limited compared to the current technology. That being said, it was the best technology available at the time for monitoring metal loss in casing and was sufficient to indicate the presence of corrosion issues.

   Mr. Carnahan incorrectly references a quote [page 2, line 12] found in a Pipeline & Gas Journal article (footnote #9). The original quote, which is related to pipeline inspection, is being misapplied to downhole logging. The complete quote is:

   > "Historically, the results of the first-generation MFL tools were not very satisfactory, but BG (British Gas) and then PII developed advanced electronics and analysis algorithms and software which set new standards in the industry."

   In Mr. Carnahan's testimony [at page 2, line 12, and page 8, line 13], he modifies the quote as follows:

   > "Historically, however, the results of the first generation of MFL tools were not very satisfactory.[9]"

   The original quotation notes the advances in technology but were not acknowledged by Mr. Carnahan. The statement by Goedecke, the original author, about first-generation magnetic flux leakage (MFL) tools and subsequent advances in technology was in reference to pipeline inspection tools. These first-generation MFL tools were developed from approximately 1959–1965 [1, 2, 3]. The first commercial effort to collect information using MFL tools was by AMF Tuboscope in 1965; the name of the tool was the Linalog [1, 2, 3]. By 1983, 112,000 km of pipeline had been inspected [4]. Mr. Carnahan mischaracterizes the Vertilog as a first-generation MFL tool but there were significant advances in MFL technology that began in the pipeline industry [2] prior to the Vertilog's deployment into oil and gas wells in the mid 1970's.

   Mr. Carnahan negatively portrays the Vertilog [page 2, line 8], "… as a mechanism that attempts to utilize Magnetic Flux Leakage (MFL) to detect casing metal loss[8]." The footnote #8 that Mr. Carnahan refers to was a 1977 Society of Petroleum (SPE) paper [5] written by employees of the logging company Dresser Atlas, which would later become part of Baker Hughes. The word "*attempts*" is not used in the reference. Although Mr. Carnahan describes the working principles of the Vertilog, he fails to provide the context that MFL and eddy current technology for the use of corrosion inspection were well established in oil and gas pipeline operations. The SPE paper's authors describe the Vertilog tool as follows:

It is a quantitative measurement of corrosive damage, indicating if the metal loss is internal or external, and if it is isolated or circumferential. Holes in the casing can be identified as well as parted casing. This survey in conjunction with other measurements, can be used to detect, monitor, and establish preventive techniques for corrosive problems.

Figure 1 shows the Vertilog and Digital Vertilog (DVRT) performance specifications as of 1991 (provided by Mr. Rod Foster, Well Integrity Senior Advisor, Baker Hughes). The two tools are essentially the same tool and sensor system but the DVRT has upgraded electronics for improved acquisition and computerized processing [6]. The DVRT was deployed in approximately 1991, superseding the Vertilog. As a point of reference, the DVRT was considered by Blade[i] for use in logging of the 11 3/4 in. surface casing as part of the SS-25 RCA. Considering the wall thickness of 0.317 in. (for 7 in. 23 ppf production casing in SS-25), the Vertilog and DVRT could detect defects deeper than 30% or 0.095 in. and size them +/- 15% or 0.048 in. For the Vertilog and DVRT, a 50% deep defect could be sized between 35–65%. In comparison, the High Resolution Vertilog (HRVRT) can detect defects that are deeper than 15% or 0.048 in. and size them +/- 10% or 0.032 in. For the HRVRT, a 50% deep defect could be sized between 40-60%.

Measurement Range:	30 to 90% penetration of the casing wall in single string
Absolute Accuracy:	±15% of actual pit depth in single string casing for isolated pitting, when casing information such as weight, grade, etc. is available
Repeatability:	±10% of first reading if pipe was fully magnetized on first pass
Sensitivity:	Casing defects as small as 0.375 in. (9.5 mm) in diameter with as little as 30% penetration can be detected and recorded at 100 ft/min (30.5 m/min) in single string
Radial Investigation:	Tool is designed to inspect the full casing circumference
Depth of Investigation:	100% of the wall of the inside casing

Figure 1: Performance Specifications for the Vertilog, and Digital Vertilog from 1991

Table 1 shows a listing of casing inspection logs that were downloaded from the DOGGR website [7] during the course of Blade's RCA; the logs are within 10 years of the proposed dates of the 1988 Interoffice Correspondence 2-year logging program [8]. As discussed in Blade's Main RCA report [9, p. 204], Blade's position is that SoCalGas made a recommendation to run the Vertilog in 20 wells that concerned them at the time. Blade reviewed the logs listed in the table that were run in approximately the same time frame as the 1988 Interoffice Correspondence. Although we did not perform an exhaustive study; in our opinion, the Vertilog was superior to the inspection tools of its day, specifically, the Welex Casing Inspection Log, McCullough Electronic Casing Caliper, and Schlumberger Electromagnetic Thickness Log. The recommendation to run Vertilog casing inspections in 20 wells appeared to Blade to have been based on using the best available technology at that time for the purpose of assessing the mechanical condition of casing flow wells completed in the 1940s and 1950s.

[i] In 2016–2017, the DVRT was the was only MFL tool available to inspect the 11 3/4 in. casing. Although the sensor system was developed in the mid-1970's with upgraded electronics in approximately 1991, the DVRT was still in-service and was initially Blade's primary MFL logging option. Because it was important to attain the most accurate data, Blade requested that Baker Hughes and its vendor, Microline Technology Corporation, adapt the HRVRT to 11 3/4 in. casing size. The DVRT was not used in the SS-25 RCA.

Mr. Carnahan's assertion is that the Vertilog was unreliable and inaccurate and combined with other factors, would not have prevented the SS-25 incident. His basis for finding the Vertilog unreliable and inaccurate is derived from his numerical comparison of five (5) Vertilogs from 1988–1990 to various HRVRT and USIT logs run in 2013 and 2016–2018. This is an approach that would not have been available to SoCalGas in the late 1980s or early 1990s. Certainly, logging technology of 2010s would be expected to be more accurate than that of late 1980s and early 1990s. However, this does not mean that the older logging tools did not provide useful or actionable information.

For example, in 1989, researchers evaluated four types of casing inspection tools, stating the following [10]:

> Electromagnetic casing inspection logs are commonly used in the industry to survey the condition of casing. Logs may be used to estimate the amount of pitting, degree of corrosion, wall thinning, changes in diameter, and other casing features. Occasionally, casing inspection logs are used to investigate a casing failure in a well. Interpretations of casing inspection logs may be used to determine the type of remedial work on a well where a casing failure has occurred, or they may be an important factor in a commercial casing failure claim.

There are key concepts in this paper related to casing inspection tools available in 1989. The first was that casing inspection tools were commonly used for detecting pitting, degree of corrosion, and wall thinning. The second was the authors describe MFL technology, specifically mentioning the Vertilog, as capable of being able to distinguish between split and parted casing.

Two of the wells in Table 1 had underground blowouts, namely F-3 and FF-34A, which were logged in 1986 and 1991 respectively. These dates bookend the Vertilog logging campaign outlined in the 1988 Interoffice Correspondence. Note that the Schlumberger Ultrasonic Imager (USIT) was run in P-42B in 1993, which was not that long after the September 10, 1990 FF-34A casing failure and when the Vertilog logging campaign was discontinued.

Table 1: Aliso Canyon Casing Inspection Logs within 10 years of 1988–1990

Well	Date	Vendor	Log Name

SS-14	May 26, 1998	Halliburton	Casing Inspection Log
SF-2	November 19, 1999	Schlumberger	Ultrasonic Imaging Tool

[a] – Wells listed in the 1988 Memo (F-4, P-37, P-46, SS-9, SS-8, P-34, F-2)
[b] – Wells that had blowouts (F-3, FF-34A)
[c] – Wells reviewed by Mr. Carnahan (F-4, P-46, SS-9, SS-8, FF-35B)
[d] – Logs not available on the DOGGR website (P-34, FF-35B, F-2)

Mr. Carnahan's spreadsheet analysis neglects important findings that are visible graphically on the log. There is considerable information that can be derived from looking at the log image. Different logs employ different technology; the characterization and sizing of features may appear different. Most logging companies have some version of the cement bond log with variable density (CBL – VDL) for the determination of zonal isolation (i.e., to evaluate if the cement is an effective barrier). Although these logs have been utilized for over 50 years, the best way to interpret the presence of cement and the bond to pipe and formation is to *look* at the log. There are wavy, chevron, zigzag, and other patterns that have meaning. This is the same for the Vertilog and other casing inspection logs. There is data in the patterns.

Blade performed an analysis of F-4's 1988 Vertilog as part of the RCA [11] comparing it to the 2016 Ultrasonic Imager (USIT) log. Figure 2 shows these two logs with the Vertilog on the left and USIT on the right. To aid in interpretation from joint to joint, the logs have been adjusted so that the casing connections of each log are aligned. External metal loss is denoted by blue text at A, B, and C on the Vertilog's Flux Leak track, and by the same letter on the USIT's wall thickness track. At A-A, external metal loss is found just above a connection. At B-B, external metal loss is found approximately midway in the joint. At C-C, there is external metal loss below a connection. The point here is the two logs found the same defects.

There was good agreement between the logs at most depths. However, in some cases, the logs did not agree. It should not be assumed that the 2016 USIT log was the more accurate one. In Blade's experience, MFL tools are better at detecting pitting corrosion. In general, it's a flawed concept to compare one log tool to another and automatically claim one is more accurate than the other. Log data has to be compared to truth data (direct measurements of defects) to assess log performance. In today's era, repeatability and reproducibility of pipeline inspection tools are verified independently in pull-through tests (e.g., Pipeline Research Council International Integrity and Inspection projects). Even today, very little data has been published in testing downhole logging tools in controlled environments. An independent comparison of casing inspection logging tools spanning decades does not exist, however, the Vertilog and other casing inspection tools could have been used as an indicator of an issue.

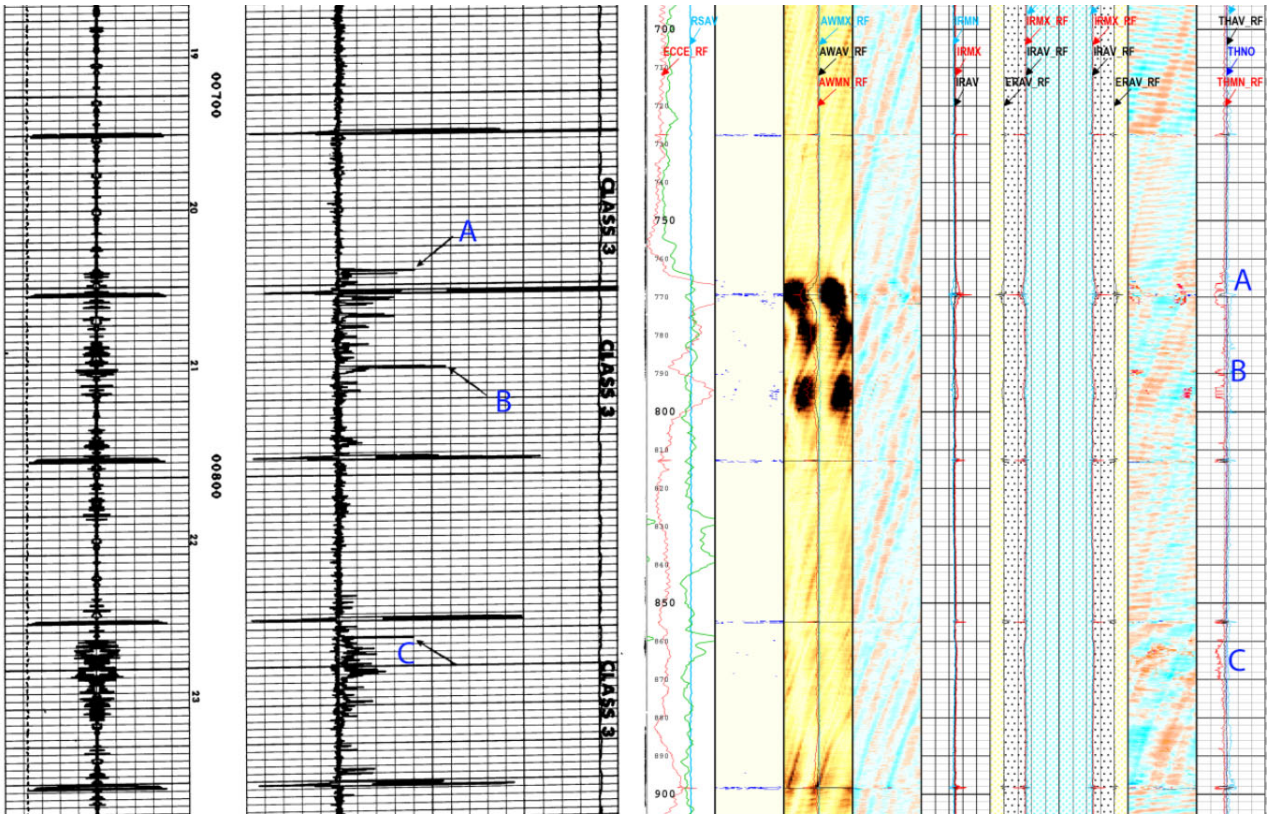

Figure 2: F-4 1988 Vertilog (Left) and 2016 USIT (Right) Comparison

3. Is there any context either in or outside of Mr. Carnahan's testimony that Blade wishes to add in order to explain its answers? If so, please provide it and explain.

   SoCalGas had a two-year plan in 1988 to determine the mechanical condition of the casing in 20 wells originally completed in the 1940s and 1950s. Blade reviewed the records of all 20 wells to evaluate subsequent casing inspections and the casing problems that occurred in the following years. A number of casing problems were identified. SoCalGas made a recommendation to run casing inspection logs in 20 wells that concerned them at the time, and the opportunity to inspect the casing in SS-25 was missed. There is no way to know what an inspection of the SS-25 casing would have shown in 1988, but it is possible that corrosion was present and detectable, and steps could have been taken to avoid the leak in 2015 [9, pp. 2, 160, 173–181, 204-205] [12].

   The fact is that SS-25 and other 1988 Interoffice Correspondence wells did not get inspected according to plan.

4. If Blade accepts any part of the statement as true, does it change any of the conclusions Blade reached in its Root Cause Analysis?

   Even if Blade accepted Mr. Carnahan's statement as true, it would not change any of the conclusions Blade reached in its Root Cause Analysis.

5. If the answer to question 3 is yes, which conclusions change and what must they say now?

   Not Applicable. No conclusion changes are needed.

2.2 Statement 2

Pages 3 and 4: "While useful to a certain extent, the Vertilog technology circa 1988 suffered from certain substantial deficiencies."

2.2.1 Blade Response

1. Does Blade Energy Partners agree or disagree with the statement?

   Disagree.

2. If Blade disagrees with any portion of the statement, why?

   The Vertilog circa 1988 was useful because it could be used to assess casing integrity in terms of the location and severity of metal loss.

3. Is there any context either in or outside of Mr. Carnahan's testimony that Blade wishes to add in order to explain its answers? If so, please provide it and explain.

   See the response to Statement 1, Question 3.

4. If Blade accepts any part of the statement as true, does it change any of the conclusions Blade reached in its Root Cause Analysis?

   Mr. Carnahan's statement does not change the RCA conclusions.

5. If the answer to question 3 is yes, which conclusions change and what must they say now?

   Not applicable. No conclusion changes are needed.

2.3 Statement 3

Page 4: "For example, the Vertilog technology did not provide a method for differentiating isolated pitting from general corrosion."

2.3.1 Blade Response

1. Does Blade Energy Partners agree or disagree with the statement?

   Disagree.

2. If Blade disagrees with any portion of the statement, why?

   The Vertilog was capable of differentiating general corrosion from isolated pitting. The methodology is discussed in a previously referenced SPE paper [5]. Figure 3 shows the F-4 Vertilog Defect Report. Isolated pitting is denoted by IP and general corrosion is denoted by GC.

3. Is there any context either in or outside of Mr. Carnahan's testimony that Blade wishes to add in order to explain its answers? If so, please provide it and explain.

   See the response to Statement 1, Question 3.

4. If Blade accepts any part of the statement as true, does it change any of the conclusions Blade reached in its Root Cause Analysis?

   No.

5. If the answer to question 3 is yes, which conclusions change and what must they say now?

   Not applicable. No conclusion changes are needed.

2.4 Statement 4

Page 5: "Another problem with Vertilog is that there are multiple permutations associated with the analysis of metal loss at any given depth, resulting in inherent uncertainty when interpreting the results."

2.4.1 Blade Response

1. Does Blade Energy Partners agree or disagree with the statement?

Disagree.

2. If Blade disagrees with any portion of the statement, why?

   Casing inspection logs of all types can be processed and analyzed using different criteria and assumptions. There is inherent uncertainty in interpreting all casing inspection logs. The process is not automated with only one set of answers. Log analysts use their best judgement to provide most probable interpretations. See below for standard verbiage for casing inspection logs from Baker Hughes:

   FF-32A, HR Vertilog, 2016

   > In making interpretations of logs our employees will give customer the benefit of their best judgment. But since all interpretations are opinions based on inferences from electrical or other measurements, we cannot, and we do not guarantee the accuracy or correctness of any interpretation. We shall not be liable or responsible for any loss, cost, damages, or expenses whatsoever incurred or sustained by the customer resulting from any interpretation made by any of our employees.

3. Is there any context either in or outside of Mr. Carnahan's testimony that Blade wishes to add in order to explain its answers? If so, please provide it and explain.

   See the response to Statement 1, Question 3.

4. If Blade accepts any part of the statement as true, does it change any of the conclusions Blade reached in its Root Cause Analysis?

   No.

5. If the answer to question 3 is yes, which conclusions change and what must they say now?

   Not applicable. No conclusion changes are needed.

2.5 Statement 5

Page 7: "Additional flaws of Vertilog were its inability to distinguish between defects and hardware (such as centralizers and scratchers) and its difficulty interpreting corrosion located near the surface casing shoe."

2.5.1 Blade Response

1. Does Blade Energy Partners agree or disagree with the statement?

   Disagree.

2. If Blade disagrees with any portion of the statement, why?

   Blade would agree that the tool will have difficulty interpreting corrosion above, but not below, the shoe.

   Blade agrees with "…flaws of Vertilog were its inability to distinguish between defects and hardware (such as centralizers and scratchers)...". However, there is a key omission in Mr. Carnahan's testimony regarding the method in which the tool designers had envisioned solving this issue. References [5, 6] describe the use of accurate casing records to address the interpretation of centralizers and scratchers. The quote from [6, p. 1] below explains this issue clearly:

   > In the earlier Vertilog survey, casing hardware (e.g., scratchers and centralizers) caused responses which are similar to corrosive defect responses. Often casing records must be relied upon for identifying the log responses due to scratchers and centralizers, to insure [sic] that these responses

are not misinterpreted as casing defects. If the records are accurate, casing hardware responses are not mistakenly interpreted as defects. If the records are inaccurate, casing hardware responses can be interpreted as corrosive defects.

During the course of Blade's Analysis of Aliso Canyon Wells with Casing Failures study, numerous well records were analyzed. In our opinion, many of the well records that SoCalGas inherited from previous operators did not include an accurate location for centralizers and scratchers. Blade also reviewed hundreds of casing inspection logs from Aliso Canyon. It was common for the production casing string (e.g., 7 in., or 8 5/8 in. casings) to include a few joints of casing that were a different weight than reported. In other words, in the 200 or so joints that comprise the production casing string, it was likely that an occasional joint of thicker or thinner walled casing was run in the wrong position. This may not have any bearing on the casing string's pressure capacity. Inaccurate records on centralizers, scratchers, and casing weight and dimensions could result in Vertilog defect misinterpretation.

3. Is there any context either in or outside of Mr. Carnahan's testimony that Blade wishes to add in order to explain its answers? If so, please provide it and explain.

   In Blade's opinion, the Vertilog may overstate metal loss in multi-string casing configurations where an outer casing exists over part of the casing being inspected; this is discussed in the *Aliso Canyon Shallow Corrosion Analysis* supplementary report [11, p. 34].

4. If Blade accepts any part of the statement as true, does it change any of the conclusions Blade reached in its Root Cause Analysis?

   No.

5. If the answer to question 3 is yes, which conclusions change and what must they say now?

   Not applicable. No conclusion changes are needed.

2.6 Statement 6

Page 20: "Pressure testing is intended to detect existing casing leaks, not wall loss."

2.6.1 Blade Response

1. Does Blade Energy Partners agree or disagree with the statement?

   Agree.

2. If Blade disagrees with any portion of the statement, why?

   Not applicable. Blade agrees with the statement.

3. Is there any context either in or outside of Mr. Carnahan's testimony that Blade wishes to add in order to explain its answers? If so, please provide it and explain.

   No.

4. If Blade accepts any part of the statement as true, does it change any of the conclusions Blade reached in its Root Cause Analysis?

   No conclusion changes are needed.

5. If the answer to question 3 is yes, which conclusions change and what must they say now?

Not applicable. No conclusion changes are needed.

2.7 Statement 7

Pages 24-25, which states:

The Blade main report and various supplementary reports assert that the SS-25 7-in. casing's vertical rupture and circumferential parting were two separate events, with the circumferential parting occurring some period of time after the initial vertical rupture, but while the well was still on injection. To the contrary, it is evident the SS-25 7-in. casing vertical rupture and circumferential parting occurred as a single event, as illustrated in Figure 12 and Figure 13, and for the reasons described below:

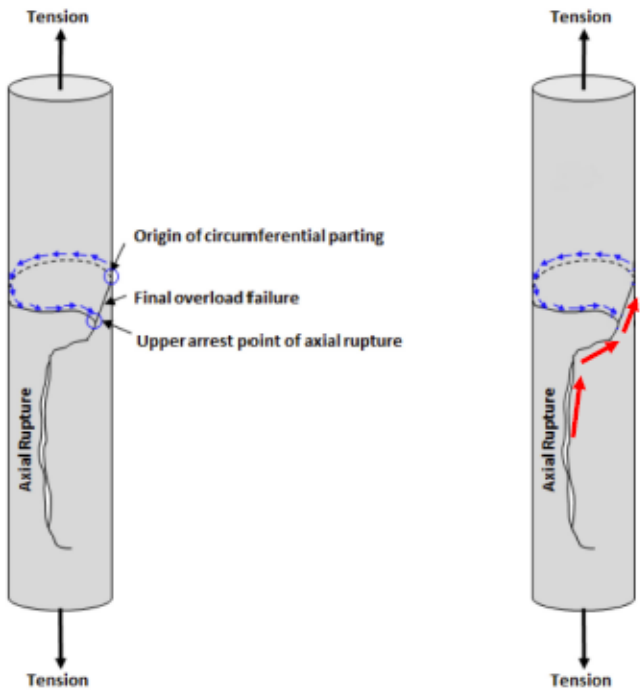

Figure 12. Left: Figure 70 from page 73 of Blade main report. Right: Corrected Figure 70 with red arrows added, which in addition to existing blue arrows, show actual crack propagation direction. The upper vertical fracture did not arrest abruptly at the location indicated by Blade. The circumferential fracture simply ran into the existing (mostly) vertical fracture and stopped (location of lowest blue arrow).

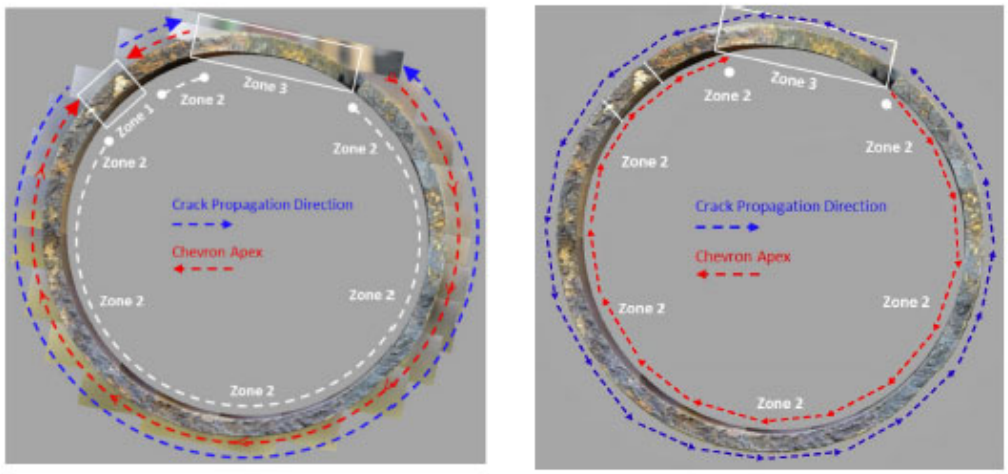

Figure 13. Left: Figure 69 from Blade main report. Right: Corrected Figure 69 showing actual crack growth direction.

2.7.1 Blade Response

1. Does Blade Energy Partners agree or disagree with the statement?

   Disagree.

2. If Blade disagrees with any portion of the statement, why?

   Mr. Carnahan's statement does not take into consideration all of the facts provided in Blade's Main and supplementary reports. Central to the argument are two facts. First, there are arrest turning points on both ends of the axial rupture. Second, there is no continuity of chevron marks from the axial rupture to the circumferential parting. This is further discussed in detail below.

   On page 54 in Section 2.4 of Blade's Main Report [9], it clearly states: "Visual and stereoscopic examination of the circumferential parting showed that the failure was not a continuation of the axial rupture, but rather re-initiated near the corner on one side of the parted casing. The origin site was determined based on chevron marks identified on the fracture surface. Figure 47 is a (a) laser scan and (b) image which identifies the upper arrest point, circumferential parting initiation site, and the final overload failure. Figure 48 is stitched stereo images showing the chevron marks and propagation direction of the circumferential parting. These observations indicate that the axial rupture and circumferential parting were two separate events despite their close proximity, and that they are most likely related to each other. This is discussed in more detail later within this section." Figures 47 and 48 are extracted from the Blade Main Report.

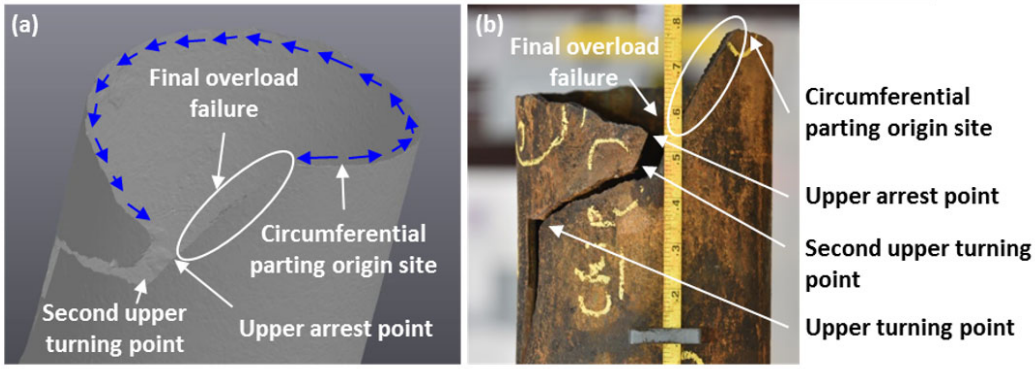

Figure 47: (a) Laser Scan and (b) Photo Indicating Circumferential Parting Initiation Site and Final Failure

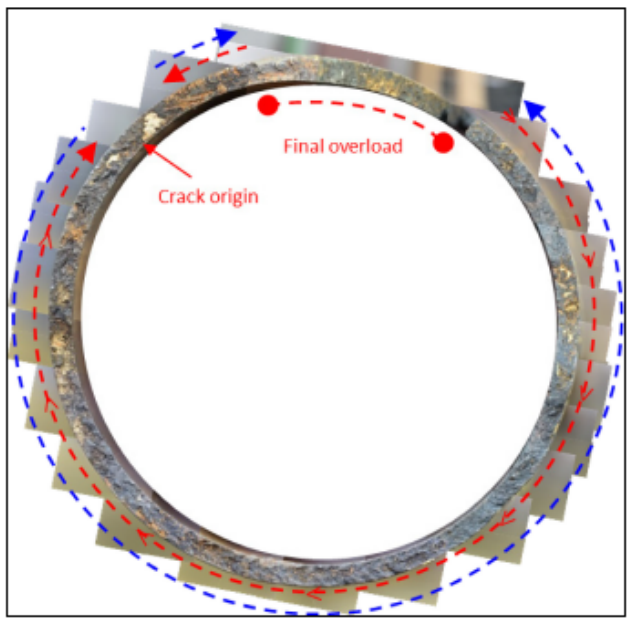

Figure 48: Stitched Images of the Lower Circumferential Parting Fracture Surface

Additional evidence is provided by Blade (Figure 67 on page 71 of Blade's Main report) illustrates the three zones of the circumferential parting. Figure 67 (a) is a stereo image showing the three zones, origin, and the direction of the crack propagation. Figure 67 (b) is a 3D schematic showing the overall circumferential parting steps. Figure 67 (c) is a close-up of the Zone 3 fracture surface, which does not exhibit any chevron marks, thus there is no continuity of the axial fracture.

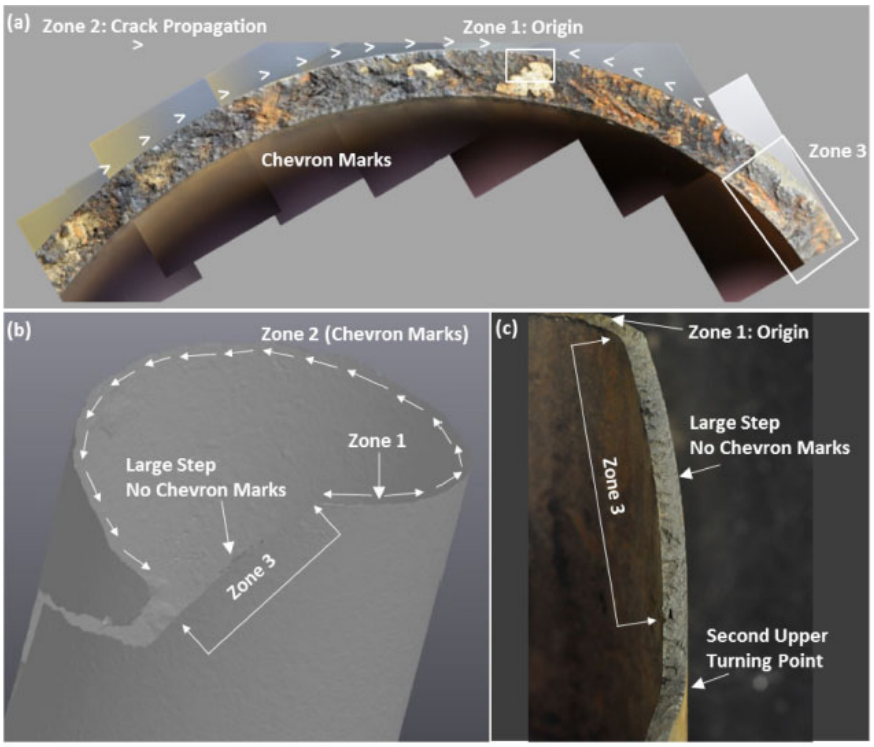

Figure 67: (a) Stereo Image (b) 3D Schematic of Zones (c) Macro Image of Three Zones

Based on the factual evidence shown above (pages 72 and 73 in Blade's Main report), Blade concluded "Additional detailed visual and stereoscopic examination showed that the circumferential parting was not an extension of the axial rupture. Chevron marks produced by the circumferential parting did not follow the chevron marks produced by the axial rupture. The initiation site and chevron marks produced by the circumferential parting were located approximately 3.7 in. (94 mm) from the upper arrest point of the axial rupture. Figure 70 (i.e., Figure 12 above quoted by Mr. Carnahan's testimony) is a schematic of the crack path for the axial rupture and circumferential parting. The schematic shows how the circumferential parting initiated above the arrest point of the axial rupture. The crack propagated circumferentially until it reached the axial rupture arrest point. The final ligament failed due to the axial load generated by the weight and tension of the 7 in. casing string. **The axial rupture and circumferential parting are thought to be two separate events because there was no evidence that the chevron marks from the axial rupture continued into the circumferential parting.** The close proximity of the two failures suggests that they are related despite being two separate events." (emphasis added)

Blade has followed the well established guidelines described in the literature, for example, *Fracture Appearance and Mechanisms of Deformation and Fracture*, Metals Handbook Vol. 11, 2011, pages 559-561 [13], and determined that the SS-25 failure consisted of two separate events because of the absence of evidence showing a single pathway of chevron marks connecting the axial fracture with the circumferential parting. There is no continuity of chevron marks from axial to circumferential. There is an arrest point on the axial fracture as shown by the metallurgical evidence. These facts have to be rationalized in any interpretation of the failure sequence.

Blade disagrees with the interpretation in Mr. Carnahan's testimony.

3. Is there any context either in or outside of Mr. Carnahan's testimony that Blade wishes to add in order to explain its answers? If so, please provide it and explain.

No additional context is required. The factual evidence provided in Blade's reports support the fracture sequence described in the report.

4. If Blade accepts any part of the statement as true, does it change any of the conclusions Blade reached in its Root Cause Analysis?

   Blade does not accept any part of Mr. Carnahan's statement as true. If Blade were to accept Mr. Carnahan's primary assertion that the vertical rupture and the circumferential part were one event, then it would only change Blade's interpretation on the failure sequence. However, it would not change the failure analysis conclusions. The failure was caused by 85% metal loss due to external corrosion. It would not change any of the RCA conclusions.

5. If the answer to question 3 is yes, which conclusions change and what must they say now?

   Not applicable, no conclusions change.

2.8 Statement 8

The SS-25 fracture surface exhibits clear chevron marks at a number of locations. Chevron marks denote the direction of propagation of cracks in steels – the apex of the chevron points toward the fracture origin (Figure 14). Chevron marks on the SS-25 fracture surface show clearly that the circumferential fracture is an extension of the axial fracture (Figure 15). This interpretation is consistent with remarkably similar chevron marks shown in a textbook on failure analysis (Figure 16).

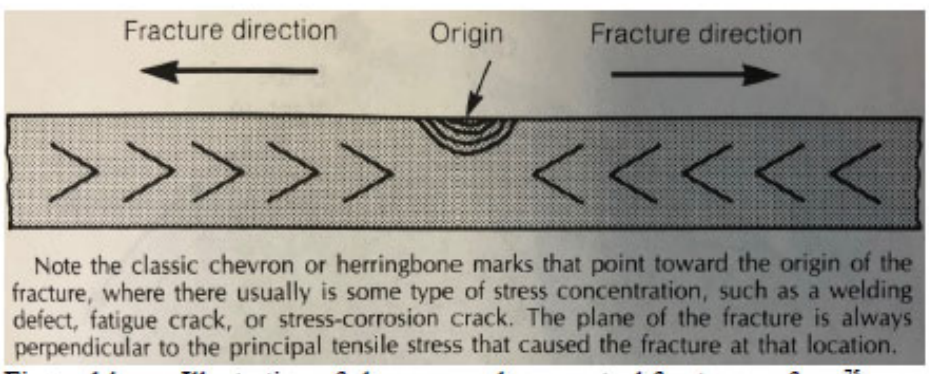

Figure 14. Illustration of chevron marks on a steel fracture surface.[75]

Figure 15. Figure 68 from page 72 of Blade main report. Red rectangle encloses backward chevron marks drawn by Blade. Red chevron marks inserted above are consistent with chevron marks present on the fracture surface. Blade misidentifies the chevron marks as flowing towards the origin. Based on both my physical inspection on February 27-28, 2020, and my analysis of this image, the chevron marks travel to the right, as indicated by the red arrows at the bottom of the figure.

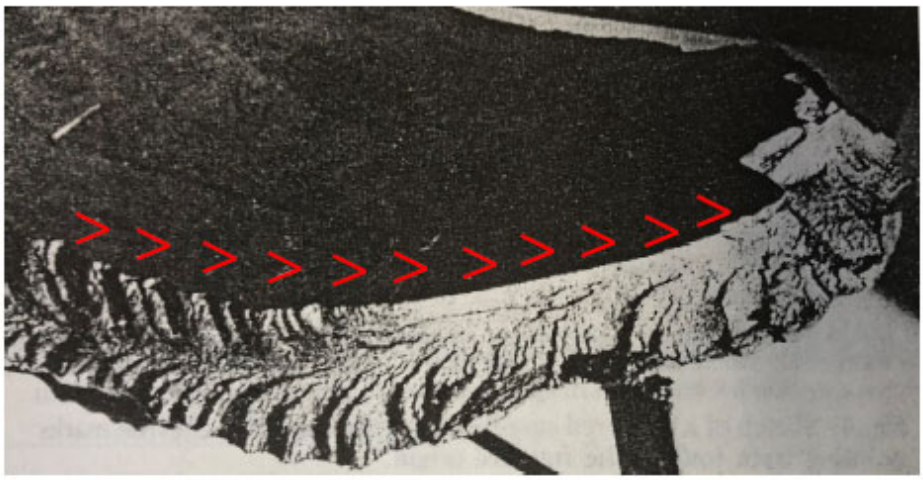

Figure 16. Fragment of a thick-walled fractured drum. The fracture, which started at the right, ran rapidly to the left, resulting in a well-defined chevron pattern.[76]

2.8.1 Blade Response

1. Does Blade Energy Partners agree or disagree with the statement?

   Disagree.

2. If Blade disagrees with any portion of the statement, why?

   Blade disagrees with Mr. Carnahan's testimony because he does not show with metallurgical evidence, the extension of the axial fracture to the circumferential parting. Therefore, there is no metallurgical evidence to support the interpretation that axial rupture and circumferential parting are one event.

   Mr. Carnahan's testimony correctly states that "the SS-25 fracture surface exhibits clear chevron marks at a number of locations. Chevron marks denote the direction of propagation of cracks in steels—the apex of the chevron points toward the fracture origin (Figure 14 provided by Mr. Carnahan in his testimony)", however, he incorrectly states that, "chevron marks on the SS-25

fracture surface show clearly that the circumferential fracture is an extension of the axial fracture (Figure 15)". Mr. Carnahan did not show where in the figure that he clearly saw the chevron marks extending from the axial fracture to the circumferential fracture. In contrast, as previously indicated in Blade's response to Mr. Carnahan's Statement 7, Blade provided macro- and micro-fractographic evidence in the Main and Supplementary Reports, see Figure 67 on page 71 of the Main Report, which shows no chevron marks present after the axial fracture was arrested and no chevron marks on the final overload rupture.

The figure below (Figure 68 (a), page 72 of Blade Main Report) shows no chevron marks on the final overload rupture. For clarity, we have annotated the upper corner on the right-hand side of the figure with the green arrow) indicating no chevron marks on the final overload failure of Zone 3 of the circumferential parting. On the circumferential fracture surface there is no extension of the axial fracture chevron marks.

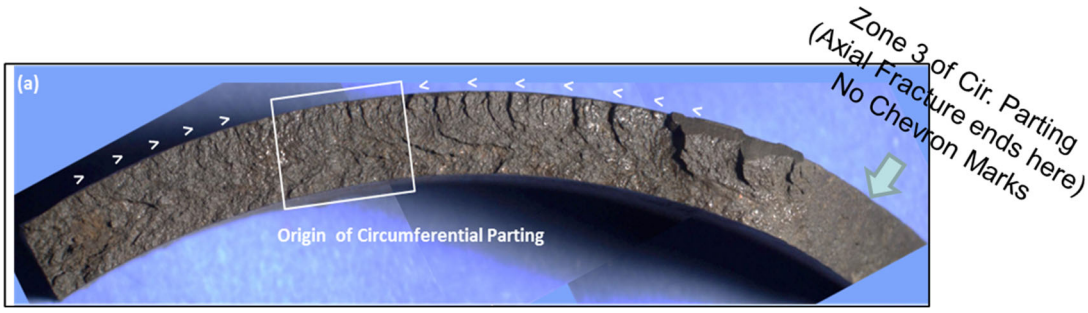

Figure 68 (a), Page 72 Blade Main Report

In the caption of Figure 15 below, Mr. Carnahan states "Blade misidentified the chevron marks as flowing towards the origin. Based on both my physical inspection on February 27-28, 2020, and my analysis of the image, the chevron marks travel to the right, as indicated by the red arrows at the bottom of the figure."

Figure 15. Figure 68 from page 72 of Blade main report. Red rectangle encloses backward chevron marks drawn by Blade. Red chevron marks inserted above are consistent with chevron marks present on the fracture surface. Blade misidentifies the chevron marks as flowing towards the origin. Based on both my physical inspection on February 27-28, 2020, and my analysis of this image, the chevron marks travel to the right, as indicated by the red arrows at the bottom of the figure.

Blade disagrees with the statement because the visual and stereomicroscopic examinations performed by Blade showed that the apexes of the chevron marks are in the opposite directions around the origin. This is further clarified in Figure 68(a), page 72 of the Blade Main Report below that shows the chevron marks point back towards the origin from either side of the origin. For

clarity, white dashed lines have been added to the figure to outline the chevron marks that point back towards the origin from either side of the origin. This is inconsistent with Figure 16 of Mr. Carnahan's testimony.

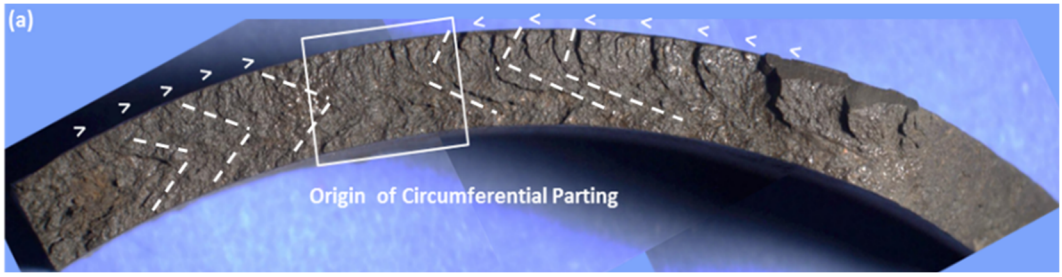

Figure 68 (a), Page 72 Blade Main Report

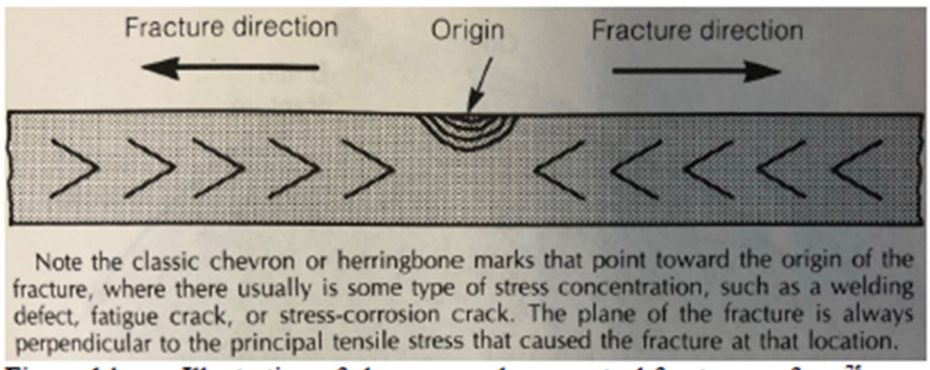

Figure 14. Illustration of chevron marks on a steel fracture surface.[75]

Figure 16. Fragment of a thick-walled fractured drum. The fracture, which started at the right, ran rapidly to the left, resulting in a well-defined chevron pattern.[76]

In summary, the explanation provided in the Blade Main and Supplementary reports demonstrates the existence of two events in the failure process:

- The chevron marks are not continuous and do not extend from the axial rupture to the circumferential parting. See Figure 67(a) on page 71 of the Blade Main Report.

- There is a clear indication of arrest at the end of the axial fracture path as shown in the Blade supplementary report *SS-25 Casing Failure Analysis Report* [14]on page 121, Figure 142.
- There are chevron markings in opposite directions on the circumferential fracture surface which point towards the origin, see Figures 68 and 69 on page 72 of the Main Report and Figure 160 on page 134 and Figures 161 and 162 on page 135 of the supplementary report.

3. Is there any context either in or outside of Mr. Carnahan's testimony that Blade wishes to add in order to explain its answers? If so, please provide it and explain.

   No.

4. If Blade accepts any part of the statement as true, does it change any of the conclusions Blade reached in its Root Cause Analysis?

   Blade does not accept any part of Mr. Carnahan's statement as true. If Blade were to accept Mr. Carnahan's primary assertion that the vertical rupture and the circumferential part were one event, then it would only change Blade's interpretation on the failure sequence. However, it would not change the failure analysis conclusions. The failure was caused by 85% metal loss due to external corrosion. It would not change any of the RCA conclusions.

5. If the answer to question 3 is yes, which conclusions change and what must they say now?

   Not applicable, no conclusions change.

2.9 Statement 9

Blade's contention that a separate fracture origin exists on the circumferential portion of the fracture is incorrect (Figure 17). Rather than a fracture origin, this area is merely a continuation of the circumferential portion of the fracture. Fracture surface markings within the hypothesized origin are the same as or similar to those outside of the origin.

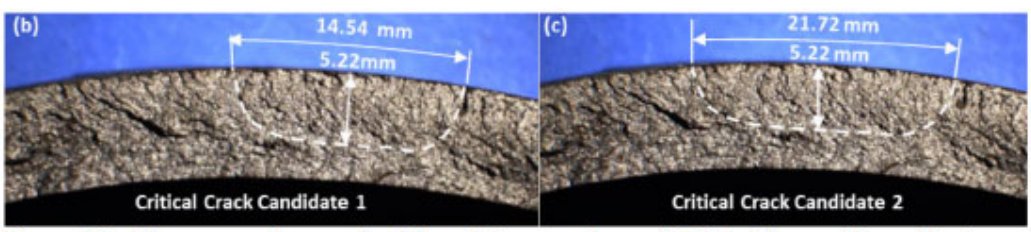

Figure 17. There are no features in either of the areas shown in Blade Figures 68b or 68c that suggest the existence of a fracture origin.

2.9.1 Blade Response

1. Does Blade Energy Partners agree or disagree with the statement?

   Disagree.

2. If Blade disagrees with any portion of the statement, why?

An examination of the chevron marks in Figure 17 (i.e., Figure 68 in Blade's Main Report, page 72), showed that the features inside the origin were different from chevron marks outside the origin. The examination identified an area (the origin) that was absent of chevron marks but had chevron marks on either side pointing towards it. For clarity, white dashed lines have been added to outline the chevron marks that point back towards to the origin from either side of the origin. This observation is consistent with the illustration, Figure 14, provided by Mr. Carnahan.

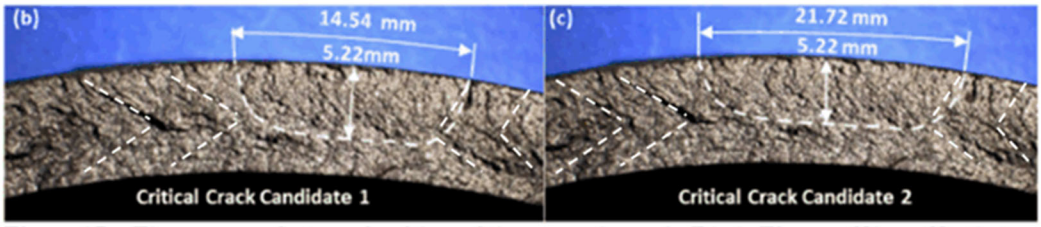

Figure 17. There are no features in either of the areas shown in Blade Figures 68b or 68c that suggest the existence of a fracture origin.

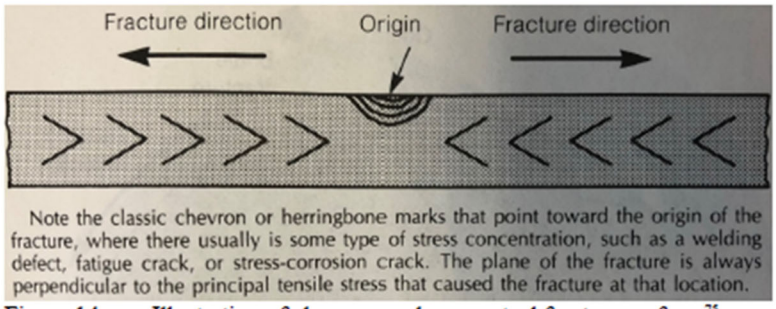

Figure 14. Illustration of chevron marks on a steel fracture surface.[75]

3. Is there any context either in or outside of Mr. Carnahan's testimony that Blade wishes to add in order to explain its answers? If so, please provide it and explain.

   No.

4. If Blade accepts any part of the statement as true, does it change any of the conclusions Blade reached in its Root Cause Analysis?

   Blade does not accept any part of Mr. Carnahan's statement as true. If Blade were to accept Mr. Carnahan's primary assertion that the vertical rupture and the circumferential part were one event, then it would only change Blade's interpretation on the failure sequence. However, it would not change the failure analysis conclusions. The failure was caused by 85% metal loss due to external corrosion. It would not change any of the RCA conclusions.

5. If the answer to question 3 is yes, which conclusions change and what must they say now?

   Not applicable, no conclusions change.

2.10 Statement 10

The Blade report says nothing about how this alleged fracture origin came into existence. If the origin was created during the casing manufacturing process or by a sub-critical crack growth mechanism such as fatigue or stress-corrosion, the surface of the origin would appear distinctly different.

2.10.1 Blade Response

1. Does Blade Energy Partners agree or disagree with the statement?

   Disagree.

2. If Blade disagrees with any portion of the statement, why?

   Blade disagrees with Mr. Carnahan's testimony because there is a SEM micrograph in the Blade supplementary report that clearly identifies the circumferential fracture origin. This has not been referenced or discussed in Mr. Carnahan's testimony.

   Blade showed that "the SEM examination of Zone 1 identified a pre-existing crack-like flaw on the OD side of the origin", see Figures 168 and 169 on pages 140 – 141 of the *SS-25 Casing Failure Analysis* supplementary report. The crack-like flaw was shallow, with a measured maximum depth of 196 µm. This was a pre-existing flaw and was associated with the origin of the circumferential fracture. Figure 170 in the same supplementary report shows an EDS analysis indicating that the surface of the flaw was severely oxidized by a scale that could not be removed during cleaning. The adjacent fracture surface was easily cleaned and clearly showed cleavage facets. This observation suggests that the flaw existed prior to the circumferential parting. This OD surface flaw may have promoted brittle cracking to form the origin of the circumferential parting, even though the flaw was shallow. The presence of a pre-existing OD oxidized flaw clearly exhibits that the circumferential parting had a separate initiation site. This information was not considered in Mr. Carnahan's testimony.

   A complete validation of the size of the origin (i.e., the critical crack size for circumferential parting) is given in Section 2.4.4 of Blade's Main Report (page 74) and in Section 4.3 of the *SS-25 Casing Failure Analysis* supplementary report (page 164). Further discussion on this topic in detail is given in the next section, i.e., Blade's response to Mr. Carnahan testimony Statement 11, Section 2.11 in this document.

3. Is there any context either in or outside of Mr. Carnahan's testimony that Blade wishes to add in order to explain its answers? If so, please provide it and explain.

   No.

4. If Blade accepts any part of the statement as true, does it change any of the conclusions Blade reached in its Root Cause Analysis?

   Blade does not accept any part of Mr. Carnahan's statement as true. Blade did identify an origin for the circumferential fracture, the evidence was provided by the stereo microscopic and SEM micrographs in the Blade supplementary report. If, however, Mr. Carnahan's testimony is considered to be true, it would not change the failure analysis conclusions. The failure was caused by 85% metal loss due to external corrosion. It would not change any of the RCA conclusions.

5. If the answer to question 3 is yes, which conclusions change and what must they say now?

Not applicable, no conclusions change.

2.11 Statement 11

Blade's inability to determine the size of alleged fracture origin (they report it as 5.22 mm deep and either 14.54 mm long or 21.72 mm long[72]) is consistent with the absence of features identifying it as an origin.

2.11.1 Blade Response

1. Does Blade Energy Partners agree or disagree with the statement?

   Disagree.

2. If Blade disagrees with any portion of the statement, why?

   Blade did identify two semi elliptical areas as possible critical crack sizes (origin) for the circumferential parting based on thorough examination with the stereo microscope and SEM; it was 5.22 mm deep and either 14.54 mm long or 21.72 mm long. The exact length is later established in the Blade report as 21.72 mm long.

   Blade identified the fracture origin of the circumferential parting based on the observed apexes of the chevron marks pointing at the origin, along with the presence of a pre-existing OD oxidized flaw. This was also discussed in Statements 9 and 10. Blade identified two semi elliptical areas as possible critical crack sizes (origin) for the circumferential parting based on thorough examination with the stereo microscope and SEM, one is 14.54 mm long x 5.22 mm deep and the other one 21.72 mm long with the same depth, see pages 71 and 72 of Blade's Main Report and Section 3.3.1 on page 134 of Blade's supplementary report *SS-25 Casing Failure Analysis* for details. Figure 17 provided by Mr. Carnahan in Statement 9 (i.e., Figure 68 in Blade's Main Report, page 72), with added dashed lines to outline the chevron marks), showed that the features inside the origin were different from chevron marks outside the origin. The examination identified an area (the origin) that was absent of chevron marks but had chevron marks on either side pointing at it.

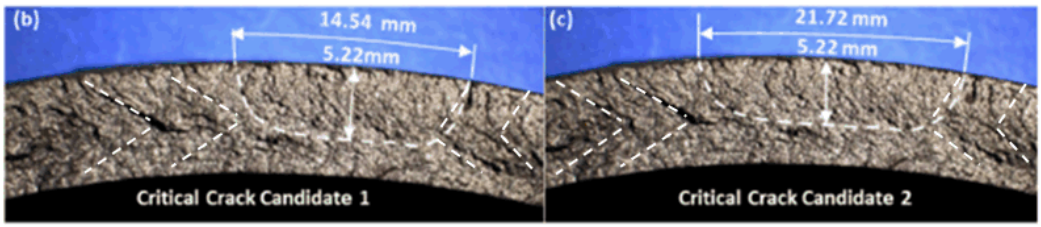

Figure 17. There are no features in either of the areas shown in Blade Figures 68b or 68c that suggest the existence of a fracture origin.

The location of the origin is often well identified, and uncertainty in origin sizing is not uncommon. Therefore, it is common practice that the identified candidate flaw sizes are often validated or refined using fracture mechanics methods or FEA and other methodologies. Such an approach was undertaken for the circumferential flaw.

The validation of the two possible sizes of the origin (critical crack size) for circumferential parting was performed using the following approach:

- Fracture mechanics calculation of the applied stress intensity factor for each of the possible origin size, i.e., the driving force for circumferential parting using the flaw size and axial load

as per API 579 [15] and BS 7910 [16] procedures (see Section 4.3.1 of the *SS-25 Casing Failure Analysis* supplementary report, pages 164-165 for details)

- Fracture toughness from CVN was estimated as a function of temperature using API 579 and BS7910 recommended procedures (see Section 4.3.3 of the supplementary report, pages 167-168 for details)
- An independent estimate of the casing temperature at time of failure using a thermo hydraulic model (see Section 4.3.4 of the supplementary report, page 169 for details)

By comparing the validation methods above, one of the two possible size of the origin, that is, the one having the size of 21.72mm long x 5.22 mm deep was validated as the most likely critical crack size for the circumferential parting. This is discussed in detail in Blade Main and supplementary reports.

For this failure, Blade integrated two different approaches to refine the origin. The origin was first established using microscopy and visual observations. Next, Blade used fracture mechanics and temperature, followed by toughness (established through laboratory testing) to finalize the origin size. Using one methodology such as, macro- and micro- fractographic methods, to interpret failure is inadequate for failure analysis; such interpretation has to be consistent with quantitative fracture mechanics estimates.

Consequently, Blade has unequivocally established that the circumferential parting initiated from the origin identified by using microscopy, visual observations and fracture mechanics.

3. Is there any context either in or outside of Mr. Carnahan's testimony that Blade wishes to add in order to explain its answers? If so, please provide it and explain.

   No.

4. If Blade accepts any part of the statement as true, does it change any of the conclusions Blade reached in its Root Cause Analysis?

   Blade does not accept any part of Mr. Carnahan's statement as true. If Blade were to accept Mr. Carnahan's assertion that "Blade's inability to determine the size of alleged fracture origin (they report it as 5.22 mm deep and either 14.54 mm long or 21.72 mm long) is consistent with the absence of features identifying it as an origin", then it would only change Blade's interpretation on the failure sequence. However, it would not change the failure analysis conclusions. The failure was caused by 85% metal loss due to external corrosion. It would not change any of the RCA conclusions.

5. If the answer to question 3 is yes, which conclusions change and what must they say now?

   Not applicable, no conclusions change.

2.12 Statement 12

Blade's scanning electron microscope (SEM) photos of the hypothesized origin show predominantly cleavage features.[73] Blade reported that no noticeable changes in fracture mode were observed outside of the origin[74] and their SEM photographs corroborate this. As such, the hypothesized origin must have been created by mechanical force in the same manner as the circumferential parting.

2.12.1 Blade Response

1. Does Blade Energy Partners agree or disagree with the statement?

   Disagree.

2. If Blade disagrees with any portion of the statement, why?

   Because the circumferential parting had initiated from a crack-like surface flaw at a temperature below the steel ductile to brittle transition temperature (DBTT), the micro fracture mode would be cleavage. One would not expect any noticeable change in the micro fracture mode outside of the origin that was produced at the same temperature below the ductile to brittle transition temperature of the steel. This was a temperature driven fracture mode. The absence of a ductile origin is consistent with the low temperature experienced, prior to circumferential parting and after the axial rupture, due to escaping gas. As discussed previously, data from all aspects of the failure (metallurgical, loads, temperatures) should be integrated to deliver a precise interpretation. Just interpreting metallurgical data alone is inadequate. A comprehensive interpretation is crucial to identifying the fracture sequence.

   The SEM images below show the origin was initiated from a crack like surface flaw by cleavage (Figures 169 and 170 on page 141, *SS-25 Casing Failure Analysis* supplementary report).

3. Is there any context either in or outside of Mr. Carnahan's testimony that Blade wishes to add in order to explain its answers? If so, please provide it and explain.

   No.

4. If Blade accepts any part of the statement as true, does it change any of the conclusions Blade reached in its Root Cause Analysis?

   Blade does not accept any part of Mr. Carnahan's statement as true. If Blade were to accept Mr. Carnahan's assertion: that "Blade's scanning electron microscope (SEM) photos of the hypothesized origin show predominantly cleavage features. Blade reported that no noticeable changes in fracture mode were observed outside of the origin and their SEM photographs corroborate this. As such, the hypothesized origin must have been created by mechanical force in the same manner as the circumferential parting", then it would only change Blade's interpretation on the failure sequence. However, it would not change the failure analysis conclusions. The failure was caused by 85% metal loss due to external corrosion. It would not change any of the RCA conclusions.

5. If the answer to question 3 is yes, which conclusions change and what must they say now?

   Not applicable, no conclusions change.

2.13 Statement 13

Blade's analysis of the circumferential parting is logically flawed. According to Blade's analysis and calculations, the origin was required for circumferential parting to occur as a separate event. But the fracture mode of the origin is the same as that of the circumferential parting, begging the question as to how the origin came into existence, since mechanical loads were insufficient to cause a separate circumferential parting in the absence of the origin.

2.13.1 Blade Response

1. Does Blade Energy Partners agree or disagree with the statement?

   Disagree.

2. If Blade disagrees with any portion of the statement, why?

Blade's analysis of the circumferential parting followed well-established guidelines for determination of the failure origin, and the evidence of discontinuity of chevron marks between circumferential parting and axial rupture provide a sound scientific basis to conclude that the circumferential parting occurred as a separate event. The circumferential fracture mode was a temperature driven process, consequently, the origin has cleavage features that is consistent with fracture under low temperatures.

The rationale for Blade's findings has been discussed in the responses to Statements 10, 11, and 12.

Moreover, as indicated in the previous Statement, on pages 140 – 142 of the *SS-25 Casing Failure Analysis* supplementary report, Blade clearly indicated that "the SEM examination of Zone 1 of the circumferential parting identified a pre-existing, crack-like flaw on the OD side of the origin. The OD surface flaw may have promoted brittle cracking from the origin of the circumferential parting, even though the flaw was shallow". In other words, a brittle crack (i.e., the origin) was initiated from the crack like surface flaw at a temperature below ductile to brittle transition temperature (DBTT) and the brittle crack size was larger than the critical crack size at that temperature, resulting in crack instability and the circumferential brittle parting. One would not expect any noticeable change in micro fracture mode within and outside of the origin that was produced at a temperature below ductile to brittle transition temperature of the steel. This was temperature driven fracture mode.

A complete validation of the size of the origin (critical crack size) is given in Section 2.4.4, pages 74 – 79 of Blade's Main Report and Section 4.3, pages 164 – 169 of the *SS-25 Casing Failure Analysis* supplementary report.

3. Is there any context either in or outside of Mr. Carnahan's testimony that Blade wishes to add in order to explain its answers? If so, please provide it and explain.

   No.

4. If Blade accepts any part of the statement as true, does it change any of the conclusions Blade reached in its Root Cause Analysis?

   Blade does not accept any part of Mr. Carnahan's statement as true. If Blade were to accept Mr. Carnahan's assertion that "Blade's analysis of the circumferential parting is logically flawed.", then it would only change Blade's interpretation on the failure sequence. However, it would not change the failure analysis conclusions. The failure was caused by 85% metal loss due to external corrosion. It would not change any of the RCA conclusions.

5. If the answer to question 3 is yes, which conclusions change and what must they say now?

   Not applicable, no conclusions change.

2.14 Statement 14

For there to have been a circumferential fracture separated in time from the vertical fracture, the vertical fracture would have to arrest (stop). There is no fractographic evidence showing arrest of the vertical fracture extending upward from the area of the burst. The vertical fracture extending downward from the area of the burst arrested most likely because it was approaching thicker material at the casing threaded connection.

2.14.1 Blade Response

1. Does Blade Energy Partners agree or disagree with the statement?

   Disagree.

2. If Blade disagrees with any portion of the statement, why?

   There are two issues raised here by Mr. Carnahan: (a) there is no fractographic evidence showing arrest of the vertical fracture extending upward from the area of the burst and (b) the vertical fracture extending downward from the area of the burst arrested most likely because it was approaching thicker material at the casing threaded connection. Blade's response to Mr. Carnahan's testimony is as follows:

   Issue (a): there is no fractographic evidence showing arrest of the vertical fracture extending upward from the area of the burst.

   Blade's Response to Issue (a): Blade did provide extensive macro and micro fractographic evidence showing arrest of the vertical fracture extending upward from the area of the burst. The evidence was provided and discussed in the *SS-25 Casing Failure Analysis* supplementary report on page 76 (Figure 78), page 81 (Figure 86, Macro), page 82 (Figure 87, Macro), page 109 (Figures 123, 124, Macro), page 121 (Figures 142 and 143, Macro), page 122 (Figure 144 Micro), page 124 (Figure 146 Micro), and page 146 (Figure 178 Macro).

   As stated in the supplementary report, Figure 78 (page 76) and Figure 86 (page 81) illustrates the upper (upward) turning point, second upper (upward) turning point, and arrest point. The images show the upper (upward) section of the axial rupture. Figure 87 (page 82) shows the lower (downward) turning and arrest points.

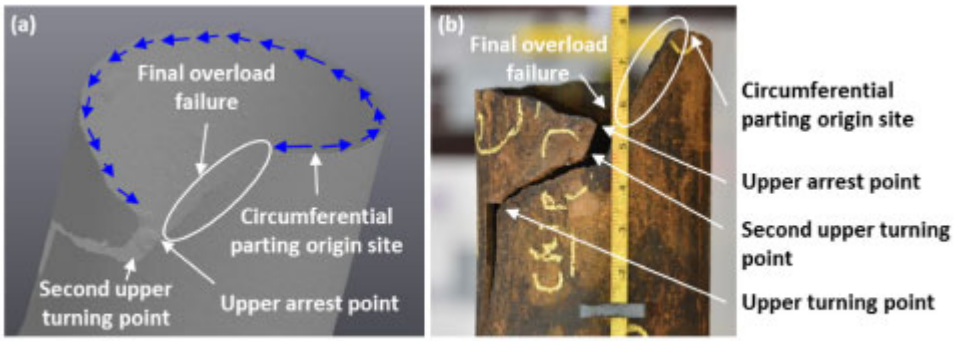

Figure 78: (a) Laser Scan and (b) Circumferential Parting

Figure 86: Macro Image of the Two Upper Turning Points and Single Arrest Point

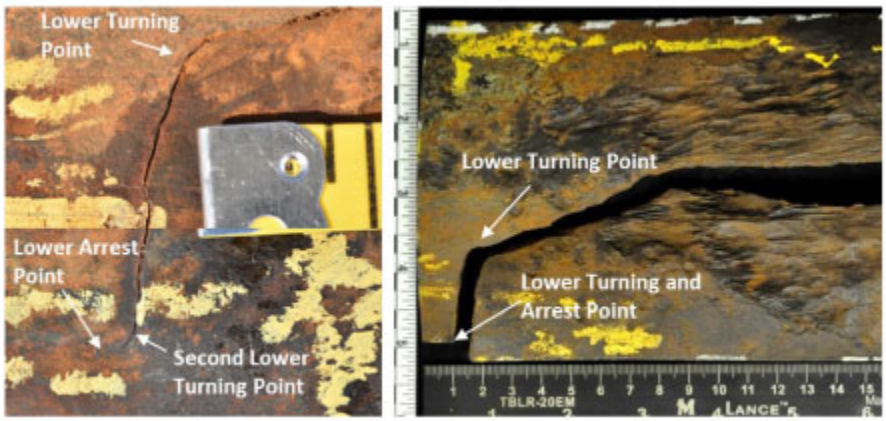

Figure 87: Macro Images of the Lower Turning and Arrest Points

Figure 142 (page 121 in the supplementary report) below shows more detail on the second upper (upward) turning point and upper (upward) arrest area. The upper (upward) arrest area is identified by a slight angle change on the inclined surface. The fracture surface of the upper (upward) arrest area shows no chevron marks because the axial crack was arrested.

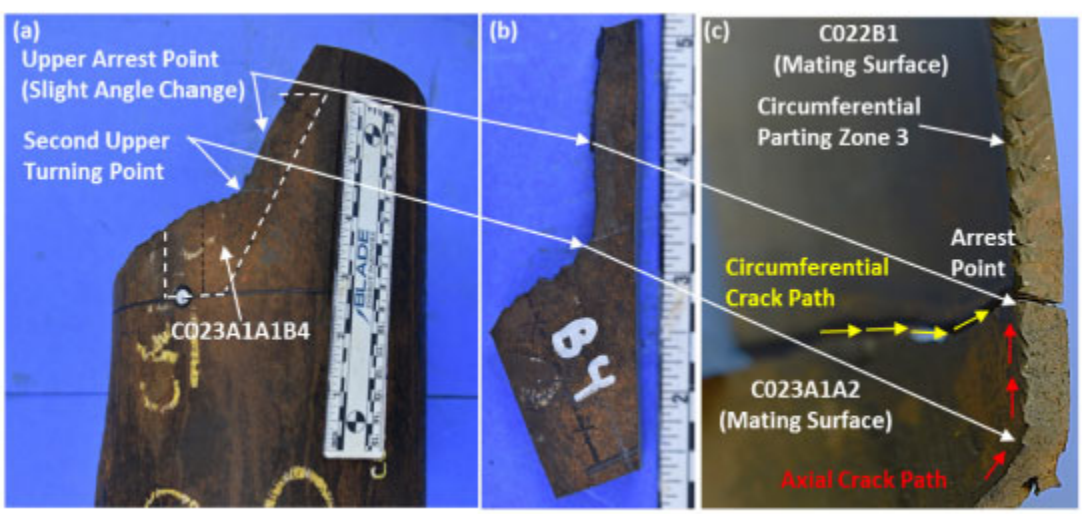

Figure 142: Specimen C023A1A1B4 Extraction

Figure 146 (page 124 of the supplementary report) below are the SEM images of the axial upper (upward) arrest area showing no cleavage facets. There are two observations in the arrest region that support the fact that the crack was arrested. First is the absence of chevron marks observed with a stereo microscope. Secondly, the absence of cleavage facets, observed using a SEM in the same region. Both of these factors support the interpretation that the axial crack slowed down and arrested in this region around a temperature of 80°F. Had the crack propagated per Mr. Carnahan's hypothesis, there should have been chevron marks and cleavage facets in this axial to circumferential transition region, identified as Zone 3.

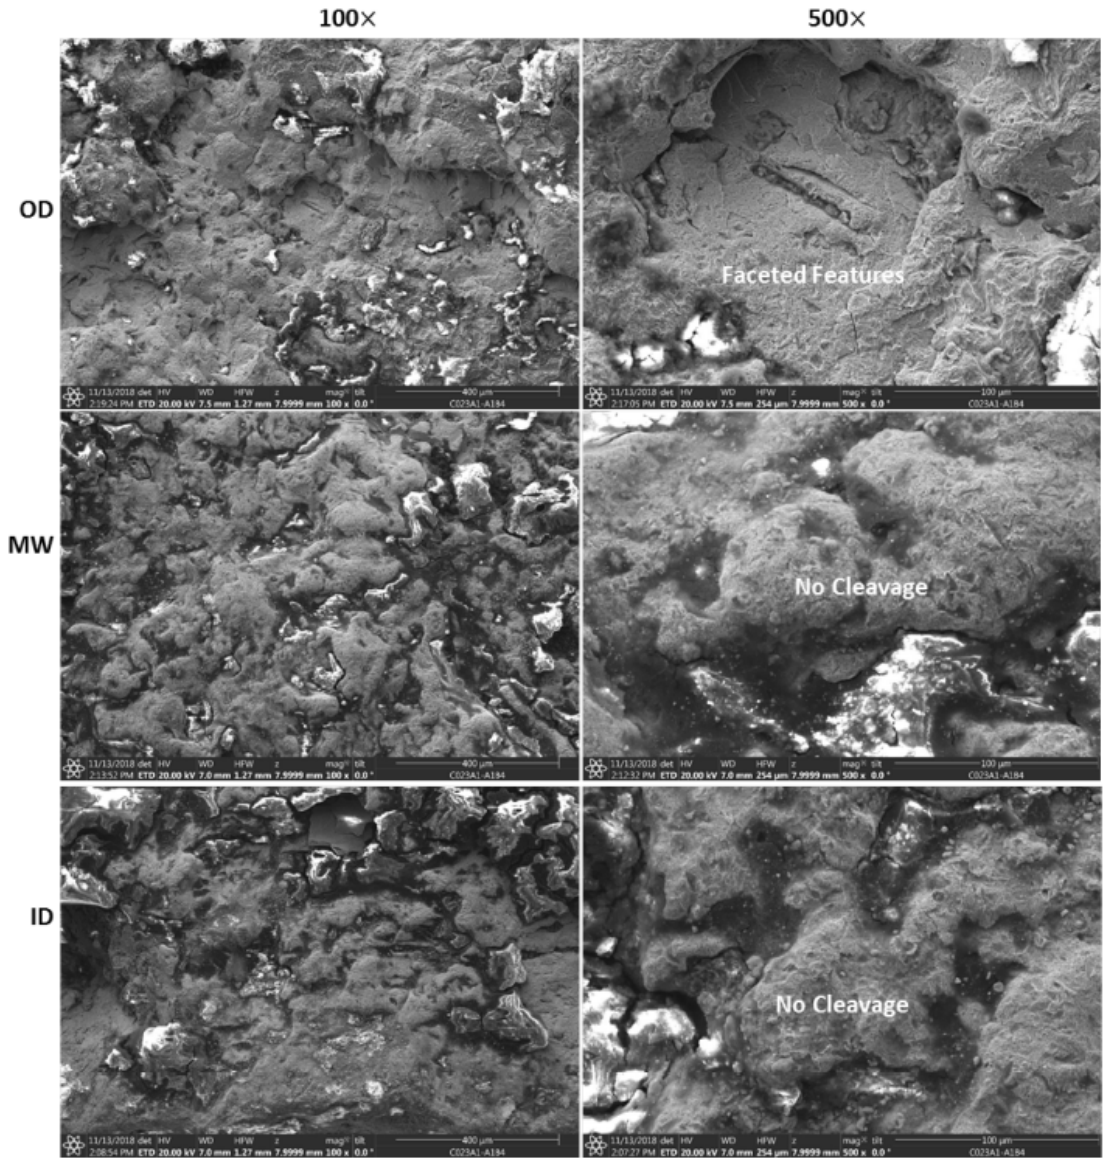

Figure 146: Specimen C023A1A1B4 A3 Showing OD, MW, and ID at 100× and 500×

Figure 178 (a) (page 146 of the supplementary report) shows a schematic of Zone 3 of final circumferential parting. The yellow arrow points to Figure 178 (b) and (c) that show macro and stereo images at a higher magnification of Zone 3. The images show a step-like appearance on the

ID side of the fracture surface. The OD side of the fracture surface appears to be smooth. The fracture surface shows no evidence of chevron marks.

The SEM examination (Figure 180 on page 148 of the supplementary report) showed that the fracture surface near the OD side was mostly cleavage separation, while the ID side showed a mix of cleavage facets and a woody type of plastic deformation. The fracture surface morphology at the mid-wall was a combination of the OD and ID morphologies. This evidence is consistent with the brittle overload failure at temperature below ductile-brittle transition temperature (DBTT).

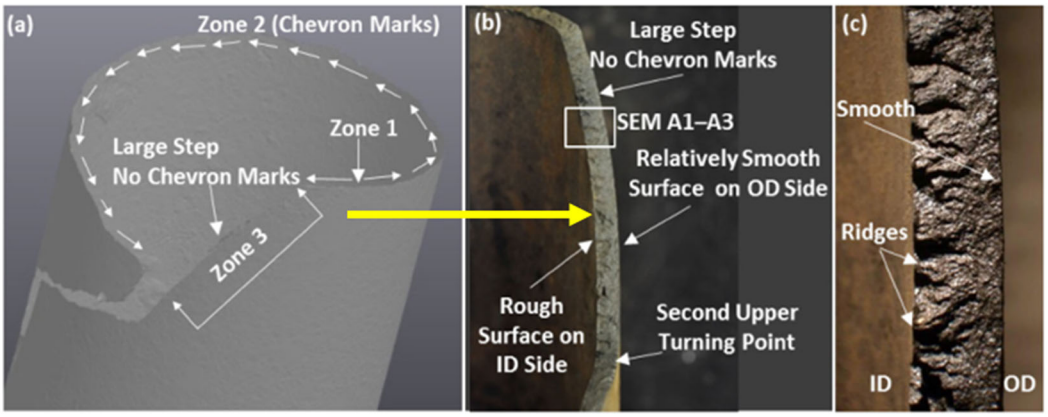

Figure 178: (a) Schematic and (b) (c) Image of Zone 3 (Final Overload Failure)

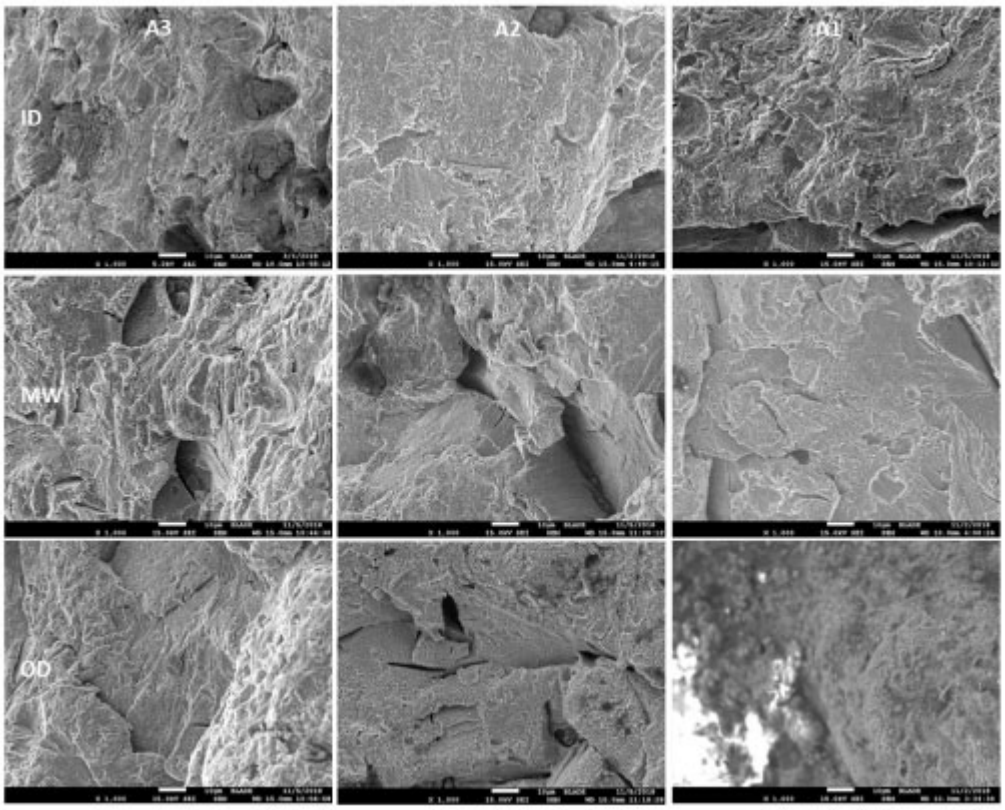

Figure 180: Fracture Surface Morphologies near the ID, MW, and OD Taken at 1,000×

Based on evidence discussed above and other data, Blade's Main Report states on page 54 "Visual and stereoscopic examination of the circumferential parting showed that the failure was not a

continuation of the axial rupture, but rather re-initiated near the corner on one side of the parted casing". If it was a single event from the axial (vertical) rupture to the circumferential parting, there should be a single continuous pathway of chevron marks. The evidence does not support a single event because both the upward arrest area of the axial rupture and Zone 3 of circumferential parting do not contain chevron marks. Therefore, the vertical and circumferential fracture are two separate events with their own initiation sites.

Issue (b): the vertical fracture extending downward from the area of the burst arrested most likely because it was approaching thicker material at the casing threaded connection.

Blade's response to Issue (b): Blade disagrees with Mr. Carnahan's statement that the crack may have arrested at the wall thickness change near the connection. The arrest point was about 9 in. from the start of the change in wall thickness of the casing pin connection, therefore the arrest is not coincident with the wall thickness change. However, Blade does agree that the connection contributed to the lower arrest point. Blade has addressed this issue in its supplementary report *SS-25 Casing Failure Analysis* (Section 3.2.1, page 78). Figure 81 (page 79) shows that the origin was not symmetrically located at the center of the rupture. The non-symmetric location of the origin can be explained by the proximity of the origin to connection 22. The axial crack initiated in Zone 1 and propagated in opposite directions. The lower (i.e., "downward" used by Mr. Carnahan) crack front propagated towards connection 22, which provided additional constraint. Parameters that may contribute to the constraint include connection make up stresses and residual stresses due to local deformation. The upper crack was not influenced by any additional constraint allowing the crack to propagate further before arresting.

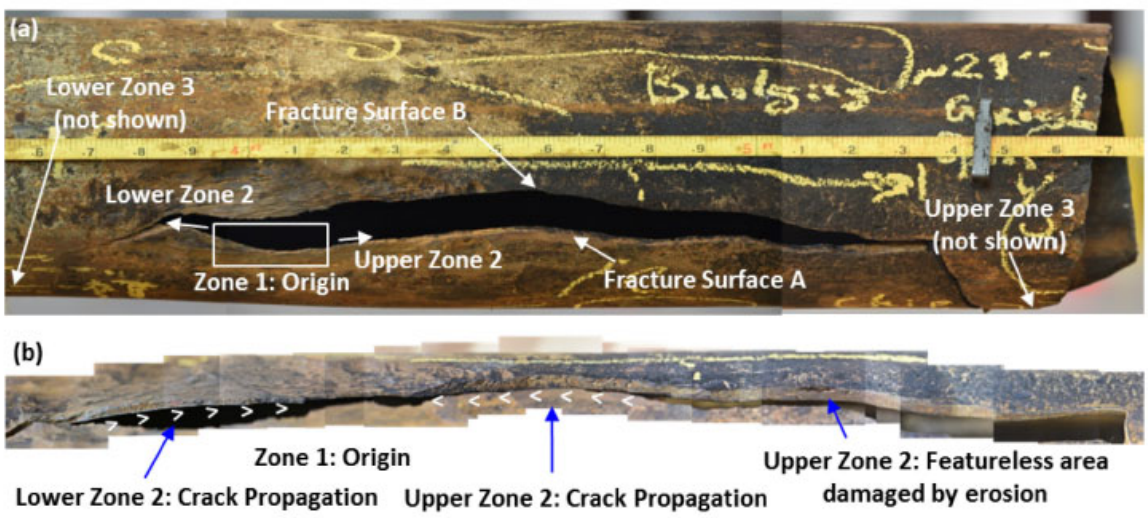

Figure 81: (a) Front and (b) Top Views of Fracture Surface B Identifying Zones 1 and 2

3. Is there any context either in or outside of Mr. Carnahan's testimony that Blade wishes to add in order to explain its answers? If so, please provide it and explain.

   No.

4. If Blade accepts any part of the statement as true, does it change any of the conclusions Blade reached in its Root Cause Analysis?

   Blade does not accept any part of Mr. Carnahan's statement as true. If Blade were to accept Mr. Carnahan's assertion then it would only change Blade's interpretation on the failure sequence.

However, it would not change the failure analysis conclusions. The failure was caused by 85% metal loss due to external corrosion. It would not change any of the RCA conclusions.

5. If the answer to question 3 is yes, which conclusions change and what must they say now?

   Not applicable, no conclusions change.

2.15 Statement 15

The 7-in. casing did not have to become cold for the circumferential fracture to occur. The fracture that extended vertically upward from burst area did not require cooling of the material. Similarly, no further cooling would be required for this fracture to change direction and propagate circumferentially.

2.15.1 Blade Response

1. Does Blade Energy Partners agree or disagree with the statement?

   Disagree.

2. If Blade disagrees with any portion of the statement, why?

   There were two events. The axial rupture happened at a temperature around 80°F. However, following the axial rupture the temperature dropped locally, and then the circumferential parting occurred. Blade has provided extensive evidence to support this interpretation.

   Firstly, Mr. Carnahan's testimony "The 7-in. casing did not have to become cold for the circumferential fracture to occur" ignores the evidence provided in Blade's Main Report, is subjective, and without any basis. The fact is, as stated on page 55 in Blade's Main Report, that "the circumferential parting was brittle, which was different from the axial rupture. No evidence of local plastic deformation or overload necking was observed near the fracture surfaces on either side of the circumferential parting" and "a temperature for the circumferential parting was estimated to be in the range of –76°F to –38°F (–60°C to –39°C)" based on the critical defect size and fracture mechanics models (API 579 FAD and BS7910 FAD) (Table 6 on page 79 of the Main Report) and a series of CVN tests (Sections 4.3.1, pages 164 – 166 of the *SS-25 Casing Failure Analysis* supplementary report).

   Mr. Carnahan does not address the absence of local plastic deformation or lack of overload necking in the circumferential parting region, which would be required to validate or support Mr. Carnahan's contention. Further, Mr. Carnahan has not assessed the fact that the tensile load was low and could not have failed the casing in the circumferential orientation unless the temperature dropped and the toughness was reduced. Integration of stresses, metallurgical factors and temperature is necessary here to interpret the failure sequence.

   Secondly, Blade agrees with Mr. Carnahan's testimony that "The fracture that extended vertically upward from burst area did not require cooling of the material". In Blade's Main Report, it is clearly stated that the axial rupture occurred at an estimated temperature of 80°F; this estimate was based on the historical temperature profile data at the failure depth of 892 ft (joint 22) and is consistent with observed bulging and ductile tearing associated with the axial rupture (page 74 in Section 2.4.4 of Blade's Main Report). Blade never states anywhere in the report that the fracture that extended vertically upward from the burst area required cooling of the material.

   Thirdly, Blade disagrees with Mr. Carnahan's statement "Similarly, no further cooling would be required for this fracture to change direction and propagate circumferentially". This statement is

not relevant to the failure at SS-25.There were two events, the axial rupture occurred at 80°F, whereas the circumferential parting occurred at a much lower temperature. This has been previously discussed in detail. There is a preponderance of evidence that supports Blade interpretation.

3. Is there any context either in or outside of Mr. Carnahan's testimony that Blade wishes to add in order to explain its answers? If so, please provide it and explain.

   No.

4. If Blade accepts any part of the statement as true, does it change any of the conclusions Blade reached in its Root Cause Analysis?

   Blade does not accept any part of Mr. Carnahan's conclusion in the above statement. Blade does agree with Mr. Carnahan's testimony "The fracture that extended vertically upward from burst area did not require cooling of the material." This is consistent with Blade's conclusion in its reports. Mr. Carnahan's testimony, if accepted to be true in its totality, it would not change the failure analysis conclusions. The failure was caused by 85% metal loss due to external corrosion. It would not change any of the RCA conclusions.

5. If the answer to question 3 is yes, which conclusions change and what must they say now?

   Not applicable, no conclusions change.

2.16 Statement 16

There is no mechanical reason for the upward extending vertical fracture to arrest. The stress intensity at the tip of the fracture, essentially the driving force for fracture, was increasing as the fracture became longer.

2.16.1 Blade Response

1. Does Blade Energy Partners agree or disagree with the statement?

   Disagree.

2. If Blade disagrees with any portion of the statement, why?

   Fracture mechanics text books [17] [18] [19] and extensive literature [20] [21] [22] [23] [24] have explained the crack arrest concept. The driving force for a running crack is dynamic and decays as a function of time, as described in fracture mechanics text books and literature. It depends on two factors: (a) the rate of internal pressure drop due to the release of liquid or gas and (b) the resistance to crack propagation that is dependent on the material's crack arrest toughness (CVN, KJ, CTOA, etc.). Developing the methods for arrest of a running crack in steels is the focus of fracture mechanics for safety and minimizing consequences of rupture [20] [21] [22]. The evidence provided by the SS-25 RCA has shown that the running axial crack in the SS-25 7 in. casing was arrested.

   Figure 4 presents a schematic of the failure process [25]. The sketch in the red box conceptually summarized the conditions for crack arrest, that is, a through-wall defect ruptures but arrests if the pressure is low, and/or if the pipe material toughness is high.

   The differential pressure at the time of the SS-25 7 in. casing axial rupture was 2,405 psi (Table 5, page 156, *SS-25 Casing Failure Analysis* supplementary report), the calculated hoop stress is only

42.6% of actual yield strength, which was a low stress failure, i.e., a low driving force for failure. On the other hand, the temperature at the time of the axial rupture was 80°F. The material exhibited high ductility and toughness. Therefore, this was a low driving force and high resistance failure condition, which falls in the crack arrest category. Therefore, the upward crack would eventually be arrested.

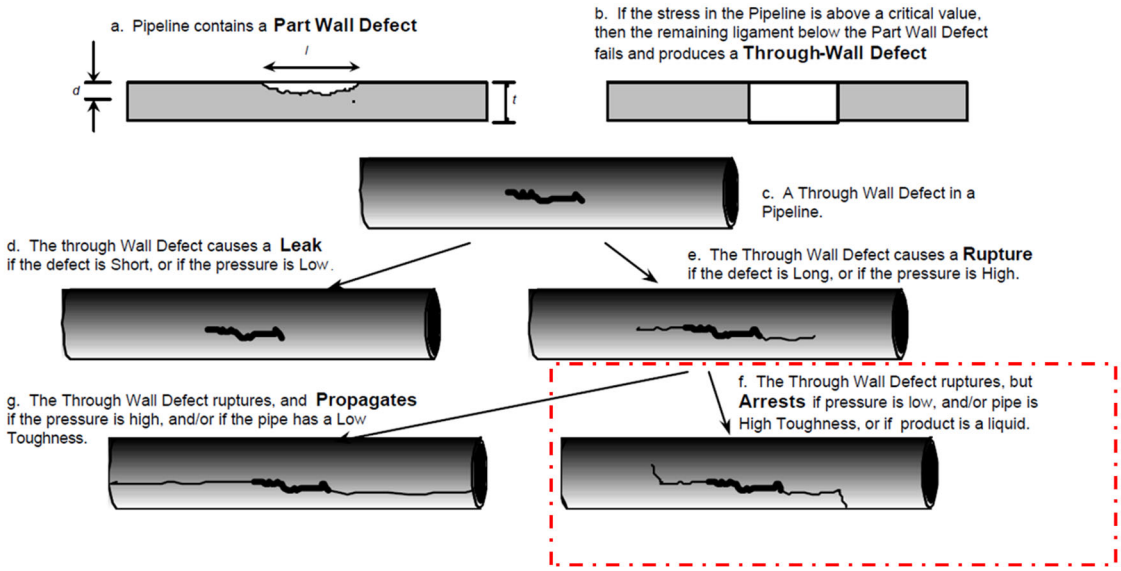

Figure 4: Pipe Failure Process

The crack arrest phenomenon as observed in the SS-25 7 in. casing has been discussed in literature, for example ASM Handbook Volume 12 *Fractography Visual Examination and Light Microscopy* and Vol. 20 *Material Selection and Design Chapter Using Failure Analysis in Material Selection*. The figure below is reproduced from ASM Vol 20 showing the arrested axial crack in a full section of X60 grade line pipe by ductile fracture at 13°C (56°F) which is 8°F above its 50% shear-area. The crack, moving at 278 ft/s (85 m/s), stopped after a short distance. The fracture was ductile and the line pipe was tough enough at this temperature to arrest the crack.

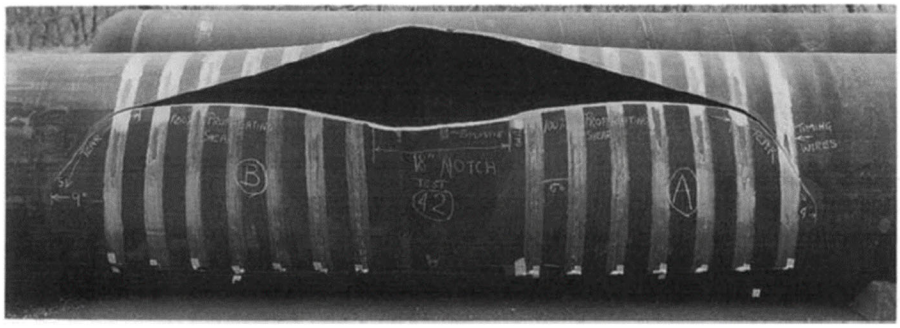

Fig. 1 Ductile fracture of a full section X60 grade line pipe tested at 56 °F (13 °C), which is 8 °F above its 50% shear-area DWTT

Therefore, Blade disagrees with Mr. Carnahan's statement "There is no mechanical reason for the upward extending vertical fracture to arrest. The stress intensity at the tip of the fracture, essentially the driving force for fracture, was increasing as the fracture became longer". This statement is inconsistent with literature data and understanding regarding running cracks and crack arrest phenomena. Blade supplementary report, *SS-25 Failure Analysis*, on page 73 states,

"The visual examination showed that during the axial rupture, plastic bulging occurred first with slow ductile tearing due to the internal pressure. Tearing instability occurred once the axial flaw reached the critical size and was followed by a rapid crack propagation in the axial direction that left behind chevron marks (Figure 76 [c]). The crack changed direction (upper and lower turning points) and finally arrested due to dynamic energy consumption (17) (18) (19). There were two turning points on the upper and lower side of the rupture. This phenomenon is not uncommon for an axial rupture."

3. Is there any context either in or outside of Mr. Carnahan's testimony that Blade wishes to add in order to explain its answers? If so, please provide it and explain.

   No.

4. If Blade accepts any part of the statement as true, does it change any of the conclusions Blade reached in its Root Cause Analysis?

   Blade does not accept any part of Mr. Carnahan's statement as true. If Blade were to accept Mr. Carnahan's assertion that "There is no mechanical reason for the upward extending vertical fracture to arrest. The stress intensity at the tip of the fracture, essentially the driving force for fracture, was increasing as the fracture became longer", then it would only change Blade's interpretation on the failure sequence. However, it would not change the failure analysis conclusions. The failure was caused by 85% metal loss due to external corrosion. It would not change any of the RCA conclusions.

5. If the answer to question 3 is yes, which conclusions change and what must they say now?

   Not applicable, no conclusions change.

2.17 Statement 17

Pages 28-30 of Mr. Carnahan's testimony, which states:

The cooling shown on the SS-25 temperature logs at this depth was not indicative of a leak. The movement of gas into or out of the storage zone always causes localized cooling; indeed, cooling behavior where a storage well meets the reservoir has been well known for many years, as can be seen in Figure 19.

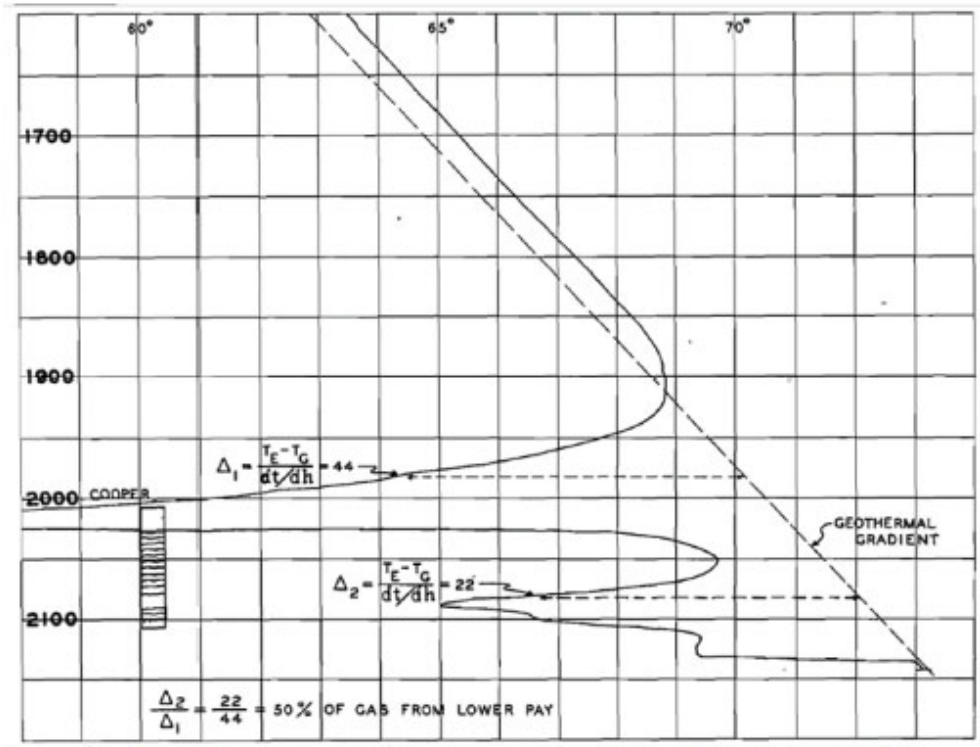

Figure 19. Gas well temperature log showing cooling at the packer and perforation (Bird, 1954).

2.17.1 Blade Response

1. Does Blade Energy Partners agree or disagree with the statement?

   Agree.

2. If Blade disagrees with any portion of the statement, why?

   Not applicable. Blade agrees with the statement.

3. Is there any context either in or outside of Mr. Carnahan's testimony that Blade wishes to add in order to explain its answers? If so, please provide it and explain.

   Blade discussed this phenomenon in supplementary report *SS-25 Temperature, Pressure, and Noise Log Analysis* [26, p. 16].

4. If Blade accepts any part of the statement as true, does it change any of the conclusions Blade reached in its Root Cause Analysis?

   No.

5. If the answer to question 3 is yes, which conclusions change and what must they say now?

   Not applicable. No conclusion changes are needed.

2.18 Statement 18

All storage wells at Aliso Canyon exhibit the same or similar cooling at that depth. For example, Figure 20 shows that Fernando Fee 32A and Porter 72A both exhibit cooling at the bottom of the wells, and the same is true for SS-25A and SS-25B (Figure 21).

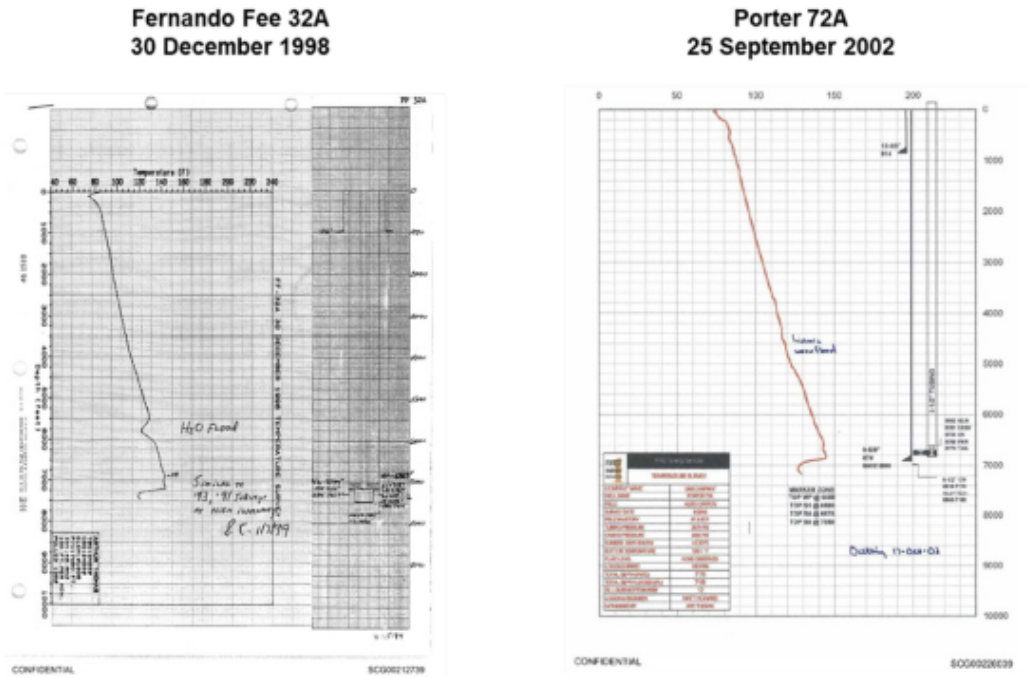

Figure 20. Temperature logs for Fernando Fee 32A (left) and Porter 72A (right).

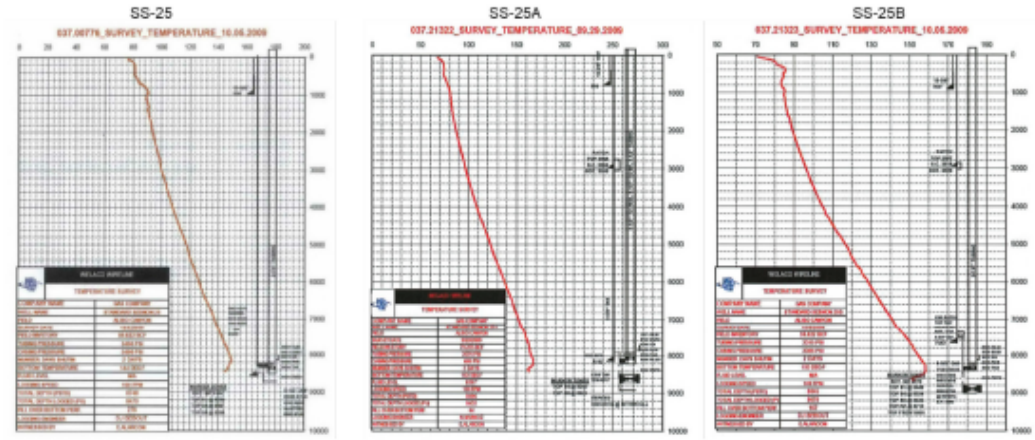

Figure 21. Temperature logs taken in 2009 in wells SS-25, SS-25A, and SS-25B.

2.18.1 Blade Response

1. Does Blade Energy Partners agree or disagree with the statement?

   Agree.

2. If Blade disagrees with any portion of the statement, why?

Not applicable. Blade agrees with the statement.

3. Is there any context either in or outside of Mr. Carnahan's testimony that Blade wishes to add in order to explain its answers? If so, please provide it and explain.

   Blade agrees with this statement, and has discussed the cooling in a supplementary report [27, p. 16].

4. If Blade accepts any part of the statement as true, does it change any of the conclusions Blade reached in its Root Cause Analysis?

   No.

5. If the answer to question 3 is yes, which conclusions change and what must they say now?

   Not applicable. No conclusion changes are needed.

2.19 Statement 19

Some temperature surveys over the years reported possible slight leakage in the vicinity of the production casing shoe and noise logs were run following a number of these temperature surveys. SoCalGas performed noise logs in SS-25 on the following ten dates: September 8, 1978, December 11, 1978, August 8, 1979, November 24, 1981, February 23, 1983, April 11, 1984, July 27, 1984, November 7, 1991, November 7, 2006, and June 1, 2012. None of these noise logs indicate a gas leak in the production casing. None of these noise logs indicate a gas leak in the production casing or at the production casing shoe.

2.19.1 Blade Response

1. Does Blade Energy Partners agree or disagree with the statement?

   Blade agrees with, "None of these noise logs indicate a gas leak in the production casing."

   Blade disagrees with, "None of these noise logs indicate a gas leak . . . at the production casing shoe."

2. If Blade disagrees with any portion of the statement, why?

   One of the noise logs, performed on April 11, 1984, identified a possible leak near the production casing shoe. Multiple temperatures logs and a radioactive tracer survey were run during this period. This casing shoe leak was not observed in subsequent noise logs. More importantly, there was never any indication via noise or temperature logs of any casing integrity issues prior to October 23, 2015 incident.

3. Is there any context either in or outside of Mr. Carnahan's testimony that Blade wishes to add in order to explain its answers? If so, please provide it and explain.

   Figure 5 shows the April 11, 1984 log [28]. Denoted in yellow in the Results and Remarks section is, "POSSIBLE SLIGHT SHOE LEAKAGE MIGRATING HIGHER THAN 8440'" at a shut-in pressure of 1,595 psi. Note the purpose of the survey was to "CHECK FOR SHOE LEAK".

   Figure 6 shows the July 27, 1984 log [29]. Denoted in yellow in the Results and Remarks section, "NO INDICATION OF ANY GAS LEAKAGE" at a shut-in pressure of 2,390 psi. Also note the purpose of the survey was to "TO CHECK FOR GAS LEAKAGE AT THE CASING SHOE AND/OR THE W. S. O. ". The W. S. O. refers to the water shut off perforations.

The shut-in tubing and casing pressures during the July 27, 1984 noise survey is 795 psi higher than during April 11, 1984 noise survey. Leaks are almost always more prominent when the pressures are higher. If the casing shoe leak was present it should have been evident at the higher pressure (i.e., inventory) and observed on the July 27, 1984 noise log and subsequent logs.

DATE 7-27-84
PURPOSE OF SURVEY
TO CHECK FOR GAS LEAKAGE AT THE CASING SHOE AND/OR TOP OF C.C.

Figure 6: SS-25, Noise Log Header on July 27, 1984, "No Indication of Any Gas Leakage", 2,390 psi

There is a supplementary report titled *SS-25 Temperature, Pressure, and Noise Logs Analysis* [26], and the focus of that report was to assess any evidence of any pre-existing casing integrity issue on SS-25. No temperature, pressure, or noise anomalies in the surveys indicated a preexisting casing failure before the October 23, 2015 incident [9, p. 31]. Casing shoe leaks (i.e., gas from storage zone traveling out of that zone behind casing) were not the focus – these types of leaks would not have any bearing on the corrosion and subsequent casing failure at 892 ft.

4. If Blade accepts any part of the statement as true, does it change any of the conclusions Blade reached in its Root Cause Analysis?

   No change. There were no indications of a preexisting casing integrity issue.

5. If the answer to question 3 is yes, which conclusions change and what must they say now?

   No conclusion changes are needed.

2.20 Statement 20

A radioactive tracer survey performed on July 29, 1984 reported possible slight leakage behind pipe from top perf at 8510 ft up to around 8430 ft and 8190 ft. This survey indicates gas flowing up to the bottom of the cap rock at approximately 8182 ft and into the permeable S1 formation.

2.20.1 Blade Response

1. Does Blade Energy Partners agree or disagree with the statement?

   Agree.

2. If Blade disagrees with any portion of the statement, why?

   Not applicable. Blade agrees with the statement.

3. Is there any context either in or outside of Mr. Carnahan's testimony that Blade wishes to add in order to explain its answers? If so, please provide it and explain.

   See the response to Statement 18 question 3.

4. If Blade accepts any part of the statement as true, does it change any of the conclusions Blade reached in its Root Cause Analysis?

   No change. There were no indications of a preexisting casing integrity issue.

5. If the answer to question 3 is yes, which conclusions change and what must they say now?

   Not applicable. No conclusion changes are needed.

2.21 Statement 21

The noise logs display four curves, representing sound at frequencies of 200 Hz, 600 Hz, 1,000 Hz, and 2,000 Hz, respectively. Low frequency noise (200 and 600 Hz) is usually indicative of surface noise or low rate flow of fluids behind casing. High frequency noise (1,000 and 2,000 Hz) is usually indicative of the flow of gas, bubbling of gas in liquids, or high-rate gas flow. The interpretation of noise logs is well-established: a sharply-defined, high-frequency noise over a short length of casing is an indication of a gas leak.

2.21.1 Blade Response

1. Does Blade Energy Partners agree or disagree with the statement?

   Agree.

2. If Blade disagrees with any portion of the statement, why?

   Not applicable. Blade agrees with the statement.

3. Is there any context either in or outside of Mr. Carnahan's testimony that Blade wishes to add in order to explain its answers? If so, please provide it and explain.

   No.

4. If Blade accepts any part of the statement as true, does it change any of the conclusions Blade reached in its Root Cause Analysis?

   No change. There were no indications of a preexisting casing integrity issue.

5. If the answer to question 3 is yes, which conclusions change and what must they say now?

   Not applicable. No conclusion changes are needed.

2.22 Statement 22

There are no such sharply-defined, high-frequency noises over short lengths of casing in the SS-25 noise logs that would indicate the presence of a gas leak. In some of the logs, there is a noticeable sharp peak in noise, but these were caused by the operators testing the noise logging tool prior to entering the

completion equipment at or below 8,000 ft., and these operator tests are clearly labeled on the logs (see, e.g., November 24, 1981 log).

2.22.1 Blade Response

1. Does Blade Energy Partners agree or disagree with the statement?

   Agree.

2. If Blade disagrees with any portion of the statement, why?

   Not applicable. Blade agrees with the statement.

3. Is there any context either in or outside of Mr. Carnahan's testimony that Blade wishes to add in order to explain its answers? If so, please provide it and explain.

   No.

4. If Blade accepts any part of the statement as true, does it change any of the conclusions Blade reached in its Root Cause Analysis?

   No change in the conclusions.

5. If the answer to question 3 is yes, which conclusions change and what must they say now?

   Not applicable. No conclusion changes are needed.

2.23 Statement 23

SoCalGas performed the noise log of December 11, 1978 from 5,800 to 7,770 ft., and that log measured no anomalous noise. The logs of November 7, 2006 and June 1, 2012 were performed for the entire length of the well and measured no anomalous noise.

2.23.1 Blade Response

1. Does Blade Energy Partners agree or disagree with the statement?

   Agree.

2. If Blade disagrees with any portion of the statement, why?

   Not applicable. Blade agrees with the statement.

3. Is there any context either in or outside of Mr. Carnahan's testimony that Blade wishes to add in order to explain its answers? If so, please provide it and explain.

   No.

4. If Blade accepts any part of the statement as true, does it change any of the conclusions Blade reached in its Root Cause Analysis?

   No change in the conclusions.

5. If the answer to question 3 is yes, which conclusions change and what must they say now?

   Not applicable. No conclusion changes are needed.

2.24 Statement 24

SoCalGas performed the remaining noise logs performed in 1978, 1979, 1981, 1984 (2 runs), and 1991 to assess potential leaks. All logs measured generally shallow low frequency noise (200 to 600 Hz). These low-frequency measurements are interpreted to originate from surface noise at the Aliso Canyon site or operations in nearby wells, which is common and described by McKinley [1995].84 The 1978 log includes operator comments referencing surface noise.

2.24.1 Blade Response

1. Does Blade Energy Partners agree or disagree with the statement?

   In general, Blade agrees with this statement. Noise originating from surface was detected in some logs and this source of the noise was documented in the Results and Remarks section of the log.

2. If Blade disagrees with any portion of the statement, why?

   Blade disagrees with, "All logs measured generally shallow low frequency noise (200 to 600 Hz)." Some, but not all, logs have measured shallow noise.

3. Is there any context either in or outside of Mr. Carnahan's testimony that Blade wishes to add in order to explain its answers? If so, please provide it and explain.

   No.

4. If Blade accepts any part of the statement as true, does it change any of the conclusions Blade reached in its Root Cause Analysis?

   No change in the conclusions.

5. If the answer to question 3 is yes, which conclusions change and what must they say now?

   Not applicable. No conclusion changes are needed.

2.25 Statement 25

The same six logs also measured noise across all four frequency ranges slightly above the packer and completion equipment at the base of the well, and across the storage formation. Such noise is expected and is associated with movement of gas in the storage formation and through the completion equipment. The 1991 log includes operator comments regarding noise interpreted as "bubbling" at a depth of about 7,500 ft., which is shown in the excerpt of the log in Figure 22. As can be seen in the figure, the noise log was repeated over the depth range of 7,200 ft. to 7,600 ft. and the indicated bubbling noise was not detected.

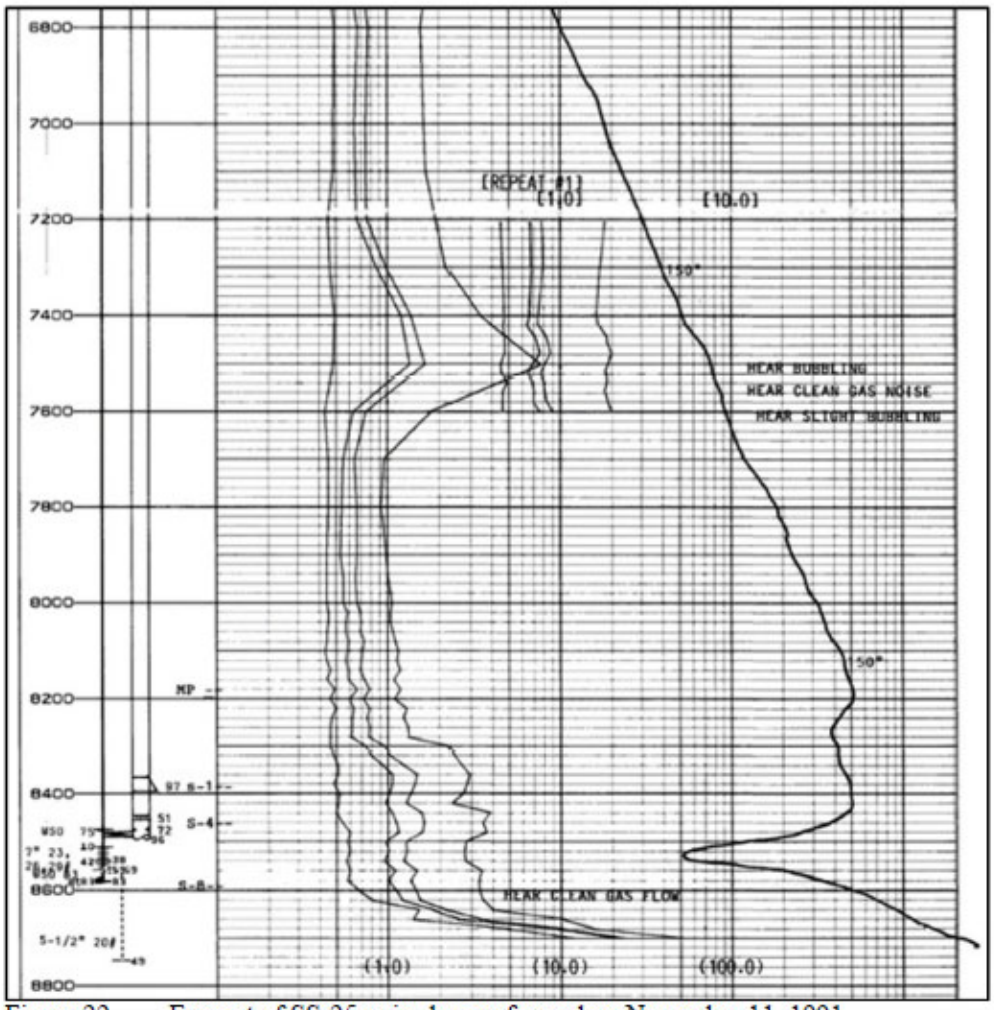

Figure 22. Excerpt of SS-25 noise log performed on November 11, 1991.

2.25.1 Blade Response

1. Does Blade Energy Partners agree or disagree with the statement?

   Disagree.

2. If Blade disagrees with any portion of the statement, why?

   Blade disagrees with "The same six logs also measured noise across all four frequency ranges slightly above the packer and completion equipment at the base of the well, and across the storage formation." Not all the logs were run across the packer, completion equipment and storage formation. For example, in the December 8, 1978 log, the deepest observation point was approximately 7,900 ft, which is above the packer and storage formation.

   Blade agrees that in the repeat section from 7,200–7,800 ft bubbling noise was not detected.

3. Is there any context either in or outside of Mr. Carnahan's testimony that Blade wishes to add in order to explain its answers? If so, please provide it and explain.

   No.

4. If Blade accepts any part of the statement as true, does it change any of the conclusions Blade reached in its Root Cause Analysis?

   No change in the conclusions.

5. If the answer to question 3 is yes, which conclusions change and what must they say now?

   Not applicable. No conclusion changes are needed.

CHAPTER 3
EXHIBITS

General Procedure

Washing Through Gas Hydrates

November 3, 2015

1. Rig up coiled tubing equipment.
2. Test all equipment.
3. Displace glycol to cross above master valve.
4. Attempt to displace glycol to 467 ft.
5. If unable to displace glycol wash through suspected hydrate plug in tubing.
6. Begin circulating with 10.8 ppg $CaCl_2$ at 1.0 bpm.
7. Adjust choke to maintain 2,700 to 3,000 psi back pressure.
8. Record pump pressure.
9. Set kick out on pump to 500 psi above recorded pump pressure.
10. Begin washing down at 10 to 15 ft/min pumping 10.8 ppg $CaCl_2$. (The rate in will be dictated by the ability to wash through any hydrates).
11. Maintain 2,700 to 3,000 psi back pressure with choke. Adjust choke accordingly watching for choke plugging off with hydrates.
12. Work pipe to ensure coiled tubing does not become stuck.
13. Continue washing in the hole to the end of tubing pumping 10.8 ppg $CaCl_2$.

Kill Procedure

SS-25

Nov. 12, 2015

1. Ensure a minimum of 600 bbls of 9.4 ppg $CaCl_2$ is available to pump before perforating the tubing.
2. Make up 2-7/8" EZSV on e-line.
3. Stab lubricator. Test to 300/4,000 psi.
4. RIH with 2-7/8" EZSV.
5. Set EZSV at ± 8,390 ft.
6. Pull out of hole.
7. Perform positive test on EZSV to 500 psi above tubing pressure.
8. Observe 30 minutes.
9. Perform negative test on EZSV to 500 psi below tubing pressure.
10. Observe for 30 minutes.
11. RIH with tubing punch.
12. Pressure tubing to 2,000 psi.
13. Perforate tubing ± 8,391 – 8,385 ft. (16 Shots, 0.3" x 3/8" Charge, 4 shots/foot)
14. Pull out of hole into lubricator.
15. Close swab valve and upper maseter.
16. Pump 10 bbls 9.4 ppg Polymer Plug.
17. Start pumping 9.4 ppg $CaCl_2$ at 4 bpm. Observe pressures
18. Increase pump rate according to pump pressure. MAX PUMP PRESSURE – 4,000 psi.
    - Observe pump pressure when KWM leaves the perforations. Attempt to maintain constant pump pressure.
    - If unable to maintain constant pump pressure a decision will be made to open choke to allow KWM to flow up the 2-7/8" x 7" annulus.
19. Pump 303 bbls. Observe well.

Barite Pill
November 14, 2015

1. Mix 22 bbls of 18.0 ppg barite pill in batch mixer.

BARITE PLUG – WATER BASED SLURRY – 1 BARREL					
Slurry wt, ppg	**14.0**	**16.0**	**18.0**	**20.0**	**22.0**

QUICK-THIN, ppb	2	2	2	2	2
Caustic Soda, ppb	.5	.5	.5	.5	.5

2. Pump 50 bbls of 9.4 ppg $CaCl_2$ to ensure perforations are open.
3. Continue pumping170 bbls 9.4 ppg $CaCl_2$ at 8- 10 bpm.
4. Displace 22 bbls of 18.0 ppg barite pill.
5. Displace barite pill with 50 bbls of 9.4 $CaCl_2$ at 4 bpm
6. Shut down.
7. Wait on barite pill for 12 hours.

Barite Pill
November 14, 2015

1. Mix 22 bbls of 18.0 ppg barite pill in batch mixer.

BARITE PLUG – WATER BASED SLURRY – 1 BARREL					
Slurry wt, ppg	**14.0**	**16.0**	**18.0**	**20.0**	**22.0**
Fresh Water, % bbl	.788	.713	.638	.563	.489

QUICK-THIN, ppb	2	2	2	2	2
Caustic Soda, ppb	.5	.5	.5	.5	.5

2. Pump 50 bbls of 9.4 ppg $CaCl_2$ to ensure perforations are open.
3. Continue pumping170 bbls 9.4 ppg $CaCl_2$ at 8- 10 bpm.
4. Displace 22 bbls of 18.0 ppg barite pill.
5. Displace barite pill with 50 bbls of 9.4 $CaCl_2$ at 4 bpm
6. Shut down.
7. Wait on barite pill for 12 hours.

Barite Pill
November 15, 2015

1. Pump 50 bbls 9.4 $CaCl_2$ down tubing to ensure perforations are open.
2. Mix 35 bbls of 18.0 ppg barite pill in batch mixer.

BARITE PLUG – WATER BASED SLURRY – 1 BARREL					
Slurry wt, ppg	**14.0**	**16.0**	**18.0**	**20.0**	**22.0**
Fresh Water, % bbl	.788	.713	.638	.563	.489
BAROID, ppb	310	420	530	641	750
QUICK-THIN, ppb	2	2	2	2	2
Caustic Soda, ppb	.5	.5	.5	.5	.5

Fresh Water	22.3 bbls	
Barite	18,550 lbs	(185.5 sacks)
Thinner	70 lbs	
Caustic	17.5 lbs	

3. Begin pumping 9.4 ppg $CaCl_2$ at 8 - 10 bpm.
4. Pump 170 bbls $CaCl_2$ at 8 – 10 bpm.
5. Pump 35 bbls of 18.0 ppg barite pill down the tubing.
6. Begin displacing barite pill with 9.4 ppg $CaCl_2$ at 8 bpm.
7. After 13 bbls displaced slow pump rate to 6 bpm.
8. After 30 bbls displacement slow pump rate to 4 bpm.
9. After 40 bbls displaced slow pump rate to 2 bpm.
10. After 45 bbls displaced slow pump rate to 1 bpm.
11. After 50 bbls displaced shut down.
12. Wait on barite pill for 12 hours.
13. Monitor Pressures.

Contingencies

A. 125 bbls of 9.4 ppg $CaCl_2$ + 22 bbls of 18.0 ppg Barite Pill in the 7” x 2-7/8” annulus equates to 2,700 psi hydrostatic pressure.
B. If transfer pump goes down while transferring the barite pill to the pump truck immediately displace any pill in the tubing out of the perforations with 9.4 ppg $CaCl_2$.

C. The barite pill can be pumped at any time. If surface conditions deteriorate a decision will be made to pump the barite pill even if 170 bbls of 9.4 ppg $CaCl_2$ has not been pumped.

Barite Pill
November 15, 2015

1. Mix 22 bbls of 18.0 ppg barite pill in batch mixer.

BARITE PLUG – WATER BASED SLURRY – 1 BARREL					
Slurry wt, ppg	**14.0**	**16.0**	**18.0**	**20.0**	**22.0**
Fresh Water, % bbl	.788	.713	.638	.563	.489
BAROID, ppb	310	420	530	641	750
QUICK-THIN, ppb	2	2	2	2	2
Caustic Soda, ppb	.5	.5	.5	.5	.5

2. Pump 50 bbls of 9.4 ppg $CaCl_2$ to ensure perforations are open.
3. Continue pumping170 bbls (220 bbls total) 9.4 ppg $CaCl_2$ at 8 - 10 bpm.
4. Displace 22 bbls of 18.0 ppg barite pill.
5. Displace barite pill with 50 bbls of 9.4 $CaCl_2$ at 4 bpm
6. Shut down.
7. Wait on barite pill for 12 hours.
8. Monitor Pressures.

Contingencies

A. 125 bbls of 9.4 ppg $CaCl_2$ + 22 bbls of 18.0 ppg Barite Pill in the 7" x 2-7/8" annulus equates to 2,700 psi hydrostatic pressure.

B. If transfer pump goes down while transferring the barite pill to the pump truck immediately displace any pill in the tubing out of the perforations with 9.4 ppg $CaCl_2$.

C. The barite pill can be pumped at anytime. If surface conditions deteriorate a decision will be made to pump the barite pill even if 170 bbls of 9.4 ppg $CaCl_2$ has not been pumped.

WELL 25

Kill Program

11-24-15

1. Mix 50 bbl GEO Zan pill in 9.4 ppg $CaCl_2$
2. Mix 35 bbl 18.0 ppg Barite Pill.
3. Pump 50 bbls GEO Zan pill down tubing.
   - Prepare 50 bbls GEO Zan pill in 9.4 ppg $CaCl_2$.
4. Begin pumping fresh water at 12-15 bpm.
   - Monitor pump pressures. Pump at highest rate possible keeping pump pressure below 5,000 psi.
5. Pump 1,000 bbls of fresh water at 11-15 bpm.
6. Observe well.
7. If well is dead continue with **STEP 9.**
8. If well is not dead continue with **STEP 12.**
9. Pump 35 bbl 18.0 ppg Barite Pill down tubing.
10. Displace out of the perforations. (Estimated Displacement Volume – 55.5 bbls.)
11. If well is not dead begin pumping 9.4 ppg $CaCl_2$ at 8 – 10 BPM. Pump LCM pills as needed.
    - Monitor pump pressures. Pump at highest rate possible keeping pump pressure below 5,000 psi.
12. Pump 500 bbls CaCl2 at 8-10 bpm.
    - Monitor pump pressures. Pump at highest rate possible keeping pump pressure below 5,000 psi.
13. Pump 35 bbls 18.0 ppg barite pill down tubing.
14. Displace with 56 bbls $CaCl_2$

Contingencies

A. If while pumping unable to build pump pressure pump 15 bbl Polymer "sweeps".
B. Slow pump rates to try and build pump pressure.
C. If surface conditions deteriorate the barite pill can be pumped at any time.
D. Have transport trucks loaded with $CaCl_2$ to fill frac tank once pumping operations commence.
E. Have transport truck loaded with fresh water once pumping operations commence.

WELL 25

Kill Program

11-25-15

1. Mix 100 bbl GEO Zan pill with LCM in 9.4 ppg $CaCl_2$
2. Pump 50 bbls GEO Zan pill down tubing.
   - Prepare 50 bbls GEO Zan pill in 9.4 ppg $CaCl_2$.
3. Begin pumping fresh water down tubing at 12-15 bpm.
   - Monitor pump pressures. Pump at highest rate possible keeping pump pressure below 5,000 psi.
4. Pump a minimum 1,000 bbls of fresh water at 12-15 bpm.
5. Bleed off 7" casing.
6. Once 7" casing bleeds off pump 100 bbls GEO Zan pill down tubing.
7. Displace place GEO Zan pill will 56 bbls of 9.4 $CaCl_s$
8. Displace out of the perforations. (Estimated Displacement Volume – 56 bbls.)
9. Line up to pump down 7" casing.
10. Pump "Junk Shot" down 7" casing.
11. Fill 7" casing with fresh water.
12. Observe well.

PROJECT MEMO

Date:	12- 12- 2015	**Well Name and Number:**	Standard Senson 25
Company Name:	SOCAL Gas Company		Los Angeles
Company Billing Address:		**State:**	California
		Country:	USA
Client AFE #:		**Well Location:**	Aliso Canyon Storage Facility
Client Representative:	Bret Lane	**Well Type:**	Gas Storage
Report Generated By:	R. Gomez	**Field:**	

BACKGROUND

Background

The Southern California Gas Company Standard Sesnon 25 Well sustained a surface blowout resulting in broaches and fissures at the surface. Intervention operations have consisted of high volume high rate kills and have proved to be ineffective as the well continues to flow uncontrolled at surface. The main reason the well cannot be killed is that the well cannot sustain a column of fluid that will hydrostatically control the well.

The following procedure is designed to breakdown the production reservoir in order to pump a matting material to effect a seal and provide a base on which to seal off the porosity of the producing zone.

Operations will consist of pumping 60 bbls of 15.0 ppg water based mud followed with a "junk shot" followed with a 100 bbl 15.0 ppg Diaseal M pill (diatomaceous earth) and 300 bbls of 15.0 ppg WBM.

Location Preparation

To reduce further erosion of the broach adjacent to the well, Boots & Coots personnel will line the inside of the broach with large diameter (6" – 10") river rock. Additionally, a pump out line will be available so that any produced fluids may be siphoned off at the conclusion of pumping operations.

B & C will remove any surface equipment and concrete barriers that will interfere with spotting mud tanks, pump trucks and blenders.

Tubing Severance

Run in the hole with a gauge ring to the deepest depth possible, pickup a radial cutting torch on slickline to the maximum depth and cut the tubing above the perforations. Make a second cut 10 ft. above the original cut to insure that there are no obstructions.

Commence pumping operations with 60 bbls of 15.0 ppg WBM and pump down the tubing at a rate of 2.0 - 4.0 bpm with a maximum pressure of 4,000 psi. Follow immediately with a junk shot consisting of rope, cut rubber, .5 " steel balls, nut plug, kwik seal (medium).

Diaseal-M Mixing Procedure

The proposed procedure is for mixing a 15.0 ppg 100 bbl Diaseal M Squeeze with LCM added to it. **Note: The LCM should be limited to the use of walnut hulls.** The Diaseal M squeeze should be mixed using a hopper and ribbon blender. Ideally, the 100 bbl pill will require 90 bbls fresh water, 125 sacks of Diaseal M and 90 sacks of barite to achieve the 15.0 ppg. Add an equivalent of 30 ppb walnut plug.

Diaseal-M Pumping

After mixing the Diaseal M pump the slurry down the tubing at a rate of 2 - 4 bpm, displace Diaseal M with 300 bbls of 15.0 ppg WBM at the same rate.

Shut down pumping operations and monitor well for 12 hours. Prepare to repeat the procedure up to 4 times.

Materials List

1- Hopper
2- 100 bbl ribbon blender
3- Mud tanks w/ agitation
4- 600 sacks Diaseal M
5- 1500 bbls 15.0 ppg WBM
6- 30 .5" steel balls
7- 30 sacks Kwik Seal (medium)

BARITE PLUG (WBM) RECOMMENDED OPTION

Barite plugs are utilized in well control operations primarily for the purpose of sealing formations that are flowing into the wellbore. The desired result of the plug is to have the weighting material settle rapidly and evenly. In most applications, the required weighting material will be barite with some cases requiring hematite. Combinations of both weighting materials may also be used. Either material can be mixed in water based fluids.

The optimum range for weighting up with barite is from 14.0 ppg to 16.0 ppg although slurries may be weighted up to 22.0 ppg using barite. The optimum range for using hematite is from 16.0 ppg to 18.0 ppg with higher weights achieved through additions of galena.

Factors that affect settling rates include contaminants, density; make up water, gel strengths and viscosity. The heavier the plug the slower the settling rate will be because of a higher solids content resulting in higher gel strengths and viscosities. The higher the concentration of contaminants, the higher the viscosity resulting in slower settling times.

Increased settling times can be achieved in water based muds by pre-treatment of the makeup water with Sodium Acid Pyrophosphate (SAPP) to precipitate out any calcium. It is highly recommended to use either SAPP or Desco® (thinner) to reduce further chemical flocculation.

A general rule of thumb is to mix the barite plug to approximately 2.0 ppg above the mud weight in use at the time.

The barite slurry may be pumped through the drillpipe through a cementing head or through the standpipe and kelly. In either case, the pump tie-in to the drillpipe should contain provisions for hooking up both the cementing pump and the rig pump so that either can be used to displace the slurry. If this is not done, and the cementing unit breaks down, the barite may settle in the drillpipe before the mud pump tie-in can be made or the cementing unit repaired. Blockage of the drillstring by barite settling will complicate the well control problem.

Field Mixing of Barite Plugs

1. Determine the number of barrels of plug you want to set.
2. Determine the amount of water needed. This will be about 50% of the total volume for a 14.5 ppg barite plug.
3. Put half of the number of barrels of water required in the pit. For example, for 50 bbl plug, you would need about 25-26 bbls of water total. Put 12-13 bbls in the pit.
4. Empty and clean the slugging pit.
5. Put just enough mixing water in the pit to obtain a suction with the mixing system
6. Add one 50 lb of SAAP (Sodium Acid Pyrophosphate) into the mixing water, agitate for approximately 10 minutes.
7. Begin adding weight material until desired weight is obtained. The pill should become viscous. The idea is to get as much barite into the fluid as possible without it starting to fall out or making the fluid unworkable. Continue agitation.
8. Trickle in the remaining water and barite until the final volume is built.

There are a few recommendations regarding setting of the plug that you should consider.

- Run a pilot test with the plug to determine the settling time. Measure the settled volume in a vis cup at several different time intervals. Measure the settled volume of the barite when it has all fallen out. This can be useful in determining the actual settled volume vs. the calculated settled volume.
- Spacers before and behind the plug may cause them to settle out in the drill string.
- Pump the plug with the cementing unit.
- Displace the plug with the cementing unit.
- Have both the rig pumps and the cementing unit lined up to pump. If one pump goes down, be able to quickly switch to the other pump.
- Over displace the plug out of the drill string by 5 bbls.
- Pump $^1/_2$-1 barrel or so every 15 minutes or so to ensure that the drill string remains clear.

- Pump plug and chase with mud. **DO NOT CHASE THE PLUG WITH WATER.**
- Pump the plug at a high enough rate to ensure that there is pressure on the drill string. Don't let the drill string go on a vacuum, if possible. Monitor the drill pipe pressure carefully while pumping in case the plug shows signs of settling out while pumping.
- Wait on the plug after setting a minimum of 8 hours, check surface sample. If necessary wait up to 12 hours.

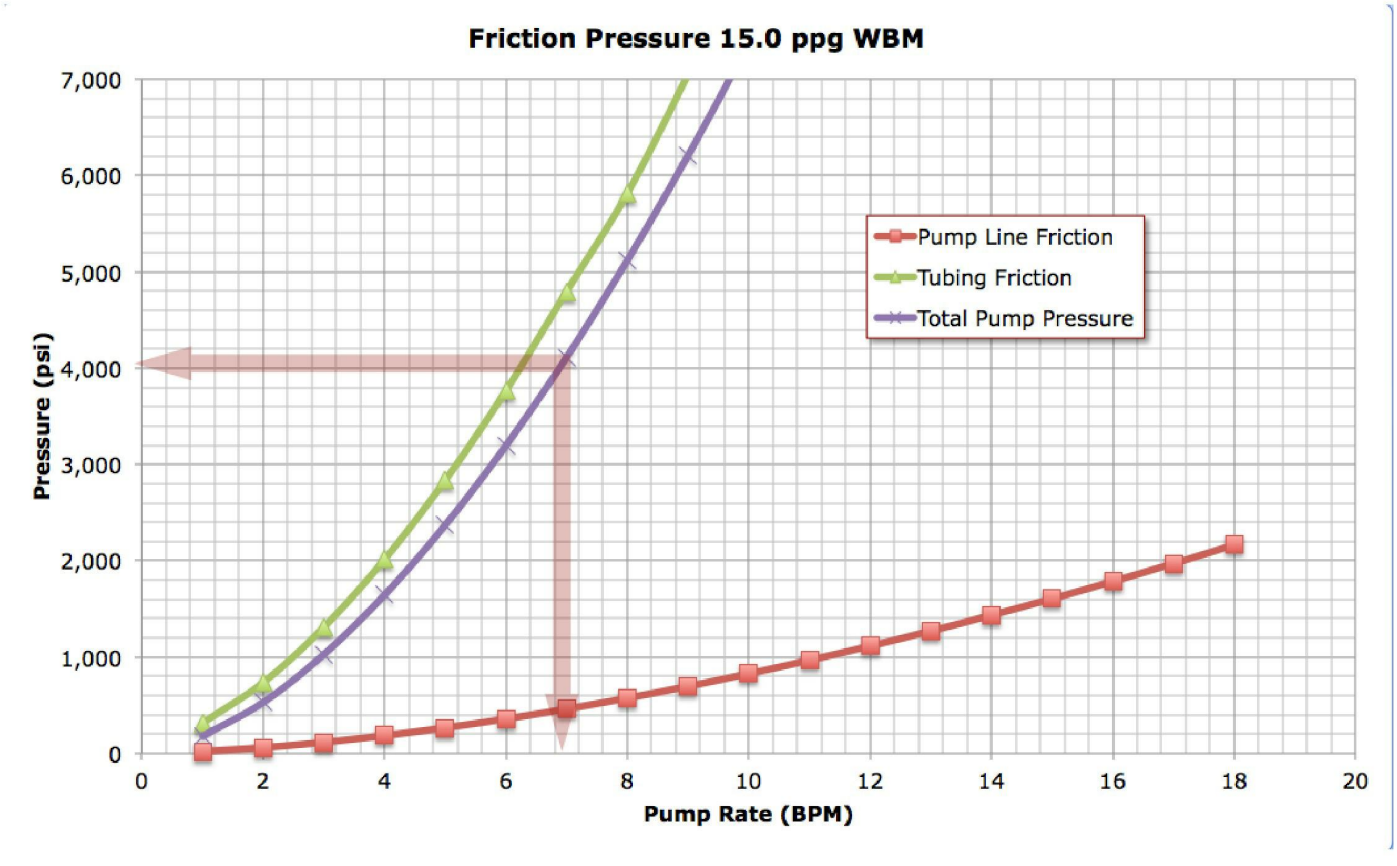
Table #1 - Make-up of water and barite supply

Slurry wt	Sx. Barite/Bbl.	Gal. Water/Bbl.
14 Lb/gal	3.1 sx.	33.2 Gals
15	3.7	31.7
16	4.2	30.1
17	4.8	28.6
18	5.3	27.0
19	5.9	25.5
20	6.4	23.9
21	7.0	22.4

This procedure would require setting a mag range plug at the bottom of the drillpipe at 5,952 feetjust above the BHA

Barite Pill Preparation

1. 4 sacks SAPP or 4 sacks Desco
2. 400 sacks barite
3. 200 bbls water



Sodium Silicate Procedure

1. Designate one pump truck to pump fresh water and sodium silicate pill and one pump truck to pump $CaCl_2$. **($CaCl_2$ and Sodium Silicate CANNONT come in contact with each other in pumps, transfer hoses, or pump line.)**
2. Clean batch mixer tanks with fresh water and flush transfer hoses with fresh water to remove any $CaCl_2$
3. Fill Batch mixer tank with 30 bbls fresh water.
4. Clean displacement tanks and flush pump lines with fresh water to remove any $CaCl_2$.
5. Pump 318 bbls 9.4 ppg $CaCl_2$ with pump designated for $CaCl_2$ at highest rate possible keeping pump pressure below 5,000 psi.
6. Displace 6 bbls of fresh water from batch mixer tank with pump truck designated for water and sodium silicate.
7. Pump 15 bbls Sodium Silicate with pump.
8. Pump 6 bbls of fresh water from batch mixer.
9. Displace with 56 bbls $CaCl_2$.

SOUTHERN CALIFORNIA GAS COMPANY
CPUC-SAFETY AND ENFORCEMENT DIVISION
DATA REQUEST DATED OCTOBER 23, 2018

SOCALGAS RESPONSE DATED DECEMBER 6, 2018

SoCalGas provides the following Responses to the CPUC-Safety and Enforcement Division's (CPUC-SED) data request dated October 23, 2018 related to the preliminary investigation regarding the Aliso Canyon Well Leak. CPUC-SED initially requested that Responses be provided by November 7, 2018. SoCalGas requested and CPUC-SED granted, an extension of the due date until December 7, 2018. On December 4, 2018, CPUC-SED asked whether SoCalGas could provide its Responses earlier than December 7, 2018. In accordance with CPUC-SED's request, SoCalGas is submitting its Responses on December 6, 2018. The Responses are based upon the best available, non-privileged information that SoCalGas was able to locate through a diligent search within the time allotted to respond to this request, and within SoCalGas' possession, custody, or control. SoCalGas reserves the right to supplement, amend or correct the Responses to the extent that it discovers additional responsive information.

SoCalGas submits these Responses, while generally objecting to any Request that fails to provide a defined time period to which SoCalGas may tailor its Response, and to the extent that any Request is overly broad, vague, ambiguous, unduly burdensome, assumes facts, or otherwise fails to describe with reasonable particularity the information sought. SoCalGas further submits these Responses without conceding the relevance of the subject matter of any Request or Response. SoCalGas reserves the right to object to use of these Responses, or information contained therein, in any dispute, matter or legal proceeding before any court, action. Finally, at the time of this Response, there are no pending oral data requests from the CPUC-SED to SoCalGas.

For this set of questions, please refer to the following timeline, which is a verbatim copy of what SED received from Southern California Gas Company (SoCalGas) in response to a question 1 of an SED Data Request to SoCalGas, dated November 13, 2015. For reference, a copy of the SED Data Request dated November 13, 2015 is Appendix A at the bottom of this data request. Questions are shown below this timeline stated from SoCalGas.

Aliso Canyon Natural Gas Leak November 15, 2015

DRAFT Timeline of Events*

- Friday, October 23 – Leak discovered, area made safe for well procedures, personnel and equipment mobilized; standard procedures began, internal notifications made.
- Saturday, October 24 – Standard procedures to stop leak not effective. SoCalGas brings in additional external expertise (Onyx & Halliburton). Regulatory notifications begin.
- Sunday, October 25 –Boots and Coots experts arrive, mobilize and begin evaluation. SoCalGas Media & Employee Communications team participating. Initial information regarding situation distributed to Customer Contact Center and others that night. Regulatory notifications expanded.
- Monday, October 26 – SoCalGas' Emergency Operations Center (EOC) activated in monitor mode to provide support to Aliso Canyon Incident Command team. Evaluations continue on the well. Customer message posted on socalgas.com. SoCalGas holds community meeting on Aliso Canyon Turbine Replacement Project. Provided information and answers about leak. Some customers expressed anger/frustration about the leak.

- Tuesday, October 27 – Crews conduct more diagnostics and tests. Letter sent to customers, posted, emailed to elected officials, HOAs. SoCalGas sets up dedicated email and phone hotline for customer inquiries. Daily operational briefing set up for fire dept., emergency management and elected official Public Information Officers (PIO). Daily briefings with SCAQMD begin.
- Wednesday, October 28 – Crews use wireline rig for diagnostics. KTLA-TV Channel 5 and KABC-TV Channel 7 cover story. Customer letter hand delivered to 1,400 homes. Public information booth set up at Aliso Canyon facility and staffed from 10 a.m. and 5 p.m. daily.
- Thursday, October 29 – Multiple diagnostics, including initial "wireline" completed. Determined need for coiled tubing rig to be brought in. SoCalGas mails 8,100 letters to Porter Ranch area. SoCalGas creates Frequently Asked Questions fact sheet to help respond to customer questions.
- Friday, October 30 – Wireline equipment removed. Update letter, fact sheet emailed with message that odor will last. SoCalGas begins daily air sampling of multiple random sites on site and in community which is available on socalgas.com. KTLA-TV Channel 5 and KABC-TV Channel 7 cover protest at Aliso Canyon gates by local activists. Less than 20 attend rally. L.A. Daily News runs story and photos: "Natural Gas Leak Near Porter Ranch Lingers Nearly One Week Later."
- Saturday, October 31--Crews at SoCalGas work to prepare site for coiled tubing rig. SoCalGas delivers an update via letter to 1,400 homes closest to the facility.
- Sunday, November 1—Coiled tubing rig arrives in late afternoon. Adjacent wells killed (one Saturday & one Sunday) in preparation for work on SS-25.
- Monday, November 2 – Equipment unloaded, set up. SoCalGas mails letter to 8,100 customers. SoCalGas.com begins daily posting of updates; Posted air sampling results on socalgas.com.
- Tuesday, November 3 – Coiled tubing ready set up and connected, started pressure testing.
- Wednesday, November 4 – Coiled tubing pressure testing continues. SoCalGas briefs representatives from L.A. City and County Fire Departments, Hazmat, SCAQMD, DOGGR, L.A. County Department of Health and elected officials prior to the Porter Ranch Neighborhood Council meeting. SoCalGas speaks at the Porter Ranch Neighborhood Council. KTLA-TV Channel 5 and KCBS-TV Channel 2, KNX 1070 radio cover. Ken Bruno from CPUC SED visits with Jimmie Cho, SoCalGas Senior Vice President - Gas Operations and System Integrity, for tour of site. L.A. Daily News runs story: "Leaking Natural Gas Well Concerns Porter Ranch Residents."
- Thursday, Nov 5. – Coiled tubing pressure testing completed. L.A. Daily News reports on community meeting. Reporter Greg Wilcox visits Aliso Canyon main office area and interviews Jimmie Cho and Glenn La Fevers, SoCalGas' Storage Operations Manager. SoCalGas supplies photos to press. L.A. Daily News updates story: "Porter Ranch Residents Confront Officials Over Gas Leak."
- Friday, Nov. 6 – Coiled tubing rig begins breaking through the blockage and introducing fluid into the well. SoCalGas adds daily p.m. email briefing to local PIOs and elected officials.
- Saturday, Nov 7 - Second day of multi-day coiled tubing operation focuses on additional evaluation to guide the next step efforts to stop the flow of gas. Wireline rig set up. SoCalGas continues air monitoring. CARB/CEC fly plane over site to monitor methane. L.A. Daily News online article "New Attempt Made to Stop Gas Leak" featured on home page, reports on situation and includes photos coiled tubing rig and of SoCalGas execs meeting with LAFD officials on site. Posted on front page of weekend edition.

- Sunday Nov. 8 – Well-management experts continue multi-day evaluation. The focus was on continued evaluation of the well pipe conditions. Information from multiple diagnostic tests will guide next steps to safely stop the flow of gas. L.A. Daily News runs column: "Leaking Well a Vexing Problem."
- Monday November 9 – Well-management experts continue multi-day evaluation. L.A. Daily News runs column: "Crews Make Progress in Repairing Gas Leak."
- November 10 - Additional well testing work performed. Hosted a site visit by representatives from state and local agencies and elected offices. Visitors were provided an overview of Aliso Canyon and Storage operations, and briefed on the current status of efforts to mitigate the leaking well.
- November 11 - Conducted data analysis, finalized strategy to stop the leak, and began preparing the site with the appropriate well-control equipment.
- November 12 - Successfully installed the "bridge plug" in the well tubing and continued to prepare the well site.
- November 13 - Tubing perforation activities performed and attempted stop the flow of gas by putting fluids down the well. During this operation, there was a release of a mist into the air. Based on the information at this time, it is not believed that these materials pose a threat to public health. Out of an abundance of caution, residents were notified to stay inside. Once determined that the mist was contained to our facility, residents were again notified that there was no reason to remain inside. Office of Emergency Services and National Response Center were notified of the release. They were updated at 3:14 pm that flow was reduced.
- November 14 – Evaluating the well conditions, preparing the site and determining the best strategy for our continued efforts to stop the flow of gas. Representatives from the L.A. County Health & Hazmat have inspected the site today and yesterday and observed our containment procedures. Collected samples of the mud and liquid from yesterday's release and having it analyzed and expect results tonight. At 1:05 pm OES and NRC were notified of release containment and minor additional release of crude oil at 4:30 am.

* Based on best available information at this time.

<u>Question 1</u>:

With regards to the statement: "Saturday, October 24 – Standard procedures to stop leak not effective. SoCalGas brings in additional external expertise (Onyx & Halliburton). Regulatory notifications begin."

a. Please identify and provide which procedures SoCalGas is referring to in this statement.
b. Please specify the page numbers and quote the words of each procedure that SoCalGas says were "not effective".
c. Please explain why SoCalGas states that these procedures were not effective.
d. Once SoCalGas determined that these procedures were not effective, did SoCalGas attempt to follow other non-standard procedures?
e. If the answer to question 1d is yes, which ones?
f. If the answer to question 1d is yes, explain why SoCalGas attempted to follow the non-standard procedures it did?
g. If the answer to question 1d is no, why did SoCalGas not follow other non-standard

procedures?

h. Identify all personnel from Onyx brought in as additional external expertise.
i. Provide the resumes showing backgrounds of each personnel member from Onyx.
j. Explain the role of each member of Onyx who SoCalGas brought in for additional external expertise.
k. Provide the contract or contracts with Onyx for bringing in their additional external expertise.
l. Provide the invoices from Onyx to provide their additional external expertise.
m. What steps did SoCalGas take in following these procedures?
n. At what point did SoCalGas learn that their standard procedures to stop the leak were ineffective? How did SoCalGas tell that the procedures were ineffective?
o. Please provide all individuals with knowledge of the answers to this question. Please include those who wrote the answer to the question.

Response 1:

a. The procedures performed on the October 24, 2015 included the wellhead seal repair operation followed by the well kill attempt down the tubing and casing. SoCalGas operators performed the first top kill operation by pumping polymer solution into the 2 7/8" tubing. The tubing pressure increased rapidly, indicating the presence of a blockage in the tubing. Next, 89 barrels of brine were pumped into the casing annular space in a further attempt to kill the well.
b. SoCalGas objects to this request to the degree that it assumes "Standard procedure" is referring to a written formal SoCalGas procedure. Notwithstanding this objection, SoCalGas responds as follows: See Response 1.a.
c. See Response 1.a. They were not effective because gas continued leaking from the well after the actions were taken.
d. SoCalGas objects to this request on the ground that it is vague and ambiguous as to the term "non-standard." Notwithstanding this objection, SoCalGas responds as follows: See Response 1.a.
e. See Response 1.d.
f. See Response 1.d.
g. See Response 1.d.
h. Please see electronic documents with Bates range AC_CPUC_SED_DR_33_0000001 - AC_CPUC_SED_DR_33_0000002.
i. SoCalGas objects to this request as vague and ambiguous as to the term "backgrounds." Notwithstanding this objection, SoCalGas responds as follows: SoCalGas has conducted a reasonable search and has not found any responsive documents within its possession, custody, or control.
j. In this context, SoCalGas understands the phrase "additional external expertise" to mean the use of contractors with specialized experience and equipment. Onyx Oil Services (Onyx) supplied the 2" piping, the choke manifold and the gas/liquid separator that connected the wellhead to the Halliburton pump and the storage tank, for the well kill activities on October 24, 2015. The primary function of the Onyx personnel was to set up the surface piping, then operate their surface equipment under the supervision of SoCalGas. Onyx personnel followed the direction of SoCalGas during the well kill and made no decisions or recommendations while the kill fluid was being pumped. For a list of the personnel and their roles, see Response 1.h.
k. Please see the previously provided electronic documents with the following Bates ranges: AC_CPUC_SED_DR_17_0043004-AC_CPUC_SED_DR_17_0043027

AC_CPUC_SED_DR_17_0043462-AC_CPUC_SED_DR_17_0043471
AC_CPUC_SED_DR_17_0044052-AC_CPUC_SED_DR_17_0044054
AC_CPUC_SED_DR_17_0044686-AC_CPUC_SED_DR_17_0044693
AC_CPUC_SED_DR_17_0044998-AC_CPUC_SED_DR_17_0045006
AC_CPUC_SED_DR_17_0046158-AC_CPUC_SED_DR_17_0046254

l. In this context, SoCalGas understands the phrase "additional external expertise" to mean the use of contractors with specialized experience and equipment. For the invoice for field work performed by Onyx Oil Services on October 24, 2015, please see Response 1.h.

m. SoCalGas objects to this request as vague and ambiguous as to "these procedures."

n. See Response 1.a.-b.

o. SoCalGas objects to this request as overly broad and vague as to the terms "this question" and "the question." SoCalGas interprets the request to be seeking the identities of individuals that may have first-hand knowledge of the events described in the above responses. SoCalGas responds as follows: Todd Van de Putte, Alan Fortenberry, Oleksiy Garchev, Larry Andrews, Tom Egbert, John Cerulle, Mike Dozier, and Mike Volkmar. In addition, please see the contractors listed on the SoCalGas Daily Operations Report for October 24, 2015 (AC_CPUC_SED_DR_16_0000649 - AC_CPUC_SED_DR_16_0000650). Counsel to SoCalGas coordinated preparation of this data response.

Question 2:

Regarding the statement, "Sunday, October 25 Boots and Coots experts arrive, mobilize and begin evaluation. SoCalGas Media & Employee Communications team participating. Initial information regarding situation."

a. Were the Boots and Coots experts who arrived part of the additional expertise brought in from Halliburton that was mentioned in the statement dated "Saturday, October 24"?

b. Were additional external experts from Halliburton brought in as of Saturday, October 24 who were not the Boots and Coots experts who arrived on Sunday, October 25?

c. If the answer to 2b is yes, please list all such additional, non-Boots and Coots experts from Halliburton who arrived on Sunday, October 25.

d. Please provide all individuals with knowledge of the answers to this question. Please include those who wrote the answer to the question.

Response 2:

a. No. Halliburton and Onyx personnel assisted with logistics and support (e.g., pump truck) for the well kill activities performed on October 24, 2015. SoCalGas first contacted Boots & Coots after the October 24, 2015 well kill was unsuccessful, and Boots & Coots personnel first arrived at Aliso Canyon on October 25, 2015. SoCalGas generally refers to Boots & Coots as the specialized well control experts who assisted with the well kills and the relief well after arriving at Aliso Canyon on October 25, 2015.

b. Yes. Halliburton personnel, who were not also Boots & Coots personnel, assisted with and provided support for the well kill performed on October 24, 2015.

c. No new Halliburton personnel arrived on Sunday, October 25, 2015, other than those who were Boots & Coots personnel.

d. SoCalGas objects to this request as overly broad and vague as to the terms "this question" and "the question." SoCalGas interprets the request to be seeking the identities of individuals that may have first-hand knowledge of the events described in the above responses. SoCalGas responds as follows: Todd Van de Putte, Alan Fortenberry, and

Mike Dozier. In addition, please see the Boots & Coots personnel listed on the Boots & Coots Daily Report for October 25, 2015 (AC_CPUC_SED_DR_16_0025633) and the contractors listed on the SoCalGas Daily Operations Report for October 25, 2015 (AC_CPUC_SED_DR_16_00000651 - AC_CPUC_SED_DR_16_00000652). Counsel to SoCalGas coordinated preparation of this data response.

Question 3:

With regards to the statement, "Thursday, October 29 – Multiple diagnostics, including initial 'wireline' completed."

a. Please define "wireline" as used in this sentence.
b. Please explain what the wireline did.
c. Please provide the information/data gathered as a result of the "wireline".
d. Please provide all individuals with knowledge of the answers to this question. Please include those who wrote the answer to the question.

Response 3:

a. The term "wireline" refers to the cabling technology used in the oil and gas industry to lower down equipment, wireline tools, or measuring devices into a wellbore.
b. SoCalGas objects to this request as vague and ambiguous as to the phrase "what the wireline did." Notwithstanding this objection, SoCalGas responds as follows: For Boots & Coots' Daily Report for October 29, 2015, please see previously provided electronic document with Bates range AC_CPUC_SED_DR_16_0025635.
c. See Response 3.b.
d. SoCalGas objects to this request as overly broad and vague as to the terms "this question" and "the question." SoCalGas interprets the request to be seeking the identities of individuals that may have first-hand knowledge of the events described in the above responses. SoCalGas responds as follows: Bret Lane and Todd Van de Putte. In addition, please see the Boots & Coots personnel listed on the Boots & Coots Daily Report for October 29, 2015 (AC_CPUC_SED_DR_16_0025635) and the contractors listed on the SoCalGas Daily Operations Report for October 29, 2015 (AC_CPUC_SED_DR_16_0000659 – AC_CPUC_SED_DR-16_0000660). Counsel to SoCalGas coordinated preparation of this data response.

Question 4:

With regards to the statement, Sunday, November 1—Coiled tubing rig arrives in late afternoon. Adjacent wells killed (one Saturday & one Sunday) in preparation for work on SS-25.

a. Please define the word "killed" in the context of the above statement.
b. Which adjacent wells were killed?
c. Why were these adjacent wells killed in preparation for work on SS-25?
d. Please provide all individuals with knowledge of the answers to this question. Please include those who wrote the answer to the question.

Response 4:

a. Killing a well refers to the process of introducing a hydrostatic head of fluid into the well tubulars that exceeds the pressure of the gas trying to escape. When the hydrostatic head pressure exceeds the gas pressure, gas is not able to escape up through the well tubulars.

b. SS25A and SS25B.
c. Due to the close proximity of SS25A and SS25B to SS25, each well was plugged and filled with kill fluid as a precautionary measure.
d. SoCalGas objects to this request as overly broad and vague as to the terms "this question" and "the question." SoCalGas interprets the request to be seeking the identities of individuals that may have first-hand knowledge of the events described in the above responses. SoCalGas responds as follows: Bret Lane and Todd Van de Putte. In addition, please see the Boots & Coots personnel listed on the Boots & Coots Daily Report for November 1, 2015 (AC_CPUC_SED_DR_16_0025638) and the contractors listed on the SoCalGas Daily Operations Report for November 1, 2015 (AC_CPUC_SED_DR_16_0000665 - AC_CPUC_SED_DR_16_0000666). Counsel to SoCalGas coordinated preparation of this data response.

Question 5:

With regards to the statement, "Tuesday, November 3, 2015 – Coiled tubing ready set up and connected, started pressure testing."

a. What was the purpose of setting up the coil tubing?
b. What was the purpose of starting the pressure testing?
c. What were the pressure testing results?
d. Provide documentation showing the pressure testing results.
e. What course of action did SoCalGas take as a result of the pressure testing results?
f. Did SoCalGas follow its pressure testing procedure?
g. If the answer to 6f is yes, provide the procedure that was followed. Please cite the page, and quote the part of it that was specifically followed.
h. Please provide all individuals with knowledge of the answers to this question. Please include those who wrote the answer to the question.

Response 5:

a. The coiled tubing unit was set up to clear a suspected obstruction in the SS-25 tubing. Boots & Coots personnel were directly responsible for operating the coiled tubing.
b. The purpose of pressure testing in this context was to test the safety equipment and equipment that would be used in the coiled tubing operation. Boots & Coots personnel directly performed the pressure testing and may have additional information on this issue.
c. Please see Boots & Coots' Daily Report for November 3, 2015 please see previously provided electronic document with Bates range AC_CPUC_SED_DR_16_0025640.
d. Please see Response 5.c.
e. Boots & Coots continued operations to clear the suspected obstruction in the SS-25 tubing. Boots & Coots personnel performed the pressure testing and may have additional information on this issue.
f. SoCalGas objects to this request to the degree that it assumes SoCalGas performed the pressure testing on the equipment to be used for the coiled tubing operation.
g. See Response 5.f.
h. SoCalGas objects to this request as overly broad and vague as to the terms "this question" and "the question." SoCalGas interprets the request to be seeking the identities of individuals that may have first-hand knowledge of the events described in the above responses. SoCalGas responds as follows: Bret Lane and Todd Van de Putte. In addition, please see the Boots & Coots personnel listed on the Boots & Coots Daily Report for November 3, 2015 (AC_CPUC_SED_DR_16_0025640) and the contractors

listed on the SoCalGas Daily Operations Report for November 3, 2015 (AC_CPUC_SED_DR_16_0000670 - AC_CPUC_SED_DR_16_0000672). Counsel to SoCalGas coordinated preparation of this data response.

Question 6:

With regards to the statement, "Friday, Nov. 6, 2015 – Coiled tubing rig begins breaking through the blockage and introducing fluid into the well."

a. Please describe the blockage, including the location and depth.
b. Were any noise and temperature readings taken after October 23, 2015 and prior to inserting the coiled tubing? If so:
   i. How many?
   ii. What date was each taken?
   iii. What were the results of each reading?
   iv. Provide the results of each reading.
   v. What information, procedures, or other sources did SoCalGas based its decision upon to insert coiled tubing?
   vi. Provide all sources of the information identified in response to question 6v.
c. Was this the first time after the beginning of the incident that fluid was introduced into the well?
d. If not, when was the first time fluid was introduced into the well?
e. What was the purpose of introducing the fluid into the well?
f. Provide documentation from prior to the introduction of fluid into the well that showed the purpose and intent of introducing that fluid.
g. Did the fluid achieve its intended purpose?
h. Provide all documentation and communication supporting the answer to question 6f.
i. Did SoCalGas consider this a top-well kill attempt? Please explain.
j. Was this the first time SoCalGas introduced fluid into SS-25 following the incident on October 23, 2015? If not, list all other instances, including dates.
k. Please provide all individuals with knowledge of the answers to this question. Please include those who wrote the answer to the question.

Response 6:

a. Please see previously provided Boots & Coots' Daily Report dated November 6, 2015, with Bates range AC_CPUC_SED_DR_16_0025643.
b. Please see previously provided Boots & Coots' Daily Reports from October 25, 2015 through November 6, 2015 with Bates range AC_CPUC_SED_DR_16_0025631 - AC_CPUC_SED_DR_16_0025643.
c. No.
d. October 24, 2015.
e. SoCalGas objects to this request as vague and ambiguous as to time. Notwithstanding this objection, SoCalGas responds as follows: To the extent CPUC-SED is requesting information about the first time fluid was introduced into the well, well kill fluid was pumped into SS-25 on October 24, 2015. The purpose of pumping the well kill fluid was to introduce a hydrostatic head of fluid into the well that exceeded the pressure of the gas in the well.

f. SoCalGas objects to this request as vague and ambiguous as to time. Notwithstanding this objection, SoCalGas responds as follows: To the extent CPUC-SED is requesting information about the first time fluid was introduced into the well following discovery of the leak, well kill fluid was pumped into SS-25 on October 24, 2015. For SoCalGas' Gas Standards which describe the well kill process for routine situations, please see electronic documents with Bates range AC_CPUC_SED_DR_17_0000128 - AC_CPUC_SED_DR_17_0000142. While the kill of SS25 was not a routine situation, the purpose and use of the well kill fluids provided in the Gas Standard is consistent. In addition, for communications identified by searching relevant SoCalGas' employees email data sets to locate emails related to the incident response on October 23-24, 2015, please see previously provided electronic documents with Bates range AC_CPUC_SED_DR_33_0000003 - AC_CPUC_SED_DR_33_0000163.

g. SoCalGas objects to this request as vague and ambiguous as to time. Notwithstanding this objection, SoCalGas responds as follows: To the extent CPUC-SED is requesting information about the first time fluid was introduced into SS-25 on October 24, 2015, no, because the October 24, 2015 well kill attempt was not successful. To the extent CPUC-SED is requesting information about the introduction of fluid on November 6, 2015, yes because the November 6, 2015 blockage removal was successful.

h. We interpret this question as seeking documentation in support of 6g. See Response 6.f.

i. SoCalGas objects as vague and ambiguous as to the term "this." To the extent that CPUC-SED is requesting information about the activities on November 6, 2015, those activities do not constitute a well kill attempt.

j. Other than in connection with the October 24, 2015 kill activities, no fluid was introduced into SS-25 prior to the coiled tubing operation.

k. SoCalGas objects to this request as overly broad and vague as to the terms "this question" and "the question." SoCalGas interprets the request to be seeking the identities of individuals that may have first-hand knowledge of the events described in the above responses. SoCalGas responds as follows: Bret Lane and Todd Van de Putte. In addition, please see the Boots & Coots personnel listed on the Boots & Coots Daily Report for November 6, 2015 (AC_CPUC_SED_DR_16_0025643) and the contractors listed on the SoCalGas Daily Operations Reports for October 24 through November 6, 2015 (AC_CPUC_SED_DR_16_0000649 - AC_CPUC_SED_DR_16_0000681). Counsel to SoCalGas coordinated preparation of this data response.

Question 7:

With regards to the statement, "Sunday Nov. 8, 2015 – Well-management experts continue multi-day evaluation. The focus was on continued evaluation of the well pipe conditions."

a. List the sources of information were used by the well-management experts during their "continued evaluation of the well pipe conditions".
b. Provide the sources of information used by the well-management experts during their "continued evaluation of the well pipe conditions".
c. Were any of the sources of information used by the well-management experts during their "continued evaluation of the well pipe conditions" inaccurate?
d. If the answer to 7c is yes, provide all inaccurate sources of information used by the well-management experts.
e. What were the conclusions, findings and other results of the "continued evaluation of the well pipe conditions".
f. Was the "continued evaluation of the well pipe conditions" only for SS-25? If not, list all wells it was for?
g. What was the purpose of the "continued evaluation of the well pipe conditions"?

h. Provide a list with the names of all of the "well-management experts" that were part of the "multi-day evaluation". Be sure this list includes those who were part of the "multi-day evaluation" identified on Monday November 9, 2015 as well.
i. Please provide all individuals with knowledge of the answers to this question. Please include those who wrote the answer to the question.

Response 7:

a. SoCalGas objects to the phrase "sources of information" as vague and ambiguous. SoCalGas further objects on the grounds that the particular sources of information used by Boots & Coots in the course of continued evaluation of well pipe conditions is beyond SoCalGas' scope of knowledge. SoCalGas understands "well management experts" to mean Boots & Coots. Notwithstanding this objection, please see previously provided Boots & Coots' Daily Report for November 8, 2015 with Bates range AC_CPUC_SED_DR_16_0025645. Boots & Coots may have additional information responsive to this request.
b. See Response 7.a.
c. See Response 7.a. SoCalGas has no reason to believe that Boots & Coots used or relied on any inaccurate information in the course of evaluating well pipe conditions.
d. N/A.
e. See Response 7.a.
f. The "continued evaluation of the well pipe conditions" was for SS25 only. Boots & Coots may have additional information.
g. The purpose of the "continued evaluation of the well pipe conditions" was to collect more data from SS25 and assess the leak. Boots & Coots may have additional information as to the purpose of the continued evaluation.
h. We understand this request to be seeking names of Boots & Coots personnel. Boots & Coots' Daily Reports for November 8-9, 2015 include a list of Boots & Coots personnel performing the evaluation of the well pipe conditions. Please see previously provided electronic documents Bates range AC_CPUC_SED_DR_16_0025645 – AC_CPUC_SED_DR_16_0025646.
i. SoCalGas objects to this request as overly broad and vague as to the terms "this question" and "the question." SoCalGas interprets the request to be seeking the identities of individuals that may have first-hand knowledge of the events described in the above responses. SoCalGas responds as follows: Bret Lane and Todd Van de Putte. In addition, please see the Boots & Coots personnel listed on the Boots & Coots Daily Reports for November 8-9, 2015 (AC_CPUC_SED_DR_16_0025645 - AC_CPUC_SED_DR_16_0025646) and the contractors listed on the SoCalGas Daily Operations Report for November 8 and 9, 2015 (AC_CPUC_SED_DR_16_0000685 - AC_CPUC_SED_DR_16_0000690). Counsel to SoCalGas coordinated preparation of this data response.

Question 8:

Regarding the statement, "November 10, 2015 - Additional well testing work performed."

a. Please identify all additional well testing work performed.
b. Was this well testing work performed in accordance with procedure?
c. Please provide all individuals with knowledge of the answers to this question. Please include those who wrote the answer to the question.

Response 8:

a. Please see previously provided Boots & Coots' Daily Report dated November 10, 2015 with Bates range AC_CPUC_SED_DR_16_0025647.
b. SoCalGas objects to this request as vague and ambiguous as to the term "procedure."
c. SoCalGas objects to this request as overly broad and vague as to the terms "this question" and "the question." SoCalGas interprets the request to be seeking the identities of individuals that may have first-hand knowledge of the events described in the above responses. SoCalGas responds as follows: Bret Lane and Todd Van de Putte. In addition, please see the Boots & Coots personnel listed on the Boots & Coots Daily Report for November 10, 2015 (AC_CPUC_SED_DR_16_0025647) and the contractors listed on the SoCalGas Daily Operations Report for November 10, 2015 (AC_CPUC_SED_DR_16_0000691 - AC_CPUC_SED_DR_16_0000693). Counsel to SoCalGas coordinated preparation of this data response.

Question 9:

Regarding the statement, "November 11 - Conducted data analysis, finalized strategy to stop the leak, and began preparing the site with the appropriate well-control equipment."

a. List all sources of data used to conduct the data analysis.
b. Were any of these sources of data inaccurate?
c. If the answer to question 9b is yes, which ones?
d. If the answer to question 9b is yes, when did SoCalGas learn such information was inaccurate?
e. If the answer to question 9b is yes, how did SoCalGas learn such information was inaccurate?
f. If the answer to question 9b is yes, provide all sources of inaccurate data used in the data analysis conducted.
g. Has SoCalGas corrected the inaccurate data?
h. If so, when was the data corrected?
i. If so, how was SoCalGas able to correct the inaccurate data?
j. Please provide all individuals with knowledge of the answers to this question. Please include those who wrote the answer to the question.

Response 9:

a. SoCalGas objects to this request to the degree that it assumes SoCalGas performed the data analysis on November 11, 2015. Boots & Coots conducted the data analysis on November 11, 2015. The particular sources of data used by Boots & Coots for purposes of the data analysis is beyond SoCalGas' scope of knowledge. Notwithstanding this objection, SoCalGas responds as follows: Please see previously provided Boots & Coots' Daily Report for November 11, 2015 with Bates range AC_CPUC_SED_DR_16_0025648. Boots & Coots may have additional information on this issue.
b. See Response 9.a. SoCalGas has no reason to believe that any sources of data that Boots & Coots used during that period was not accurate.
c. N/A.
d. N/A.
e. N/A.

f. N/A.
g. N/A.
h. N/A.
i. N/A.
j. SoCalGas objects to this request as overly broad and vague as to the terms "this question" and "the question." SoCalGas interprets the request to be seeking the identities of individuals that may have first-hand knowledge of the events described in the above responses. SoCalGas responds as follows: Bret Lane and Todd Van de Putte. In addition, please see the Boots & Coots personnel listed on the Boots & Coots Daily Report for November 11, 2015 (AC_CPUC_SED_DR_16_0025648) and the contractors listed on the SoCalGas Daily Operations Report for November 11, 2015 (AC_CPUC_SED_DR_16_0000694 - AC_CPUC_SED_DR_16_0000696). Counsel to SoCalGas coordinated preparation of this data response.

Question 10:

Regarding the statement, "Nov 12, 2015 - Successfully installed the "bridge plug" in the well tubing and continued to prepare the well site."

a. What was SoCalGas's complete goal for installing the "bridge plug"?
b. Was SoCalGas's installation of the bridge plug an attempt to stop the leak of gas from well SS-25?
c. Provide all documentation dates November 12, 2015 and prior to that date supporting the answer to question 10b.
d. What were the purposes, goals and objectives related to installing the bridge plug?
e. Provide all documentation from November 12, 2015 and prior to that date showing the purposes, goals and objectives relating to installation of the bridge plug.
f. Did the installation of the bridge plug meet all purposes, goals and objectives from prior to its installation?
g. Provide all documentation (including communications) showing whether the installation of the bridge plug met all purposes, goals and objectives provided in response to question 10f?
h. Prior to the beginning of the installation of the bridge plug on November 12, 2015, in what precise location of the well tubing was the bridge plug intended to be installed?
i. Provide all documentation and communication supporting the answer to question 9h.
j. Provide the plans and specifications from November 12, 2015 and prior to that date showing the location in the tubing in which the bridge plug was to be installed.
k. Was the bridge plug successfully installed in its intended precise location in the well tubing?
l. If the answer to question 10k is no, what prevented the bridge plug from being successfully installed in its intended location within the tubing?
m. If the bridge plug was not installed in its precise location that was intended prior to its installation, was SoCalGas able to remove it or drill it out?
n. If the answer to question 9m is no, why not?
o. If the bridge plug did not achieve the stated purposes, goals and objectives
p. Provide the procedure for installation of the bridge plug in step-by-step fashion.
q. If there was no procedure for installing the bridge plug, why not?
r. Was the procedure for installing the bridge plug followed?
s. If not, why not?
t. Which individuals proposed installing the bridge plug?

u. Were any consequences of installing a bridge plug contemplated prior to the time it was installed? If so, what were they?
v. Provide all documentation (including communications) showing the answers to question 10u.
w. Please provide all individuals with knowledge of the answers to this question. Please include those who wrote the answer to the question.

Response 10:

a. SoCalGas objects to the term "complete goal" as vague and ambiguous. The purpose, goal, and/or objective for the bridge plug installation in conjunction with the tubing perforation, was to create a known flow area in the tubing in order to kill the well. Boots & Coots performed the installation of the bridge plug and may have additional information.
b. See Response 10.a.
c. SoCalGas understands that the goal for installing the bridge plug was to facilitate a top-kill through the tubing. For Boots & Coots' Daily Report for November 12, 2015, please see previously provided electronic documents with Bates range AC_CPUC_SED_DR_16_0025649. In addition, SoCalGas previously provided CPUC-SED requested communications between SoCalGas and Boots & Coots. Those documents were identified by searching relevant SoCalGas employees' email data sets to locate emails to/from Boots & Coots from October 1, 2015 to January 31, 2018. Please see electronic documents with Bates Range AC_CPUC_SED_DR_16_0001027-AC_CPUC_SED_DR_16_0019407.
d. See Response 10.a.
e. See Response 10.c.
f. SoCalGas understands that the purpose, goal, and objective of installing the bridge plug was to create a known flow area in the tubing, and that this purpose, goal, and/or objective was met.
g. See Response 10.c.
h. SoCalGas understands that the bridge plug was to be installed at the lowest depth possible above the subsurface safety valve ports.
i. See Response 10.c.
j. See Response 10.c.
k. SoCalGas understands that the bridge plug was set at the lowest depth possible above the subsurface safety valve ports.
l. N/A.
m. N/A.
n. SoCalGas objects to this request as vague and ambiguous as to "9m." Notwithstanding this objection, SoCalGas responds as follows: SoCalGas interprets this request as relating to Question 10m. N/A.
o. SoCalGas objects to this request as vague and ambiguous as to "If the bridge plug did not achieve the stated purposes, goals and objectives."
p. See Response 10.c.
q. See Response 10.c.
r. See Response 10.c.
s. See Response 10.c.
t. Boots & Coots.
u. Yes, Boots & Coots explained that installation of the bridge plug would remove access to the tubing below the bridge plug.

v. SoCalGas previously provided CPUC-SED requested communications between SoCalGas and Boots & Coots. Those documents were identified by searching relevant SoCalGas employees' email data sets to locate emails to/from Boots & Coots from October 1, 2015 to January 31, 2018. Please see electronic documents with Bates Range AC_CPUC_SED_DR_16_0001027-AC_CPUC_SED_DR_16_0019407.

w. SoCalGas objects to this request as overly broad and vague as to the terms "this question" and "the question." SoCalGas interprets the request to be seeking the identities of individuals that may have first-hand knowledge of the events described in the above responses. SoCalGas responds as follows: Bret Lane, and Todd Van de Putte. In addition, please see the Boots & Coots personnel listed on the Boots & Coots Daily Report for November 12, 2015 (AC_CPUC_SED_DR_16_0025649) and the contractors listed on the SoCalGas Daily Operations Report for November 12, 2015 (AC_CPUC_SED_DR_16_0000697 - AC_CPUC_SED_DR_16_0000699). Counsel to SoCalGas coordinated preparation of this data response.

Question 11:

Regarding the statement "November 13 - Tubing perforation activities performed and attempted stop the flow of gas by putting fluids down the well. During this operation, there was a release of a mist into the air. Based on the information at this time, it is not believed that these materials pose a threat to public health."

a. Explain the purpose, objectives and goals related to the tubing perforation activities?
b. Provide all documentation prior to performance of tubing perforation activities that show the purpose, objectives and goals related to the tubing perforation activities?
c. Were the goals, objectives and purpose related to the tubing perforation activities met?
d. If the answer to question 11c is no, which goals, objectives and purposes relating to the tubing perforation activities were not met? Please explain.
e. Were any consequences of tubing perforation activities the time they began? If so, what were they?
f. Please provide all individuals with knowledge of the answers to this question. Please include those who wrote the answer to the question.

Response 11:

a. See Response 10.a.
b. SoCalGas previously provided CPUC-SED requested communications between SoCalGas and Boots & Coots. Those documents were identified by searching relevant SoCalGas employees' email data sets to locate emails to/from Boots & Coots from October 1, 2015 to January 31, 2018. Please see electronic documents with Bates Range AC_CPUC_SED_DR_16_0001027-AC_CPUC_SED_DR_16_0019407.
c. SoCalGas understands that the purpose, goal, and/or objective for perforating the tubing in conjunction with installing the bridge plug, was to create a known flow area in the tubing in order to kill the well, and was met.
d. N/A.
e. SoCalGas objects to this request as vague and ambiguous as to "[w]ere any consequences of the tubing perforation activities the time they began?"
f. SoCalGas objects to this request as overly broad and vague as to the terms "this question" and "the question." SoCalGas interprets the request to be seeking the identities of individuals that may have first-hand knowledge of the events described in the above responses. SoCalGas responds as follows: Bret Lane and Todd Van de Putte. In addition, please see the

Boots & Coots personnel listed on the Boots & Coots Daily Report for November 13, 2015 (AC_CPUC_SED_DR_16_0025650) and the contractors listed on the SoCalGas Daily Operations Report for November 13, 2015 (AC_CPUC_SED_DR_16_0000700 - AC_CPUC_SED_DR_16_0000702). Counsel to SoCalGas coordinated preparation of this data response.

Question 12:

Regarding the statement "November 14-25, 2015 – Four top-well kill attempts were made by Boots and Coots by attempting to pump various types of fluid down the well."

a. Please describe each top well kill attempt made by Boots and Coots in detail.
b. Please include precise dates of each one.
c. Please provide a detailed list of all fluids used in each top-well kill attempt.
d. Please provide the order in which the various fluids were pumped down the well.
e. Were any others involved in the execution of these well kill attempts? If so:
    i. List them.
    ii. Explain the roles of each one.
f. With regards to the top well-kill attempts, what options, if any, were no longer feasible after the installation of the bridge plug in the tubing?
g. In what ways did the bridge plug prevent the attempted Boots and Coots top-well kill attempts from succeeding?
h. Given these and other well kill attempts, did SoCalGas and its consultants consider flaring the gas released from SS-25?
i. If the answer to question 12f is yes, at what point was this considered?
j. Why did SoCalGas not flare the gas released from SS-25?

Response 12:

a. On November 15, kill attempt #3 was performed by pumping a barite pill and brine into the well. On November 18, kill attempt #4 was performed by pumping a barite pill and brine into the well. On November 24, kill attempt #5 was performed by pumping a Geo Zan pill, barite pill, water, and brine into the well. On November 25, kill attempt #6 was performed by pumping a Geo Zan pill, barite pill, water, and brine into the well. For further detail regarding these kill attempts, please refer to previously provided electronic documents with Bates range AC_CPUC_SED_DR_16_0000709 (November 15), AC_CPUC_SED_DR_16_0000718 (November 18), AC_CPUC_SED_DR_16_0000735 (November 24), and AC_CPUC_SED_DR_16_0000738 (November 25).
b. Between November 14, 2015 and November 25, 2015, Boots & Coots performed well kill operations on the following dates:
    - November 15, 2015
    - November 18, 2015
    - November 24, 2015
    - November 25, 2015
c. Fluids used in each well kill attempt performed between November 14, 2015 and November 25, 2015 are as follows:
    - November 15, 2015: 9.4 ppg $CaCl_2$, 18.0 ppg barite pill
    - November 18, 2015: 9.4 ppg $CaCl_2$, 18.0 ppg barite pill
    - November 24, 2015: GEO Zan pill loaded with LCM, fresh water, 18.0 ppg barite pill

- November 25, 2015: GEO Zan pill loaded with LCM, fresh water, 9.4 ppg $CaCl_2$

d. Fluids were pumped in the following order:
   - November 15, 2015: 9.4 ppg $CaCl_2$, followed by 18.0 ppg barite pill, followed by 9.4 ppg $CaCl_2$
   - November 18, 2015: 9.4 ppg $CaCl_2$, followed by 18.0 ppg barite pill, followed by 9.4 ppg $CaCl_2$
   - November 24, 2015: GEO Zan pill loaded with LCM, followed by fresh water, followed by 18.0 ppg barite pill, followed by 9.4 ppg $CaCl_2$
   - November 25, 2015: GEO Zan pill loaded with LCM, followed by fresh water, followed by GEO Zan pill loaded with LCM, followed by 9.4 ppg $CaCl_2$

e. Other contractors provided support in performing the well kill attempts. For a list of contractors, please see SoCalGas' Daily Operations Reports for November 15, 18, 24, and 25 (see AC_CPUC_SED_DR_16_0000706 - AC_CPUC_SED_DR_16_0000708 (November 15), AC_CPUC_SED_DR_16_0000715 - AC_CPUC_SED_DR_16_0000717 (November 18), AC_CPUC_SED_DR_16_0000732 - AC_CPUC_SED_DR_16_0000734 (November 24), AC_CPUC_SED_DR_16_0000735 - AC_CPUC_SED_DR_16_0000737 (November 25)).

f. SoCalGas is unaware of the options that may have been no longer feasible as a result of the installation of the bridge plug.

g. SoCalGas objects to this request to the degree that it assumes facts with regards to the statement "bridge plug prevented the attempted Boots & Coots top-well kill attempts from succeeding." Notwithstanding this objection, SoCalGas responds as follows: SoCalGas is unaware of any ways in which the installation of the bridge plug prevented the attempted Boots and Coots top-well kill attempts from succeeding.

h. SoCalGas objects to this request as vague and ambiguous as to the phrase "flaring the gas release from SS-25." Notwithstanding this objection, SoCalGas responds as follows: Yes.

i. SoCalGas objects to this request as vague and ambiguous as to the phrase "flaring the gas release from SS-25" and the term "12f." Notwithstanding this objection, SoCalGas responds as follows: On or around November 2015.

j. SoCalGas objects to this request as vague and ambiguous as to the phrase "flaring the gas release from SS-25." Notwithstanding this objection, SoCalGas responds as follows: After extensive design and study, SoCalGas ultimately determined not to install the gas capture system at SS-25 that would have resulted in the flaring of gas at SS-25 because of safety concerns expressed by our engineers, including Boots & Coots.

Question 13:

Are the words in the draft response now final?

a. If not, please edit the draft response so it is final, and track the changes. Please also provide a clean version.
b. Please provide all individuals with knowledge of the answers to this question. Please include those who wrote the answer to the question.

Response 13:

SoCalGas objects to this request as overly broad, unduly burdensome and vague and ambiguous. Notwithstanding this objection, SoCalGas responds as follows: The "DRAFT Timeline of Events" provided in response to the CPUC-SED Data Request to SoCalGas dated November 13, 2015, represented the best information available as of November 15, 2015. Based on the context of the other questions in this data request SoCalGas understands this request as seeking a detailed technical account of

all efforts to control the well. The most complete and detailed account can be found in the compiled and previously provided SoCalGas Daily Operations Reports (AC_CPUC_SED_DR_16_0000361 - AC_CPUC_SED_DR_16_0001026) and Boots & Coots Daily Reports (AC_CPUC_SED_DR_16_0025631 - AC_CPUC_SED_DR_16_0025808).

a. N/A.
b. SoCalGas objects to this request as overly broad and vague as to the terms "this question,", "the question," and "final." Counsel to SoCalGas coordinated preparation of this data response.

Question 14:

Please provide all individuals responsible for writing the draft timeline of events. Please include all individuals who were responsible for preparation of the writing.

Response 14:

To the extent CPUC-SED is referring to the "DRAFT Timeline of Events" provided in response to the CPUC-SED Data Request to SoCalGas dated November 13, 2015, the Draft Timeline of Events was prepared by SoCalGas' Aliso Canyon Incident Public Information Office.

Question 15:

Please refer to the SoCalGas statement in response to SED's Data Request from November 13, 2015, question number 7, which stated:

"October 23 - After the leak was discovered, the site was secured and SoCalGas crews at the facility immediately took a step-by-step approach to locate and seal the leak at the wellhead. First, SoCalGas brought in a contractor (Cameron) to attempt to stop the leak by making a repair to the wellhead seals. This occurred early on October 24. When this first step was not successful, SoCalGas continued to monitor well pressures, brought in additional contractors (Halliburton and Onyx), and ordered well abatement equipment to be delivered to the wellhead. SoCalGas and our contractors then attempted to stop the flow of gas from SS-25 by pumping a polymer carbonate fluid down the well at approximately 12:30 pm on October 24. We were unable to pump the necessary fluid down the well using this procedure. As a result, this effort was also not successful in stopping the leak. At approximately 2:30 pm on October 24, SoCal Gas shut down this pumping operation."

a. Provide the contract between SoCalGas and Cameron that was created for the purpose of Cameron's attempt to stop the leak by making a repair to the wellhead seals.
b. Provide Cameron's qualifications for making repairs to wellhead seals.
c. Why did SoCalGas think it was needed to make repairs to the wellhead seals?
d. Why was Cameron's attempt to repair the wellhead seals not successful?
e. Provide the contact information for Cameron.

Response 15:

a. Cameron West Coast's (Cameron) work at SS-25 was performed under an existing Standard Services Agreement with SoCalGas. For SoCalGas' agreements with Cameron please see previously provided electronic documents with Bates range AC_CPUC_SED_DR_17_0045052 – AC_CPUC_SED_DR_17_0045093.
b. SoCalGas objects to this request as overly broad and unduly burdensome, and vague and ambiguous as to "qualifications." Notwithstanding this objection, SoCalGas responds as

follows: SoCalGas has conducted a reasonable search and has not found any responsive documents within its possession, custody, or control.

c. SoCalGas personnel investigating the leak on the evening of October 23, 2015 heard a noise that sounded like gas moving down the well and suspected that a leaking wellhead seal may have been the cause.

d. Cameron's attempt to repair the wellhead seal was successful, however, this did not stop the leak.

e. Please see 1.a.

Response to Data Request

Response to SED Data Request-63

Prepared for:
Mr. Darryl Gruen
CPUC Legal Division

Purpose:
Blade response to the CPUC Data Request SED 63 related to the Reply Testimony of Mr. L. William Abel on behalf of SoCalGas.

1 Background

The Legal Division of the California Public Utilities Commission issued a Data Request to Blade Energy Partners (Blade) on April 2, 2020. Data Request No: SED 63 is related the Preliminary Investigation of Southern California Gas Company's Aliso Canyon Storage Facility.

The CPUC questions (from file: "I1906016 SED DR 63 Final.pdf") are included verbatim followed by the Blade responses to the questions.

The passages are from the document titled: Chapter III, Prepared Reply Testimony of L. William Abel on behalf of Southern California Gas Company (U 904 G) (file name: "3_Ch. III - Abel (A Final).pdf").

2 Questions and Responses

2.1 Question 1

1. On page 12, "Blade's modeling simply represents an academic exercise to calculate the kill fluid density and pump rate that theoretically *could have* killed SS-25, and fails to account for several important safety considerations that impacted Boots & Coots' well kill efforts. First, as Boots & Coots explained to SED during SED's August 2018 examination, the first step upon arriving at a well control event is to secure the area and ensure the safety of personnel. [Footnote omitted.]. Indeed, as discussed in SoCalGas' opening testimony, safety is a paramount consideration in any well control operation, and the response to the SS-25 leak was no different—extensive measures were implemented to mitigate the risk of ignition. [Footnote omitted]. Second, in designing a well kill plan, a well control company must take extreme caution not to implement a well kill operation that may worsen the leak, and thereby increase the risk of ignition, or jeopardize the success of subsequent kill attempts. Boots & Coots appropriately considered these factors, and made adjustments to its kill operations accordingly." With this passage on mind, please answer:

2.1.1 Questions and Blade Responses

a. Does Blade agree that, "Blade's modeling simply represents an academic exercise to calculate the kill fluid density and pump rate that theoretically could have killed SS-25?"

   No.

b. If Blade disagrees with this statement, please state the reasons for disagreeing.

   Blade's efforts to model the kill operations were not an academic exercise—it was specifically to ascertain why the top kill well-control efforts were unsuccessful and why it took 111 days to stop the gas from the Aliso Canyon gas storage reservoir from escaping to the atmosphere. As discussed in the Blade Report [1] (page 229), Blade conducted a transient kill simulation study to evaluate the likelihood of success of the actual kill attempts. Blade intentionally used the same field data that were available to the onsite well control personnel during the time of well kill operations for this evaluation. According to Blade's modeling, all the SS-25 kill attempts were predicted to be unsuccessful.

   It is not clear to Blade how Boots and Coots selected the pump rates and kill fluid densities for each kill attempt. The kill fluid densities did not change materially until kill attempt #7.

c. Does Blade take the position that its modeling would have successfully killed well SS-25?

   Because of the modeling and kill attempt operational uncertainties, no one can guarantee a successful well kill strictly based on modeling results. Modeling to determine a plan for the pumping operations is the first important component of a well kill plan. The modeling uses available data and reasonable engineering assumptions for unknown data. In fact, the advantage of modeling is that it allows for evaluation of uncertainties in the data and assumptions. The second component of a kill operation is to carry out the pumping operations according to the plan developed through modeling. If the modeling results are flawed, or if the pumping operation does not go as planned, a well kill attempt will likely be unsuccessful.

Blade takes the position that kill modeling is necessary to properly plan a kill operation where early success in killing the well is of high importance. Such modeling could include transient kill modeling or other analytical approaches that take into account pressure, kill fluid properties, flow rates and restrictions in the flow path. There was no evidence provided to Blade that kill modeling or other analytical approaches were undertaken for kill attempts #1 through #6.

Furthermore, Blade contends that by the time of kill attempt #2, the complexity of the kill operation should have been well understood. Twenty days were available to gather data on the well conditions during the time interval between kill attempts #1 and #2. Diagnostic logs were run in the well showing temperature anomalies and possible leak depths. By then it was clear that there was a leak in the 7 in. casing at some shallow depth; and this was documented in the daily reports. This time period was adequate to conduct kill modeling. Gas was flowing from the reservoir up through the 7 in. casing × 2 7/8 in. tubing annulus and then outside of the 7 in. casing. The gas was escaping into the surrounding formation and some was migrating to the surface. This was not a standard top kill operation based on the available data.

The following are examples of data and assumptions that could have been made regarding the leak severity, leak depth, and flow path:

- The SoCalGas SS-25 daily report for October 24, 2015 [2] stated "At this time, It [sic] appears that we had a wellhead seal leak and/or a very shallow 7" production casing leak."
- The temperature log run on November 8, 2015 [3], showed cooling anomalies at 365 ft and 890 ft indicating the possible depths of gas expansion and cooling associated with a leak.
- The Boots & Coots daily report on November 13, 2015 (Add Energy Report [4], page 89, AC_BLD_0031392), stating that after pumping junk shots down the 2 7/8 in. × 7 in. annulus, brine was observed after 5 bbl were pumped.
- Both Add Energy [4] (page 9, AC_BLD_0031312) and Blade [5] (page 51) estimated the SS-25 gas flow rate using data that was available at the time of the leak. Add Energy stated on page 7, "This estimated flow rate is not dependent of the flow path from the bottom of the tubing to surface, but only calculated based on pressures and the inflow performance relation (IPR) estimated from well tests."

A kill design is based on the well parameters such as geometry, flow path restrictions, and gas flow rate as well as the kill parameters including kill fluid density, pump rate, fluid volume, and surface pump pressure. Kill modeling is an effective way of accounting for these variables and their uncertainties and then screening well kill plans to determine which plans may be successful and which are likely to be unsuccessful thereby maximizing the chances of success. Kill modeling is safer, more efficient, and less risky than pumping multiple unsuccessful kill attempts. The risk of unsuccessful kill attempts includes damage to the site and the well's surface equipment that can limit additional kill attempts. The modeling allows learnings from each kill attempt to be incorporated into the next one. The seven unsuccessful kill attempts at SS-25 resulted in a large and deep crater around the wellhead and conductor casing creating a hazardous condition and required waiting for the relief well to stop the gas flow from SS-25 to the atmosphere.

Question 1 includes a comment on safety considerations and the following statement:

> Second, in designing a well kill plan, a well control company must take extreme caution not to implement a well kill operation that may worsen the leak, and thereby increase the risk of ignition, or jeopardize the success of subsequent kill attempts.

Blade agrees with this statement. This is exactly why kill modeling is a necessary component of designing a successful well kill plan. However, evidence indicates that this did not happen at SS-25. The use of higher density fluids, as predicted by the kill modeling, would not have compromised safety during the kill attempts. Specifically, kill attempt #2 resulted in the formation of the crater around the wellhead and conductor. Similarly designed, unsuccessful kill attempts continued after kill attempt #2. During kill attempt #6, the flow line from the 7 in. casing and tubing head broke, monitoring devices were damaged, and the pump line to the casing head broke. The pump line tee broke off because of wellhead movement and the 11 3/4 in. × 7 in. annulus valve backed out during kill attempt #7 allowing the annulus to vent gas at surface and enlarge the crater. The additional kill attempts continued even when the well and surface conditions had deteriorated from after kill attempt #2.

Blade was provided with what appear to be some graphical results of modeling for kill attempt #7, the final SS-25 top kill attempt on December 22, 2015 [6] [7]. Kill modelling was not mentioned in the August 8, 2018, Examination Under Oath of Mr. Danny Walzel and Mr. James Kopecky [8] (pages SED 00635 – SED 00786). It is clearly stated in this document that Boot & Coots did not calculate the well flow rate which is a key variable needed for developing a kill plan (pages SED 00736 – SED 00737).

It appears from data provided to Blade that kill modeling was performed in preparation for kill attempt #7, unlike the lack of any modeling prior to the previous six kill attempts. But by this time the surface conditions had deteriorated from previous attempts and wellhead movement and safety concerns prevented the kill fluids from being pumped according the plan. Kill attempt #7 appeared to come close to killing the well, but it was terminated because of undesirable movement of the wellhead and pump lines that broke during the job. It is important to note that the kill attempt #7 fluid densities were similar to the results from the Blade transient kill models for the previous kill attempts.

d. If so, what is the factual basis for such a position?

As discussed in Question 1 c, modeling by itself cannot ensure a successful well kill.

e. Were the adjustments to kill operations that Mr. Abel mentions disclosed to Blade during its Root Cause Analysis?

Blade had access to historical kill data including:

- Some pre-job procedures
- SoCalGas daily operations reports
- Boots & Coots daily operations reports
- Halliburton post-job reports
- DOGGR daily operations summary reports

However, the rationale and the factors considered in designing the kill attempts were not made available to Blade.

The subject of kill modeling was raised many times with SoCalGas during the RCA. Multiple data requests were sent to SoCalGas regarding the kill attempts, rationale behind the kill attempts, and associated kill data. Consequently, Blade requested a discussion meeting and suggested the Boots & Coots personnel who were onsite and were associated with planning and executing the kill attempts join the discussion meeting [9]. Such a meeting never occurred.

f. If so, did Blade consider whether Boots & Coots appropriately considered all factors and made correct adjustments to its kill operations?

As discussed in the response to Question 1 e, the rationale for the well kill adjustments were not disclosed to Blade.

Although requested, Blade did not have direct access to the Boots & Coots personnel to determine if Boots & Coots appropriately considered all factors and made correct adjustments to its kill operations. Our review of the Boots & Coots well kill plans for attempts #2 – 6 did not document the rationale for the kill attempts. The 2018 Boots & Coots Examination Under Oath [8] did not have the details required to ascertain whether Boots & Coots considered all factors.

In Blade's view, kill attempt #7 had significant adjustments to the kill plan from previous kill attempts, and it was similar to the results of the Blade modeling.

g. Provide any documents and necessary additional context to support the answers provided.

Two documents were provided by SoCalGas to Blade that appear to be graphical results of kill modeling. These graphs appear to be generated within Schlumberger's *Drillbench* software. This is industry standard well control modeling software and the same software that Blade used in its kill analysis. Images of the documents are included in Figure 1 and Figure 2.

Figure 2 shows an AOF (absolute open flow) of 25 MMscf7/D and a gas flow rate of 15 MMscf/D. Blade estimated the well was flowing approximately 57 MMscf/D on December 22, 2015, [5] *SS-25 Well Nodal-Analysis with Uncontrolled Leak Estimation*, page 51. The final kill attempt #7 was pumped on December 22, 2015.

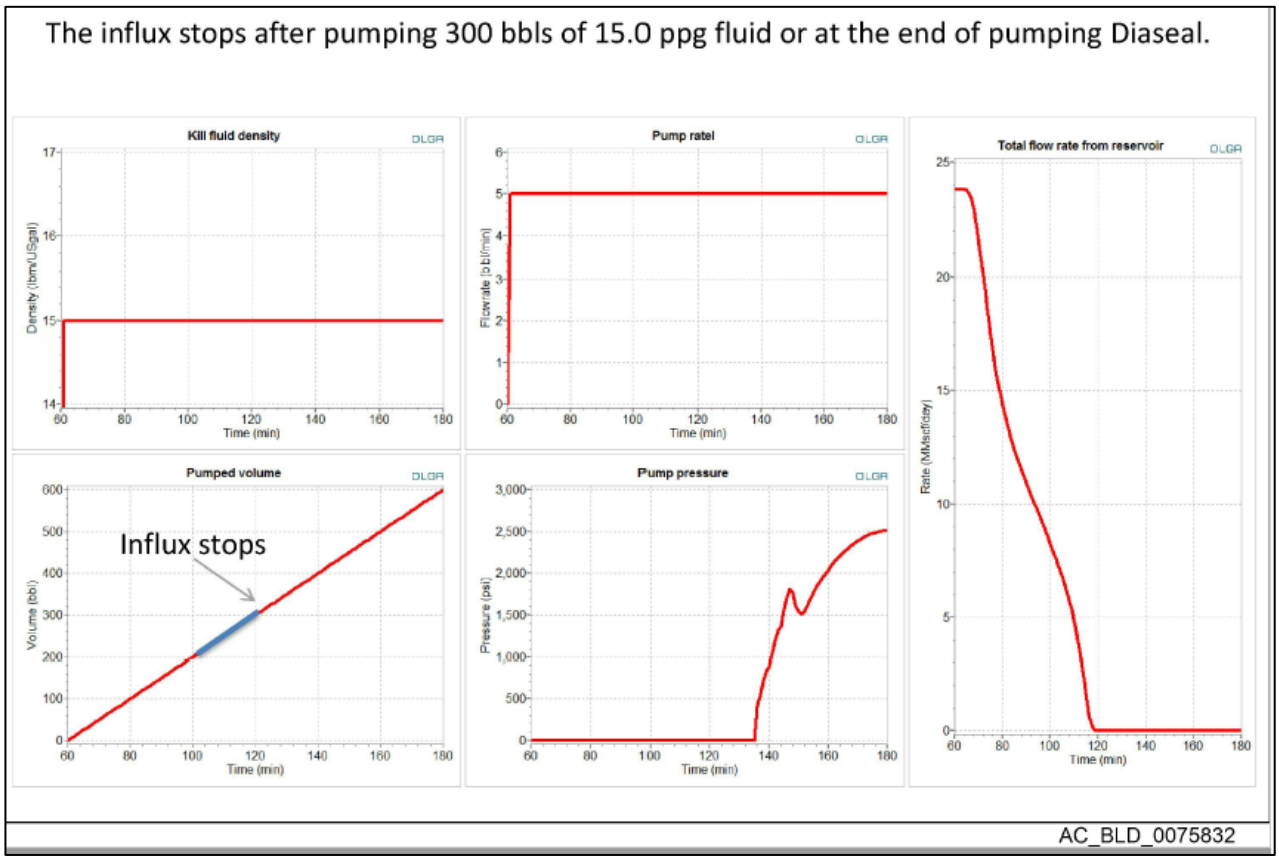

Figure 1: Kill Modeling Graphical Results

Snapshot of pumping 15.0 ppg WBM at the rate of 3 bpm

Basis of simulation:		Results:	
Reservoir pressure:	2,200 psi	Gas flow rate:	15 MMscfd
AOF:	25 MMscfd	Max pump pressure:	1,450 psi
SITP:	1,400 psi	Kill fluid volume:	65 bbls
Depth of exit point:	450 ft MD	Fracture occurs:	105 bbls
Restriction at exit point:	Yes	Top of fluid level in the annulus:	5,500 ft MD
Kill fluid density:	15.0 ppg		
Kill fluid viscosity:	25 cP

2.2 Question 2

2. Please refer to the following passage on page 12 of Mr. Abel's testimony: Mr. Walzel testified that while the SS-25 wellhead equipment was rated to 5,000 PSI, given the unknown condition of the leak, Boots & Coots set a "safety limit" or "safety factor" well below the working pressure of the equipment. [Footnote omitted]. I believe that it was prudent for Boots & Coots to have set a safety factor so as not to risk damaging the wellhead." With this passage in mind, please answer:

2.2.1 Questions and Blade Responses

a. Does Blade's modeling consider risk to damaging the wellhead?

Yes. Blade considered the wellhead rated working pressure of 5,000 psi. The Blade kill simulations for all of the kill attempts resulted in a maximum predicted pump pressure of 3,644 psi for kill attempt #2 with decreasing maximum pump pressure for subsequent kill attempts because the reservoir pressure was declining with time. The maximum predicted pump pressure of 3,644 psi is below the "safety limit" set by Boots and Coots of 4,000 psi. The field was on withdrawal during the kill attempts so the reservoir pressure was dropping.

b. What is Blade's view as to whether this alleged "safety factor" below the working pressure of the equipment was prudent so as not to risk damaging the wellhead?

Blade agrees that it is prudent to use a safety factor to avoid damage to the wellhead and surface equipment. Blade's simulations showed that the wellhead pressures would not have exceeded 3,644 psi with the higher fluid densities. The model results honored the wellhead safety factor.

c. In Blade's view, given what could have been known about the condition of well SS-25 and other related factors by Boots & Coots at the time of its well kill attempts, could Boots & Coots have known whether the pump rate and fluid density it used was inadequate to kill well SS-25?

Yes, well kill modeling would have demonstrated that the pump rate and fluid density were inadequate to kill well SS-25.

Data were available on October 23, 2015, October 24, 2015 (when the first kill attempt was pumped), and November 8, 2015 (when a temperature, pressure, and spinner survey was run). These data could have been used for kill modeling to determine whether the planned kill attempt was likely to kill the well. A summary of the data available includes the following:

- October 23, 2015: The wellbore geometry was known, i.e., casing internal diameter, tubing outside and inside diameter, packer depth, ported mandrel with slots depth, perforations depth, etc. It could have been assumed that the flow path was from the perforations, up the casing, through the tubing to the ported mandrel slots, exit the slots, up the 7 in. casing × 2 7/8 in. tubing annulus until the flow exited the 7 in. casing leak into the surface casing × production casing annulus. The tubing was shut in at surface diverting the flow up the annulus. The gas at surface during kill attempt #1 indicated the leak was shallow enough to broach to surface. The flowing casing pressure of approximately 270 psi on October 23, 2015, gave information on the back pressure the leak was flowing against without needing to know the exact flow path of the gas to surface.
- October 23, 2015: The reservoir pressure was available from the pressure monitoring well SS-5 and the historical SS-25 well test data were available. As described in the Blade Report [1] pages 127 – 134, the well test data could have been used to determine the well deliverability based on the bottom hole pressure (BHP) to estimate the gas flow rate. The flow rate decreased with time because the field was being produced to reduce the BHP.
- October 23, 2015: While the size of the hole in the casing was unknown, the area of the casing × tubing annulus cross section could have been used as the size of the hole in the casing as a worst case (which in fact turned out to be correct because the 7 in. casing was parted).
- October 24, 2015: Kill attempt #1 reported gas at surface after pumping 89 bbl of fluid down the casing. This indicated a shallow leak as documented in the SoCalGas SS-25 daily report for October 24, 2015 [2] "At this time, It appears that we had a wellhead seal leak and/or a very shallow 7" production casing leak."
- November 8, 2015: A production log survey [3] (temperature, pressure, and spinner) was run and it showed cooling anomalies at approximately 365 ft and at 890 ft. Assumptions for modeling could have used these two depths as possible leak depths. The analysis from the temperature survey was dated November 12, 2015. As it turned out the leak was at 892 ft, the lower temperature anomaly depth. Blade modeled a leak at 440 ft and determined the

parameters to kill the well at a 440 ft leak were approximately the same as a leak at 892 ft [10] SS-25 Transient Well Kill Analysis, page 35.

- November 13, 2015: Junk shots were pumped during kill attempt #2. After 5 bbl of brine was pumped down the annulus, brine was observed from the fissures (Add Energy Report [4], page 89).

Blade believes that kill modeling using the well data described in Question 2 c. would have shown that the reported fluids pumped (volume, density, and rate) during kill attempts #2 through 6 would not have killed the well. A summary of the Blade analysis of the actual kill attempts are included in a supplementary report [10] *SS-25 Transient Well Kill Analysis*, page 20.

2.3 Question 3

3. Please refer to the following passage on page 13 of Mr. Abel's testimony, "Further, Boots & Coots' pumping operations were implemented not only in consideration of the pressure rating of the surface equipment, but also based on observation of the wellhead's physical response to pumping operations. Mr. Walzel described that during certain pumping operations, the SS-25 wellhead was "moving around a lot," which at times caused Boots & Coots to slow or stop pumping operations an [sic], in one case, broke the flow lines on the 7 inch tubing and casing, and the nipple on the wellhead. [Footnote omitted] While it does not appear that Blade's modeling accounted for these safety considerations, Boots & Coots appropriately tailored its kill operations—in real-time—to limit the potential risk of further damaging the well and compromising safety."

2.3.1 Questions and Blade Responses

a. Does Blade agree that Blade's modeling did not account for the considerations such as those identified above?

Blade's modeling assumed the fluids would be pumped at the rates, volumes, and density that would kill the well according to the kill modeling. It should be noted that any interruption in the planned pumping schedule such as slowing or stopping pumping will likely result in an unsuccessful kill attempt. Modeling results are the basis of pre-job planning. Safety considerations encountered during the kill attempts may interrupt and abort an attempt. However, the usage of heavier fluids, planned using the modeling results, may have reduced the well head movement.

Although requested, Blade did not have direct access to the Boots & Coots personnel to determine what Boots & Coots had considered and the rationale for kill operations. The 2018 Boots & Coots Examination Under Oath [8] did not have the details required to ascertain whether Boots & Coots considered all factors.

b. If not, did SoCalGas provide Blade with this information when Blade was doing its Root Cause Analysis?

Information that Boots & Coots appropriately tailored its kill operations—in real-time—to limit the potential risk of further damaging the well and compromising safety was not provided to Blade. As discussed in Question 1 e., Blade requested data regarding kill planning, modeling, and operations many times, but such data were not provided.

Safety considerations always take precedence when carrying out the field operations. The planning of a kill operation includes the modeling results to know how to plan the equipment, the personnel, the physical layout, and the fluids for the field operations. Safety considerations are

normally discussed at the pre-job meeting in the field. While the pumping is underway, changes in the plan can occur if things are not going according the plan or if there is a reason to change the operation because of a safety consideration. Events like wellhead movement and broken lines are reasons why the pumping plan could change.

It also needs to be pointed out that the modeling is based on an assumed pump rate and fluid density to maintain a bottom hole pressure because of fluid friction and, if the pump rate is reduced or stopped, the loss of friction pressure may allow the well to start flowing again. If this happens, the kill attempt is likely to be unsuccessful. The well, surface equipment, and pumping equipment need to be in a condition that allows the pumping operation to continue without interruption to have a chance of a successful kill. A review of data from kill attempts #2 through 6 reported no indications that safety issues would have compromised the ability to kill the well with heavier fluids at the pump rates resulting from the Blade modeling.

This shows the importance of using kill modeling, which considers the normal variables and accounts for other limitations, to provide results that maximize the chances of success to kill the well on the first attempt. The well and surface conditions are usually going to be the best for the earlier kill attempts.

c. If not, did Blade provide SoCalGas with the opportunity to provide Blade with this information when Blade was doing its Root Cause Analysis?

Blade made multiple data requests for data related to kill operations and kill modeling in addition to a request for a face-to-face meeting with the Boots & Coots personnel with first-hand knowledge of the SS-25 kill operations. A meeting with Blade and Boots & Coots could not be arranged. This was discussed in Question 1 e.

d. Provide any context necessary in support of these answers.

Blade data requests to SoCalGas related to killing the SS-25 well includes the following:

- Data Request February 11, 2016 [11]
- Data Request May 4, 2016 [12]
- Data Request June 29, 2018 [13]
- Data Request August 29, 2018 [14]
- Data Request October 26, 2018 [15]
- Data Request December 19, 2018 [9]
- Data Request January 2, 2019 [16]

2.4 Question 4

4. Please refer to the following passage on page 13 of Mr. Abel's testimony: "Second, Blade had the benefit of gathering more precise data points that were not available to Boots & Coots while planning, modeling, and executing its well kill attempts: 1) the precise depth and severity of damage to the production casing, and 2) the flow path of the gas from the 7" casing leak to the surface. Indeed, computer modeling is sensitive to the well geometry (i.e., leak depth, severity, and flow path), which means that more precise information will produce more accurate modeling outputs. However, precise flow path geometry is typically unavailable during an active leak response. . .While Blade was able to determine that the production casing had completely parted 892 feet after extracting and examining the

7" casing, Boots & Coots could only estimate the flow path geometry based on real-time observation and analysis of pumping operations. Second, after extracting the 7" casing, Blade had the advantage of using a video camera to analyze the 11-3/4" casing an observe holes—which Blade determined were the "likely consequence of the axial rupture" of the 7" casing. [Footnote omitted.]. The existence of holes in the surface casing is significant because it impacts the flow path of the leak and, in turn, the accuracy of the transient modeling. Accordingly, while Blade was able to extract the 7" casing to gather additional data to incorporate into its modeling, Boots & Coots could not have done the same. The practical impact of this disparity in information is that Blade's modeling was refined by additional data points that were not available to Boots & Coots." With this passage in mind, please answer.

2.4.1 Questions and Blade Responses

a. Does Blade agree that each of the points raised in this passage were available to Blade, but Boots & Coots could not have gathered such information at the time it was attempting the well kills of SS-25?

No.

b. If not, which data points does Blade view that Boots & Coots could have attained?

Assumptions regarding the leak path and leak depth were made within a few days of the leak event on October 23, 2015, and likely within hours because a wellbore schematic (WBS) with well details information was needed for kill planning. Examples of the evolution of wellbore schematics prepared post October 23, 2015, include wellbore schematics from SoCalGas, a Boots & Coots WBS from a December 16, 2015, presentation, a WBS from an Add Energy Report released in February, 2016, (work done prior to February), and a Blade WBS with final data. Log surveys run on November 8, 2015, were also available that indicated possible leak depths. A review of these documents shows there were no material changes to the leak path and there would be no impact on modeling results. Refer to Figure 3 through Figure 8.

Precise data of the leak location and leak path were not needed for transient kill modeling.

Figure 3 shows a rough sketch of SS-25 with an indication of the leak flow path to surface [17] (page 79, AC_CPUC_0000101). Figure 4 shows more details of the suspected gas flow path. The sketches indicate a leak in the 7 in. production casing with the leak path outside the 11 3/4 in. casing to surface [18].

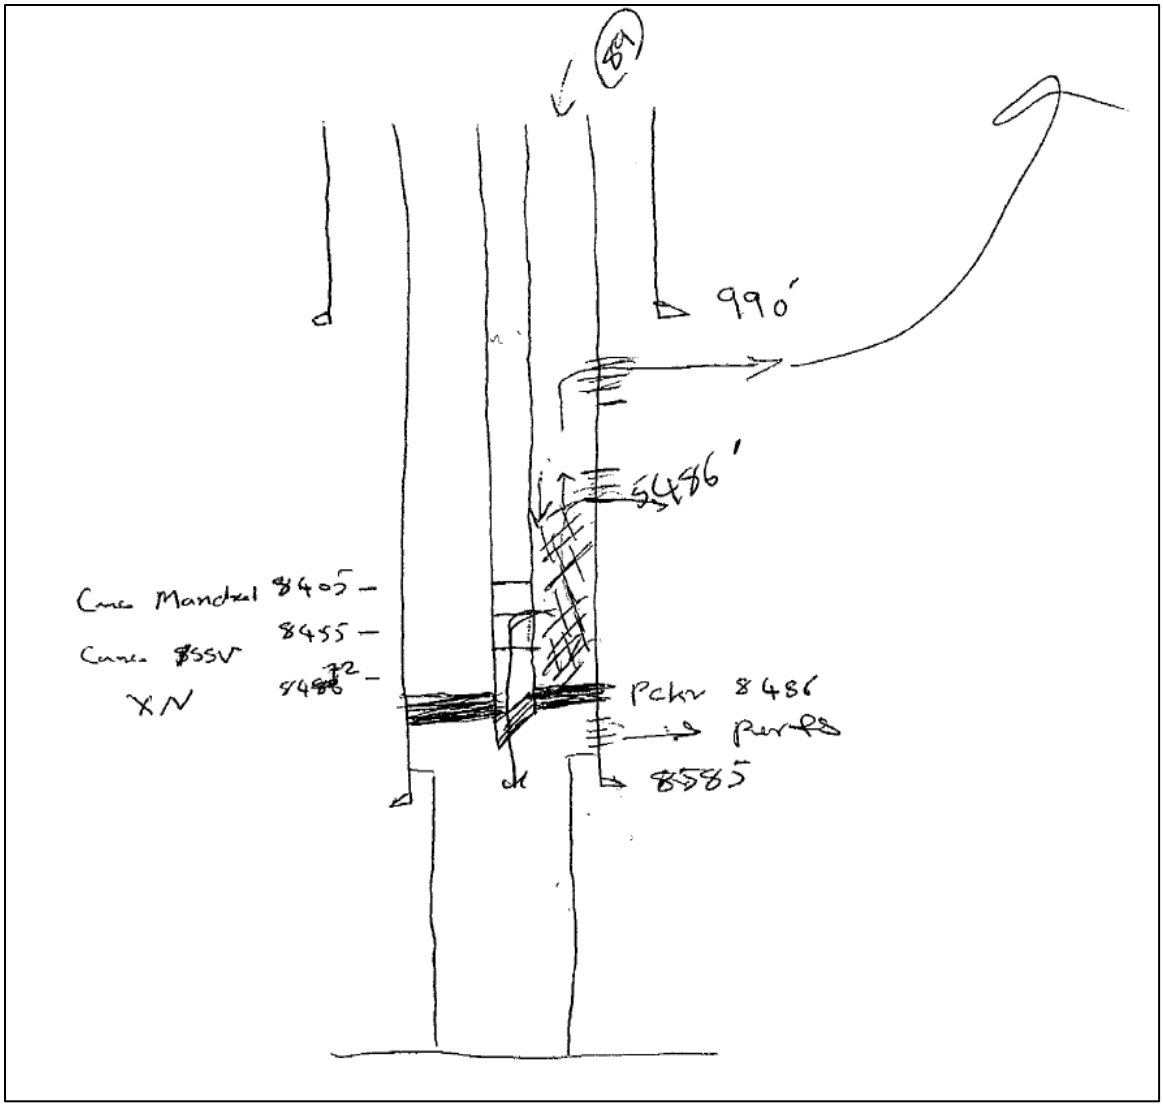

Figure 3: SoCalGas Wellbore Schematic of SS-25 (circa October 24, 2015)

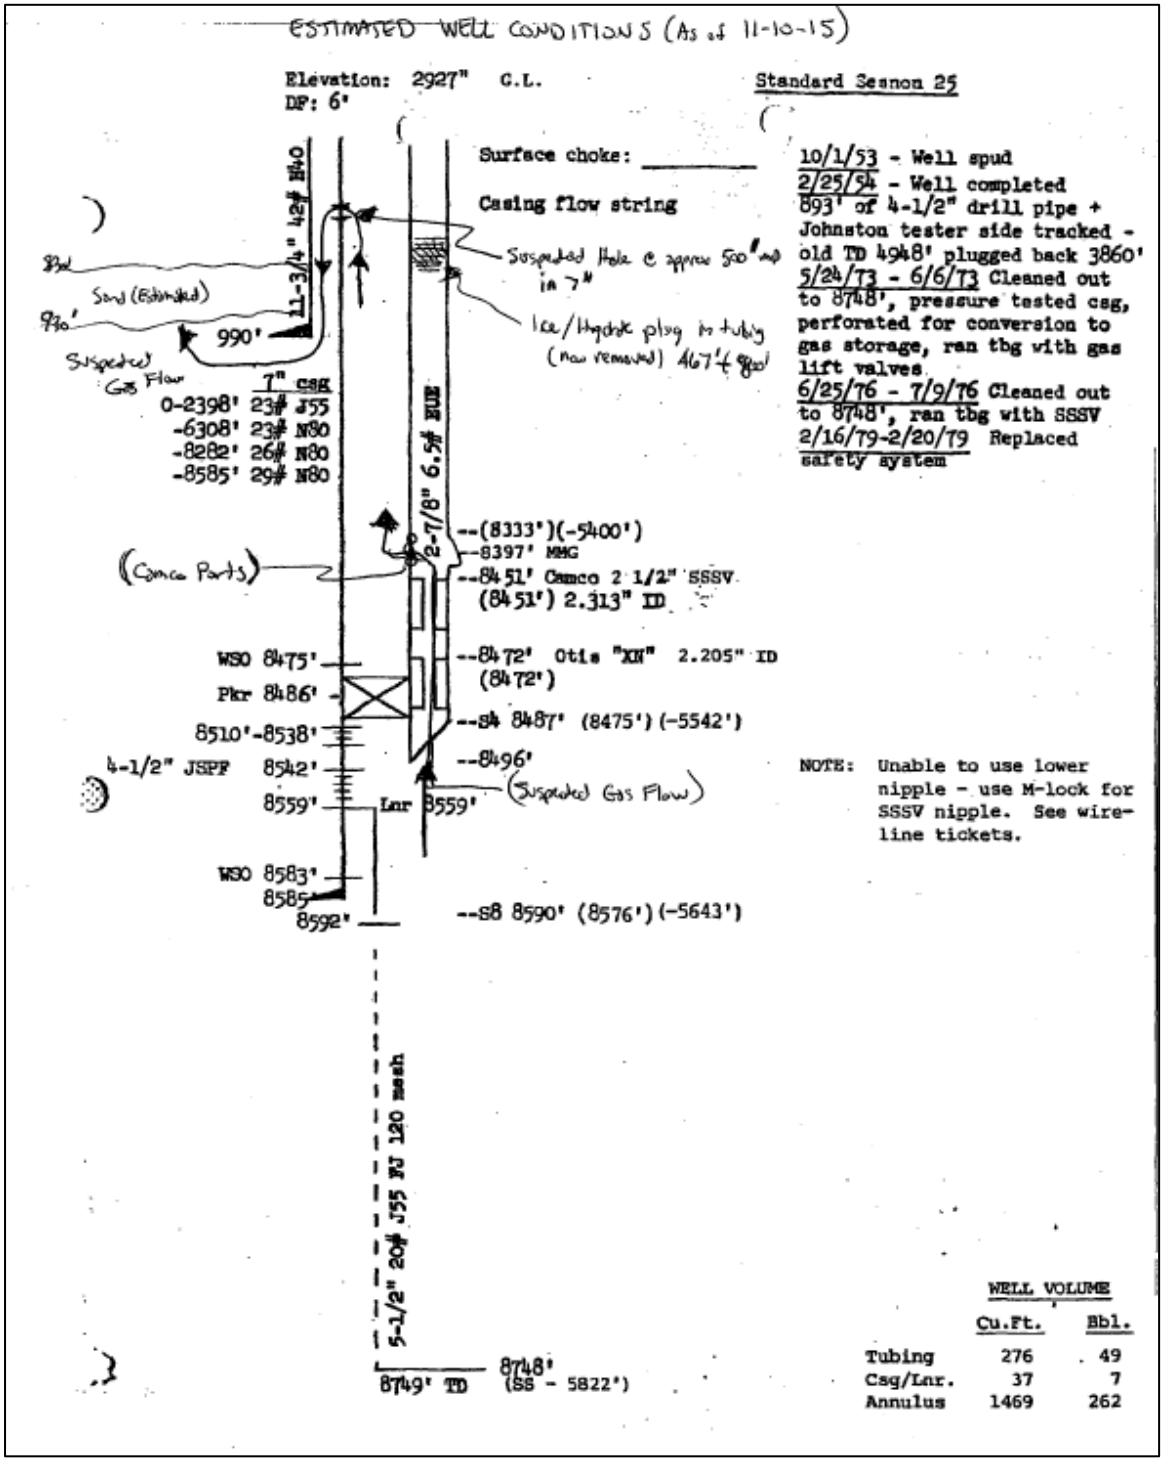

Figure 4: SoCalGas Wellbore Schematic of SS-25 (November 10, 2015)

On November 8, 2015, a production log including temperature, pressure, and spinner surveys was run [3]. It showed temperature anomalies with comments and a possible leak depth at 890 ft near the 11 3/4 in. shoe depth (Figure 5). The leak depth turned out to be correct and was confirmed when the casing was recovered.

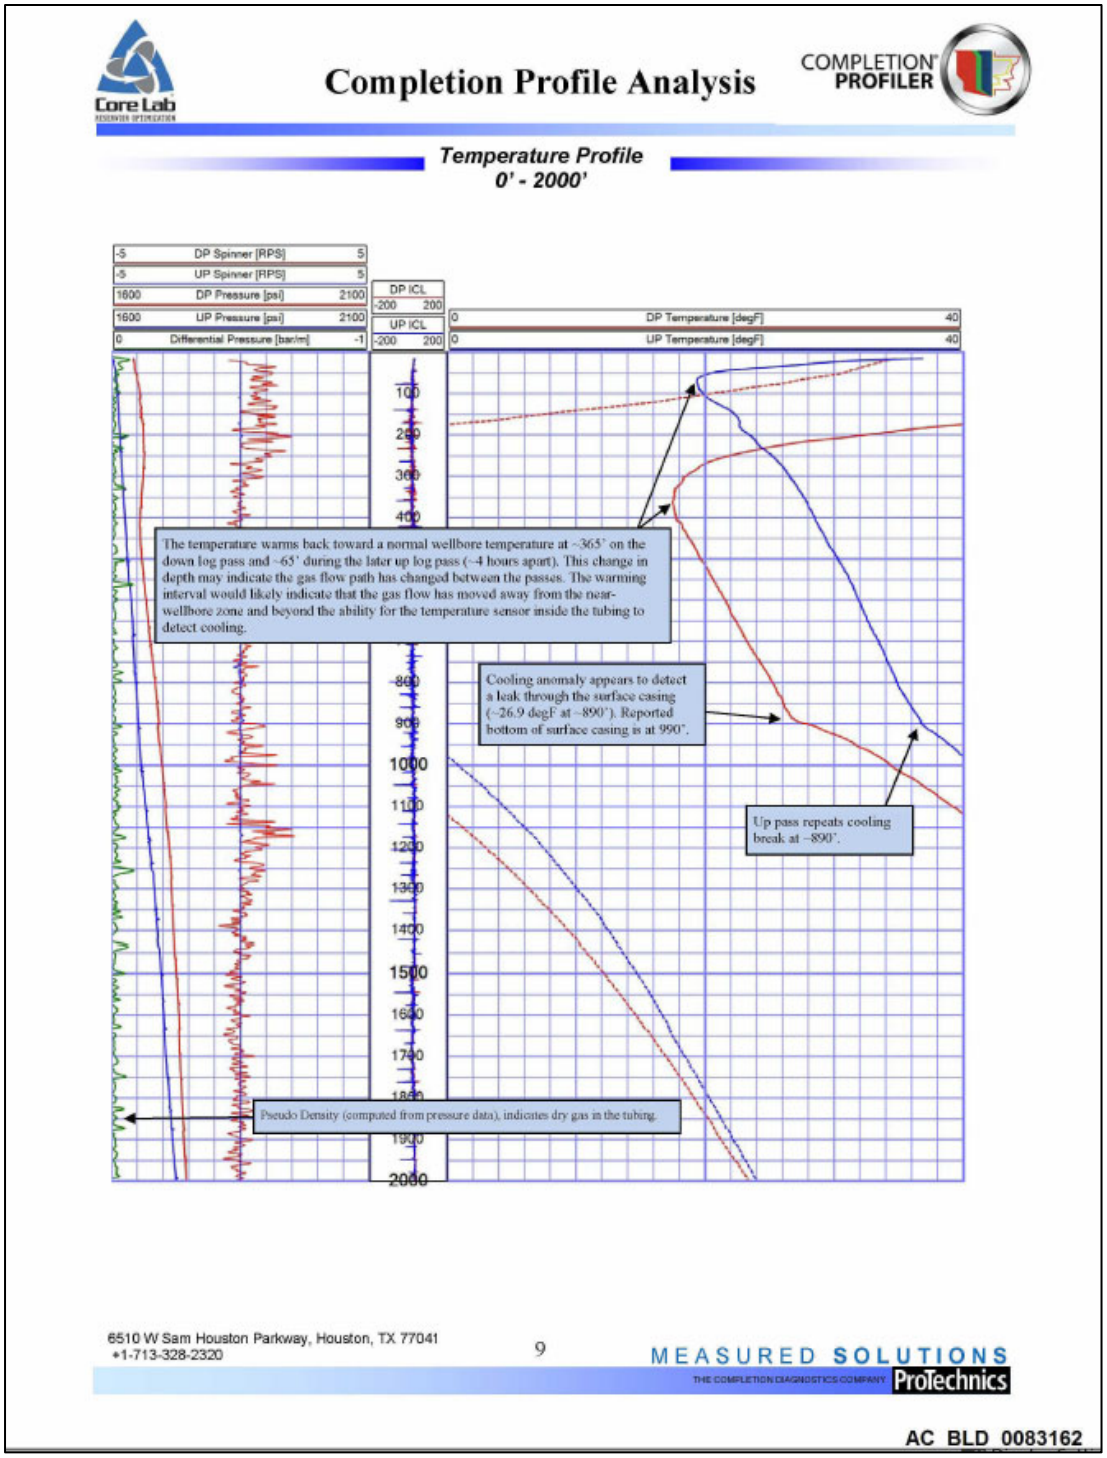

Figure 5: Temperature Profile (November 8, 2015)

Figure 7 shows the Boots & Coots version of the WBS with gas flow paths from a presentation dated December 16, 2015 [19].

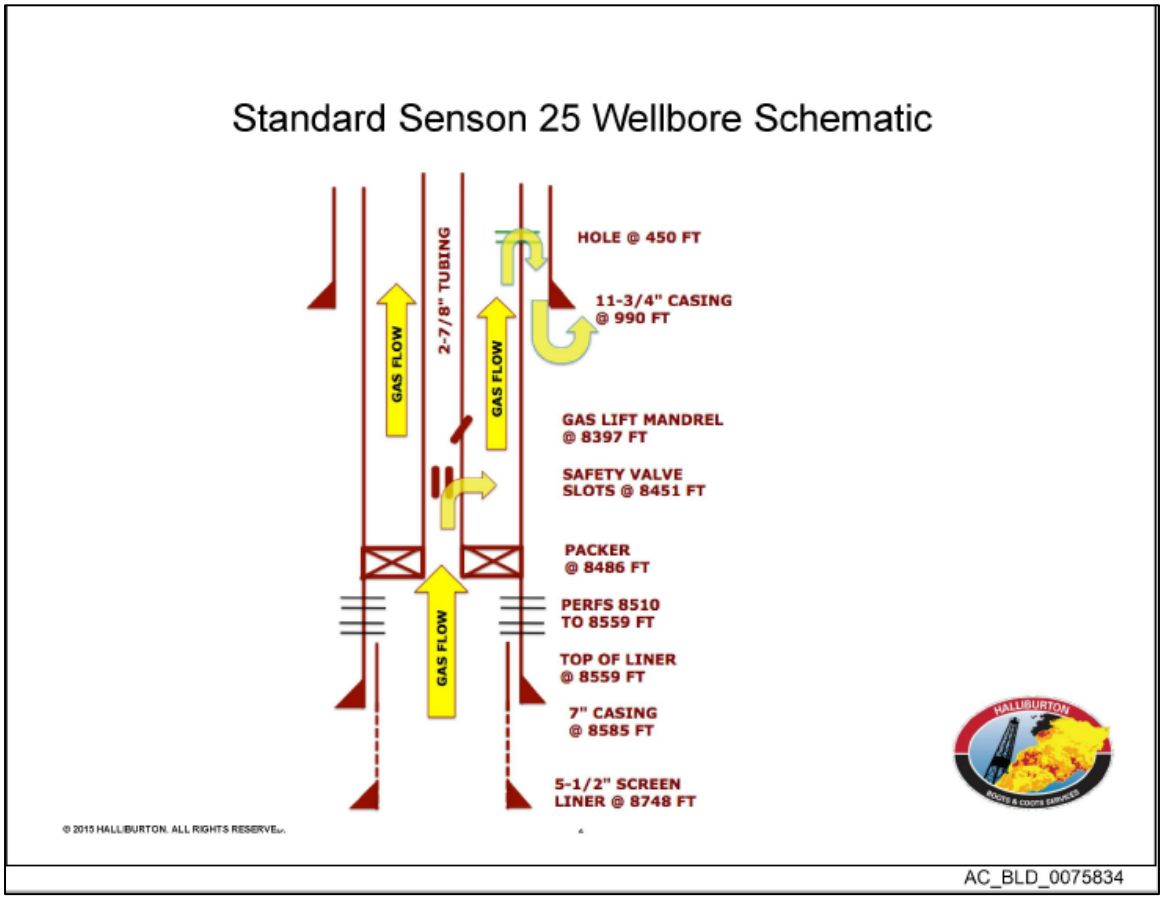

Figure 6: Boots & Coots Wellbore Schematic (December 16, 2015)

Figure 7 shows the WBS from the Add Energy Report released in February 2016 [4] (page 34, AC_BLD_0031337). The gas flow paths are indicated by the red arrows. A leak depth at 440 ft was estimated by Add Energy.

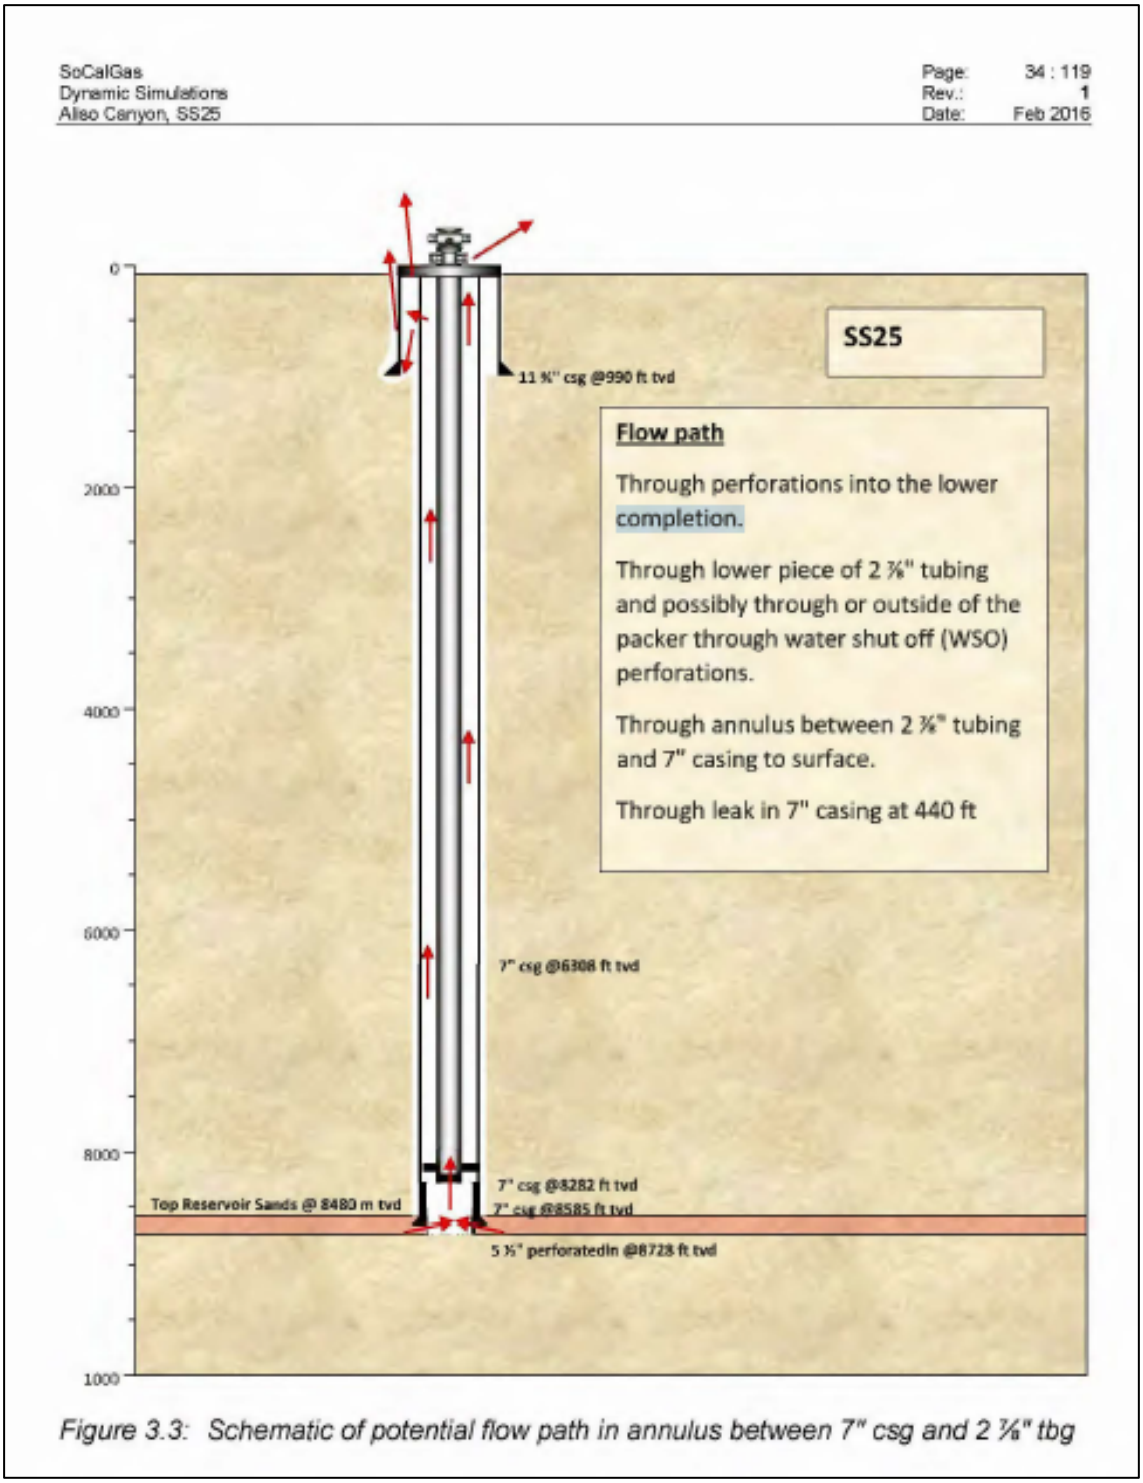

Figure 7: Add Energy Wellbore Schematic

Figure 8 shows the WBS for SS-25 prepared by Blade with the parted 7 in. casing at 892 ft.

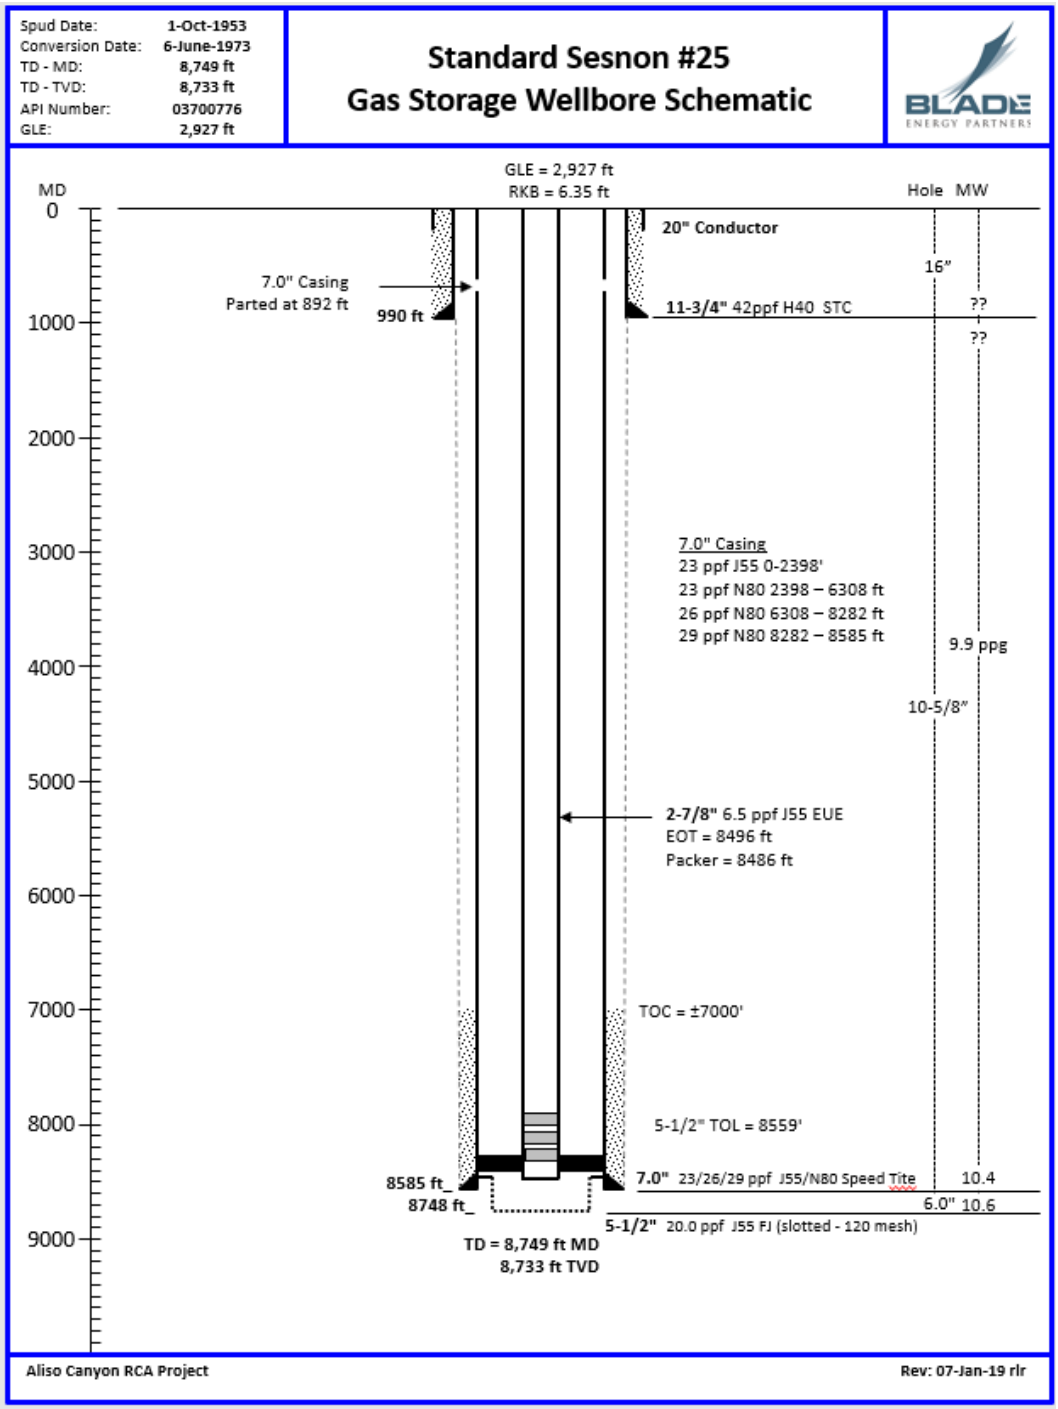

Figure 8: Blade Wellbore Schematic

An estimate of the depth of the leak was available from the temperature survey run on November 8, 2015 [3]. The survey showed temperature anomalies at 890 ft and 365 ft (Figure 5). Blade modeling shows flow from either depth resulted in no change in the pump rate and fluid density required to kill the well [10] *SS-25 Transient Well Kill Analysis*, page 35. The severity of the leak could have been assumed as the cross-sectional area of the casing × tubing annulus which turned

out to be correct with parted 7 in. casing. The flow path pressure restriction from the leak to surface was inferred by Blade based on the 7 in. casing surface flowing pressure of approximately 270 psi on October 23, 2015. The 7 in. casing flowing pressure takes into account the restrictions in the flow path to surface and the holes in the surface casing were not relevant.

The holes in the 11 3/4 in. casing were discovered in August 2018 after the 7 in. casing was extracted. The majority of the Blade kill modeling was done in 2016, some two years before the holes were discovered. The Blade kill modeling has never considered the holes in the 11 3/4 in. casing directly. The effect of the holes on the flow and pressure from the leak depth to surface is accounted for in the flowing casing pressure. The flowing casing pressure was known at the time of the event on October 23, 2015. Knowing the existence of the 11 3/4 in. holes was not relevant and was immaterial for the modeling.

The Add Energy Report [4] in 2016, had correctly predicted the flow path, ". . . the pressure in the outer annulus reached the fracture pressure of the 11 3/4" casing shoe with the consequence that flow paths were created outside of this casing to surface." (Add Energy Report page 9, AC_BLD_0031312) In the absence of any additional data, Add Energy had a near correct interpretation of the leak path, leak rates, and even the complexities of the hydrates forming. The Add Energy Report includes a discussion of potential flow paths (page 32, AC_BLD_0031335) where a possible shallow hole in the 11 3/4 in. casing is mentioned two times. Add Energy didn't have any of the benefits that Blade had with the actual physical failure, subsequent inspection and temperature logging data, nor any downhole video camera data. Notably, Add Energy estimated a flow rate 80 MMSCF/d at the time of the first kill attempt; they stated the methodology as, "(This estimated flow rate is not dependent of the flow path from the bottom of the tubing to surface, but only calculated based on pressures and the inflow performance relation (IPR) estimated from well tests)." (Add Energy Report page 7, AC_BLD_0031310). Add Energy's findings were not groundbreaking academic research but were an obvious extensions of industry standard modeling. Further, the Add Energy Report also assumed a shallow 7 in. casing leak location.

The knowledge of the exact 7 in. casing leak location and the presence of 11 3/4 in. holes does not impact the modeling. All of the required data was available during the kill attempts to conduct such modeling.

c. If Blade lists an answer to question 4b, explain why Boots & Coots could have attained these data points.

A key parameter required for kill modeling with realistic results, not mentioned in the passage, is the SS-25 gas flow rate. The gas flow rate, and the other data mentioned in Question 4 b. were available with reasonable certainty to conduct kill modeling. The data needed for modeling, including the estimate of the gas flow rate, a key parameter for kill modeling, are discussed in detail in response to Question 2 c.

d. In Blade's view, with the data that Boots & Coots had at the time it was attempting to kill well SS-25, could Boots & Coots successfully have killed well SS-25?

Yes, assuming that available data and reasonable assumptions had been used for the kill modeling (and assuming that the pumping was carried out according to plan developed through modeling), Boots & Coots could likely have killed SS-25. By "reasonable" we mean that assumptions were made based on engineering analysis, experience, and judgment. In addition, uncertainties in the input data should have been evaluated using the modeling to determine the sensitivities to a

given parameter. Conservative assumptions are normally made in designing kill plans to improve the chances for a successful outcome.

Blade evaluated each kill attempt using reasonable assumptions of bottom hole pressure and gas flow rate and modeling showed the well could have been killed with 12 ppg or 15 ppg drilling fluid pumped between 5 and 10 bpm depending on the specific kill attempt. The bottom hole pressure was changing with time, correspondingly, the kill parameters changed. Details of the kill scenarios are included in the Blade supplementary report *SS-25 Transient Well Kill Analysis* [10] (pages 27 – 31).

The Blade modeling planned killing the well with weighted drilling fluid which is better suited to prevent gas migration and leak-off into the formation than the low-density clear fluid that was used in kill attempts #2 – 6. Boots & Coots used 15 ppg drilling fluid in the final kill attempt #7 which was consistent with the Blade modeling results. This is discussed in the supplementary report SS-25 Transient Well Kill Analysis [10] (page 38).

e. If so, on which attempt?

Kill attempt #2 (the first Boots & Coots attempt) or kill attempt #3 were possible to achieve a successful kill assuming proper modeling was done with valid input data and a successful pumping operation according to the modeling results. This is discussed in the Blade Report [1] (page 4). A pumping operation with no interruptions is extremely important to prevent the well from flowing once it was killed during the kill operation. If the pumping fluid friction pressure is lost or reduced during the kill operation, the kill attempt will likely fail. It should be noted that operational uncertainties are not accounted for in modeling.

f. If the answer to Question 4 d is yes, why?

The well and site were in the best condition of all of the kill attempts for kill attempt #2. However, the SoCalGas November 13, 2015, daily report [2] shows there was a pump shut down during the job which interrupted the planned kill operation and resulted in an unsuccessful kill attempt.

Unfortunately, the surface conditions deteriorated during and after kill attempt #2. A quote from a DOGGR report [20] describes the damage caused by the kill attempt.

> Overall, this was the day that the well actually blew out in the conventional sense. Previously, it was not clear that the well was in a blowout situation. But after this pumping job, a blowout vent opened 20' from the wellbore and began shooting debris 75' into the air.

g. In Blade's view, with the data that Boots & Coots had and could have attained at the time it was attempting to kill well SS-25, could Boots & Coots successfully have killed well SS-25?

See Question 4 d.

h. If so, on which attempt?

See Question 4 e.

i. If the answer to question g is yes, why?

See Question 4 f.

2.5 Question 5

5. Please refer to the following passage of page 14 of Mr. Abel's testimony.

Lastly, Blade's model disregarded other key variables in pertinent well control operations. Blade's primary design variables were fluid density and pump rate. Other parameters such as viscosity, fluid stability, availability, and toxicity must also be considered. Further, not only must a kill operation stop the gas flow, the well must be stable when the kill fluid column is in a static state (i.e., after pumping stops). The pressure profile and corresponding tubular and wellbore integrity (which changes with depth) must also be considered and not exceeded. Because the Blade Report did not analyze these additional parameters, it is unknown if the fluid characteristics proposed by Blade (and alleged by SED) would have killed the well.

With this passage in mind, please answer:

2.5.1 Questions and Blade Responses

a. Does Blade agree that its model disregarded other key variables in pertinent well control operations?

No.

b. Why or why not?

The parameters fluid stability, availability, and toxicity are not input data to a kill model. Blade used fluid viscosity in the modeling analysis. Fluid viscosity is an important parameter used to estimate the friction pressure calculations which affect the pressure profile in the fluid flow path in the wellbore and the surface pump pressure.

c. Provide additional context and facts as necessary.

Fluid stability is important to ensure the solids in the weighted kill fluid (drilling fluid) remain suspended when the fluid is static. This would be a requirement that would be part of the specifications and requirements communicated to the supplier of the kill fluid when the fluid is ordered. The fluid properties would be confirmed before the fluid was pumped to ensure stability and other properties. This is a common requirement when dealing with fluids where the density is controlled by adding solids to the fluid.

Fluids with the proper density and flow properties are available from numerous suppliers. The kill fluids being discussed are also referred to as drilling fluid and are commonly used in oilfield drilling and workover operations. The fluid used by Boots & Coots in kill attempt #7 was 15 ppg water-based fluid that was procured and made available for the kill attempt. Blade identified similar densities for fluids for kill #2 through #6. A well kill model would have revealed that 12 ppg or 15 ppg fluid could have been used earlier in the kill attempts. As discussed in Question 4 d, using a drilling fluid as the kill fluid has several advantages over a clear fluid related to preventing gas migration and fluid leak-off into the formation.

Boots & Coots pumped barite pills as part of kill attempts #3, 4, and 5. However, because the well was not killed, the gas flow prevented the barite from settling and forming a competent plug or bridge in the annulus. A barite pill needs several hours in a static condition to settle.

It is not clear why toxicity is mentioned. It is not something that affects the modeling or the killing operations. Water-based fluids are commonly made up of non-toxic materials and there would be no reason to include toxic materials in a kill fluid.

d. Does Blade agree that "it is unknown if the fluid characteristics proposed by Blade (and alleged by SED) would have killed the well?

Yes, because the fluid characteristics along with the fluid densities and pump rates modeled by Blade were not used in a kill attempt and operational uncertainties are not reflected in modeling.

e. Why or why not?

The main parameter of the fluid used to kill a well is density with sufficient additives to maintain a stable fluid at surface and downhole conditions. The fluids proposed based on the Blade modeling included water-based fluids with 12 ppg or 15 ppg density and are standard-commonly available fluids with known flow properties.

f. Provide additional context and facts as necessary.

Not only are the fluid characteristics important; as discussed, the requirement for a successful well kill is to determine the fluid density and pump rate required to kill the well by stopping the influx of gas and then pumping the kill fluid in the same manner that it was modeled. If there are interruptions in the pumping, the kill is likely to be unsuccessful.

2.6 Question 6

6. Please refer to the following passage of pages 14 and 15 of Mr. Abel's testimony.

In sum, Blade's post-hoc transient modeling was an academic exercise that cannot fairly be compared to Boots & Coots' task of working on site under real-time constraints, and dealing with practical, field-level concerns (e.g., severe weather, wellhead condition, and safety of personnel). Even assuming Blade's transient modeling generated reasonable outputs, there is no basis for SED to claim that Boots & Coots should have killed SS-25 sooner—particularly as early as the second attempt (on November 13, approximately 3 weeks after the leak commenced)—when Blade needed 5-6 weeks to model a well kill, [Footnote omitted] not including time spent on the investigation and casing removal. Boots & Coots' approach of increasing pump rate and fluid density over well kill attempts 2 through 7 reflects a measured and logical process that did not compromise the safety in the process of bringing the well under control.

With this passage in mind, please answer:

2.6.1 Questions and Blade Responses

a. Does Blade view that its transient modeling generated reasonable outputs?

Yes.

b. Why?

Blade used available data (as described in the response to Question 2 c.) to construct its model. This model demonstrated that the well could be killed using 12 ppg or 15 ppg fluids pumped at reasonable rates.

c. Does Blade maintain that there is a basis for the claim that Boots & Coots should have killed SS-25 sooner?

Blade is not in a position to determine if Boots & Coots should have killed SS-25 sooner.

d. Why or why not?

As discussed previously, there are two components of a well kill required to result in a successful outcome. The first is a plan based on available data and reasonable assumptions if data is not available. Blade contends that because of the obvious complexity of the well control situation, kill

modeling was needed to develop a plan that maximized the chances of a successful kill. The second part is implementation of the pumping operations in the field. The fluid density and fluid pump rate have to match or exceed the plan and pumping must be completed without interruptions. When both components are done correctly, there is a good chance the kill will be successful. If either component is not right, a failed kill attempt is likely.

e. Does Blade maintain that there is a basis for the claim that Boots & Coots should have killed SS-25 as early as the second attempt, even if Blade needed 5 to 6 weeks to model a well kill (excluding investigation and casing removal time)?

The statement that Blade needed 5 to 6 weeks to model a well kill was taken out of context.

The accurate statement is "So for us [Blade] it took much longer; four, five, six weeks to analyze all of the seven kills." [21] (page 1058:14 – 16). Blade modeling included a detailed assessment of gas flowrates and history matching. This level of accuracy was not required for kill modeling prior to kill attempts.

Blade believes that more accurate kill modeling, using data available as early as the second kill attempt, would have led to a better well kill plan. Such modeling would have taken less than a week to complete. *Drillbench* software is intended to be used prior to well kill operations. A properly designed well kill plan, if implemented correctly, would have increased the chances of success. However, operational uncertainties are not reflected in modeling.

f. Why or why not?

See Question 6 d.

g. Even if Blade needed 5 to 6 weeks to model a well kill, does Blade maintain that Boots & Coots needed that long to do its own transient modeling at the time of the SS-25 incident?

No and again, the statement that Blade needed 5 to 6 weeks to model a well kill was taken out of context as discussed in Question 6 e.

h. Why or why not?

Blade is not in a position to know how long it would take Boots & Coots to do transient modeling. However, for engineers familiar with the *Drillbench* software could conduct such analysis with reasonable assumptions within a few days.

The data obtained by Blade for modeling was collected through numerous data requests over an extended time period.

i. Does Blade agree that Boots & Coots approach of increasing pump rate and fluid density over well kill attempts 2 through 7 reflects a measured and logical process that did not compromise the safety in the process of bringing the well under control?

Not necessarily.

j. If Blade disagrees with any portion of Mr. Abel's statement mentioned in question 6i, please identify each such portion.

Blade disagrees with the following portions of Mr. Abel's statement:

- "In sum, Blade's post-hoc transient modeling was an academic exercise that cannot fairly be compared to Boots & Coots' task of working on site under real-time constraints, and

dealing with practical, field-level concerns (e.g., severe weather, wellhead condition, and safety of personnel)."

- "Even assuming Blade's transient modeling generated reasonable outputs, there is no basis for SED to claim that Boots & Coots should have killed SS-25 sooner—particularly as early as the second attempt (on November 13, approximately 3 weeks after the leak commenced)—when Blade needed 5-6 weeks to model a well kill, [Footnote omitted] not including time spent on the investigation and casing removal."
- "Boots & Coots' approach of increasing pump rate and fluid density over well kill attempts 2 through 7 reflects a measured and logical process that did not compromise the safety in the process of bringing the well under control."

k. Please explain why Blade disagrees with each portion of Mr. Abel's statement identified in response to Question 6 j.

For the first bullet point of Question 6 j., see our answers to Question 1 b.

For the second bullet point of Question 6 j., see our answers to Question 6 e.

For the third bullet point of Question 6 j., our answer is as follows:

Based on kill attempt data and reports provided to Blade, the fluid density did not increase during kill attempts #2 through 6. The majority of the kill fluid pumped was 9.4 ppg brine and 8.34 ppg fresh water with some 18 ppg barite pills. This assertion is supported by Mr. Walzel with Boots & Coots. He stated ". . . I think the fluid weights stayed the same." in the *SED CPUC Opening Testimony Supporting Attachments* document [8] (page SED 00717:18 – 19). The fluid density did increase to 15 ppg for kill attempt #7. The data does show the pump rate increased from 8 to 9 bpm for kill attempts #2, 3, and 4 to 13 bpm for kill attempts #5 and 6. The pump rate for kill attempt #7 was 5.8 bpm.

As discussed in the Blade Report [1] (page 4), "Based on the data reviewed by Blade, the well-control company appeared to have designed the kill attempts solely by calculating a kill fluid density that was higher than the static bottom hole pressure." The result was that the well was not killed and the surface conditions continued to deteriorate. The well was brought under control in February 2016 from the relief well, not from top kill attempts in November and December of 2015.

l. Provide additional context and facts in support of the question 6 responses as necessary.

Not applicable. See the discussion in Question 6 a – k responses.

ORDER INSTITUTING INVESTIGATION ON THE COMMISSION'S OWN MOTION INTO THE OPERATIONS AND PRACTICES OF SOUTHERN CALIFORNIA GAS COMPANY WITH RESPECT TO THE ALISO CANYON STORAGE FACILITY AND THE RELEASE OF NATURAL GAS, AND ORDER TO SHOW CAUSE WHY SOUTHERN CALIFORNIA GAS COMPANY SHOULD NOT BE SANCTIONED FOR ALLOWING THE UNCONTROLLED RELEASE OF NATURAL GAS FROM ITS ALISO CANYON STORAGE FACILITY (I.19-06-016)

SOUTHERN CALIFORNIA GAS COMPANY

(DATA REQUEST SED-61 DATED APRIL 1, 2020)

SOCALGAS RESPONSE DATED APRIL 15, 2020

SoCalGas provides the following Responses to the Safety & Enforcement Division (SED) data request dated April 1, 2020 in I.19-06-016. The Responses are based upon the best available, nonprivileged information that SoCalGas was able to locate through a diligent search within the time allotted to respond to this request, and within SoCalGas' possession, custody, or control. SoCalGas reserves the right to supplement, amend or correct the Responses to the extent that it discovers additional responsive information.

SoCalGas objects to the instructions submitted by SED and to the continuing and indefinite nature of this request on the grounds that they are overbroad and unduly burdensome. Special interrogatory instructions of this nature and continuing interrogatories are expressly prohibited by California Code of Civil Procedure Section 2030.060(d) and 030.060(g), respectively. SoCalGas will provide responsive documents in existence at the time of its response. Should SED seek to update its request, SoCalGas will respond to such a request as a new data request in the future.

SoCalGas submits these Responses, while generally objecting to any Request that fails to provide a defined time period to which SoCalGas may tailor its Response, and to the extent that any Request is overly broad, vague, ambiguous, unduly burdensome, assumes facts, or otherwise fails to describe with reasonable particularity the information sought. SoCalGas further submits these Responses without conceding the relevance of the subject matter of any Request or Response. SoCalGas reserves the right to object to use of these Responses, or information contained therein, in any dispute, matter or legal proceeding. Finally, at the time of this Response, there are no pending oral data requests from SED to SoCalGas.

QUESTION 1:

For this question set, Please refer to the document entitled, "Prepared Reply Testimony of L. William Abel on Behalf of Southern California Gas Company".

1. On page 2, refer to the statement that says, "I am familiar with Boots & Coots and believe they were fully qualified to perform well kill and relief well operations at SS-25." Regarding this statement, please answer:
    a. At the time they worked on well kill operations of Well SS-25, did Mr. Abel know any of the individuals who actually worked on those well kill operations?

b. If so, please list all such individuals?
c. Please explain how Mr. Able knows each of the individuals provided in response to question 1a.

Response 1:

SoCalGas objects to this request as vague and ambiguous as to "know" and unduly burdensome to the extent that it fails to identify the specific individuals that are the subject of the question. SoCalGas further objects to this request to the extent that it mischaracterizes Mr. Abel's testimony and assumes familiarity requires personal knowledge. Without waiving or limiting the forgoing objections, SoCalGas responds as follows.

a. Yes.

b-c. Among the Boots & Coots personnel who contributed to the SS-25 well control operations, Mr. Abel knows or was familiar with each of the following individuals prior to October 23, 2015:

- Jim LaGrone (professionally)
- Danny Clayton (professionally and personally)
- Rolly Gomez (professionally)
- Arash Haghshenas (professionally)
- Richard Hatteberg (professionally and personally)
- John Hatteberg (professionally and personally)
- Bud Curtis (professionally and personally)

Question 2:

On page 3, refer to the statement that says, "After Boots & Coots personnel arrived on site and were briefed by SoCalGas, Boots & Coots assumed primary control of the well control operations at SS-25; SoCalGas then monitored and managed Boots & Coots personnel in the manner that is generally accepted in the industry." Regarding this statement, please answer.

a. What exactly is "the manner that is generally accepted in the industry" to which Mr. Abel refers? Please explain.

b. Provide the documentation that shows that the answer provided in response to question 2a is the "manner that is generally accepted in the industry".
c. How does Mr. Abel know that "SoCalGas then monitored and managed Boots & Coots personnel in the manner that is generally accepted in the industry"? Please explain in detail.
d. Regarding the quoted statement in 2.c, did Mr. Abel observe SoCalGas's monitoring and management of Boots & Coots personnel at the time SoCalGas did it, or did he learn about it after it happened?

Response 2:

SoCalGas objects to this request to the extent that it mischaracterizes Mr. Abel's testimony by selectively quoting from Mr. Abel's testimony. Subject to and without waiving the foregoing objection, SoCalGas responds as follows.

a. Please see Mr. Abel's testimony at SoCalGas' Reply Testimony, Chapter III, pages 3-4:

> In all emergency well control operations, the customary role of the operator (here, SoCalGas) is to provide information about the well and reservoir, access to local resources common to the region, rapid procurement of necessary materials and services and, most importantly, coordinate with local authorities and regulators (e.g., CPUC, DOGGR) to allow the well control provider (Boots & Coots) to focus on the well kill. Here, consistent with industry practice, SoCalGas oversaw and approved Boots & Coots' recommended well control plans, but did not determine the manner in which Boots & Coots prepared or executed its well kill operations.
>
> ***
>
> In addition, as summarized, in part, in SoCalGas' Opening Testimony, SoCalGas acted prudently in response to the leak by, among other things:
>
> - Ensuring that Boots & Coots personnel had all information, equipment, contractors, and supplies necessary for Boots & Coots to do its job and execute its designed well kill plan;

- Promptly organizing and mobilizing pump-to-kill equipment to the site as quickly as feasible in a safe and efficient manner; the leak was discovered in the afternoon and the pump-to-kill was accomplished the next morning;

- Implementing a formal emergency response command and control system, and an Incident Command Structure per FEMA standards, so that the well control efforts could be managed in the most expedient manner possible (e.g., one senior Incident Commander with the authority to make critical decisions on the fly so the project could proceed without delay); and

- Maintaining site security and safety of all personnel involved and those in and around sensitive areas (i.e., "hot" zone), on a 24/7 basis.

b. Mr. Abel determined that SoCalGas monitored and managed Boots & Coots personnel in the manner that is generally accepted in the industry based on his more than 44 years of experience in the well control industry. Mr. Abel has participated in more than 500 well kill operations worldwide, and has personally designed and supervised well capping and kill operations for over 60 wells.

c. Mr. Abel determined that SoCalGas monitored and managed Boots & Coots personnel in the manner that is generally accepted in the industry after evaluating information he learned from, among other sources: prepared written testimony submitted in this proceeding, transcripts of several Examinations Under Oath conducted by SED of several SoCalGas and Boots & Coots personnel, live testimony of Boots & Coots personnel involved in the well kill operations, Daily Operations Report notes prepared by Boots & Coots, and responses to many data requests.

d. See Response to Question 2.c.

<u>Question 3:</u>

On page 3, refer to the statement that says, "In all emergency well control operations,

the customary role of the operator (here, SoCalGas) is to provide information about the well and reservoir, access to local resources common to the region, rapid procurement of necessary materials and services and, most importantly, coordinate with local authorities and regulators (e.g., CPUC, DOGGR) to allow the well control provider (Boots & Coots) to focus on the well kill. Here, consistent with industry practice, SoCalGas oversaw and approved Boots & Coots' recommended well control plans, but did not determine the manner in which Boots & Coots prepared and executed its well kill operations."

a. How does Mr. Abel know that SoCalGas oversaw and approved Boots & Coots' recommended well control plans?
b. Provide the well control plans that Boots & Coots recommended and that SoCalGas oversaw and approved.
c. Confirm that these are the same plans Mr. Abel saw when he made this statement.
d. Were Boots & Coots's recommended well kill plans based upon Boots & Coots's transient modeling?
e. If yes, did SoCalGas see the transient model prepared by Boots & Coots's that corresponded to each well kill plan?
f. If yes, identify each SoCalGas personnel member that saw the transient model prepared by Boots & Coots.

<u>Response 3:</u>

a. See Response to Question 2c.
b. See documents previously produced to SED with the following bates numbers: AC_CPUC_SED_DR_16_0000349 - AC_CPUC_SED_DR_16_0000360; AC_CPUC_SED_DR_16_0021452.
c. Confirmed.
d. Based on information and belief, SoCalGas understands that the kill plan summaries prepared by Boots & Coots were informed, in part, by the transient kill modeling that Boots & Coots conducted, beginning after Boots & Coots' second well kill attempt.
e. In the course of Boots & Coots' well control efforts, SoCalGas understood that Boots & Coots conducted modeling in connection with the SS-25 top kill operations. SoCalGas reviewed and discussed the kill plans with Boots & Coots, but SoCalGas did not review the model that may have informed the kill plans.
f. N/A.

ORDER INSTITUTING INVESTIGATION ON THE COMMISSION'S OWN MOTION INTO THE OPERATIONS AND PRACTICES OF SOUTHERN CALIFORNIA GAS COMPANY WITH RESPECT TO THE ALISO CANYON STORAGE FACILITY AND THE RELEASE OF NATURAL GAS, AND ORDER TO SHOW CAUSE WHY SOUTHERN CALIFORNIA GAS COMPANY SHOULD NOT BE SANCTIONED FOR ALLOWING THE UNCONTROLLED RELEASE OF NATURAL GAS FROM ITS ALISO CANYON STORAGE FACILITY (I.19-06-016)

SOUTHERN CALIFORNIA GAS COMPANY

(DATA REQUEST SED-61 DATED APRIL 1, 2020)

SOCALGAS RESPONSE DATED APRIL 15, 2020

Question 4:

Please refer to the following passage of Mr. Abel on page 4 of his testimony:

"In addition, as summarized, in part, in SoCalGas' Opening Testimony, SoCalGas acted prudently in response to the leak by, among other things:
• Ensuring that Boots & Coots personnel had all information, equipment, contractors, and supplies necessary for Boots & Coots to do its job and execute its designed well kill plan;
• Promptly organizing and mobilizing pump-to-kill equipment to the site as quickly as feasible in a safe and efficient manner; the leak was discovered in the afternoon and the pump-to-kill was accomplished the next morning;
• Implementing a formal emergency response command and control system, and an Incident Command Structure per FEMA standards, so that the well control efforts could be managed in the most expedient manner possible (e.g., one senior Incident Commander with the authority to make critical decisions on the fly so the project could proceed without delay); and
• Maintaining site security and safety of all personnel involved and those in and around sensitive areas (i.e., "hot" zone), on a 24/7 basis."

With this passage in mind, please answer:

a. Does this passage have any factual basis other than reference to SoCalGas's Opening testimony?
b. If the answer to question 4a is yes, please provide the documentation showing such factual basis, including the point that basis supports.

Response 4:

SoCalGas objects to this question as unintelligible. SoCalGas further objects to this question as vague and ambiguous, particularly with respect to "any factual basis." Subject to and without waiving the foregoing objections, SoCalGas responds as follows.

a. Yes.
b. In addition to SoCalGas' Opening Testimony, please see SED Opening Testimony Exhibit, SED00635-00786 (Danny Walzel and James Kopecky, Examination Under Oath (Aug. 8, 2018), SoCalGas' Reply Testimony, Ex. III-4 (Danny Walzel Depo. (Feb. 21, 2020).); Boots & Coots' Daily Operations Reports; SoCalGas Daily Well Work Reports. These documents have been

previously provided to SED or are already in SED's possession.

Question 5:

Please refer to the following passage of Mr. Abel's testimony on page 5:

"Ultimately, based on the records I have evaluated and my extensive experience and expertise in well control operations, SoCalGas' leak response was prudent, reasonable, and consistent with industry practice. Further, SoCalGas displayed the necessary expertise to monitor and manage its well control experts."

a. Please provide the records Mr. Abel has evaluated to draw these conclusions in one seamless document, containing unique Bates numbers.
b. Of those records provided in response to question 5a, please highlight the specific passages in the records that Mr. Abel relied upon to draw the conclusions in this passage.
c. Did Mr. Abel review any records that led him to come up with a different conclusion than the one he drew in this passage?
d. If so, please provide the records, highlight the passages, and state the conclusion or conclusions each passage led him to draw.

Response 5:

SoCalGas objects to this request as vague and ambiguous, particularly as to the phase "one seamless document." SoCalGas further objects to this request as unduly burdensome to the extent that it requires SoCalGas to merge a voluminous set of records into a single document. SoCalGas further objects to this request as unduly burdensome to the extent SED's sole sponsoring witness, Margaret Felts, has already formed an opinion consistent with Mr. Abel's (see, Margaret Felts Depo. Tr. 150:3–151:11 (Feb. 5, 2020)). SoCalGas further objects to this request the extent SED mischaracterizes Mr. Abel's testimony; Mr. Abel's testimony was not informed by only a single document. Subject to and without waiving the foregoing objections, SoCalGas responds as follows.

a. Mr. Abel arrived at the referenced conclusion after evaluating a voluminous set of documents, which SoCalGas is still in the process of compiling; this response will be supplemented as soon as practicable with those documents. Responsive

documents that are already in SED's possession include the documents submitted with SoCalGas' Reply Testimony Chapter III (Abel) on March 20, 2020 and the SoCalGas Daily Well Work Summaries, previously produced to SED with bates numbers (AC_CPUC_0207880 – 0207979, AC_CPUC_0096441–0096630).

b. SoCalGas objects to this request as vague and ambiguous and unduly burdensome to the extent SED's sole sponsoring witness, Margaret Felts, has already formed an opinion consistent with Mr. Abel's (see, Margaret Felts Depo. Tr. 150:3–151:11 (Feb. 5, 2020)). SoCalGas further objects to this request on the grounds it seeks information that was already provided to SED.

c. SoCalGas objects to this request to the extent it is vague and ambiguous with respect to the term "different" and unintelligible to the extent it asks whether Mr. Abel has formed an opinion contrary to the one expressed in the reply testimony he has sponsored on behalf of SoCalGas. Subject to and without waiving the foregoing objections, SoCalGas responds as follows. No.

d. N/A.

<u>Question 6:</u>

Please refer to the following passage of Mr. Abel's testimony on page 5: "As an initial matter, SED incorrectly assumes that a reasonable top kill attempt necessarily requires transient kill modeling. By way of background, there are two approaches for modeling a well kill: (1) steady state, and (2) transient. A steady state model consists of a set of equations based on the assumption that flow rate does not change over time (i.e., steady state). . . In fact, out of the more than 500 well control operations I have participated in during my career (approximately 90% of which were top kill operations), I have never relied on transient kill modeling for a top kill well control effort."

a. Provide the exact quote and page from SED's testimony that Mr. Abel relies upon to support his allegation that "SED incorrectly assumes that a reasonable top kill attempt necessarily requires transient kill modeling."
b. Is it Mr. Abel's contention that steady state modeling was appropriate for any of the top kill attempts of well SS-25 after October 22, 2015?
c. If the answer to question 6b is yes, please identify which ones, and the basis for such a contention.
d. Is it Mr. Abel's contention that no modeling was appropriate for any of the top kill attempts of well SS-25 after October 22, 2015?
e. If the answer to question 6d is yes, please identify which ones, and the

basis for such a contention.

f. Is it Mr. Abel's contention that transient kill modeling was not appropriate for any of the kill attempts of well SS-25 after October 22, 2015?
g. If the answer to question 6f is yes, please identify which ones, and the basis for such a contention.
h. Please provide all documentation in support of any basis Mr. Abel provides in support of any contentions provided in response to the subquestions of question 6.
i. Please identify Mr. Abel's qualifications with using transient modeling to do top kill attempts.

Response 6:

a. SoCalGas objects to this request as unduly burdensome to the extent it asks SoCalGas to identify aspects of SED's testimony to SED. Subject to and without waiving the foregoing objection, SoCalGas responds as follows. See SED's Opening Testimony, pp. 28-39. SoCalGas does not quote below the entirety of SED's testimony, but notes the following excerpt in which SED alleges a violation of PUC section 451 against SoCalGas for allegedly failing to conduct transient modeling for kill attempts two through six:

Given that SoCalGas had no well kill control plans and there are no data indicating transient modeling -- any modeling -- or analysis conducted to design the second through sixth well kill attempts, and such modeling would have provided the necessary information to successfully kill the well, SoCalGas violated Section 451.

The Section 451 violation began November 13, 2015, the day SoCalGas unsuccessfully executed the second well kill attempt without modeling, and continued through February 11, 2016, the date of the successful relief well kill attempt. Because the second through sixth well kill attempts should have been successful with proper modeling, shareholders should be required to pay all expenses associated with each one.

b. SoCalGas objects to this request to the extent it mischaracterizes Mr. Abel's testimony or assumes that modeling is required or appropriate for all top kill operations. Subject to and without waiving the foregoing objection, SoCalGas

responds as follows. Steady state modeling would not have been required in order to control the well SS-25.

c. SoCalGas objects to this request to the extent it mischaracterizes Mr. Abel's testimony. SoCalGas further objects to this question to the extent it is vague and ambiguous with respect to "which ones." Subject to and without waiving the foregoing objection, SoCalGas responds as follows. See response to Question 6b.

d. SoCalGas objects to this request to the extent it mischaracterizes Mr. Abel's testimony. Subject to and without waiving the foregoing objection, SoCalGas responds as follows. Modeling would not have been required in order to control well SS-25.

e. SoCalGas objects to this request to the extent it mischaracterizes Mr. Abel's testimony. SoCalGas further objects to this question to the extent it is vague and ambiguous with respect to "which ones." Subject to and without waiving the foregoing objection, SoCalGas responds as follows. See response to Question 6d.

f. SoCalGas objects to this request to the extent it mischaracterizes Mr. Abel's testimony. Subject to and without waiving the foregoing objection, SoCalGas responds as follows. Transient modeling would not have been required in order to control well SS-25.

g. SoCalGas objects to this request to the extent it mischaracterizes Mr. Abel's testimony. SoCalGas further objects to this question to the extent it is vague and ambiguous with respect to "which ones." Subject to and without waiving the foregoing objection, SoCalGas responds as follows. See response to Question 6f.

h. SoCalGas objects to this question as unintelligible, vague and ambiguous, and overly burdensome pursuant to Rule 10.1 of the Commission's Rules of Practice and Procedure.

i. SoCalGas objects to this request to the extent it seeks information that has already been provided to SED. Subject to and without waiving the foregoing

objections, SoCalGas responds as follows. Mr. Abel has participated in more than 500 well kill operations worldwide, and has personally designed and supervised well capping and kill operations in over 60 wells. For additional detail regarding Mr. Abel's experience and publications related to well control operations, please see Mr. Abel's curriculum vitae (SoCalGas Reply Testimony Chapter III (Abel), Ex. III-1). Mr. Abel's publications specific to modeling include: "Fire Fighting and Blowout Control", L. William Abel, et al, ABEL Engineering (Gulf Publishing), Chapter 12, Published Textbook, 540 pages, January 1994; "Planning a Dynamic Kill", L. William Abel, P.E., Abel Engineering, Journal of Petroleum Technology, Technology Today Series, SPE 36071, May, 1996; "Comparison of Steady State and Transient Analysis Dynamic Kill Models for Prediction of Pumping Requirements", IADC/SPE 35120, L. William Abel, SPE, ABEL Engineering Co. and Donald W. Shackelford, SPE, Halliburton Energy Services, Inc.

Question 7:

Please refer to the following passage of Mr. Abel, pp. 7 and 8.

Further, contrary to SED's assertions that Boots & Coots may have implemented its well kill attempts based on a flow rate that was too low (30 MMscf/D), as described in SoCalGas' Reply Testimony Chapter IV (Walzel/Haghshenas), Boots & Coots' transient modeling estimated and modeled gas flow rates ranging from 15-70 MMscf/d.

a. Please state how Mr. Able knows that Boots & Coots' transient modeling estimated and modeled gas flow rates range from 15-70 MMscf/d.
b. Has Mr. Able seen Boots & Coots's transient models that Mr. Walzel allegedly had stolen in late December, 2015?

Response 7:

a. Mr. Abel based his response on the testimony of Boots & Coots personnel. Please see SoCalGas' Reply Testimony Chapter III (Abel), Ex. III-4 (Danny Walzel Depo. Tr. 134:18-135:7 (Feb. 21, 2020)), and SoCalGas Reply Testimony Chapter IV (Walzel/Haghshenas) at 6.
b. No. As described in SoCalGas' Reply Testimony Chapter IV (Walzel/Haghshenas), Mr. Walzel's laptop was stolen from Mr. Walzel's vehicle

and never recovered. (See, SoCalGas Reply Testimony Chapter III (Abel) Ex. III-4 (Danny Walzel Depo. Tr. 77:1-78:14.)

Question 8:

Please refer to the following passages of Mr. Abel's testimony, page 16:

As it relates specifically to post-leak plans for relief well #2, SS-25A, and SS-25B, the relief well program developed for SS-25 was sufficient because the relief well plan for SS-25 was easily adaptable for relief well #2, SS-25A, or SS-25B. Given that the wells all share the same reservoir depths and intercept points relative to the reservoir, the relief well plan for SS-25 was adaptable to the other wells, with very minor modifications. Further, SED's proposal is inconsistent with industry standard.

With this in mind, please answer.

a. Please list all industry standards that show that SED's proposal is inconsistent with the industry standard.

b. Please provide all industry standards listed in response to question 8a, and provide the page number(s) relied upon, and highlight the text relied upon.

Response 8

SoCalGas objects to this request as overly burdensome, and to the extent that it mischaracterizes Mr. Abel's testimony by selectively quoting his testimony. Subject to and without waiving the foregoing objections, SoCalGas responds as follows.

a. Mr. Abel's testimony regarding the industry standard practices for relief well planning is based on his observations and practices over the course of more than 44 years of experience in the well control industry. Mr. Abel has participated in more than 500 well kill operations worldwide, and has personally designed and supervised well capping and kill operations in over 60 wells. As Mr. Abel noted in his reply testimony on behalf of SoCalGas, over the course of his extensive career in well control operations, he had observed only "one instance where well kill plans for neighboring wells were concurrently in place at the outset of a relief well operation." As Mr. Abel further states:

Even in that instance, I believed that it was unnecessary. That scenario

> was also distinguishable because the neighboring wells there were production wells, and the well control team was concerned with accidentally making contact with those wells while drilling the relief well. Here, SS-25A and SS-25B had already been hydrostatically controlled (respectively, on October 31, and November 1, 2015[] prior to commencing work on the relief well, so that concern did not apply.

(SoCalGas Reply Testimony, Ch. III (Abel), pp. 16-17.).

b. Please see response to Question 8a.

BEFORE THE PUBLIC UTILITIES COMMISSION

OF THE

STATE OF CALIFORNIA

Pre-Formal Inquiry into California Gas Management, Practices and Procedures Related To The Aliso Canyon Incident in October, 2015.

EXAMINATION UNDER OATH OF DANNY WALZEL and JAMES KOPECKY

CONFIDENTIAL

REPORTER'S TRANSCRIPT
San Francisco, California
August 8, 2018
Pages 1 - 152

1 BE IT REMEMBERED THAT, by Consent of
2 the Witness, and on Wednesday, August 8,
3 2018, commencing at the hour of 10:10 a.m.
4 thereof, at the offices of the CALIFORNIA
5 PUBLIC UTILITIES COMMISSION, 505 Van Ness
6 Avenue, Room 4300, San Francisco, California
7 94102, before ANDREA L. ROSS, CSR No. 7896;
8 SHANNON M. ROSS, CSR No. 8916; and DORIS
9 HUAMAN, CSR No. 10538, personally appeared
10 **(DANNY WALZEL),**
11 called as a witness herein, who, being first
12 duly sworn, was thereupon examined and
13 interrogated as hereinafter set forth, and
14 **(JAMES KOPECKY),**
15 called as a witness herein, who, being first
16 duly sworn, was thereupon examined and
17 interrogated as hereinafter set forth
18 * * * * *
19 EXAMINATION
20 BY MR. GRUEN:
21 Q For starters, why don't we go
22 around the room and just identify your name
23 and spell your name, please, for the record.
24 We'll ask everyone to do it and then your
25 title and then the name of the entity who you
26 work for.
27 My name is Darryl Gruen,
28 D-a-r-r-y-l, G-r-u-e-n. I'm an attorney for

1 the Safety and Enforcement Division of the
2 California Public Utilities Commission.
3 MS. ROSE: My name is Julietta Rose,
4 J-u-l-i-e-t-t-a, R-o-s-e. I am a law clerk
5 for the legal division.
6 MR. BRUNO: My name is Kenneth Bruno.
7 I'm the program manager of gas safety branch,
8 Safety and Enforcement Division here at the
9 California Public Utilities Commission.
10 MR. SHER: Nicholas Sher, S-h-e-r, with
11 the Safety and Enforcement Division,
12 attorney.
13 MR. HOLTER: Randy Holter, R-a-n-d-y,
14 H-o-l-t-e-r. I work for the Safety and
15 Enforcement Division. I'm a senior utilities
16 engineer specialist.
17 MS. PENNINGTON-HILL: Kaitlyn
18 Pennington-Hill, K-a-i-t-l-y-n,
19 P-e-n-n-i-n-g-t-o-n hyphen H-i-l-l, attorney
20 for Halliburton.
21 MR. HELSLEY: Michael Helsley,
22 M-i-c-h-a-e-l, H-e-l-s-l-e-y, attorney at
23 Wanger Jones Helsley and an attorney for
24 Halliburton and Boots & Coots.
25 WITNESS KOPECKY: A James Kopecky,
26 K-o-p-e-c-k-y. I'm a well control specialist
27 for Halliburton, Boots & Coots.
28 WITNESS WALZEL: A Danny Walzel,

1 D-a-n-n-y, W-a-l-z-e-l, well patrol engineer
2 for Boots & Coots, Halliburton.
3 MR. GRUEN: Q Mr. Kopecky and
4 Mr. Walzel, thank you very much for being
5 here today. We appreciate that. We
6 understand that you're here voluntarily and
7 you're here with your counsel voluntarily. I
8 just -- I spoke with counsel off the record
9 and just wanted to clarify for the record, we
10 understand that what we discuss today, just
11 the actual points of discussion today, that
12 there's an agreement to keep that, keep the
13 points for the discussion confidential.
14 Counsel, did I capture that right?
15 MR. HELSLEY: Yeah, that's fine. I
16 agree with that.
17 MR. GRUEN: Okay.
18 MR. HELSLEY: Also, I just want to let
19 everyone know that SoCalGas, they were --
20 they helped bring the witnesses here today
21 and helped facilitate this. Just wanted to
22 let -- I just wanted to put that on the
23 record.
24 MR. GRUEN: Q Appreciate that. Thank
25 you. Let's see. With that, just a couple of
26 points of clarification before I turn it over
27 to Ms. Rose.
28 Gentlemen, Mr. Kopecky and

1 Mr. Walzel, do you have any concerns with
2 sharing information related to your work at
3 Aliso Canyon on well access 25 today?
4 WITNESS KOPECKY: A No.
5 WITNESS WALZEL: A No.
6 Q Do you have any interest in sharing
7 the information, sharing information related
8 to your work, on well access 25 today,
9 anything that you want to share with us?
10 WITNESS WALZEL: A What do you mean by
11 interest?
12 Q Is there anything that you want to
13 tell us from your work, related to your work?
14 WITNESS WALZEL: A Just your
15 questions.
16 WITNESS KOPECKY: A Yeah.
17 Q Okay, we'll move forward with the
18 questions absolutely, okay. With that,
19 Ms. Rose is going to ask you a little bit
20 about your background related to why you are
21 qualified to do what you did on well access
22 25. So with that, go ahead, Ms. Rose.
23 MS. ROSE: Thank you.
24 EXAMINATION
25 BY MS. ROSE:
26 Q So how would you describe what you
27 do in general at your job?
28 WITNESS KOPECKY: A You want to go

1 first, Danny?
2 Q Or individually if it's quite
3 different.
4 WITNESS WALZEL: A Yes, you know,
5 customers call us when they're having well
6 control issues and, you know, anything from
7 underground blow-outs to surface blow-outs to
8 circulating out of keg, you know, pressure
9 control, call us out to resolve the issue.
10 WITNESS KOPECKY: A As well control
11 specialist, I work under a broad direction of
12 the senior well control specialist typically
13 on any well control event, the types that
14 Danny mentioned.
15 Q Okay. So more kind of individual
16 issues versus just well interventions?
17 WITNESS KOPECKY: A We also do well
18 interventions.
19 Q Okay, thank you. How did you --
20 how did you become a well control engineer,
21 well control specialist? What kind of
22 training did you get?
23 WITNESS KOPECKY: A I have a -- prior
24 to joining Boots & Coots in 2004, I had a
25 20-year surface wellhead equipment
26 background.
27 Q Okay.
28 A And I work for Boots & Coots in

1 different capacities throughout the world on
2 different well control events. I joined the
3 well control group, I believe, five years ago
4 or six as a well control specialist.
5 WITNESS WALZEL: A I started at Boots
6 & Coots in 2002. I was hired after
7 graduating Texas A&M University with a
8 petroleum engineering degree and, you know,
9 and since then, I've worked in just about
10 every aspect of what Boots & Coots does.
11 I've been doing it for 16 years.
12 Q Okay. So you've worked there
13 before it was bought by Halliburton?
14 WITNESS KOPECKY: A Yes.
15 WITNESS WALZEL: A Yes.
16 Q Can you describe, if at all, how
17 the company has changed since Halliburton
18 acquired it?
19 WITNESS KOPECKY: A Pertaining to?
20 Q Your experience as an employee,
21 management, direction, just -- if nothing
22 comes to mind, then that's fine too.
23 A Well, there certainly have been
24 changes I can't really grasp, but I think
25 it's just, you know, it's being part of a
26 larger company.
27 WITNESS WALZEL: A Yeah, I would say
28 it's, you know, our day-to-day work we do in

1 the field hasn't changed.
2 Q Okay.
3 WITNESS KOPECKY: A I agree.
4 Q Okay, thank you. So you obviously
5 specialize in well control. Do you work on a
6 lot of gas well leaks in particular?
7 WITNESS WALZEL: A Yes.
8 Q About how many would you say you've
9 worked on in the past year?
10 WITNESS KOPECKY: A In the past year?
11 Q Yes, about, yeah --
12 A Well --
13 Q Yeah --
14 (Crosstalk.)
15 WITNESS KOPECKY: A Probably four.
16 Q Okay.
17 WITNESS WALZEL: A I've worked on one
18 gas blowout this year.
19 Q Okay. And where were they?
20 WITNESS KOPECKY: A Columbia.
21 WITNESS WALZEL: A Columbia.
22 Q Okay.
23 WITNESS KOPECKY: A Columbia,
24 Trinidad-Tobago, and can't recall. South
25 Texas.
26 Q Okay.
27 A And I don't recall if France was in
28 this year or just the end --

1 Q Okay, but --
2 A -- the end of last year --
3 Q Okay, but recently though?
4 WITNESS WALZEL: A Oh, you mean like
5 this calendar year?
6 Q Yeah or -- no, just the past year
7 give or take, you know.
8 A Trying to think of which ones I did
9 at the end of last year. Yeah, I can't
10 recall any gas leaks towards the end of last
11 year.
12 Q And how many of them, if any, were
13 like Aliso, like SS-25, maybe not in terms of
14 the longevity of the leak but, you know, the
15 way the well was.
16 WITNESS WALZEL: A Columbia was just
17 like it.
18 Q Just like it?
19 A Yes.
20 Q Okay. How so?
21 (Crosstalk.)
22 THE REPORTER: Excuse me, gentlemen, we
23 need to do this one at a time, please. Thank
24 you.
25 WITNESS KOPECKY: A As Danny was
26 saying and I interrupted him, it was a broach
27 to the surface.
28 MS. ROSE: Q Okay. Did it have a

similar kind of underlying geology as well?

WITNESS KOPECKY: A No.

WITNESS WALZEL: A No.

Q No, okay. Have you worked on many that had a similar underlying geology?

WITNESS KOPECKY: A Let me -- I'm going to clarify. When I said no about the geology, it was not a storage well.

Q Okay.

A Okay.

Q So they are actually just extracting the gas for the first time?

WITNESS KOPECKY: A I think the well was temporarily abandoned in Columbia, wasn't it?

Q Okay.

WITNESS WALZEL: A They weren't producing it at the time.

Q Okay. So going back to your background a little bit, would you say that you have some expertise at killing leaky wells?

WITNESS WALZEL: A Yes.

WITNESS KOPECKY: A Yes.

Q And what in particular makes -- kind of gives you that expertise versus, say, someone that manages a field?

WITNESS WALZEL: A I would say what --

1 just the -- a lot of what we do is, you know,
2 you gain the experience just from doing it.
3 Q Okay.
4 A We've learned from, you know, guys
5 that worked at Reddit Air for 30, 40 years,
6 you know, 50 years plus experience.
7 Q Yeah.
8 A You know, with our -- obviously the
9 petroleum background, engineering background,
10 and then learning it in the field.
11 Q Okay.
12 WITNESS KOPECKY: A And, yeah, I'd add
13 that's what differentiates us is quality of
14 our engineers.
15 Q The quality in terms of kind of
16 experience?
17 A Experience, yes.
18 Q Okay. Do you get specialized
19 training? Is it more that you just kind of
20 going along to jobs and eventually pick up
21 more understanding or anything?
22 A Well, and again, I'm not an
23 engineer but we do attend types of training,
24 a lot of it required. But you gain the most
25 experience not in the classroom but in the
26 field.
27 Q Okay.
28 WITNESS WALZEL: A Yeah.

1 Q Like working with people that are
2 more senior or just confronting your
3 problems?
4 A All the aboves, working with people
5 that have done it and going out and actually
6 doing it.
7 Q Thanks. And why would you say that
8 you and your colleagues that went to Aliso
9 Canyon for SS-25 were qualified to handle
10 that particular gas leak?
11 A Just the experience of having done
12 it before.
13 WITNESS KOPECKY: A I agree.
14 Q Have you ever testified in court
15 as, like, an expert witness or anything like
16 that?
17 WITNESS KOPECKY: A No.
18 WITNESS WALZEL: A No.
19 Q So for each of you, can you
20 describe the last well that you worked on,
21 kind of like what kind of well, where was it,
22 how did you make a decision about how to deal
23 with it, you know, what happened when you got
24 there, that kind of thing.
25 WITNESS WALZEL: A Well, the last one
26 I was involved with was in Columbia. It had
27 broke the surface. There was gas and oil,
28 water coming up 200 foot from the well. And

1 we -- it ended up -- it ended up bridging and
2 we got a snubbing unit and went in and set
3 cement plugs and --
4 Q I'm sorry, could you --
5 A So bridging with -- essentially the
6 well plugged itself off on its own.
7 Q Okay.
8 A It was making a lot of sand.
9 Q Okay.
10 A And plugged up with sand.
11 Q Okay. And how soon was that after
12 you got there?
13 A I don't know the exact date how
14 many days --
15 Q Yeah.
16 A -- but within a week, week and a
17 half it bridged when we started flowing it to
18 relieve the pressure.
19 Q Okay. And when you showed up,
20 what -- like, what did you do? Like, did you
21 ask for information, did you go survey the
22 well? Like, what's your thought process when
23 you got to that well?
24 A Well, they had provided drilling
25 records, you know, kind of a -- yeah, what
26 they were, you know, what they were planning
27 on doing, which was, I believe, put P and A
28 in the well, plug and abandon. We did a site

1 survey and we ordered out equipment to pumps
2 and, you know, kill fluids,
3 installed additional --
4 (Crosstalk.)
5 THE REPORTER: Excuse me, folks, I
6 can't take you both down at the same time.
7 Thank you.
8 WITNESS WALZEL: A Installed
9 additional valves on the wellhead, ordered a
10 snubbing unit from the US. And then as we
11 were just getting ready to rig up the
12 snubbing unit is when the well bridged. So
13 we used the snubbing unit to go in and clean
14 it out and set cement plugs.
15 MS. ROSE: Q Okay. And did you -- is
16 there kind of a -- when you get to the well,
17 and you say, okay, this is a well, it's
18 leaking, you know, it's a certain kind of
19 well, is there any kind of like formula that
20 you use or is it more just intuition? Like,
21 how do you decide what you're going to do?
22 WITNESS WALZEL: A Well, I mean, you
23 know, there's the formulas to figure out kill
24 fluids and volumes. And then a lot of it
25 is -- and we also ordered out wireline
26 equipment, you know. A lot of it is running
27 logs to, diagnostic logs, to find flow paths,
28 holes.

1 Q When you say diagnostic logs, are
2 those like past records or future --
3 A No, yeah, we get out there and run
4 them.
5 Q Okay.
6 A Typically it would be moist
7 temperature logs, gyros, spinner logs, you
8 know, those would be the main --
9 Q Okay.
10 A -- the main three that we run.
11 Q Okay. And then based on the
12 results of those, you decide --
13 A Right.
14 Q -- how you're going to approach the
15 well. Okay. Do you find it useful to talk
16 to the people that actually work on the field
17 who haven't dealt with the well in the past
18 or not so much?
19 A Yes.
20 Q Yes, okay. And what kind of
21 information would you ask them?
22 A You know, just drilling, you know,
23 well history --
24 WITNESS KOPECKY: A Formation
25 pressure.
26 WITNESS WALZEL: A Formation pressure.
27 WITNESS KOPECKY: A Tubular data.
28 WITNESS WALZEL: A Tubular data,

1 wellhead equipment, pressure ratings, stuff
2 like that.
3 Q Okay. And that's all -- that all
4 sounds like information you could also get
5 from a written record or not so often?
6 WITNESS KOPECKY: A Well, we --
7 although we may ask, we always ensure it's
8 going to be confirmed by written record --
9 Q Okay.
10 A -- if at all possible.
11 Q Okay. Okay. Okay. Thank you.
12 Could you describe the last well you worked
13 on.
14 A Well, I was on the well with
15 Danny --
16 Q Okay.
17 A -- in Columbia.
18 Q Okay.
19 A Participated in that. I don't
20 think I'm really -- I was in Trinidad-Tobago
21 on a well kill, but I don't think -- it was a
22 different situation and I don't think I'm at
23 liberty to --
24 Q Okay.
25 A -- because of confidentiality with
26 that client.
27 Q Okay. Is there a recent kill, well
28 kill, that you can talk about?

1 A The one prior to that would have
2 been Columbia.
3 Q Okay. Okay. Thank you. So the
4 one in Columbia, would you say that that was
5 kind of a standard or typical well kill?
6 A Well, it bridged itself.
7 Q It bridged itself. Is that normal?
8 WITNESS WALZEL: A Sometimes it
9 happens; sometimes it doesn't. Every well --
10 no two are the same when we show up.
11 Q Okay.
12 WITNESS KOPECKY: A As Danny said,
13 it's typically not typical.
14 Q Okay.
15 A What I mean by that is no two are
16 exactly the same. They're all unique
17 scenarios.
18 Q Are there any kind of criteria that
19 you would use that even just thinking about
20 it for yourselves to kind of group them like,
21 oh, this is a certain type or anything like
22 that?
23 WITNESS WALZEL: A Other than surface
24 blowout, underground blowout, broach, you
25 know.
26 Q Okay.
27 A That's how you can classify them --
28 Q Yeah.

1 A -- but then each one has its own
2 set of problems, you know, that you go
3 through the diagnostics and, you know,
4 there's no, you know, just every kill is
5 different.
6 Q Okay. Fair enough. When you show
7 up, are there any -- is there anything that
8 you do typically to either figure out what
9 you're going to do or first steps?
10 WITNESS KOPECKY: A First steps
11 typically when we show up in a well control
12 event is to ensure we secure the area, ensure
13 safety of personnel and accountability.
14 Q Okay.
15 A And then clear any hazardous
16 material from the area that could be the hot
17 zone, if you will, that could be impacted
18 such as fuel tanks or oxygen acetylene type
19 bottles, anything that could escalate the
20 situation.
21 Q Okay. And then what would you do
22 after that?
23 A Try to get an evaluation of the
24 situation.
25 Q Okay. And that would be through?
26 A Visual.
27 Q Visual, visual evaluation. And
28 does that actually really inform what you

1 choose to do next? I don't know, I mean I've
2 never been to a well.
3 A I mean it allows you to set your
4 zones, your exclusion zones.
5 Q What's an exclusion zone?
6 A Well, there are areas that you
7 don't allow any personnel in.
8 Q Okay.
9 A And then there's warm zones that
10 you can have personnel in viewing, preparing
11 to go into the hot zone or coming out,
12 exiting the hot zone. And then you've got
13 your areas that you can assemble equipment,
14 things of that nature.
15 Q Okay. So this is all kind of
16 securing the area safety. And then once that
17 kind of work is complete, how do you start
18 evaluating the well itself?
19 WITNESS WALZEL: A Well, like James
20 said, visual, can you see where the flow is
21 coming from, are we going to have access to
22 the wellhead, conditions of the wellhead. As
23 I said earlier, you can get access to the
24 wellhead, you know, are we going to be able
25 to put pump lines on it, rig up coil tubing
26 units, wireline units.
27 Q Coil what?
28 A Coil tubing, you know, equipment to

1 go in and do the well intervention.
2 WITNESS KOPECKY: A Remediate.
3 WITNESS WALZEL: A Remediate.
4 Q Okay. And then is this the time at
5 which you also runs those logs and maybe look
6 at a well history or is that later?
7 A Well, I mean if there's
8 information, then we'll review that.
9 Sometimes it takes a little while to run the
10 logs, you know, days or by the time you get
11 equipment, source the equipment, so, yeah,
12 look at the logs, order out equipment.
13 Q Okay.
14 WITNESS KOPECKY: A I agree.
15 Q Okay. And do you typically ask to
16 speak to any one kind of person or to see any
17 kind of record when you show up?
18 A Well, we would typically identify
19 the incident commander.
20 Q Okay. And what do you talk to them
21 about?
22 A Well, again, we don't own the well.
23 Q Yeah.
24 A But we're there to make
25 recommendations.
26 Q Uh-huh.
27 A So we would talk to him about what
28 they have in mind, you know, again, about

1 accountability of personnel, those type of
2 issues initially.
3 Q Okay. Is there anyone else that
4 you make it a priority to speak to?
5 WITNESS WALZEL: A Well, I mean just
6 each company, you know, if there's engineers,
7 geologists, just anybody that will have
8 information.
9 Q Okay, okay. And --
10 WITNESS KOPECKY: A And, again, just
11 for clarification, when I say we, we seek out
12 this individual, we talk to this individual.
13 A lot of times we're included in those
14 meetings. Sometimes we're not. It's done by
15 the senior --
16 Q Okay.
17 A -- personnel of Boots & Coots on
18 location.
19 Q Okay. And as far as records or
20 information that you look for when you show
21 up, is there anything that you typically look
22 for?
23 WITNESS WALZEL: A I think we've
24 already --
25 Q Yeah.
26 A Well history --
27 Q Well history, okay.
28 A Tubulars.

1 Q Okay, okay. I just want to make
2 sure.
3 A Yes.
4 Q Okay, thank you. I think I'm good.
5 MR. GRUEN: Thank you, Ms. Rose.
6 EXAMINATION (resumed)
7 BY MR. GRUEN:
8 Q Appreciate that. Thanks for that.
9 A couple things just to follow up on. I take
10 your point that each incident is different.
11 What I heard earlier, too, is that there's
12 some similarities between Columbia, what
13 happened in Columbia, and then what happened
14 in SS-25.
15 I think you had mentioned that one
16 was -- that those were a surface breach. So
17 to that point, they were similar.
18 WITNESS WALZEL: A Similar, yeah.
19 Q Even though I'm sure there were
20 lots of differences, too, to your point. So
21 just walking through that, is -- and then the
22 bridging in Columbia would have been
23 different --
24 A Right.
25 Q -- than SS-25. What else between
26 Columbia and SS-25, if anything, was similar?
27 A That there was a broach to surface.
28 That was pretty much all that was similar.

1 WITNESS KOPECKY: A I think that's the
2 only similarity.
3 Q Okay, thank you. All right, so
4 just to talk a little bit about -- I'm going
5 to ask you to maybe, if you can as best you
6 can, and I know it's three years ago
7 approximately so it's been a little time and
8 I'll work with you to help try and jog your
9 memory if you can't remember.
10 I think most people might -- their
11 memories might start to fade about what
12 happened three years ago so I get that. But
13 having said that, to the best you can, what
14 I'd like to ask you to do is give us an
15 understanding of in your experience from when
16 you first started, when you first learned
17 about SS-25 and the incident there, to give
18 us as best you can a timeline in your
19 experience of what happened including how you
20 learned, and then the different well kill
21 attempts that you had.
22 I recognize that's really broad.
23 It may take a little bit of time to do that.
24 So just maybe if we could start kind of at
25 the beginning sort of and I'll ask questions
26 about how you learned and if we could walk
27 forward in time from there to when you
28 finished up, so I'll -- this is just kind of

1 a high point. I'll start to ask questions
2 about that.
3 But I just wanted to kind of give
4 you an idea up front to where I'm going on
5 this. So maybe with that, if you could, as
6 best you can remember, approximately when --
7 and I'm not going to hold you to the exact
8 date -- but approximately when did you first
9 learn about the incident, did each of you
10 learn about the incident at SS-25?
11 A Well, I'll begin. I won't be --
12 unfortunately I won't be able to get very far
13 with the timeline.
14 Q Okay.
15 A But I initially -- I took the phone
16 call for the SS-25 at approximately by memory
17 8:00, 8:30 Houston time. And I conferred
18 with the gentleman that had phoned me with
19 SoCal. We determined that we were going to
20 need to mobilize. I contacted my employer
21 or, excuse me, my direct supervisor, the well
22 control manager, and we determined that we
23 would send the senior well control
24 specialist, a well control engineer, and
25 myself initially.
26 Q Okay.
27 A And we departed on the first
28 available commercial flight the next morning

1 early because we did look into a charter, but
2 we wouldn't have been able to address
3 anything in the dark hours and we arrived as
4 early as possible so the charter wasn't
5 beneficial.
6 Q And just a couple clarifications
7 about that. When you said 8:00 to 8:30, was
8 that in the morning or the evening?
9 A Oh, evening, I'm sorry, p.m., yes.
10 Q That's okay. Do you remember who
11 the gentleman was at SoCalGas who called you?
12 A I don't recall exactly but I do
13 recall it was a gentleman by the name of Todd
14 Van Putte maybe.
15 Q Van de Putte?
16 A Maybe, something.
17 Q Okay, that's helpful. And do you
18 remember how soon after the incident that
19 phone call happened?
20 A No, I do not remember.
21 Q That question suggests I'm asking
22 you to be precise for three years ago and I'm
23 not, so let me just clarify. Would it have
24 been within hours or days after the incident
25 first happened?
26 A My recollection it would be hours
27 maximum.
28 Q Hours maximum. That's helpful.

1 Okay, thank you. And so then you would have
2 taken a charter then or you did take a
3 charter the day -- the morning after the
4 incident happened?
5 A We flew commercial in the morning.
6 Q Flew commercial the morning after
7 the incident happened?
8 A Correct.
9 Q Okay, I follow. Thank you. And
10 when you talked about the different -- I
11 think you mentioned a well control manager
12 and a well control specialist. You decided
13 that certain personnel should come out.
14 Which individuals were those?
15 A A senior well control specialist,
16 myself, and Danny.
17 Q And what was the name of the senior
18 well control specialist?
19 A Danny Clayton.
20 Q Danny Clayton, thank you. Okay.
21 And so when you first were on the phone --
22 actually let me -- so you get out to Aliso
23 Canyon field after the charter. Am I
24 following that right? You went right to the
25 field?
26 A Yes, we did.]
27 Q What was the first thing you did
28 when you got to the field?

1 WITNESS KOPECKY: A Again, I recall --
2 and, again, I'm going by memory. I recall we
3 attended a briefing.
4 Do you agree, Danny?
5 We attended a briefing prior to
6 going to the wellsite on Aliso Canyon, the
7 briefing on the current situation and safety
8 concerns.
9 Q Okay. And the way I'm asking is --
10 I appreciate that if you want to jump in at
11 any time. I'm asking -- I'm looking at
12 Mr. Kopecky, but it's really directed to both
13 of you, so feel free to jump in.
14 WITNESS WALZEL: A Okay.
15 Q So when you talk about the safety
16 concerns, do you remember what specifically
17 they were -- what was discussed at that
18 meeting?
19 WITNESS KOPECKY: Of course, we weren't
20 really aware because we hadn't seen the well,
21 but the safety concerns to our knowledge, or
22 that were communicated to us was methane gas
23 leak.
24 Q Okay. Anything else?
25 A And not for health reasons, but for
26 as an ignition, possible source.
27 Q I see. Okay. So that the surface
28 breach, was it identified as a surface breach

1 at that point?
2 WITNESS WALZEL: A Yes. I mean --
3 WITNESS KOPECKY: A Yeah. That was
4 the reason for the phone call, the initial
5 call.
6 Q Got it. Got it. So the initial
7 phone call would have identified the surface
8 breach, and due to the surface breach then
9 there was concern about ignition, there was
10 enough gas being released into the
11 atmosphere, there were concerns about
12 ignition?
13 WITNESS WALZEL: A Anytime there's
14 gas, you know, whether it's a little or
15 any -- it's always a --
16 Q I follow. Thank you.
17 WITNESS KOPECKY: A Right.
18 Q Let me back up to what else on the
19 phone call -- what were the things identified
20 on the initial phone call to you that made
21 you say, Hey, we better get out there.
22 WITNESS KOPECKY: A The fact that
23 there was a broach to surface.
24 Q Okay.
25 A Ever slight as it may have been at
26 the time, there was still a major concern.
27 Q Okay. After the safety meeting,
28 what -- so they had identified the surface

1 breach to you. Did they -- did either in the
2 phone call or the safety meeting, can you
3 describe more the problem that they had
4 described to you.
5 WITNESS WALZEL: A I mean, it was, you
6 know, there's a gas, you know, release and
7 then we went and looked at it, you know, and
8 did an observation of the well, and, you
9 know -- you know, I mean, they just
10 described, you know, what they last saw up
11 there, and we went and looked at it and
12 confirmed it.
13 Q So you observed what they had told
14 you?
15 WITNESS WALZEL: A Right.
16 Q Did you observe anything different
17 than what they told you?
18 A No.
19 WITNESS KOPECKY: No.
20 Q What did you observe up there?
21 WITNESS WALZEL: A Well, we went and
22 looked at it and, you know, there was - there
23 was an asphalt pad on location, you know,
24 around the well, and I recall there was a
25 couple cracks in the asphalt, and you could
26 see gas fumes coming up out of it.
27 Q Okay. And were you both there when
28 you went up to see the condition?

1 WITNESS KOPECKY: A Yes. And as Danny
2 mentioned, you could see the gas. You had
3 to -- you had to really look. There were
4 small fissures, cracks, and then it wasn't
5 any major discharge visually at that time.
6 Q Okay. I think you had talked about
7 doing an evaluation after doing a visual.
8 That's kind of one of the common things you
9 mentioned to Ms. Rose is what you do -- what
10 you've done commonly.
11 So at what point did you do your
12 evaluation on SS-25?
13 WITNESS WALZEL: A First day. As soon
14 as we got there.
15 Q What did you do as part of your --
16 what did you do as your evaluation on SS-25?
17 WITNESS WALZEL: A Went and looked at
18 the well and looked at the site.
19 Q What did you decide in terms of --
20 what did you find? And what did you think
21 had to be done as a result of your
22 observation?
23 WITNESS KOPECKY: A That the well
24 would have to be killed.
25 Q So let's go through the well-kill
26 attempts. And I understand there are a few,
27 and if we can -- you know, I think there
28 were -- my understanding was there were a

1 number of them. So I'd like to just
2 walk-through, as best you can remember, the
3 different well-kill attempts.
4 So after you first got there, can
5 you talk about the first well-kill attempt.
6 WITNESS WALZEL: A Yes. I mean, yeah,
7 we, you know, we ordered out equipment -
8 pumps, pump iron, choke manifolds, you know -
9 got all the unnecessary equipment off
10 location, and we pumped down -- we lined up
11 to pump down the tubing, and I can't -- I
12 can't recall the specifics of how -- how much
13 we pumped. You know, we set the -- I believe
14 all the wellhead equipment was 5,000 PSI
15 pressure rating. So we set a safety limit
16 somewhere around 4,300 pump PSI, and we
17 pumped on it, and -- but I couldn't tell you
18 how many barrels, but we deemed that it was,
19 you know -- we shut down to regroup and talk
20 about it because it wasn't, you know, going
21 as expected.
22 Q How did you decide how many barrels
23 to pump and what PSI you were going -- what
24 pressure you were going to use in order to
25 pump them and all that stuff?
26 WITNESS WALZEL: A Right. So,
27 obviously, the faster you pump, the more
28 pressure you're going to have.

1 Q Uh-huh.
2 WITNESS WALZEL: A So we tried to pump
3 as fast, you know -- see what we could pump
4 before we exceeded the safety limit and
5 pressure and then -- but like I said, I can't
6 recall how many barrels we pumped or when we
7 shut down or I don't remember -- I don't
8 remember the specifics of how many barrels we
9 pumped.
10 MR. BRUNO: May I jump in real quick?
11 MR. GRUEN: Sure. Okay.
12
13 EXAMINATION
14 BY MR. BRUNO:
15 Q Mr. Walzel, and Mr. Kopecky, I want
16 to back up just a bit, and I want to get a
17 few clarifications before we get to the first
18 well-kill attempt.
19 When you could see fissures, could
20 you also smell gas; do you recall? Could you
21 smell the odorant?
22 WITNESS WALZEL: A I can't remember if
23 I could smell it, or, you know, I remember it
24 was windy; so, you know, I can't recall if I
25 could smell it or not that day.
26 WITNESS KOPECKY: A I'm in agreement
27 with Danny. As a matter of fact, now that he
28 mentions it, which you're all probably aware,

1 it's typically windy at all times up on the
2 mountains there, apparently.
3 I don't recall any memory of
4 smelling any -- I forget what the additive is
5 called.
6 Q Yes, sir. I understand.
7 What about the concentration of
8 gas; when we're first seeing the gas coming
9 through the fissures, was that a
10 concentration of gas that was explosive, or
11 do you recall?
12 WITNESS KOPECKY: A I don't recall.
13 We work a lot in 90, 100 percent LEL. It
14 didn't seem to be a large concentration of
15 gas. It -- we weren't concerned with the
16 ignition in the immediate area, especially
17 with the wind.
18 Q And by 90 percent LEL, you mean you
19 weren't quite at the lower explosive limit?
20 WITNESS WALZEL: No.
21 WITNESS KOPECKY: No. No. I say we
22 work in those environments all the time, and
23 with my experience, this wasn't an explosive
24 environment when we initially went up to
25 observe.
26 Q Yes, sir. Thank you. Thank you
27 for that. Would you consider -- if I use the
28 term "blow-out," does that mean anything to

1 you?
2 WITNESS KOPECKY: A Certainly.
3 WITNESS WALZEL: A Yeah. I mean, the
4 definition of a "blow-out" is an uncontrolled
5 flow or release --
6 WITNESS KOPECKY: A To the atmosphere.
7 WITNESS WALZEL: A -- or underground.
8 Q So at the time of the phone call,
9 am I understanding, it was already a blow-out
10 at that point?
11 WITNESS KOPECKY: A Whenever it
12 broached the surface.
13 WITNESS WALZEL: A Correct.
14 Q Thank you for that. I just have
15 one more.
16 You mentioned the incident
17 commander is one of the first things you do
18 around the safety meeting. Had you met the
19 incident commander at that point?
20 WITNESS KOPECKY: A I don't recall.
21 I'm familiar with the incident commander. We
22 met a lot of people upon arrival. I don't
23 recall who the incident commander was at that
24 time. At that time. At that particular
25 time.
26 Q But do you recall meeting an
27 incident commander?
28 WITNESS KOPECKY: A Yes -- no, I don't

1 know that I met him on the first day because
2 I don't recall there was so many titles,
3 meeting a lot of people. We were concerned
4 with getting a chance to look at the well,
5 but, no. I did meet an incident commander
6 throughout the job thereafter.
7 Q Yes, sir. And then, if I
8 understand, I'm just going back to
9 decision-making. Did I understand you
10 correctly that the incident commander makes
11 decisions, but you guys are providing the
12 recommendations? Did I pick that up
13 correctly?
14 WITNESS KOPECKY: A I think broadly,
15 yes. Again, what I stated earlier is that we
16 don't -- typically, and I'm referring to
17 other jobs as well, when we go on location,
18 we don't take control, if you will.
19 We're governed, if you will, by
20 whomever the customer representative is.
21 We're there to make recommendations, and they
22 know that that is our expertise.
23 Q Yes, sir. Okay. I'm going to
24 throw out a name and just to the best of your
25 recollection, just kind of trying to identify
26 the incident commander. Does the name Jimmy
27 Cho jog any memory?
28 WITNESS KOPECKY: A I recall meeting

1 Jimmy.
2 WITNESS WALZEL: A Yes.
3 Q Do you think he may have been the
4 incident commander?
5 WITNESS WALZEL: A Well, initially --
6 I don't recall, but the incident commander
7 throughout the majority, you know,
8 throughout -- what I believe was Bret.
9 WITNESS KOPECKY: A Correct.
10 Q By Bret, do you mean Bret Lane?
11 WITNESS KOPECKY: Yes.
12 WITNESS WALZEL: Yes. I couldn't
13 remember his last name.
14 Q So he was in the capacity of -- by
15 "he," I mean Mr. Lane. He was in the
16 capacity of either being incident commander
17 or making decisions?
18 WITNESS WALZEL: Yes.
19 WITNESS KOPECKY: I'm assuming -- not
20 assuming. I know his entire team.
21 MR. BRUNO: Q Yes, sir. Understand.
22
23 EXAMINATION (resumed)
24 BY MR. GRUEN:
25 Q As incident commander with his
26 team, Bret Lane was making the final
27 decisions about how to proceed on the
28 well-kill attempts.

1 WITNESS KOPECKY: A I don't know that
2 to be fact.
3 Q Okay. Would you make
4 recommendations to Bret Lane and his team
5 about how to proceed well-kill attempts?
6 WITNESS WALZEL: A Yes.
7 Q Were the recommendations followed?
8 WITNESS WALZEL: A Yes. Well, yeah.
9 Q Any changes that they made to the
10 recommendations?
11 WITNESS WALZEL: A I mean, I can't
12 remember if there was, you know, any changes
13 off the top of my head right now.
14 Q Do you remember any personnel from
15 SoCalGas who talked the recommendations
16 through with you before you made them with
17 Mr. Lane's team?
18 WITNESS KOPECKY: A I was not involved
19 in the meetings with any of the
20 recommendations.
21 WITNESS WALZEL: Yes. I mean, I was --
22 typically, I would be, like, present at the
23 morning meeting, and, you know, like I said,
24 our team was in the meetings. You know, I
25 mean, it was kind of, you know, meet in the
26 trailer, talk about what we would like to do,
27 and come up with a formula and go out and do
28 our pump job.

1 Q Who was your team leader?
2 WITNESS WALZEL: A His name was Danny
3 Clayton.
4 Q Danny Clayton, yeah.
5 And so how would you come up with a
6 recommendation to SoCalGas?
7 And when I ask, I mean, did you
8 come up with a recommendation among the Boots
9 & Coots team first, and then present it to
10 SoCal?
11 WITNESS KOPECKY: A I don't believe --
12 I wasn't involved in strategy.
13 Q Okay.
14 WITNESS WALZEL: A Yeah, I mean, you
15 know, let's try to pump on it and rig up a
16 pump on it, and, you know, with the
17 kill-weight fluids, and, you know, make an
18 attempt at trying to kill it.
19 Q And that was a conversation you had
20 with Danny Clayton to figure that out?
21 WITNESS WALZEL: A Yeah. I mean,
22 really, when we got there, that was the
23 first, you know -- you know, we got to pump
24 on it to kill it.
25 Q Right. Right. Yeah. So I'm
26 following you on the strategy of how to do
27 it. I'm just trying to get at who was kind
28 of in the -- who you talked to first in order

1 to figure out how.
2 A I can't -- I don't remember who I
3 talked to first.
4 Q Okay. Okay. Someone within Boots
5 & Coots first or was it kind of an overall
6 meeting with SoCalGas and Boots & Coots to
7 figure out how to do it?
8 A Well, you know, it was always kind
9 of overall, you know, group, you know,
10 discussion.
11 Q Okay.
12 A Weigh out pros and cons and
13 consequences to come up with the best plan.
14
15 EXAMINATION
16 BY MR. BRUNO:
17 Q Mr. Wetzel --
18 WITNESS WALZEL: Walzel.
19 Q -- Walzel. I'm sorry. I'm sorry,
20 sir.
21 Or, Mr. Kopecky, just to clarify, I
22 think you mentioned you had to pump on it to
23 kill it?
24 WITNESS WALZEL: A Right.
25 Q What are you trying to achieve
26 there? You are pumping some medium down?
27 A Yeah.
28 Q Can you kind of describe that

1 process. Like, what are you trying to...
2 A Well, yeah, to, you know, to kill a
3 well you need to have hydrostatic equal to or
4 higher than the reservoir pressure. So from
5 that, you can come up with how many
6 pounds-per-gallon fluid you need, and then,
7 you know, on a well that's flowing, you know,
8 you kill it with mud weight and pump rate.
9 So, you know, part of the initial
10 pump was, you know, if it works, it works.
11 If it doesn't, it might give us some
12 information to, you know, use in the future
13 attempts.
14 Q You mentioned reservoir pressure.
15 Is that a number that you guys calculate or
16 is that a number that was given to you by
17 SoCalGas?
18 A It was a number given to us.
19 Q So is that an important input for
20 the first well-kill attempt?
21 I mean, did you -- I'm
22 understanding it to be almost like, you know,
23 do your best to design it, to overcome it. I
24 don't want to put words in your mouth --
25 WITNESS WALZEL: A Right.
26 Q And then see what happens?
27 WITNESS WALZEL: A Well, not "to see
28 what happens," but, you know, we know our --

1 you know, come up with our kill weight. You
2 know, we didn't know -- or you know, the
3 variables would be if, you know, we could
4 pump and overcome -- you know, get enough
5 hydrostatic in the well bore to maintain the
6 reservoir pressure.
7 Q And when that number was given to
8 you, was it verbal or was it written or a
9 record?
10 WITNESS WALZEL: A Well, I know it was
11 verbal and there might -- some record, you
12 know, written down somewhere.
13 Q Just based on your experience, is
14 that reservoir pressure reasonable? I mean,
15 did it sound reasonable?
16 A I mean, you know, as far as
17 reasonable, I mean, it's -- I don't remember
18 what --
19 WITNESS KOPECKY: A I don't recall
20 what it was.
21 WITNESS WALZEL: A I don't remember
22 what the equivalent mud weight was, but it
23 wasn't abnormally high.
24 Q So if I understand you correctly,
25 whatever the reservoir pressure was, you then
26 designed the mud weight --
27 WITNESS WALZEL: A Right.
28 Q And that mud weight didn't stand

1 out as abnormal?
2 WITNESS WALZEL: A No.
3 Q It was kind of in the ballpark, if
4 you will?
5 WITNESS WALZEL: A Yeah, we worked on
6 mud weights up to -- a lot higher, you know,
7 and normal mud weight.
8 MR. BRUNO: Okay. I do have one more
9 question. I apologize for jumping in,
10 Darryl.
11 MR. GRUEN: That's okay.
12 MR. BRUNO: Q The first meeting, you
13 know, the check-in with the incident
14 commander, prior to the first well-kill
15 attempt, was there any sort of feeling this
16 was going to be a standard well-kill attempt
17 or this one's different or this is going to
18 be a several month...
19 WITNESS WALZEL: A We didn't have any
20 expectations.
21 Q Yes, sir.
22 Is it always like that, there are
23 just no real expectations, it just kind of
24 depends?
25 A I mean, we don't -- yes. I mean,
26 we don't show up, Oh, this is going to be a
27 two-day job or a three-day job or two-month
28 job.

1 WITNESS KOPECKY: A And when we
2 attempted to first kill, you're always in
3 hopes that it's going to kill, that you're
4 going to be successful in killing the well.
5 WITNESS WALZEL: A Yes.]
6 EXAMINATION (resumed)
7 BY MR. GRUEN:
8 Q Just a couple of follow-ups on the
9 reservoir pressure and how that input got to
10 you. Did they -- so SoCalGas gave you the
11 reservoir pressure as an input for you to
12 calculate your mud weight?
13 WITNESS WALZEL: A Yes.
14 Q Did I follow that right? Okay.
15 Did they explain to you how they came up with
16 the reservoir pressure?
17 A They had pressure gauges.
18 Q What -- in giving you a number --
19 what was their basis for giving you the
20 number?
21 A To figure out the -- know what your
22 equivalent mud weight is.
23 Q Sure. I'm asking the question the
24 wrong way.
25 What were they -- did they do
26 anything to show you how they came up with
27 the number?
28 A I mean, what do you mean by "how

1 they came up with the number"?
2 Q You talked about logs?
3 A Right.
4 Q Did they show you the logs?
5 A I mean, it wouldn't be -- it
6 wouldn't be -- I mean, when I talk about
7 logs, I'm talking about noise temperature
8 levels. I mean, they have pressure gauges,
9 and they are maintained -- it's their gas
10 storage, so they know what the pressure is.
11 You know?
12 Q Okay. So I think I'm hearing --
13 and check me on this -- that typically
14 someone would come up with a reservoir
15 pressure based on things like noise
16 temperature logs?
17 A No.
18 Q Okay.
19 A Yeah. When I talk about logs --
20 no, I mean, it's -- they are gas-filled.
21 They are putting gas in it, taking gas out.
22 They have censors or, you know, pressure
23 gauges.
24 Q So they would -- they -- did they
25 show you that information -- any of that
26 information? I think we're going around the
27 same thing, but I'm just trying to understand
28 your answer, if they actually showed you the

1 results from the noise temp logs?
2 A It wouldn't have been -- noise temp
3 wouldn't have showed us the pressure. I
4 mean, there's a pressure gauge and a number
5 on it and --
6 Q Okay. Okay. So -- yeah, I think
7 we'll get back to it.
8 MR. SHER: Darryl, may I?
9 MR. GRUEN: Yeah.
10 MR. SHER: Q Just with regards to
11 pressure gauges, do you know -- are those
12 pressure gauges in the well itself, or are
13 those pressure gauges throughout the fields?
14 A I don't know where their gauges
15 were set up.
16 MR. GRUEN: Okay. Okay.
17 EXAMINATION
18 BY MR. BRUNO:
19 Q And Mr. Walzel or Kopecky --
20 Mr. Kopecky, you guys didn't see the gauge,
21 but there was a gauge that registered the
22 reservoir pressure; is that what you're
23 saying?
24 WITNESS WALZEL: A I mean, we saw
25 gauges on wells, and -- you know, I don't
26 recall what that number was right now or --
27 but anyways.
28 Q Right.

1 A So we -- you know, there was gauges
2 on wells out there.
3 Q But it's a direct measurement.
4 It's not a calculated -- in other words, when
5 we talk about reservoir pressure, you're
6 saying that that can be read on a gauge?
7 A Right.
8 Q Okay. Is that --
9 WITNESS KOPECKY: A In pound per
10 square inch. That's what we're referring to.
11 Q And it's atmosphere -- it's at
12 surface?
13 A Correct.
14 WITNESS WALZEL: A Right.
15 Q Does that measure the full pressure
16 of the reservoir all the way down to the
17 bottom hole?
18 A Well, you would have to account for
19 hydrostatic -- or the gas gradient from
20 surface to the reservoir, but yes, I mean,
21 calculate it -- you can calculate it.
22 Q When you're designing your mud or
23 your kill fluid, if you will --
24 A Right.
25 Q -- is it that reservoir pressure or
26 is it also a calculation? Could you maybe
27 talk about that a little bit, like how it --
28 you mentioned gradient. I'm not an expert,

1 sir, so --
2 A Right. So your reservoir has a
3 pressure. Then there's a -- in this
4 instance, it was a gas column, and then
5 there's a pressure gauge at the surface. So
6 you would -- you know, you read your --
7 WITNESS KOPECKY: A Pressure.
8 WITNESS WALZEL: A -- pressure on the
9 gauge and then add the hydro -- the gas
10 gradient column and then add those two
11 together, and it would give you your
12 reservoir pressure.
13 Q And it's that reservoir pressure,
14 when you add them together, that you are
15 designing your mud to?
16 A Well, yes, I mean, you get -- if
17 your reservoir's a thousand PSI and then --
18 there's a formula: .052 times the mud weight
19 times the depth gives you a pressure. So you
20 can calculate what that mud weight would need
21 to be.
22 Q And that calculation of adding the
23 column pressure to the gauge pressure, if you
24 will, was that done by Boots & Coots, or that
25 was done by SoCalGas?
26 A I'm sure. Yeah, I mean, we would
27 have -- I mean, we would have calculated it,
28 you know, ourselves to come up with --

1 WITNESS KOPECKY: A There would have
2 been more than one person running the
3 calculation.
4 Q It's an important number. So a lot
5 of checks?
6 A And it's a pretty simple
7 calculation.
8 Q Does that formula have a name that
9 you described?
10 WITNESS WALZEL: A Gas gradient.
11 Q Gas gradient?
12 A What I would call it.
13 Q Is that synonymous with flow rate?
14 A No. I mean, pressure and flow rate
15 are -- you can have high pressure, low flow
16 rate, low pressure, high flow rate. I mean,
17 I don't know what you mean by "synonymous."
18 Q Does the flow rate factor into the
19 equation for determination of mud weight?
20 A On a dynamic kill, yes, it would.
21 Q The design for the first well-kill
22 attempt, was that a dynamic kill?
23 A It would have -- we were pumping on
24 a well that was flowing, so it would have
25 been -- there was unknowns of flow paths, how
26 much it was flowing, reservoir, you know --
27 there was some unknowns. So you design it
28 for the max we could pump, and that's the max

1 you could pump.
2 MR. SHER: Q Just for clarification,
3 you said the first well-kill attempt. Is it
4 true that SoCalGas tried to do a well-kill
5 attempt prior to Boots & Coots' first
6 attempt.
7 A I mean, I wasn't there, so I don't
8 know.
9 Q Did they provide you any
10 information as to whether or not they
11 attempted an attempt to kill the well prior
12 to Boots & Coots doing so?
13 WITNESS KOPECKY: A I didn't see any
14 documentation.
15 MR. GRUEN: Q What other things
16 factored into the calcs for Boots & Coots'
17 first well-kill attempt? So you talked about
18 flow rate.
19 A Right.
20 Q You talked about the other factors
21 that you used to make your calculation.
22 A Like I said, there was unknowns of
23 where flow path might be, how -- the rate of
24 flow. You know, if it's a small hole, it
25 might be flowing really fast. There's
26 several unknowns. All we knew was, hey, our
27 wellhead equipment is only good for this. So
28 that's our limiting factor.

1 WITNESS KOPECKY: A Limiting factor.
2 WITNESS WALZEL: A So we pumped as
3 fast as we could, and that -- you know, the
4 wellhead -- you don't want to exceed your
5 wellhead equipment.
6 Q Got you. Can you describe what the
7 different unknowns were that you just talked
8 about?
9 A Yeah. Initially, you know, any
10 possible flow paths, conditions of the two
11 being -- conditions around -- you know,
12 around the well -- you know, the formation
13 around the well. But, you know, the flow
14 rate and flow paths were, you know, probably
15 the two biggest.
16 Q Okay.
17 EXAMINATION
18 BY MS. ROSE:
19 Q Two biggest unknowns?
20 A Right.
21 Q Okay. In your experience, is it
22 possible to get that -- have you in past
23 well-kill attempts been able to get flow
24 paths and flow rates to get perfect
25 information for those things?
26 A Well, from -- you know, from
27 running, say, a noise temp log, you can get a
28 picture of where the flow might be entering

1 and exiting a wellbore. Spinner survey is
2 nothing more than a little spinner on a tool,
3 and if it's not spinning, it's not flowing.
4 If it's spinning somewhere, you can kind of
5 pinpoint holes. There's USIT logs and
6 different logs to run to get a picture of the
7 flow paths.
8 And then you can -- if the well is
9 being diverted, you can set up pressure
10 gauges and get an estimate of gas flow. Or,
11 you know, if it's several -- if it's oil,
12 water, gas, you know, makes it a little more
13 complicated to get an exact. But, you know,
14 typically, you know, you design it, and then
15 you can put in a -- you know, you'd have
16 extra hydraulic horsepower and stuff to -- if
17 you need to pump more. But in this case, the
18 5,000 PSI was kind of limited on how fast you
19 could actually pump on the well.
20 Q So with regards to the noise temp
21 logs and the spinner surveys and those
22 things, were any of those used here in order
23 to get access, get a better understanding of
24 the flow paths and the flow rates?
25 A Yes.
26 Q Can you talk about that more?
27 A Yes. I don't recall if we did it
28 after the first attempt or second attempt,

1 but we ran noise temperature. And from what
2 I recall, there was a severe cooling at -- it
3 was -- it was over a range, but it was cold
4 enough that the tools weren't communicating
5 with the logging truck. That was the first
6 I've ever seen.
7 EXAMINATION
8 BY MR. SHER:
9 Q What does that mean if it's cold?
10 A I guess the tools have -- oh. If
11 it's cold, that means the gas is expanding in
12 the cooling. And I guess the tools -- I
13 don't know if it was how the temperature
14 rate -- I never seen it before, but over that
15 range, it was -- or those depths, it was
16 cold. So the tool was not communicating with
17 the logging truck. So we ran it, and it was
18 cold over -- I don't remember the depth,
19 but -- exactly, but you know, maybe, say, 800
20 to 1,000 foot there was a cooling. So we ran
21 the spinner survey, and it didn't show
22 anything until, I remember, right at the
23 bottom it was spinning.
24 So, you know, at the time it
25 appeared that the gas was exiting the tubing
26 fairly deep. Then we also -- yes. So we ran
27 those two.
28 Q Sorry. By "fairly deep," in your

1 experience, is that 1,000 feet or 8,000 feet?
2 A Yeah. I'm sorry. When I say
3 "fairly deep," it was just -- well, it was
4 as -- I don't remember the number, but the
5 spinner looked normal until it got as deep as
6 we ran it in the well. When I say "fairly
7 deep," it was towards the bottom of the well.
8 So that's why I said "fairly."
9 Q So that gives you an idea that the
10 gas is escaping the tubing or the casing at
11 some point deeper than 1,000 feet in the
12 well?
13 A No. Well, it gave a range. It was
14 kind of a -- it was cold over -- you know, it
15 was cold over certain -- again, the
16 information wasn't being sent to the logging
17 truck very good -- very well. So it was just
18 a range of depth where it was cold. So there
19 wasn't -- you couldn't say, Oh, it's right --
20 there's a hole right here. It was just
21 somewhere over -- there's likely a hole.
22 Q Okay.
23 MR. SHER: Q Sorry. On that point --
24 so when you have gas expanding and creating
25 cooling, it means that gas is going from a
26 smaller, maybe, aperture to a larger -- is
27 that --
28 A Are you talking about hole size?

1 Q Yes.
2 A I mean, it means it's going through
3 a hole and expanding.
4 MS. ROSE: Q So the volume of the gas
5 would be increasing?
6 A Yeah. I mean, it's expanding.
7 MS. ROSE: Yeah.
8 EXAMINATION (resumed)
9 BY MR. GRUEN:
10 Q So just regarding the flow paths
11 and flow rates -- so the noise temp logs, you
12 ran it. You ran a spinner survey, right?
13 A Mm-hmm.
14 Q You did your own noise temp log?
15 You created your own?
16 A What do you mean by I created it?
17 Q I'm wondering if you used
18 SoCalGas's -- if they provided you a noise
19 temp log or --
20 A No. There was one run while we
21 were out there.
22 Q And you used the information that
23 you had from both the noise temp log and the
24 spinner survey while you were out there?
25 A Right.
26 Q Did you get any information from
27 SoCalGas about the condition of the well
28 before you got out there?

A No.

Q No. Okay.

WITNESS KOPECKY: A No.

MR. GRUEN: Okay.

MR. SHER: Darryl -- sorry -- I just want to note it's 11:15. Does anyone need a break for the bathroom?

WITNESS KOPECKY: A Sure.

MR. GRUEN: Let's go off the record.

(Off the record.)

MR. GRUEN: Back on the record.

Q If we can just -- if we could keep moving forward. I'm trying to get a time line as best we can.

WITNESS WALZEL: A Mm-hmm.

Q So when you first came out -- and we were talking a little bit about a well-kill attempt that you did -- how soon after you came out approximately do you remember that you started the first well kill?

A Oh. I don't recall how many days that was.

Q Okay.

WITNESS KOPECKY: A I do not either.

Q Do you recall approximately how many well-kill attempts you did?

A I recall approximately three to

1 possibly five.
2 Q Over how long a period
3 approximately?
4 A Approximately 28 days.
5 WITNESS WALZEL: A Right.
6 Q Okay. And again, approximately how
7 often did you do each well-kill attempt?
8 WITNESS KOPECKY: A I don't recall.
9 WITNESS WALZEL: A I don't recall how
10 many days were in between because between
11 some of them we were doing -- we had -- we
12 had to do other things.
13 Q Okay. Okay. So three to five
14 well-kill attempts over about 28 days. Do
15 you recall how -- so I think you described
16 the weight of the mud and the pressure that
17 you used on the first attempt that you tried?
18 A Right.
19 Q How did those factors change, if at
20 all, from the first attempt to the second?
21 A I mean, the reservoir pressure was
22 decreasing. You know, that's -- that would
23 be the reservoir pressure, and maybe the flow
24 coming from the well might have decreased.
25 But again, that was over time. The pressure
26 was the only thing that I recall recorded
27 that could be verified had changed.
28 Q Decreasing?

1 A Decreasing.
2 Q Okay. Okay. Anything to add, Mr.
3 Kopecky?
4 WITNESS KOPECKY: A No. Just as Danny
5 says, the pressure was decreasing, and going
6 by memory, to my knowledge, SoCal was
7 reducing that pressure by moving from that
8 reservoir -- moving the gas.
9 Q As the pressure decreased, how
10 would you adjust the weight of the mud?
11 WITNESS WALZEL: A Well, I mean, I
12 don't recall how -- if the mud weight was
13 changed or if we changed the mud weight while
14 we did it.
15 Q Okay.
16 WITNESS KOPECKY: A And just for
17 clarification -- and we typically use the
18 term "mud weight," but I don't recall -- I
19 don't recall if it was actually mud or if it
20 was a clear brine.
21 Q So there was a substance, and you
22 were figuring out what weight to use?
23 WITNESS KOPECKY: A Right.
24 WITNESS WALZEL: A Right.
25 Q Did you consider other options? I
26 assume this -- maybe I should clarify this.
27 These were all top well attempts, right?
28 A Mm-hmm.

1 Q Were there -- I don't have the
2 knowledge that you both have. Were there
3 other options that you considered other than
4 the top well-kill attempts in order to kill
5 the SS-25?
6 A We discussed a relief well.
7 WITNESS KOPECKY: A And I was aware
8 that they were -- SoCal was making the
9 preparations and physically saw them. I
10 don't remember on what day I physically saw
11 preparations being made in constructing pads,
12 and things of that nature -- two pads, as a
13 matter of fact, but they were making
14 preparations to drill the relief well
15 simultaneously. Of course, it takes time to
16 get everything together -- a rig. So it
17 really wouldn't be same options, but they
18 were proceeding with that -- that
19 contingency.
20 Q Did you have any recommendations --
21 did you talk with them about the relief well?
22 A I didn't personally, but I know
23 that Boots & Coots did.
24 WITNESS WALZEL: A Right.
25 Q Who at Boots & Coots talked to
26 SoCalGas about the relief well?
27 A Well, the conversation I recall
28 early -- and I don't remember if it was after

1 the first or the second, but early on in the
2 thing, you know -- hey, we always want to be
3 planning a relief well in case surface
4 intervention doesn't work or isn't possible.
5 And they were -- I was told our engineers are
6 gathering data and coming up with a plan.
7 Then our -- we have -- a relief
8 well group started working with them and
9 planning relief well directories, you know,
10 the kill from the relief well to the blowout
11 well, but I wasn't involved with the relief
12 well planning. But early on in the planning
13 it was already -- the wheels were -- the
14 process was in motion.
15 Q Okay. Just in terms -- let me go
16 back to the three to five well-kill attempts
17 that you made. I get it. This is a rough
18 estimate. Again, we're talking about
19 something about three years ago. So just in
20 your experience, how often have you been
21 successful on your first well-kill attempt
22 approximately?
23 A Oh, I wouldn't have a number
24 percentage-wise.
25 Q Can you give a rough estimate?
26 A I mean, I could say they are not
27 always killed on the first time.
28 Q So maybe between 80 and 90 percent

are killed on the first time or 50 and 60 percent are killed the first time?

A I mean, I wouldn't have -- I wouldn't know a percentage.

Q I guess I'm wondering just based on your experience how often -- how often -- I get that they are not all killed the first time, but they are -- some of them are killed the first time, I would imagine, right?

A Yeah. Some are.

Q So are we closer to almost all of them being killed the first time, or is it closer to almost none of them being killed the first time?

A I mean, I don't have a percentage. Somewhere in between.

Q Okay. How about you?

WITNESS KOPECKY: A No, I'm thinking -- trying to, but I can't come up with any kind of percentage either.

Q Was Columbia killed the first time?

WITNESS WALZEL: A If I remember, it bridged on its own.

Q So that means -- by "bridging," it actually stopped the gas from leaking? In the case of Columbia, it stopped the incident naturally?

A Yeah.

1 Q Did you try to kill?
2 A It bridged. If I remember, it
3 bridged as we were getting -- we were -- the
4 snubbing unit rigged up.
5 Q Oh, I see. What about some of the
6 other wells that you talked about in the past
7 year, did those -- that you mentioned to Ms.
8 Rose -- were those successful -- other than
9 Columbia, were those successful kills in the
10 first attempt?
11 WITNESS KOPECKY: A Honestly, I think
12 those -- any other wells that we mentioned
13 are somewhat -- other than the one similarity
14 that we brought up about Columbia, I think
15 other well attempts would be somewhat
16 irrelevant. That is, as we had stated
17 earlier, every situation is different. I
18 mean, it may appear similar, but there's
19 different information that goes into the
20 strategy.
21 Q Right. So I hear what you're
22 saying, and I -- I think I just like to get
23 the facts out and understand. And I get that
24 you haven't given me a specific answer to
25 this also, and I'm asking you guys both
26 directly. Okay? So let's just get this down
27 and be sure. It could be because I may have
28 some follow-ups. Okay. So just with those

1 well-kill attempts, even noting your point
2 about it not being relevant, I'd still like
3 you to answer the question. Okay?
4 So in terms of -- all right. So
5 Columbia bridged on its own. I'm just
6 looking for the other leaks. I think Mr.
7 Kopecky, you had identified a couple of them.
8 There was Columbia, Trinidad-Tobago -- did
9 that one -- was that one killed on the first
10 attempt successfully?
11 A Yes, it was.
12 Q South Texas, was that one killed on
13 the first attempt successfully?
14 A No.
15 Q When was that one killed?
16 A Maybe on the third circulation.
17 What I mean -- for clarification,
18 we're talking apples and oranges. That was a
19 drilling well. It wasn't a production well
20 or a storage well. That well was being
21 drilled. There was totally different
22 circumstances on the well in Trinidad-Tobago.
23 It took 7 barrels of fluid to kill the well.
24 Q I appreciate the clarification.
25 That's helpful. I think I'm understanding
26 why you're saying it's not relevant.
27 A Yes, sir.
28 Q So that's helpful in context.

1 Okay. Let me just ask -- I think you had
2 talked a little bit about some kind of
3 information -- some kinds of records that you
4 need or that you typically use, and I think
5 one of the things that you mentioned was
6 drilling -- drilling records and well
7 history. So could you talk about, in the
8 case of SS-25, what information you asked for
9 from Southern California Gas Company in order
10 to do your work?
11 A Yes, they provided drilling records
12 when the well was drilled. There was a --
13 some old logs, and I believe it was -- you
14 know, I can't recall what logs, but anyway,
15 you know, just your basic, you know -- what
16 the, you know, the drilling records were from
17 the company that drilled the well case and
18 sizes. There might have been some
19 resistivity log in there. I don't recall
20 exactly what it was. But you know, it would
21 have been something just to determine fluids
22 in the formation when they drilled the well
23 years ago.
24 Q Anything else?
25 A Not that I can recall right now.
26 Q Anything?
27 WITNESS KOPECKY: A No, sir.
28 Q That's helpful. So in terms of the

1 drilling records, what do you typically
2 expect to see in a drilling record given your
3 experience?
4 A Well, the normal drilling record
5 today would be we drill from this depth to
6 this depth, mud weight of this -- basically
7 just a diary of what happened at the well
8 that day.
9 Q Okay. So on a historic basis,
10 day-to-day, dating back to the beginning of
11 the well?
12 A No. This would have been during
13 the drilling process of the well.
14 Q Okay. When the well was initially
15 drilled?
16 A Correct.
17 Q Got you. Okay. And what did you
18 see in the drilling records in the case of
19 SS-25? What did you see in those drilling
20 records?
21 A Today we drilled this depth to this
22 depth, ran this casing, submitted this
23 casing, your normal drilling activity.
24 Q Did you say -- was there any
25 information regarding the drilling activity
26 that you just described that was missing?
27 A No.
28 Q How about -- what would you see on

1 the logs and the other records that you
2 talked about? What would you expect to see
3 in those cases?]
4 A From what I recall, the log, it
5 would have been a resistivity, which it was,
6 you know, a typical log that after a well
7 drill, it would have said, okay, this zone is
8 water-bearing or oil-bearing or, you know,
9 just a normal logs run after a well is
10 drilled.
11 Q Okay. So when you say
12 water-bearing, can you just clarify what that
13 means.
14 A Well, I mean it would tell you. It
15 would give you an idea if a certain zone has
16 water in it or oil in it or, you know,
17 resistivity of the fluids in the well.
18 Q Okay. And why is that? Why do you
19 need that information?
20 A Well, the whole idea for drilling
21 the oil well was to find oil so, you know, a
22 company would run them to say, hey, this
23 might be oil right here.
24 WITNESS KOPECKY: A It would give you
25 an indication of where you set your pipe.
26 Q Gotcha. So the higher the
27 resistivity, the more likely that you might
28 find oil?

1 A Right.
2 Q Okay, I follow. So what other
3 things within the well history, what other
4 records would you -- in order to do your work
5 in the course of your work -- would you ask
6 to see in order to kill a well?
7 A First of all, just for
8 clarification again, I didn't examine any of
9 the drilling records. I think I did -- the
10 only records I saw on the well were of a
11 wellhead schematic.
12 Q Okay. And what was the purpose in
13 seeing -- in asking for and seeing the
14 wellhead schematic?
15 A Well, typically when we do that, it
16 kind of helps you determine for a fact
17 tubular size by your nomenclature of your
18 wellhead equipment. If you've got a 2 7/8,
19 3 1/2, whatever, 2 3/8 tubing, typically you
20 can't see in the well, of course. And if
21 someone says, hey, we got 2 7/8 tubing and
22 typically the well will have 2 9/16 tree on
23 it, so it's just different factors that you
24 put together to draw you to a conclusion.
25 Q Okay.
26 WITNESS WALZEL: A And that
27 information is needed, you know. If we're
28 going to rig up a wireline unit or whatever,

1 you need to know flange sizes so if you need
2 to order out a valve, you know what size
3 valve to order out to, you know, to put on
4 the tree or whatever.
5 WITNESS KOPECKY: A Basically so you
6 know what you're working with.
7 Q Okay. And so what equipment, if
8 any, did the wellhead schematic -- did you
9 make any decisions about what equipment to
10 use based on the wellhead schematic?
11 WITNESS WALZEL: A I mean it would
12 have been additional valve, you know, size of
13 the valve. But if we needed to rig up a
14 wireline, we need to go from this size flange
15 or, you know, basically that would have been
16 it. That wouldn't have determined what
17 equipment we need to order, just what do we
18 need to order to rig up the equipment.
19 WITNESS KOPECKY: A We did add -- we
20 did an additional swab valve or crown valve,
21 if you will, just as an additional barrier.
22 Q What is a swab valve or a crown
23 valve?
24 A It's located at the uppermost of
25 the tree, just below your tree cap or your
26 bottom hole test adapter.
27 Q Okay.
28 A It would be your top component on

1 the tree itself.
2 Q Thank you. Were any of the flanges
3 or the valves, was there any that didn't fit
4 properly or that weren't used, that you
5 couldn't use effectively when you used the
6 equipment to hook up?
7 WITNESS WALZEL: A No.
8 WITNESS KOPECKY: A No, not to my
9 knowledge.
10 WITNESS WALZEL: A Because we rigged
11 up a, you know, ran pipe, plumbed everything
12 up from the wellhead up and tied in, you
13 know. As I recall, the valves were working.
14 WITNESS KOPECKY: A Yes.
15 Q Okay. Thank you.
16 A The equipment, service equipment,
17 was in relatively good condition.
18 Q Okay. And based on the wellhead
19 schematic, all the equipment that you had
20 hooked up properly, the wellhead schematic --
21 A It was accurate.
22 Q -- information was accurate?
23 WITNESS WALZEL: A Yeah.
24 WITNESS KOPECKY: A And then we
25 confirmed it visually.
26 Q All right. What other information
27 did you ask for regarding the history of the
28 well, if any?

1 WITNESS WALZEL: A I mean that would
2 have been -- I believe that covered all the
3 information.
4 Q Okay.
5 MR. BRUNO: Yeah, if I may.
6 MR. GRUEN: Yes.
7 EXAMINATION
8 BY MR. BRUNO:
9 Q Mr. Walzel or Mr. Kopecky, just on
10 the wellhead itself, I think we're talking
11 about the schematic so I do have a question.
12 Going back earlier we talked about you don't
13 want to exceed your wellhead equipment when
14 we're designing the, you know, the --
15 WITNESS WALZEL: A Correct.
16 Q -- to overcome. Was the wellhead
17 sufficient to overcome the --
18 A Yes.
19 Q -- the reservoir pressure?
20 A Yes.
21 Q So it wasn't limited by the
22 wellhead equipment?
23 A No. Limited to how fast we could
24 pump on it.
25 Q So it was limited by how fast you
26 can pump but not the weight?
27 A Right, yeah. Well, it has a
28 pressure rating. Every wellhead has a

1 pressure rating, 3,000, 5,000, 10,000 PSI,
2 whatever it is. And, you know, you don't
3 want to apply pressure that's more than what
4 it's rated for.
5 Q Right. You don't want to yield
6 a --
7 A Right.
8 Q -- piece of steel?
9 A Correct.
10 Q If you had a more robust wellhead
11 on 25, would you have pumped at a higher
12 rate?
13 A You would have to -- you'd have to
14 look at the tubulars and all that but, you
15 know, the wellhead was a design. It was fit
16 for purpose in our opinion.
17 WITNESS KOPECKY: A My recollection,
18 and I don't recall the number of the
19 reservoir pressure, but I think my best
20 recollection is the wellhead working pressure
21 of 5,000 pounds pretty far exceeded that
22 reservoir pressure.
23 Q Okay, so based on the reservoir
24 pressure, the ensuing calculations, and the
25 design, you weren't limited by the wellhead?
26 You were able to design a good plan to go in
27 with the first well built in?
28 WITNESS WALZEL: A Yes. I mean we

1 designed it to not exceed the pressure rating
2 of the wellhead equipment.
3 EXAMINATION
4 BY MS. ROSE:
5 Q Would you have pumped at a higher
6 pressure if the wellhead had been rated for a
7 higher pressure?
8 WITNESS WALZEL: A If it was rated for
9 it --
10 Q Yes, if it --
11 A -- and the tubulars were rated for.
12 Q Is it always better to pump at a
13 higher pressure?
14 A Not always but, you know, if you
15 pump at a faster rate, then you'll have a
16 higher pressure --
17 Q Yeah, and that's --
18 A So, but --
19 Q -- desirable?
20 WITNESS KOPECKY: A Well, just to
21 clarify again, the wellhead was normal. You
22 wouldn't find a higher rated -- on this type
23 of well, you would not find a higher rate
24 working pressure assembly anywhere.
25 Is that accurate?
26 WITNESS WALZEL: A Yeah.
27
28

1 EXAMINATION (resumed)
2 BY MR. GRUEN:
3 Q So this was -- what that means is
4 this is the highest pressure which you could
5 pump on this particular well?
6 WITNESS WALZEL: A Correct.
7 Q Why is that the case, that this is
8 the highest rated I guess, the highest
9 pressure at which you could pump based on
10 this wellhead for this kind of well?
11 WITNESS KOPECKY: A Your wellhead
12 design is based from when the well is drilled
13 taking in consideration your formation
14 pressure.
15 Q Okay. And so this --
16 A Whereas, your formation will not
17 exceed the rated working pressure of your
18 surface equipment.
19 Q So if you pumped at a higher
20 pressure than what this wellhead was designed
21 to handle, what would have happened?
22 WITNESS WALZEL: A Well, if you
23 exceed -- I mean there's a possibility of
24 your wellhead equipment failing if you exceed
25 the rating of it.
26 WITNESS KOPECKY: A Correct.
27 Q All right, okay. In terms of -- I
28 want to just go back to the timeline for a

1 second. You talked about being there for
2 about 28 days, and I think you were talking
3 about three to five well kill attempts. In
4 terms of that, how quickly did you get the
5 drilling records when you asked for them?
6 When did they provide -- when did SoCalGas
7 provide those to you?
8 A I don't know that. Danny may.
9 WITNESS WALZEL: A As I recall, they
10 had them with them already.
11 Q And same then for the resistivity
12 logs?
13 A Yes. It was a folder and all the
14 documents were in it.
15 Q Okay. All the documents you needed
16 to do your work?
17 A Yeah.
18 Q Okay, I follow.
19 WITNESS KOPECKY: A And just, if I can
20 interject, when I stated 28 days, that's
21 because I spent approximately 28 days which I
22 think everyone is aware, I think the event
23 was a little longer than that. I had rotated
24 out.
25 Q Gotcha. Thank you. I appreciate
26 that and thanks for the reminder on that.
27 Were you there longer, Mr. Walzel?
28 WITNESS WALZEL: A I was. And I

1 either got home on December 4th or
2 December 14th. I think it might have been
3 the 14th.
4 Q Let's see if I'm doing my math
5 right here. So you would have come out --
6 WITNESS KOPECKY: A I took the call
7 late October, I think, very end, 28, 27
8 October. I returned to Texas, to Houston,
9 late November so that's the best I can --
10 Q Right around Thanksgiving it sounds
11 like, give or take?
12 A Right, right -- no, I think I
13 missed that. I did.
14 Q Oh, is that right? Okay. You had
15 Thanksgiving at Aliso Canyon?
16 A Right.
17 WITNESS WALZEL: A Yes, we did.
18 MR. SHER: Probably wasn't a laughing
19 matter.
20 MR. GRUEN: Q I laugh now, but I
21 wouldn't have been laughing then either. Do
22 you recall how long after Thanksgiving you
23 had to stay?
24 WITNESS KOPECKY: A I don't. I know I
25 was there approximately 28 to 30 days.
26 Q Okay, that's helpful. And you were
27 there. So, Mr. Walzel, you were there
28 another week to two and a half weeks

1 yourself?
2 WITNESS WALZEL: A Correct.
3 Q The extra time that you were there,
4 were there any additional well kill attempts
5 that you recall?
6 WITNESS WALZEL: A I don't -- I know
7 by when I had left, there had been no more
8 attempts. And I don't know when -- I don't
9 remember what day the last one was, but
10 towards the end of my time there, it was
11 already had turned into, you know, relief
12 well.
13 And the last week or two is I would
14 say we were just there to, you know, monitor
15 the 25 site and keep it secure, monitor it
16 while they -- while they got ready for the
17 relief well. And then I made a few trips
18 down there to the rig while they were rigging
19 up.
20 Q Yeah.
21 A But they didn't -- they hadn't
22 started drilling by the time I got out of
23 there. They were still in the rigging up
24 process.
25 Q Okay. And after you both left,
26 especially after you left since you left
27 later, Mr. Walzel, did Boots & Coots
28 recommend any additional well kill attempts?

1 A No.
2 WITNESS KOPECKY: A I have no
3 knowledge either of that.
4 Q Do you know if SoCalGas tried any
5 additional well kill attempts after you both
6 left?
7 WITNESS WALZEL: A No. As I recall,
8 there was no more. I mean after the last one
9 we did, the decision was made to go in the,
10 you know, relief well.
11 Q Thank you.
12 MR. SHER: Can we go off the record?
13 (Off the record.)
14 (Whereupon, at the hour of 12:00
15 p.m., a recess was taken until 1:00 p.m.)]

1 AFTERNOON SESSION - 1:10 P.M.
2 * * * * *
3 EXAMINATION (resumed)
4 BY MR. GRUEN:
5 Q So a couple points of
6 clarification, I think before, during this
7 morning, you'd mentioned that Danny Clayton
8 was the team lead?
9 WITNESS WALZEL: A Uh-huh.
10 Q What does that mean being the team
11 lead? What did he do in his role?
12 WITNESS KOPECKY: A He communicates
13 with the client directly, and coordinates a
14 plan with the client, and then we would
15 execute the plan.
16 Is that fair, Dan?
17 WITNESS WALZEL: A Yes.
18 Q Thank you.
19 Did Danny, on the Boots & Coots'
20 side, also talk to anyone else in order to
21 execute the plan?
22 MR. SHER: For clarification,
23 "Mr. Clayton"?
24 MR. GRUEN: Thank you, Danny Clayton.
25 Q Did you understand I meant Danny
26 Clayton?
27 WITNESS KOPECKY: A Yes.
28 Q So when you were doing your work,

1 you would report directly to Danny Clayton?
2 WITNESS WALZEL: A Correct.
3 Q And as far as you know, Danny
4 was -- basically, Danny was making the
5 decision on the Boots & Coots' side about how
6 to move forward; is that fair?
7 WITNESS WALZEL: A Yes.
8 WITNESS KOPECKY: A Yes.
9 MR. SHER: Clarify, with input from the
10 rest of the team?
11 WITNESS KOPECKY: A Correct.
12 WITNESS WALZEL: A Yes.
13 MR. GRUEN: Okay. That's helpful.
14 Q Given the time you were out there
15 and what your experience was on the well-kill
16 attempts on SS-25, do you think that Southern
17 California Gas Company could have seen the
18 incident coming beforehand?
19 WITNESS WALZEL: A I don't believe so.
20 WITNESS KOPECKY: A I don't believe
21 there was any way to see that.
22 Q Okay. And that's true even if you
23 had been in their shoes, given all the
24 experience that you have, would you have been
25 able to see it coming beforehand?
26 WITNESS KOPECKY: A No.
27 Q Do you agree?
28 WITNESS WALZEL: A No.

1 Q That makes sense. I just want to
2 ask you a little bit about what you think
3 caused the incident there to best of your
4 knowledge. So given your experience and
5 background, not only with wells in general,
6 but with what happened on SS-25, to the best
7 of your knowledge, what do you think caused
8 the incident?
9 WITNESS WALZEL: A I can't comment on
10 what caused it. When we got through, there
11 was a hole in the tubulars somewhere, but as
12 far as what caused it, we weren't -- that
13 wasn't -- we didn't look into what caused it.
14 Q Okay. That's fair.
15 Anything to add?
16 WITNESS KOPECKY: A No. I agree.
17 Q Have you seen any pictures of Well
18 SS-25 since the incident?
19 WITNESS WALZEL: A No.
20 WITNESS KOPECKY: A No, I have not.
21 Q Okay. And that includes any
22 pictures of any of the tubing or the casing
23 that's been removed from the well, you
24 haven't seen anything?
25 WITNESS KOPECKY: A No, sir. I have
26 not.
27 WITNESS WALZEL: A No.
28 Q Thank you. This is a set of

1 questions. I want to understand about some
2 of the earlier well-kill attempts and if
3 those could have damaged the well or hurt the
4 chances of the later well-kill attempts
5 succeeding.
6 So once the first well-kill attempt
7 didn't work, how did that impact the second
8 well-kill attempt?
9 WITNESS WALZEL: A Well, the first
10 one, I don't remember how many barrels we
11 pumped total. As I recall, we shutdown. I
12 recall we shutdown early, and regrouped to
13 talk about it because things weren't going
14 as, you know -- to talk about what we seen
15 before continuing on.
16 Q Okay.
17 A And then on the second one, you
18 know, I think the fluid weights stayed the
19 same. I mean, I don't think we changed fluid
20 weights because we had already come up with
21 that number. There was Barite pill that was
22 going to be pumped at the end, and maybe
23 those volumes changed. Maybe one time we
24 didn't pump a Barite pill, but as far as
25 hurting the well, you know, I didn't see
26 anything from -- from pump pressures or
27 anything to say that anything within the well
28 changed. The only thing that changed was the

1 area, the area around the well.
2 You know, initially there was just
3 gas, you know, coming, you know, various
4 places around the pad. And then after one of
5 those pumped jobs -- might have been the
6 second one, but, anyway, all the gas was
7 coming up around the well, and blew the dirt
8 up from around the well, and we had to go
9 secure the well to keep it from -- stable
10 and, but that was the only thing I observed
11 to change was the area around the well.
12 Q When you observed the change in the
13 area around the well, was that after the
14 first Boots & Coots' well-kill attempt?
15 A I don't recall if it was after the
16 first or maybe the second one.
17 WITNESS KOPECKY: A I agree.
18 Q You agree?
19 WITNESS KOPECKY: A What I mean is I
20 don't recall if it was the first or second
21 well-kill attempt when the ground
22 deteriorated.
23 Q I see. Okay. Do you have any idea
24 why the ground deteriorated after the first
25 or second well-kill attempt?
26 WITNESS WALZEL: A I mean, I can't --
27 I can't say why, other than we were pumping
28 fluid in there at, you know, whatever rate we

1 were pumping, you know, and it'd circulate
2 mud up, and, you know, it's going to the path
3 of the least resistance and made its own
4 path.
5 Q Anything?
6 WITNESS KOPECKY: A I agree.
7 MR. SHER: Clarification?
8 MR. GRUEN: Okay.
9
10 EXAMINATION
11 BY MR. SHER:
12 Q Does that mean as your pumping down
13 through the well, the fluids are escaping at
14 some point from the tube where maybe there's
15 a hole where the gas was going out and that's
16 coming -- that's causing erosion around the
17 well?
18 WITNESS KOPECKY: A Well, it was
19 coming to the surface, some of your fluids.
20 Q Okay.
21 WITNESS KOPECKY: A Not all would
22 come.
23 WITNESS WALZEL: A Right. There's no
24 way to tell like we pumped 800 barrels and we
25 got 600 back because the return for his
26 company. Out and around the well, there was
27 no way to measure.
28 WITNESS KOPECKY: A No time --

1 WITNESS WALZEL: A No way to measure.
2 WITNESS KOPECKY: A -- capture.
3 WITNESS WALZEL: A Losing to the
4 formation.
5 Q I went down to the wellsite and
6 there was just a big hole and lots of oil
7 residue and so forth. So the liquid that was
8 getting pumped was coming up and caught in
9 that earth around --
10 WITNESS KOPECKY: A Yes, sir.
11 WITNESS WALZEL: A Right. We were
12 pumping down the tubing, and it was coming
13 out of the tubing because we did set a plug
14 in the tube and then perforated it; so it was
15 going out the perforations, up the casing,
16 and then exiting wherever the hole was in the
17 casing.
18 MR. SHER: Okay. Thank you.
19
20 EXAMINATION (resumed)
21 BY MR. GRUEN:
22 Q What do you think -- what did it
23 look like was coming out of the ground?
24 WITNESS WALZEL: A The fluids we were
25 pumping in and gas.
26 Q Okay. How far were they going when
27 you were out there looking at them coming
28 out?

1 WITNESS WALZEL: A How far was what
2 going?
3 Q The fluid and the gas.
4 WITNESS WALZEL: A The fluid was, if I
5 recall, it was coming up from around the well
6 and then there was some trenches, catch pits,
7 and it was going there and they were
8 collecting it from there.
9 Q Was it shooting up into the air or
10 was it just kind of running along the ground?
11 Or what did look like?
12 WITNESS WALZEL: A with the gas, it
13 was -- I don't have a word to describe it,
14 but there was some mud coming up.
15 WITNESS KOPECKY: A Right.
16 WITNESS WALZEL: A As you're pumping
17 the gas you're -- the activity of the gas
18 because you're pumping on it, but just the
19 gas breaking out through the mud. It was
20 coming up out of the cellar. Call it the
21 cellar there around the well.
22 WITNESS KOPECKY: A Percolating, kind
23 of.
24 Q Okay. Okay. All right. So I
25 think just running through those from maybe
26 the second to the third - let's say - I think
27 you mentioned, Mr. Kopecky, three to five
28 attempts. I'll assume just for the sake of

1 asking questions - and maybe I'm not quite
2 right - it's maybe five attempts, and just
3 for purposes of asking you what you noticed
4 in terms of the changes from the second to
5 the third attempt, to the third to fourth,
6 and the fourth to fifth. Does that make
7 sense?
8 So I'm just trying to get a sense
9 of how things -- what impacts to the well the
10 second attempt had, for example.
11 So anything that you noticed that
12 was changing or damaging the well from the
13 second --
14 WITNESS KOPECKY: A Well, as Danny
15 mentioned, we didn't notice any changes to
16 the well, and, of course, my changes would be
17 visually because I was located at the well.
18 The only changes that were noted
19 were the cratering of the location around the
20 well. And, again, I think -- I think there
21 were probably -- I said three to five. I
22 really think it may have been four, but I'm
23 not sure, but I think it was probably after
24 the second that we had to move our pump
25 equipment and all further up the hill to get
26 it off the location because it was deemed
27 unstable, if you will. We didn't know how
28 much erosion was going to continue on the

1 next kill attempt; so we just physically had
2 to move everything.
3 Q Did you notice the cratering
4 continue as you moved to the later attempts,
5 to the third and fourth attempt?
6 WITNESS WALZEL: A Well, after each,
7 you know, after each attempt, the crater
8 might have grew just a little bit because,
9 you know, you're introducing liquids, and,
10 you know, its going to erode more than just
11 if it's gas. So, you know, the crater got a
12 little bigger each time.
13 Q How did that change what you did in
14 terms of the kill attempts as the crater
15 grew?
16 WITNESS KOPECKY: A Well, we -- and I
17 don't recall if it was after the first kill
18 attempt, but we strengthened the catch pits
19 and got equipment in to create more berms, if
20 you will, more levies to direct any flow we
21 had from the pumping. And, of course, we
22 had, you know, extensive monitoring, gas
23 monitoring, and I don't know if that covered
24 everything.
25 WITNESS WALZEL: A Yeah. And also
26 in-between whether it was the first and
27 second or the second to third, we had to
28 get -- well, we got all the logging tools,

1 you know, the logging equipment to run the
2 noise tamp and the spinner, and we attempted
3 a gyro. We ran a gyro, too, and that was
4 for, you know, if we lost the well, we would
5 have an accurate survey for the relief well
6 drill, you know, as a contingency.
7 And before the -- it was after one
8 of those kill attempts, you know, we had, you
9 know, fluid in the tube. And, anyway, ice
10 formed a plug in the tube. And so we had to
11 get a cold tube and heat it to go through the
12 ice plugging, or the ice had formed in the
13 tube so we could gain access to run our logs.
14 MR. SHER: Would ice have formed
15 because of the cooling gas?
16 WITNESS WALZEL: A Correct.
17 MR. GRUEN: Q So was ice forming --
18 was more ice forming in the later well-kill
19 attempts compared to the earlier ones?
20 WITNESS WALZEL: A I don't -- there
21 was only one time we had to get ice out of
22 the tubing. Now, whether there was anything
23 different going on, I can't say other than
24 after the second attempt or third attempt,
25 there was still a column of fluid in the tube
26 and that froze.
27 Q Okay.
28 WITNESS WALZEL: A You know, after all

1 the other ones, all the fluid might have left
2 the tubing and there wasn't any liquid left
3 to freeze there.
4 Q Anything you want to add,
5 Mr. Kopecky?
6 WITNESS KOPECKY: A No.
7 MR. BRUNO: Darryl, if I may?
8 MR. GRUEN: Yes.
9 EXAMINATION
10 BY MR. BRUNO:
11 Q Did SoCalGas indicate any ice plug
12 before your arrival or once you got on board
13 before the first Boots & Coots' well-kill
14 attempt?
15 WITNESS KOPECKY: A Not to my
16 knowledge.
17 WITNESS WALZEL: A I don't recall any
18 discussions about ice plugs.
19 Q Am I right to gather that the --
20 it's the kill fluid that froze with the
21 combination of the leak?
22 WITNESS KOPECKY: A It could have been
23 kill fluid and well-bore fluid.
24 WITNESS WALZEL: A Right. After one
25 of the pump jobs, you know, the only thing
26 that would have been in the tubing would have
27 been the fluid we pumped; so it would have
28 been the kill fluid.

1 Q Okay. And then if I may, I think
2 Mr. Gruen hit on this, but the erosion that
3 occurred around wellhead, your kill attempts,
4 your subsequent kill attempts, those weren't
5 modified; right?
6 You moved equipment and whatnot,
7 but you didn't have to change your procedures
8 or did you do anything different that absent
9 erosion you wouldn't have done?
10 In other words, did you execute the
11 optimal plan that Boots & Coots wanted to?
12 WITNESS WALZEL: A Yes.
13 Q Did you have everything you needed
14 to do at your job?
15 WITNESS WALZEL: A Yes.
16 Q And that includes all the
17 information from SoCalGas; did you have all
18 the information you needed from SoCalGas?
19 A Yes.
20 Q What about real time information;
21 in other words, from the first kill attempt
22 and subsequent, just talk about what you're
23 learning a little more. I think you said you
24 shutdown at one point and you had a
25 conversation?
26 WITNESS WALZEL: A Right.
27 Q That appears to be typical. Like
28 you would -- real-time information you would

1 incorporate that into your plan; am I right
2 in assuming you incorporate everything; in
3 other words, what went wrong on the first one
4 and how do we adjust the second one?
5 WITNESS WALZEL: A I mean, nothing
6 went wrong, you know. Just the observations
7 of, you know, when we pumped mud down the
8 tubing, it -- we got it back. You know, we
9 could see it coming out of the well way
10 before it was expected to.
11 You know, the time that it took for
12 mud -- I call it good returns, but a good
13 amount of returns coming back from the well.
14 That came a lot later than what we figured;
15 so, you know, it was just observations like
16 that. And then one time we pumped down the
17 anulus, and all we -- we tried to pump
18 plugging material. We got it back right --
19 and it came right out of the ground.
20 Those were just the observations
21 that we saw, you know, and any real time we
22 would have pump pressures.
23 Q And all the real-time information
24 you just described, had you seen something
25 like that before on a natural gas reservoir
26 storage feel?
27 A A blowout?
28 Q Just the conditions, not exactly

1 matching what had you anticipated.
2 WITNESS WALZEL: A Oh, every job is
3 that way.
4 Q So there was nothing really
5 different then about SS-25; the kill attempts
6 I'm talking about.
7 WITNESS WALZEL: A I mean, not it
8 comparing to others, but, you know, a lot of
9 time you don't know the whole -- what the
10 pieces of the puzzle are down below the
11 ground until you kill the well. So a lot of
12 times its, you know, running your logs. It's
13 a process of elimination -- not elimination.
14 You try one thing, okay. Try something else,
15 and, you know, so but -- I mean, it looked
16 just like any gas release from an oil well.
17 Q And that's true all the way from
18 the beginning to the last kill attempt?
19 A Yes.
20 EXAMINATION
21 BY MR. SHER:
22 Q With regards to the formula that
23 was used to figure out how much weight or
24 pressure you could push down the kill
25 materials, does that make sense?
26 WITNESS WALZEL: A That wasn't a
27 formula, just the wellhead has a pressure
28 rating of 5,000 PSI.

1 Q So then in order to figure out the
2 mud weight, there a formula one uses that has
3 inputs. You talked about the pressure, the
4 length of the column.
5 Does one take a look at the inputs
6 after different kill attempts to see maybe if
7 our inputs were not right, and by "our
8 inputs" I mean SoCalGas inputs.
9 WITNESS KOPECKY: A You mean like by
10 the depth of the well or something of that
11 nature?
12 Q Yes. You stopped your meeting
13 early because the first well-kill attempt
14 didn't work and you break and have a meeting
15 and I'm assuming everyone is brainstorming as
16 to, Okay, it didn't work. What do we think
17 we need to do next to try and kill the well.
18 Does one relook at the data that was inputted
19 into that formula?
20 WITNESS WALZEL: A Well, I mean, the
21 reservoir pressure wouldn't have changed, you
22 know. I mean, it was -- decreased slowly
23 over the whole time we were there; so it
24 wouldn't have changed, and they would keep
25 the record of what the pressure in the
26 reservoir was the whole time.
27 Q And then the amount of gas in the
28 column, would that have been a variable that

1 would change as one factor?
2 WITNESS WALZEL: A In the block well
3 or just the normal -- or just another well in
4 the field that they might have been reading
5 pressure off of?
6 Q Let's go with SS-25 and the blowout
7 well. What would you expect the amount of
8 gas in the column, that figure that gets
9 inputted into the formula, to change over
10 each well-kill attempt or would you expect
11 that data to remain the same?
12 WITNESS WALZEL: A Well, yeah, the
13 column in -- if it would have been SS-25, it
14 would have been the gas blowing out, you
15 know, from whatever hole and that would be
16 dependent on the, you know, if the flow path
17 changes or if the reservoir pressure
18 decreases, and there's a lot of variables in
19 that. I was just talking about the column of
20 gas in a static well.
21 You know, if you have a pressure,
22 you know it's 100 percent gas, you calculate
23 the reservoir pressure, but, I mean, yeah,
24 the amount of gas flowing, I mean, it
25 wouldn't have been constant every second of
26 every day.
27 Q And please understand, I think, for
28 all of us none of our questions are meant to

1 undercut or question your professionalism and
2 expertise and experience. It's not our
3 intent. We are trying to understand what
4 happened, we're lay people.
5 So to me what I'm hearing is that
6 because every well is different, the basic
7 formula may not work. If your inputs are
8 completely different, how do you figure
9 out -- I'm sorry if I'm muddling things here.
10 If you couldn't -- I apologize,
11 guys.
12 MR. GRUEN: Take your time.
13 MR. SHER: Q The relief well
14 ultimately stopped the leak; correct?
15 WITNESS WALZEL: A Correct.
16 Q In your experience working on
17 natural gas storage fields that have once
18 been oil production fields, to the degree
19 you've had other experience --
20 WITNESS WALZEL: A Uh-huh.
21 Q -- with blowouts, was SS-25 unique
22 in that you couldn't stop that -- one could
23 not stop that from the top?
24 WITNESS WALZEL: A Can you repeat
25 that?
26 Q Sure. The understanding that every
27 field is different and that even wells on a
28 lease may be different, different geology, et

1 cetera, but I would expect that generally the
2 Boots & Coots of the world, the Halliburtons,
3 the folks that have experience killing wells
4 are generally successful because we don't
5 have all these wells all over the world that
6 are leaking as far as we know, but in this
7 instance, it took a number of attempts to try
8 and do a top kill and it just didn't work.
9 WITNESS WALZEL: A Right.
10 Q So in looking back, why do you
11 think the top kills didn't work?
12 WITNESS WALZEL: A Well, I mean, they
13 didn't work because we weren't able to get
14 enough hydrostatic in the well bore to be
15 equal to or higher than the reservoir
16 pressure, you know.
17 It comes down to was, you know, the
18 gas velocity exiting well bore, we couldn't
19 overcome with the limitations that we had for
20 pump rates, which were tied to our pressure,
21 which is tied to the wellhead equipment, and,
22 you know, there was still a lot of unknowns
23 at that time: Where the hole might be;
24 what -- where the gas was coming into the
25 well and leaving the tube, and, you know,
26 there's still some unknowns, but it all comes
27 down to, could we pump fast enough and not
28 exceed our pressures of the wellhead.

1 Q Based on the experience of SS-25
2 and understanding limitations that the
3 wellhead was only able to take 5,000 PSI, for
4 example, would a future remedy, if we're
5 thinking about future remedies and trying to
6 prevent these kinds of leaks requiring a
7 wellhead that could take 10,000 PSI? Would
8 that be something as a remedy you guys might
9 suggest?
10 WITNESS WALZEL: A I mean, I can't --
11 WITNESS KOPECKY: A We can't honestly
12 say or say at all that had we been able to
13 pump at a higher rate we would have been
14 successful. We're not sure. We weren't able
15 to.
16 Q Part of what we need to do as a
17 Commission is figure out how we prevent these
18 kinds of leaks in the future. So we don't
19 have the kind of expertise you do, and so it
20 would be very helpful for us to understand
21 maybe we need to require our gas operators to
22 have equipment that can take a different pump
23 rate.
24 Does that make sense to you?
25 WITNESS WALZEL: A I mean, there was
26 already a hole somewhere; so, you know, I
27 can't really comment on, you know, high
28 pressure wellheads, but, you know, the

1 wellhead was five. The casing, you know,
2 whatever. You just don't look at the
3 wellhead. It's the casing, design and
4 everything. So you know, I don't really know
5 if I can comment on that.
6 EXAMINATION
7 BY MR. BRUNO:
8 Q Mr. Walzel, what about reservoir
9 pressure itself?
10 WITNESS WALZEL: A Uh-huh.
11 Q Had you -- was the reservoir
12 pressure that you were given was that
13 different in any way or is that the pretty
14 standard typical pressure you might -- was it
15 extraordinary the pressure?
16 WITNESS WALZEL: A No. No.
17 WITNESS KOPECKY: A No.
18 WITNESS WALZEL: A I mean, I'm not
19 a -- I don't have any history of the rock
20 mechanics of the reservoir. As far as the
21 pressure, it didn't seem out of the ordinary.
22 Q And the pressure is proportional to
23 the working gas inventory?
24 WITNESS WALZEL: A Yes. The more gas
25 in there, the higher pressure you're going to
26 have.
27 Q So given, for instance, 86 billion
28 cubic feet of gas, which, I believe, is the

capacity at Aliso working gas. If you cut that in had half and you're down to 43 or give or take BCF, am I correct that a leak at that reservoir pressure would be -- would it be easier to develop a hydrostatic head to --

WITNESS WALZEL: A If it's a lower pressure, yes.

Q Okay.

A Dependent on -- you know, still dependent on the exit velocity, gas velocity coming out of the well bore, too, but, yes, if the reservoir pressure, it will take lighter fluid, you know.

Q If I may, you know, just to make sure I understand, going back to that first kill attempt with the known reservoir pressure, your team had everything they needed on paper to overcome that pressure?

A Yes. If -- if -- I mean, we still didn't know how the flow rate of the gas coming out, but, you know, it was sufficient fluid, and, again, we pumped on it, but you're still limited to the pump rate, you know.

Q How does one determine the flow rate in a blowout?

A Well, there's a lot of complex equations, you know. There's still a lot of

1 unknowns in the well bore. Where it's
2 exiting, but, you know, theoretically it
3 would be reservoir properties and pressures
4 -- reservoir properties, you get absolute
5 open flow.
6 Q So the flow rate deter- -- I guess
7 a number of factors can influence the flow
8 rate? Path of the gas if its changing?
9 A Right.
10 Q Is it possible to apply some
11 advance formula to get at the flow rate, if
12 you will, to make -- make a best estimate?
13 A Yeah, like I said, they all
14 calculate -- you can find an absolute open
15 flow rate. You know, that number right be in
16 the ballpark, might not be. There's so many
17 other variables that you don't -- there's lot
18 of blocks we don't even know what the -- you
19 know, what it's actually flowing until you
20 put it -- cap it and put it in diverter lines
21 and get pressures and whatnot.
22 That would have been the most --
23 that's one way we could figure it out if it
24 was 100 percent gas or whatever, but, you
25 know, still at the end of the day, it's -- if
26 we're going to pump, this is how fast we can
27 pump, and you know.
28 Q Right. So did Boots & Coots

1 calculate a flow rate?
2 A I don't recall if we did, or it was
3 given to us, you know. I didn't calculate
4 one.
5 Q Did Mr. Clayton, perhaps, calculate
6 one?
7 A No.
8 Q Would it be common for the
9 owner-operator to give you that piece of
10 information?
11 A Yeah, sometimes.
12 Q Again, my understanding is this is
13 something you calculate.
14 Let me back up. If there's no leak
15 and you're just flowing gas, you can
16 calculate a flow rate?
17 A Yeah, you'd a choke, and you'd go
18 through a choke, and you'd have upstream and
19 downstream pressure and choke size.
20 Q In that same situation, when you
21 have a leak and it finds a new path, you have
22 a different flow rate?
23 A The hole size is different.
24 Q So all those variables would affect
25 it.
26 A Right.
27 Q So that would have been something
28 that SoCalGas would have had to calculate

1 after the blowout?
2 A To get an estimate of the -- right.
3 Yeah. I mean, to get an accurate -- I say
4 accurate. To get another estimate of the gas
5 flow rate.
6 Q And that is a mathematical equation
7 or is that a physical measurement?
8 A It would be a calculation, you
9 know. You could physically do it if you
10 could put it in a pipe line and get two
11 pressure ratings and you know your pipe size,
12 you know, but we weren't able to do that.
13 Q So sort of a fixed volume and then
14 calculate --
15 A It would be more of a fixed area
16 and length of flow in it and a pressure drop,
17 and you could get a calculation on.
18 Q Got it.
19 Do you know if that was done by
20 SoCalGas at least or would that help you at
21 all?
22 A It was impossible.
23 Q Okay. So then you're limited to a
24 mathematical estimation?
25 A Right.
26 Q Do you know if that was done by
27 SoCalGas?
28 A I can't say if it was or if it

1 wasn't.
2 Q Okay. How was -- if I may, how was
3 the morale of the Boots and Coots kill team
4 over time, the first kill attempt, the second
5 first kill attempt, I mean, or the team
6 becoming discouraged or is it just par for
7 the course?
8 A No. I don't think -- there wasn't
9 any -- morale stayed high, the same. Yeah,
10 it's frustrating that it didn't die, but it
11 didn't affect our --
12 WITNESS KOPECKY: A Work duties.
13 WITNESS WALZEL: A -- morale.
14 Q Okay. Then when the decision was
15 made for a relief well, was it understood
16 amongst the team that you tried everything in
17 your arsenal and that was the next step?
18 WITNESS WALZEL: A Right. Yes. It
19 was the next step. It was the right
20 decision. You know, we tried. We don't want
21 to make it any worse here; so let's drill a
22 relief well and intercept at the bottom of
23 the well.
24 Q Yes, sir. I understand. Thank
25 you. What about mechanical valves on the
26 well? Did Boots & Coots check to see if
27 there were any subsurface safety valves on
28 the well as part of the planning?

1 WITNESS WALZEL: A I mean, we would
2 have looked at the well design and note it.
3 If it was in the well design, then it would
4 have been in the well, you know.
5 WITNESS KOPECKY: A To my
6 recollection, there was no subsurface safety
7 valve.
8 Q That's consistent with my
9 understanding too. I guess, my question is,
10 had SS-25 had a subsurface safety valve,
11 would you have attempted to use that before
12 first top-kill attempt?
13 WITNESS WALZEL: A Well, the safety
14 valve would have been in the tubing, and the
15 problem was on the casing, and so shutting it
16 on the tubing wouldn't have affected the gas
17 exiting on the casing.
18 Q Is there a valve -- is there any
19 type of valve, based on your experience, that
20 would have been effective had it been
21 designed in?
22 WITNESS KOPECKY: A No.
23 WITNESS WALZEL: A No. Not to prevent
24 a leak in the casing.
25 EXAMINATION
26 BY MR. SHER:
27 Q Question on that: So we have the
28 reservoir at the bottom about 8,000-odd-feet

1 deep, and then we have the casing, and inside
2 the casing we have the tubing; is that
3 correct?
4 WITNESS WALZEL: A Correct.
5 Q Is it normal for gas to come up the
6 casing, or does gas come up the casing
7 because the owner-operator is using both to
8 withdraw?
9 WITNESS WALZEL: A Depending on the
10 designs, but, I mean, we've seen, you know,
11 different parts of world that have high
12 production. They'll produce from the casing
13 and tubing, or, you know, there's no set
14 design rule, I guess.
15 Q With regards to SS-25, do you know
16 whether the owner-operator was using both the
17 casing and the tubing to withdraw or inject?
18 WITNESS KOPECKY: A I believe both.
19 WITNESS WALZEL: A Yeah. I mean, I
20 believe it was both.]
21 Q And I really appreciate -- we
22 didn't understand the safety valve would only
23 be on the tubing. So I really appreciate
24 that information.
25 A Right.
26 Q Just on that note, just to make
27 sure I understand and drill this into my
28 head, if you had a subsurface safety valve on

1 SS-25 and you were flowing through the tubing
2 and the casing, it would not be effective.
3 A It wouldn't have prevented the gas
4 from exiting the wellbore in this case --
5 scenario. The subsurface safety valve is in
6 the tubing. So say your wellhead gets
7 knocked off or your tree gets knocked off,
8 you know, you shut it and it's done, but if
9 it's exiting somewhere else in the well, it's
10 not going to --
11 WITNESS KOPECKY: A And it's typically
12 not located very deep in the tubing string.
13 Q In your experience, can you give an
14 idea of where you find them, if you can?
15 A I want to say 200 to 700 feet.
16 Q Okay.
17 A Best recollection.
18 Q So once an operator is -- decided
19 to flow through tubing and casing, there is
20 no mechanical equipment to not -- to mitigate
21 the consequences of a leak -- in other words,
22 once a leak happens or a blowout happens,
23 there is no mechanical valve or anything that
24 could shut that in, if you will? It's
25 basically top kill or relief well at that
26 point?
27 A I don't recall if the well had a
28 packer.

1 MR. SHER: Q what is a packer? Is it
2 P-A-C-K-E-R?
3 WITNESS WALZEL: A Yes.
4 WITNESS KOPECKY: A P-A-C-K-E-R.
5 WITNESS WALZEL: A Like when you run
6 tubing, there's a packer that goes around the
7 tubing and seals off between the casing, but
8 I don't recall if there was a packer or not
9 but -- how they were -- how it would have
10 been flowed both ways. But a packer would
11 just seal off around the tubing and the
12 casing. So then all your flow, if you have
13 integrity, is just up and down the tubing.
14 Q Does one install the packer when
15 one drills the well?
16 WITNESS KOPECKY: A No.
17 WITNESS WALZEL: A No.
18 Q So can you install a packer at any
19 point in the life of the well?
20 A Well, there's packers you can run
21 in casing and storm packers, test packers.
22 Yeah. I mean, there is bridge plugs and
23 stuff, but you know, their application, it
24 wouldn't be --
25 WITNESS KOPECKY: A It would be
26 installed during the completion phase or
27 work-over phase.
28 WITNESS WALZEL: A Yeah, the tubing

1 packer would have been, yeah.
2 Q I'm sorry. And the packer would,
3 in the case of Aliso, may be as deep as
4 8,000. So it's close to the bottom weight
5 reservoir?
6 WITNESS WALZEL: A Right.
7 MR. SHER: Thank you.
8 MS. ROSE: Would having a packer in the
9 well preclude you from using the casing to
10 extract gas?
11 WITNESS WALZEL: A Not necessarily.
12 It depends on your tubing design, you know,
13 if you have a sleeve you can open or close,
14 you know. Yeah, I mean, if there wasn't any
15 sleeve, but typically, there's a sliding
16 sleeve or something in there for various
17 reasons, but yeah. No, it wouldn't a hundred
18 percent isolate them.
19 MS. ROSE: Okay.
20 MR. SHER: Q Have people, just in
21 general, talked to you guys based on your
22 experience and expertise in -- whether it's
23 offering you a chance to give a training or
24 one of these classes that you guys take to
25 keep up to speed with what's going on in the
26 industry. Because you guys have tons of
27 experience. So are you able to offer advice
28 as to -- to owners and operators or

1 regulators as to how to be as safe as
2 possible in your well design so you can avoid
3 leaks?
4 A Well, I mean, we've been asked, you
5 know, by operators to come in and look at
6 fields or whatever and give advice on, like,
7 if there are drilling wells in urban areas.
8 We've given advice on that. Or if we're
9 asked to speak on a topic, then, yeah, we do.
10 WITNESS KOPECKY: A Or which they do a
11 lot nowadays is multiple well pads. They
12 invite us out at times to give them
13 recommendations on the layout in -- to reduce
14 the chance of multiple wells on fire at one
15 time, that type of thing.
16 EXAMINATION (resumed)
17 BY MR. GRUEN:
18 Q A follow-up on the flow rate you
19 were talking about earlier. I get you. It
20 sounds like if it's short of it being a
21 static well you may have some uncertainty
22 about what the flow rate is? Did I get that
23 part right?
24 WITNESS WALZEL: A Right. Yes.
25 Q Thank you. So I also understood
26 you had mathematical estimations in the case
27 of SS-25 because you obviously don't have a
28 static situation there, right? Did I get

1 that part right?
2 A Yeah. When I said mathematical, a
3 lot of times a number will be calculated with
4 this pressure, this tubing and casing design.
5 If the wellhead gets knocked off, this is how
6 much gas theoretically will come out.
7 Q Yeah. And would you expect that
8 number to change over time after an
9 unsuccessful well-kill attempt?
10 A It will change over time if the
11 reservoir pressure changes.
12 Q Here, SoCalGas was -- I think you
13 said SoCalGas was reducing reservoir
14 pressure?
15 A Yes. They were.
16 Q So that was being counted for in
17 the change of the flow rate calculation?
18 A Yes. I mean, if you were to
19 calculate, yeah, it would be used. Yeah.
20 Q You recall getting changes in the
21 flow rate calculations based on the change in
22 the reservoir?
23 A I mean, it wasn't calculated --
24 it's not something that would have been
25 calculated daily or hourly -- I mean, since
26 know one knows how much was coming out to
27 begin with.
28 Q Yeah. I get you. I get you. So

1 what about too just with the gas escaping
2 through the crater and that changed -- that's
3 a change too just in terms of you go from one
4 well-kill attempt to the next? How -- if at
5 all, how would that change the flow rate
6 calculation?
7 A I'm not following.
8 Q If you're not following it, it
9 probably means I'm not getting it right. So
10 just really quickly would the flow rate --
11 would you expect the flow rate to change
12 after the first well-kill attempt?
13 A I wouldn't expect it to change much
14 at all. I mean, the reservoir pressure
15 hasn't changed probably hardly at all, you
16 know, in a day. The gas just -- there was
17 more gas coming up around the well as opposed
18 to coming out little cracks elsewhere.
19 So ...
20 Q Just for the sake of discussion,
21 what if the reservoir pressure stayed the
22 same?
23 A If nothing in the wellbore changes,
24 then flow rate would stay the same.
25 Q So if something in the wellbore
26 changed -- could something in the wellbore
27 change after the first well-kill attempt?
28 A Not to my knowledge. The only

1 thing that changed was the earth around the
2 well.
3 Q So that's not the same thing --
4 could that -- did you have a concern that
5 that meant the wellbore casing -- that the
6 wellbore was changing because of the change
7 in the earth?
8 A No. No.
9 MR. GRUEN: Did I -- do you want to
10 follow-up on that?
11 EXAMINATION
12 BY MR. BRUNO:
13 Q Yeah. Well, I just want to ask
14 generally, in your opinion, being out there,
15 did the leak change like -- or just the path?
16 Do you think that more gas was coming out
17 after the first well-kill attempt over time?
18 Did the leak get worse? Did the blowout get
19 worse?
20 A I can't say it got worse or better,
21 because originally it was going out and
22 coming up in several places, you know.
23 Q Sure.
24 A After it -- the crater formed
25 around the well, all that stopped, and it was
26 all coming up around the well. Whether that
27 was more or less, I can't say.
28 Q So the path changed --

1 A It was isolated. It was all
2 contained in one area instead of coming up in
3 several areas. You know.
4 MR. BRUNO: Right. Okay. Thank you.
5 Thank you, sir.
6 EXAMINATION (resumed)
7 BY MR. GRUEN:
8 Q Just a couple of questions about
9 what was in the well during the attempt. So
10 I think you had mentioned mud and perhaps
11 brine being used?
12 A Mm-hmm.
13 Q One of the things we had looked at
14 was something about a junk shot?
15 A Yes.
16 Q Can you talk about that? Was that
17 used, and if so, what was in it?
18 A Right. So a lot of times we'll
19 pump a junk shot, which is junk -- rope, golf
20 balls --
21 WITNESS KOPECKY: A Rubber.
22 WITNESS WALZEL: A Rubber. Just
23 plugging material. That day, when we did
24 that, we tried -- we did pump it down the
25 casing in an attempt to plug the hole in the
26 casing, but I don't know how much -- how many
27 we did, but I mean, we pumped golf balls and
28 big materials just down the casing. As soon

as we pumped it, it was already shooting out of the ground, meaning it's exiting more to the surface of the well probably. We were getting it back really quick.

MS. ROSE: The golf balls?

WITNESS WALZEL: A Golf balls.

WITNESS KOPECKY: A So we determined that the hole was at least -- well, it also let us know that the hole was at least the size of a golf ball.

WITNESS WALZEL: A Right.

MR. GRUEN: Q Yeah. I follow your logic there. Any indications could you get from the junk shot of how big the hole was --

WITNESS KOPECKY: A No.

Q -- aside from that? Okay.

I guess the other thing I'm gathering is sometimes a junk shot works?

WITNESS WALZEL: A Oh, yes.

Q How often -- how many junk shots did you try?

A I can't -- I can't recall the specific number, but we'd pump several -- we loaded it several times that day, but I mean, we just couldn't get anything to plug the hole. The idea would be to plug the hole, keep pumping down the casing into the well, but nothing was plugging the hole.

1 Q Yeah. I follow you. Okay. And
2 after the junk shot didn't work -- or the
3 junk shots -- maybe I guess it was a couple
4 times. Did that change how you tried to kill
5 the well after that?
6 A No.
7 Q Okay. So you're back to mud or
8 brine at that point?
9 A Right.
10 Q One thing in our notes too -- I
11 think we just wanted to clarify, and I want
12 to echo Nicholas. We're not -- this is
13 respect for your professionalism today and
14 the answers you've given us. We're not
15 trying to undermine it in asking this. We're
16 trying to just understand, as lay people,
17 what happened.
18 So I note that it's three years
19 ago. I'm just going to raise this. One
20 thing in our notes is that there was another
21 well-kill attempt. It looks like there was a
22 top well-kill attempt on December 22nd or so.
23 Does that ring a bell -- or maybe our notes
24 are wrong. It could well be.
25 A I wasn't there, but I don't recall
26 ever hearing about another one on -- that
27 late.
28 Q Okay.

1 A Unless that was -- I don't even
2 remember what day it got intercepted or --
3 no. I don't have any knowledge of one on
4 December 22nd.
5 Q Understood. Thank you.
6 WITNESS KOPECKY: A I was already -- I
7 was on another job, and I had lost contact
8 with anyone affiliated with it. So I'm not
9 aware of it.
10 Q That's helpful.
11 EXAMINATION
12 BY MR. BRUNO:
13 Q Who relieved you from Boots &
14 Coots? Was there another --
15 WITNESS KOPECKY: A Yes, my
16 recollection it was Juan Moran.
17 Q Would you mind spelling that, sir,
18 or is it "Marin"?
19 A Let me make sure it Moran -- it was
20 Juan Moran or Travis Martel. I don't recall
21 which, but -- spell it? Is that what --
22 Q I was just trying to make sure I
23 understood the pronunciation.
24 A J-U-A-N M-O-R-A-N or Travis Martel,
25 M-A-R-T-E-L, and I don't recall which one
26 relieved me.
27 Q Thank you, Mr. Kopecky, and Mr.
28 Walzel, how about yourself? Were you

1 relieved by any Boots & Coots employees?
2 WITNESS WALZEL: A I was relieved --
3 there was Jim LaGrone and Rolly Gomez were
4 engineers for Boots & Coots after I left to
5 help with the relief well and activities at
6 SS-25.
7 Q Okay. Thank you, sir. J-I-M
8 L-A-G-R-O-N-E, R-O-L-L-Y G-O-M-E-Z.
9 MS. ROSE: And do you know if
10 Mr. Clayton stayed on, or was he also
11 relieved?
12 A He came home and then went back.
13 WITNESS KOPECKY: A And I do recall --
14 now that I mention it, I believe Travis
15 Martel relieved me, and Juan Moran, as the
16 senior well control specialist, I believe,
17 relieved Danny. And then Richard was in
18 there at some point.
19 WITNESS WALZEL: A Richard was there.
20 I believe Richard was -- relieved Danny.
21 MR. GRUEN: Can we seal the record.
22 EXAMINATION (resumed)
23 BY MR. GRUEN:
24 Q One thing -- I have an invoice here
25 that mentioned the two of you and Danny
26 Clayton and then Mike Baggett as well?
27 A Yes. He was our safety
28 representative.

1 Q Okay.
2 WITNESS KOPECKY: A I don't know at
3 what point we bought him, but it had to be
4 pretty quick.
5 WITNESS WALZEL: A It was quick. He
6 wasn't on the plane coming out with us, but
7 he arrived shortly thereafter.
8 Q How long was he with you?
9 WITNESS KOPECKY: A He was there when
10 I left.
11 WITNESS WALZEL: A He was there when
12 you left, but then there was a -- Patton came
13 and relieved him.
14 WITNESS KOPECKY: A Then he came back.
15 WITNESS WALZEL: A Then he came back.
16 So -- and I think he stayed pretty much for a
17 majority of the project.
18 MR. GRUEN: Let's take the seal off the
19 record for a second.
20 Q I'm going to ask you the same
21 question. Can you tell me how long Mike
22 Baggett stayed with you?
23 A I don't have a number of days.
24 Q Approximately. I'm asking the same
25 question as before.
26 A A month.
27 Q Okay.
28 A But then I believe he was there --

1 I was there a month, so he was there with me
2 probably about a month.
3 Q Okay. All right. And as safety
4 officer, what was his role?
5 A His main -- his role is to look out
6 after us. A lot of times companies we work
7 for don't want their personnel in the hot
8 zone. So as we're in the hot zone, then he
9 would be there for us and then also to work
10 with the customer and explain if we're doing
11 something a certain way that might not be
12 normal -- I'd say normal, explain why we're
13 doing it, enforce -- he was also there to
14 check people in and out of location and keep
15 track of the personnel on location.
16 Q Okay.
17 WITNESS KOPECKY: A Correct.
18 Q Thank you. Anything --
19 WITNESS WALZEL: A And gas monitoring.
20 He also would check the gas levels.
21 WITNESS KOPECKY: A One direction.
22 WITNESS WALZEL: A One direction. He
23 would actually be the first one to go up
24 every morning and check the LELs one
25 direction and permit the cranes to move in
26 and stuff like that.
27 WITNESS KOPECKY: A There would always
28 be two of us would go up --

1 WITNESS WALZEL: A Right, yeah.
2 Q I follow. Who else was -- if
3 anybody -- was it the four of you then? Was
4 there anyone else on the Boots & Coots team
5 during the -- when you both were there
6 on-site?
7 WITNESS KOPECKY: A Not to my
8 recollection, other than Danny. Danny --
9 Danny, myself and Mike.
10 WITNESS WALZEL: A Then there was --
11 well, there was another -- Mike Patton, he
12 was there -- he came for -- I don't remember
13 if he was there when you were there.
14 WITNESS KOPECKY: A No. Mike --
15 because they joined me in Azerbaijan. But if
16 you're asking who was there while I was there
17 or while Danny was there, yeah, there was
18 also -- Bud Curtis was later involved in the
19 project.
20 Q Okay. Yeah. And --
21 A Richard Hattenberg.
22 Q I heard Mike Patton, Bud Curtis,
23 Richard Hattenberg -- did I get that right?
24 A Richard Hattenberg.
25 Q Hattenberg. Okay.
26 A John was there at one point while I
27 was there liaising with SoCal engineers in
28 regards to relief wells.

1 Q So the court reporters are happy
2 with me, I'm going to ask you if you can
3 spell their names as best you can.
4 WITNESS WALZEL: A Richard,
5 R-I-C-H-A-R-D H-A-T-T-E-B-E-R-G, Bud Curtis,
6 B-U-D C-U-R-T-I-S.
7 WITNESS KOPECKY: A John.
8 WITNESS WALZEL: A J-O-H-N
9 H-A-T-T-E-N-B-E-R-G, Mike Patton, M-I-K-E
10 P-A-T-T-O-N, Bud Curtis, B-U-D C-U-R-T-I-S,
11 Travis Martel, T-R-A-V-I-S M-A-R-T-E-L.
12 MR. SHER: May we go off the record for
13 one sec?
14 (Off the record.)
15 MR. GRUEN: Let's go back on the
16 record. Thank you.
17 Q A couple other questions. In terms
18 of your -- you had talked about going into
19 the hot zone after a while -- earlier this
20 morning, rather. And just briefly, if you
21 can talk about how do you figure out the
22 limits of the hot zone?
23 WITNESS WALZEL: A Well, like for this
24 well, it was pretty much the whole location,
25 you know. There was one road going up to the
26 pad. So just everything was -- the whole
27 location was considered the hot zone.
28 WITNESS KOPECKY: A I recall, as

1 typical, yeah, it encompassed the entire
2 location, as Danny said. That's due to your
3 lower explosive limit readings out away from
4 the source.
5 Q So --
6 A When they Start to decline, then
7 you get into your warm zone and that type of
8 thing.
9 Q So where the LEL is that a
10 potential for ignition, that's the edge of
11 the hot zone?
12 WITNESS WALZEL: A Yeah. That's one
13 way to define it, or if there's a well on
14 fire, it's -- you can use radiant heat, or
15 there's -- or just whatever factors they want
16 to use to set it up. But in this instance,
17 it was mainly just LELs.
18 Q And Mr. Kopecky, I think you were
19 talking about if the case -- in the case of a
20 well being on fire, how would you define the
21 hot zone? Sounds like you'd do it
22 differently?
23 WITNESS KOPECKY: A Oh, no. That's
24 what Danny was stating. With the radiant
25 heat, that would determine your hot zone to
26 your exclusion zones. But yeah, this was
27 determined by the LEL. But when you
28 mentioned -- I forget how you stated it, you

1 know. The end of the hot zone was at the
2 lower -- I don't remember how you stated it.
3 Q I'll do my best to restate it if I
4 can. What I think I was getting at is if
5 your LEL is just at a point where your LEL --
6 your lower explosive limit could result in
7 ignition, at that point, that would be the
8 edge of your hot zone?
9 WITNESS KOPECKY: A Well, not
10 necessarily. That's the point I wanted to
11 mention is that you would also have a safety
12 factor in that. You would move it out even
13 further.
14 Q I follow you. Okay. And in this
15 case -- so you were beyond the LEL limits --
16 A Correct.
17 Q In establishing your hot zone for
18 SS-25?
19 A Yes, sir.
20 Q I follow. Thank you both. And
21 then in terms of managing the hot zone and
22 who was in it, can you tell us the different
23 personnel that were allowed to enter the hot
24 zone?
25 WITNESS WALZEL: A Depending on the
26 operation going on but -- us, Boots & Coots.
27 The crane operator would be there, his
28 swamper. If we were doing wireline, then,

1 you know -- like when James and I were out
2 there, we would put their equipment on the
3 well, but they might be in their logging unit
4 upwind on location. There was a company that
5 had to pump iron and flow iron. They were,
6 you know -- there was occasions they were in
7 the hot zone.
8 WITNESS KOPECKY: A Also, anyone that
9 did have a legitimate reason to be in the hot
10 zone was always escorted by Boots & Coots and
11 stayed with them the entire time. They were
12 never left in there unattended.
13 Q Did that include SoCalGas
14 personnel?
15 WITNESS KOPECKY: A Correct. It did.
16 Q And I think, Mr. Walzel, you were
17 talking about some of the personnel. Those
18 might have been contractors.
19 WITNESS WALZEL: A Mm-hmm.
20 Q So were there -- can you talk about
21 the SoCalGas personnel -- personnel who were
22 in there with Boots & Coots at times?
23 A Well, I mean, several times they
24 would have a -- safety representatives up
25 there on the edge with our -- Mike Baggett or
26 whoever was our safety man. You know, just
27 various -- management coming in to look, you
28 know, things like that.

1 Q And what role did those individuals
2 have when they were going into the hot zone?
3 WITNESS WALZEL: A Observe. Just take
4 a look. They were safety men. Might do
5 safety things. But if it was SoCal people,
6 it was more or less just always just take a
7 look at what is going on.
8 WITNESS KOPECKY: A Or they may come
9 up with -- there were quite a few regulatory
10 agencies that need to have a visual. They
11 would be escorted in and a lot of times
12 accompanied by, as Danny mentioned, a SoCal
13 representative.
14 Q What were the reasons for Boots &
15 Coots to go into the hot zone?
16 WITNESS WALZEL: A When there was a --
17 for instance, like I mentioned, we wanted to
18 run the noise temp tools, then we would go
19 out to the well and make up the lubricator so
20 they could run their tools in the well. And
21 we did that a lot. You know, when we went in
22 to put cables to secure the wellhead, that
23 was another example. Just whenever there was
24 something necessary to -- run logs, rig up
25 pump iron, remove pump iron, you know, just
26 things like that.
27 WITNESS KOPECKY: A Close and open
28 valves.

1 WITNESS WALZEL: A Close and open
2 valves.
3 Q Thank you. Let me switch gears a
4 little bit to -- I think you had mentioned
5 that Brett Lane was incident commander?
6 A Yes.
7 Q Did I get that right? Okay. So
8 just in terms of communication with the
9 incident commander as you were being made
10 aware of the incident, what was -- can you
11 describe the communications that you had with
12 the incident commander as you were first
13 learning about the incident at SoCalGas at
14 Aliso?
15 WITNESS WALZEL: A I believe -- I
16 mean, we knew about it -- like I was
17 mentioning, he wasn't there the first few
18 days. So we already knew about it by the
19 time he showed up.
20 WITNESS KOPECKY: A I'm not aware who
21 was the incident commander when we arrived.
22 Q Okay.
23 MR. SHER: Q Would you have updated
24 the incident commander on sort of a daily
25 basis as to what was happening?
26 WITNESS WALZEL: A Yes. The
27 communications -- there was always an open
28 line to communication, talk to him in the

1 mornings, and it was an open dialogue, I
2 guess.
3 Q And I imagine once you learned
4 about the incident you were probably thinking
5 about how -- recommending how to fix the
6 incident?
7 A Yes.
8 Q So were you talking with the
9 incident commander about fixes?
10 A Yes.
11 WITNESS KOPECKY: A No, not I. Not
12 myself personally.
13 Q Mr. Walzel, can you tell us more
14 about what you told the incident commander --
15 what you shared with the incident commander?
16 WITNESS WALZEL: A Right. I mean, I
17 don't remember exactly what we talked about,
18 but it would have been, you know, options of,
19 you know, do we do this or -- you know, pump
20 this. You know, it would have been kind of
21 brainstorming different options and then pick
22 an option that -- the best option, you
23 know -- hope for the best results with the
24 least amount of risk as far as, you know,
25 affecting future operations.
26 Q What concerns, if any, did the
27 incident commander identify to you when you
28 were talking through the recommendations and

1 options?
2 A I mean, I don't recall any specific
3 concerns, you know, other than what could
4 happen -- you know, we outlined possibilities
5 but nothing -- no specific conversation comes
6 to mind.
7 Q Okay.
8 MR. SHER: Q Would Mr. Clayton have
9 been the main liaison with Mr. Lane?
10 WITNESS WALZEL: A Yeah. He would
11 have spent -- he was in the trailer with him
12 most of the day.
13 Q So you were literally the boots on
14 the ground doing the work, and some of your
15 other team members may have been more doing,
16 for lack of a better word -- I apologize --
17 but the paperwork?
18 A Well, yes. Initially it was Danny,
19 James, myself, and then Mike Baggett showed
20 up sometime. But yes, initially, if there
21 was equipment to rig up or remove or
22 whatever, it was me and James out there doing
23 that. Then I would go to the trailer
24 different times.
25 Q You mentioned you guys -- Mr.
26 Kopecky, you got a phone call in the evening
27 about 8:00, 8:30.
28 WITNESS KOPECKY: A Yes.

1 Q Then the next morning you flew out.
2 Did SoCalGas provide you with anything to
3 review on the plane on the way out or when
4 you hit the ground at Aliso Canyon, you were
5 given information?
6 A I can't say for sure, but now that
7 you mention it, I'm -- I'm rather confident
8 that there were some documents emailed to me.
9 I feel confident that there were.
10 Q Makes sense to try to get you up to
11 speed as quick as possible?
12 A Right. I'm pretty sure that was
13 the case.
14 MR. SHER: Thank you.
15 MR. GRUEN: Q This is a while back,
16 but do you remember what you were trying to
17 do with the information -- with the documents
18 that you received -- what did -- how did you
19 move forward with that information?
20 A Well, the purpose of it would have
21 been just to familiarize us with the well as
22 much as they possibly could in that amount of
23 time. And I think -- I'm not for sure, but
24 it possibly included the wellbore schematic,
25 which would have been a critical piece of
26 information.
27 Q Yeah. Okay. Did you -- go ahead.
28 I'm sorry.

1 A But you pretty much have to put
2 your eyes on the incident. I mean, you can
3 familiarize yourself with the downhole and
4 that type of thing and you can start bouncing
5 off a plan amongst the team, but that can all
6 change when you get on the ground.
7 Q Yeah. I get you.
8 Mr. Walzel, anything that you
9 recall receiving from the incident commander
10 as you were on your way home?
11 A No. Not specifically, but it would
12 have been, you know, directions to the well,
13 wellbore schematic, just general -- like
14 James, I'd just get kind of an idea --
15 casings might set here or depth here, tubing
16 in the well, tubing not in the well, you
17 know.
18 Q Is there any information that
19 either of you requested when you -- during
20 this time regarding the incident or regarding
21 SS-25?
22 A No, I mean, we -- if you have any
23 well history -- drilling records -- and that
24 would have been to see if there was anything
25 that happened while they drilled the well
26 that might give an idea there might be a
27 problem here. Just -- I mean, it was a long
28 time ago, but we requested just stuff like

1 that. And everything we requested by them, I
2 mean, they provided.
3 Q Okay.
4 WITNESS KOPECKY: A In an initial
5 phone call, anything -- when I mentioned the
6 documents that I think I received, they would
7 have been requested by myself, because I was
8 in communication with the client I think
9 until I received a call 8:00, 8:30 and in
10 communication back and forth until
11 approximately 1:00 a.m. And any information
12 Danny received prior to boarding the plane
13 would have come from myself.]
14 Q Danny Walzel?
15 WITNESS KOPECKY: A Danny Walzel and
16 Danny Clayton.
17 Q Danny Clayton, too.
18 Okay. So you were the sort of
19 point or the liaison to receive the
20 information from SoCalGas on Boots & Coots'
21 behalf as the Boots & Coots team was leaving
22 for Los Angeles?
23 WITNESS KOPECKY: A Correct.
24 WITNESS WALZEL: A He was first on
25 call that night; so he received a call after
26 hours from dispatch.
27 Q I see. Did the point of contact
28 change before you came out?

1 Did someone else serve as the
2 person to receive the information from
3 SoCalGas or did you remain the information
4 point for SoCal.
5 WITNESS KOPECKY: A Oh, no. I was not
6 the information point once we landed. That
7 would go into Danny Clayton.
8 Q Okay. And you were the information
9 point until the Boots & Coots team landed in
10 Los Angeles?
11 WITNESS KOPECKY: A Correct.
12 Q Right. I follow.
13 And then Danny Clayton took over
14 receiving information throughout the
15 incident; is that fair?
16 WITNESS KOPECKY: A During my time
17 there.
18 Q Mr. Walzel, while you were there,
19 since you were there a little bit longer that
20 Mr. Kopecky, did Mr. Clayton remain the
21 information point throughout your time there?
22 WITNESS WALZEL: A Yes.
23 Q Thank you.
24 Let's go off the record for a
25 second.
26 (Off the record.)
27 MR. GRUEN: Back on the record.
28 Go ahead, Mr. Holter.

1 EXAMINATION
2 BY MR. HOLTER:
3 Q Gentlemen, this is for both of you
4 as we visit the subject we talked about.
5 The information we talked about,
6 getting from the Wall files and SoCalGas, and
7 we talked -- Mr. Kopecky, you said dispatch
8 notified you of a call from SoCalGas; is that
9 correct?
10 WITNESS KOPECKY: A Correct. And the
11 way it works, they patch me direct through.
12 Q And that was Todd Van de Putte that
13 you talked to who went directly to you?
14 WITNESS KOPECKY: A If I gave the
15 correct name. Yes.
16 Q Had you worked with him before
17 throughout the years?
18 WITNESS KOPECKY: A No.
19 Q So this is the first time?
20 WITNESS KOPECKY: A (Witness nods
21 head.)
22 Q And you, Mr. Walzel?
23 WITNESS WALZEL: A First time.
24 Q So you requested a set of
25 information that you needed to assess their
26 situation? You discussed it with them; is
27 that my understanding?
28 WITNESS KOPECKY: A I don't know that

1 we were able to discuss it. They were in
2 the -- here, again, I recall they were
3 gathering information on the well for me.
4 Again, it was after hours. So I
5 don't know what they had set up, but they did
6 get -- I say, I think I recall they did send
7 me some information.
8 Q Okay.
9 WITNESS KOPECKY: A That I then
10 distributed.
11 Q Granted, your memory, I'm not going
12 to press you on it. It's not the point.
13 So is it my understanding that once
14 Mr. Clayton came aboard, did he assemble a
15 team then within a matter of hours so to
16 speak? Is that how it works?
17 WITNESS WALZEL: A Well, James,
18 myself, and Dan Clayton flew out together; so
19 that was our Boots & Coots team.
20 Q You explained you were in the hot
21 zone or managing that. Are you driving --
22 what you're discovering -- now, we're moving
23 to on the site, once you're out there.
24 Are you driving what information
25 you have, including what you've read in the
26 well files from SoCalGas and feeding that
27 information to Mr. Clayton?
28 WITNESS KOPECKY: A Well, I wasn't --

1 other than, I mean, I didn't really have a
2 real purpose to review the well bore
3 schematic. Danny and Danny Clayton would
4 have been looking at that, Danny in
5 particular, to figure -- to do his
6 calculations and all, but I guess, the second
7 part of your question, were we relaying
8 information. Any time -- since we were at
9 the well itself, any time there was any
10 change in anything, we would report it down
11 to Danny that would then convey that to Lane,
12 Bret Lane.
13 Q Appreciate that.
14 WITNESS KOPECKY: A Bret Lane.
15 Q Right. Bret Lane.
16 And when you refer to "Danny" doing
17 calculations, can you clarify which Danny you
18 are talking about.
19 WITNESS KOPECKY: A Danny Walzel.
20 Q So, Mr. Walzel, are you -- is that
21 your role in this particular instance on
22 SS-25 well to provide calculations based on
23 information you gathered and provide that to
24 Mr. Clayton?
25 WITNESS WALZEL: A Well, like I
26 mentioned, but probably 90 percent of what,
27 you know, James and myself did the same
28 thing, hammer up iron, rig up, you know, if

1 there was -- Boots & Coots needed to write
2 something or present something, then, yeah,
3 then I would do the paperwork part of it. So
4 90 percent of what we did was the same.
5 WITNESS KOPECKY: A Right.
6 WITNESS WALZEL: A But, yeah, if we
7 need to do a calculation or write a
8 procedure, then I was one that did that.
9 Q Is that the structure that held
10 until you both left that incident?
11 WITNESS WALZEL: A Yes.
12 WITNESS KOPECKY: A Yes.
13 Q And then are you aware of what
14 Mr. Clayton did with that information after
15 you gave it to him?
16 WITNESS WALZEL: A Gave to what -- I
17 mean, discussed with SoCal.
18 WITNESS KOPECKY: A With SoCal.
19 Q Was there anybody from SoCal
20 providing the same comparative calcs or
21 working with you during this time,
22 Mr. Walzel?
23 WITNESS WALZEL: A Yes. I mean, there
24 wasn't someone working by my side the whole
25 time, but their engineers were doing, you
26 know, mainly relief well stuff and, you know,
27 getting a plan for that, and, you know, doing
28 engineering stuff in the office.

Q I'm actually trying to understand, again, on the same note, clarity, about who is -- if they're looking to you within your team --

WITNESS WALZEL: A Right.

Q -- and then SoCalGas supervising the calculations and which way the information is flowing, if it goes back and forth.

WITNESS WALZEL: A Yeah. It was back and forth. Like I said, it was real open. Anybody could go to anybody and talk or ask a question.

Q So on the SoCal team, can you provide some names of who was providing either engineering calculations or who the engineers you were, so to speak, bouncing off your approach with or position.

WITNESS WALZEL: A I don't remember their names.

Q But there was somebody from SoCalGas?

A Yes.

Q Was it Mr. Van de Putte?

WITNESS WALZEL: A No. He was -- my understanding was he was the consultant company man, and I think he stayed -- he was there for the first --

1 WITNESS KOPECKY: A Few days.
2 WITNESS WALZEL: A He was there for
3 the first time because I know he was there
4 when the coral tubing was doing ice plug --
5 (Clarification by reporter.)
6 WITNESS WALZEL: A At least for the
7 first kill attempt. I remember him being
8 there while we went and washed out the ice
9 plug, but, no, he was the company man, and
10 then I don't know their names, but there was
11 two or three engineers.
12 Q So would it be Mr. Lane that you
13 specifically your team's working with,
14 meaning the four of you, Mr. Baggett, two
15 Danny's --
16 WITNESS KOPECKY: A We worked a lot
17 with a gentleman by the name of Mike Dosier
18 as well, but that was -- that was -- I want
19 to say logistics.
20 WITNESS WALZEL: A Yeah. Logistics.
21 WITNESS KOPECKY: A We were sourcing
22 equipment, and he was our go-to to make that
23 happen.
24 Q So I hear you that names don't come
25 to mind, but, generally, during your time
26 there, you were considered providing -- from
27 what information you received from the site
28 and files you were providing calculations to

1 make attempts to kill. That was your role?
2 WITNESS WALZEL: A Right. It wasn't
3 like every day all day long we're just --
4 (indicating).
5 Q I understand.
6 WITNESS WALZEL: A 90 percent of it
7 was the manual labor in the hot zone, getting
8 ready for the next bump shot and stuff like
9 that.
10 Q Understood. Results came out of
11 first and second kill attempts. Is it my
12 understanding that your -- you did not make
13 any adjustments in, say, the calculations
14 other than mud weights, and whatever, but as
15 far as methodology it was the same procedure
16 throughout as when you left.
17 WITNESS WALZEL: A From the best I can
18 recall, the only -- one time we might not
19 have pumped Barite, and another time we might
20 have pumped -- changed the amount of Barite.
21 At the end, we pumped a Barite pill with the
22 idea of the Barite falling out and plugging
23 up -- plugging the bottom of the well.
24 We might have changed the volumes,
25 but, again, the pump -- we could only pump so
26 fast, and so there wasn't -- other than what
27 we pumped there wasn't a whole lot to change
28 in between each one.

1 Q And then you were talking about you
2 assessed there was a leak at some time?
3 WITNESS WALZEL: A Yeah.
4 Q Either immediately or -- was that
5 specifically to that well or did you --
6 there's two other wells near it. Did you
7 guys --
8 WITNESS WALZEL: A Correct.
9 Q -- look at those other two wells
10 and put them into your mix --
11 WITNESS KOPECKY: A As I recall, we
12 checked pressures on them.
13 WITNESS WALZEL: A We checked
14 pressures daily. Or you know, we put gauges
15 on all the -- on the wellhead, all the
16 different --
17 WITNESS KOPECKY: A Casing strings.
18 WITNESS WALZEL: A -- casing strings,
19 and I don't recall if we ran logs on one of
20 them.
21 WITNESS KOPECKY: A I'm pretty sure we
22 did, and we also attempted to monitor, I
23 believe, those gauges while we were
24 performing the kill to make sure there was no
25 communication.
26 WITNESS WALZEL: A Right because those
27 were the gauges that we could get on the
28 phone.

1 WITNESS KOPECKY: A Yeah.
2 WITNESS WALZEL: A They were being
3 continuously monitored 24 hours a day.
4 Q So SS-25 did not have that ability
5 because of the gas flow coming out of it?
6 In other words, you're talking
7 SS-25 was a dynamic kill attempt; right?
8 WITNESS WALZEL: A Yeah.
9 Q So can you restate whether you were
10 or weren't able to get a flow rate at any
11 time on SS-25?
12 WITNESS WALZEL: A No there was no
13 time we ever got an actual flow rate coming
14 from the well.
15 Q Okay. So your attempts were your
16 best professional understanding based on the
17 conditions of an unknown flow rate?
18 WITNESS WALZEL: A Correct.
19 WITNESS KOPECKY: A Correct.
20 Q And the gas company, SoCalGas, at
21 any time did they give you any numbers of
22 estimates of what they thought you should use
23 for that?
24 WITNESS KOPECKY: A Not to my
25 knowledge. You mean for the actual --
26 Q Yes.
27 WITNESS WALZEL: A No. There was
28 numbers given -- again, you know, an absolute

1 open flow numbers that were calculated. No,
2 if the well had got knocked off and it was
3 coming --
4 Q Is that like what would be called a
5 worst case calculation?
6 WITNESS WALZEL: A Worst case.
7 Q And you put your greatest
8 overburden pressure on that as your putting
9 calculations together?
10 WITNESS WALZEL: A I'm not following
11 the "overburden."
12 Q Like you -- for your head.
13 WITNESS WALZEL: A I understand.
14 Q There you go.
15 WITNESS WALZEL: A Again, it's a rate.
16 So now you got, you know, velocities and all
17 this other stuff. It's not just like normal
18 drilling where you're just choking out a
19 well; you just pump it real slow.
20 But, yes, there was numbers given,
21 you know, so what this well actually was, no
22 one really knows because it was coming out in
23 the ground. You know, there was no way to
24 capture it or still looking for all the
25 unknowns to figure out, but, you know, it
26 would have been a ball -- you know, it would
27 have been hard to get an exact number of what
28 it was.

1 Q Understood. And this continued at
2 least for the first two attempts, and then
3 was there a point which a consultant was
4 brought in to work with you?
5 Did you work with Mr. Shackleford
6 at all?
7 WITNESS KOPECKY: A I was aware that
8 he was involved, but I was long gone from the
9 operation.
10 WITNESS WALZEL: A Yes. He came after
11 I left, but it was more for the relief well.
12 Q So he didn't provide anything for
13 the top kill attempts?
14 WITNESS WALZEL: A No.
15 Q Okay. Thank you.
16 And so at what point, after you
17 assessed the leak was in SS-25, did you make
18 an assessment or could you?
19 You talked about performing a jump
20 shot. At what point did you make assessment
21 like where that was in pipe depth?
22 WITNESS WALZEL: A the only -- yeah,
23 there was no way to tell from pumping that
24 and how fast it come out because I think it
25 was like within the first five barrels, the
26 stuff was already coming out, but the only
27 thing, you know, when we ran the temperature
28 log, you know, there was -- it was cold, say,

1 800 to 1,000 feet.
2 Again, those aren't exact numbers,
3 but there was a range somewhere in there. So
4 and the tools were messing up in those
5 depths, somewhere in there. So we knew the
6 hole was probably somewhere around there.
7 Q Okay. And walk us through your
8 assessment to make a change or not a change.
9 You did generally talk about that, but maybe
10 a little more just detail about the
11 conversations you had with SoCalGas internal
12 as a team to what your approach would be
13 right there to make more kill attempts.
14 WITNESS WALZEL: A Right. So if the
15 hole was, say, at 800 foot. You're only
16 losing 800 foot a well so that's not -- you
17 know, as far as mud weight goes, that's
18 probably not a whole lot, you know, change in
19 pressure, you know, for 800 foot of 10-pound
20 mud or whatever.
21 So we were already -- from what I
22 recall, we were already overbalanced. You
23 know, the mud was sufficient. So it wouldn't
24 have really changed a bunch in the next step.
25 Q Was there any point which you
26 looked at the well and the crater and the
27 fluids coming out and assessed there may be
28 some critical point which the well would

1 reach a state where you literally could not
2 even get there and understanding the top was
3 probably about the relief well, but is there
4 a point which you discussed this is a safety
5 threshold we've seen in our experience.
6 SoCalGas is concerned.
7 Did you have discussion about that,
8 to go forward or not go forward?
9 WITNESS WALZEL: A I don't recall the
10 exact conversations, but, you know, that was
11 discussed, that -- we do we try again, and it
12 really came down to, you know, if the crater
13 got big enough and the mountain top was lost,
14 and we wouldn't have been able to get to the
15 well to do anything with because even during
16 relief-well operations you want to still
17 monitor blowout well if you can and have
18 access to it. So didn't want to disturb the
19 crater anymore.
20 Q Were you there when they put the
21 bridge over?
22 WITNESS WALZEL: A No. It was being
23 built when --
24 MR. HOLTER: So it was after you guys.
25 WITNESS WALZEL: A Right.
26 MR. HOLTER: That's it. No further
27 questions. Appreciate it. Thank you.
28 MR. GRUEN: Anyone else?

1 MS. ROSE: Can I ask a question?
2 MR. GRUEN: Yes.
3 MS. ROSE: Q Going back to when you
4 first heard about the incident on the phone
5 and then you flew over at that time and you
6 first arrived and you got that packet of
7 information, like the well-bore history, all
8 that stuff.
9 Did you receive information about
10 any other well-control efforts or well
11 intervention that had been done on SS-25
12 prior?
13 WITNESS KOPECKY: A Not to my
14 knowledge. I don't recall.
15 WITNESS WALZEL: A I don't recall
16 either.
17 MS. ROSE: Thank you.
18 MR. GRUEN: Q I have just one other
19 question. After the first well-kill attempt
20 did not work for the first Boots & Coots one,
21 what chances did you think there were of
22 succeeding the next time on the next
23 well-kill attempt?
24 Did you look at that?
25 WITNESS WALZEL: A I mean, we didn't
26 put any probability numbers to it.
27 Q Okay.
28 WITNESS KOPECKY: A I don't know. To

1 clarify, I felt confident every time we
2 pumped that we were going to kill the well.
3 WITNESS WALZEL: A Yeah.
4 WITNESS KOPECKY: A Unfortunately, we
5 weren't successful with the surface kill.
6 Q That's fair. I appreciate that.
7 WITNESS WALZEL: A I know that from
8 the first or second, it laid down and was
9 pretty -- didn't do anything for a little
10 bit, but, you know, for whatever reason
11 fluids went into the reservoir, you know, it
12 came back, you know.
13 WITNESS KOPECKY: A Could not maintain
14 the hydrostatic head.
15 MR. GRUEN: Unless anybody else has any
16 questions, we're going to thank you for your
17 time. We appreciate you being here, as well
18 as both counsel. Thank you. And that's all
19 we have for today. Let's go off the record.
20 (Whereupon, at the hour of 3:10
21 p.m., the examination under oath then adjourned.)

SHANNON ROSS
CSR No. 8916

ORDER INSTITUTING INVESTIGATION ON THE COMMISSION'S OWN MOTION INTO THE OPERATIONS AND PRACTICES OF SOUTHERN CALIFORNIA GAS COMPANY WITH RESPECT TO THE ALISO CANYON STORAGE FACILITY AND THE RELEASE OF NATURAL GAS, AND ORDER TO SHOW CAUSE WHY SOUTHERN CALIFORNIA GAS COMPANY SHOULD NOT BE SANCTIONED FOR ALLOWING THE UNCONTROLLED RELEASE OF NATURAL GAS FROM ITS ALISO CANYON STORAGE FACILITY (I.19-06-016)

SOUTHERN CALIFORNIA GAS COMPANY

(DATA REQUEST SED-SCG-57 DATED MARCH 26, 2020)

SOCALGAS RESPONSE DATED MAY 7, 2020

SoCalGas provides the following Responses to the Safety and Enforcement Division (SED) data request dated March 26, 2020 in I.19-06-016. The Responses are based upon the best available, nonprivileged information that SoCalGas was able to locate through a diligent search within the time allotted to respond to this request, and within SoCalGas' possession, custody, or control. SoCalGas' responses do not include information collected or modeled by Blade Energy Partners' during its Root Cause Analysis Investigation. SoCalGas reserves the right to supplement, amend or correct the Responses to the extent that it discovers additional responsive information.

SoCalGas objects to the instructions submitted by SED and to the continuing and indefinite nature of this request on the grounds that they are overbroad and unduly burdensome. Special interrogatory instructions of this nature and continuing interrogatories are expressly prohibited by California Code of Civil Procedure Section 2030.060(d) and 030.060(g), respectively. SoCalGas will provide responsive documents in existence at the time of its response. Should SED seek to update its request, SoCalGas will respond to such a request as a new data request in the future.

SoCalGas submits these Responses, while generally objecting to any Request that fails to provide a defined time period to which SoCalGas may tailor its Response, and to the extent that any Request is overly broad, vague, ambiguous, unduly burdensome, assumes facts, or otherwise fails to describe with reasonable particularity the information sought. SoCalGas further submits these Responses without conceding the relevance of the subject matter of any Request or Response. SoCalGas reserves the right to object to use of these Responses, or information contained therein, in any dispute, matter or legal proceeding. Finally, at the time of this Response, there are no pending oral data requests from SED to SoCalGas.

QUESTION 1:

For this data request, please refer to the SoCalGas reply testimony, Chapter IV, "Prepared Reply Testimony of Danny Walzel and Dr. Arash Haghshenas on Behalf of Southern California Gas Company".

a. Please articulate the exact role that Danny Walzel assumed to kill well SS-25.

b. Please provide all invoices and other documents from Boots & Coots to SoCalGas for work done during the time of the well SS-25 leak that show the role Mr. Walzel assumed in killing well SS-25
c. Please articulate the exact role that Dr. Hagshenas assumed to kill well SS-25.
d. Please provide all invoices and other documents from Boots & Coots to SoCalGas for work done during the time of the well SS-25 leak that show the role Dr. Haghshenas assumed in killing well SS-25

RESPONSE 1:

a. SoCalGas objects to this request on the grounds it is vague and ambiguous, particularly with respect to the terms "role" and "assumed," and seeks information that is already within SED's possession or equally available to SED (see transcript of SED's examination under oath of Mr. Walzel, attached to SED's Opening Testimony). Subject to and without waiving the foregoing objections, SoCalGas responds as follows.

Mr. Walzel contributed to Boots & Coots' well control efforts beginning on October 25, 2015, and until he departed from Aliso Canyon on December 14, 2015. During this period Mr. Walzel held the position of Senior Well Control Engineer. Mr. Walzel was responsible for rigging-up equipment, preparing modeling in connection with the kill attempts, and preparing and physically implementing the pumping operations during kill attempt numbers 2–6. SoCalGas notes that Mr. Walzel was made available to SED on August 8, 2018 for an Examination Under Oath (EUO) at the California Public Utilities Commission's San Francisco Office. Further information regarding Mr. Walzel's role was provided to SED's five questioners during that EUO.

b. SoCalGas objects to this request on the grounds it is vague and ambiguous and unintelligible to the extent it seeks invoices "that show the role Mr. Walzel assumed in killing well SS-25" "during the time of the well SS-25 leak." SoCalGas further objects to this request to the extent it is overly broad and unduly burdensome to the extent it seeks "all invoices and other documents." SoCalGas further objects to this request to the extent it seeks documents already in SED's possession. Subject to and without waiving the foregoing objections, SoCalGas responds as follows. SoCalGas assumes

this question seeks the Boots & Coots Daily Reports that SoCalGas previously provided to SED. Please see electronic documents previously produced to SED (AC_CPUC_SED_DR_16_0025631 – AC_CPUC_SED_DR_16_0025808).

c. SoCalGas objects to this request on the grounds it is vague and ambiguous, particularly with respect to the terms "role" and "assumed." Subject to and without waiving the foregoing objections, SoCalGas responds as follows.

Dr. Haghshenas was involved in the SS-25 well control efforts beginning December 2, 2015[1] and ending February 18, 2016. During this period Dr. Haghshenas conducted transient modeling for the 7th top kill attempt. Dr. Haghshenas also prepared a model and ran simulations for the relief well used to control SS-25.

d. SoCalGas objects to this request on the grounds it is vague and ambiguous and unintelligible to the extent it seeks invoices "that show the role Dr. Haghshenas assumed in killing well SS-25" "during the time of the well SS-25 leak." SoCalGas further objects to this request to the extent it is overly broad and unduly burdensome to the extent it seeks "all invoices and other documents." SoCalGas further objects to this request to the extent it seeks documents already in SED's possession. Subject to and without waiving the foregoing objections, SoCalGas responds as follows. SoCalGas understands this question to seek the Boots & Coots Daily Reports. Please see documents previously produced to SED (AC_CPUC_SED_DR_16_0025631 – AC_CPUC_SED_DR_16_0025808).

QUESTION 2:

Please refer to the following passages in the Chapter IV reply testimony, page 3 to answer rest of the questions in this data request, except for questions 32 and 33.

> Q: DID BOOTS & COOTS PERFORM TRANSIENT KILL MODELING PRIOR TO KILL ATTEMPT #7?

[1] SoCalGas notes that a typographical error appears in SoCalGas' Reply, Chapter IV (Walzel/Haghshenas) at page 2, line 3. The date "December 7" should be replaced with "December 2," as stated in this response.

> A: Yes. Boots & Coots performed transient kill modeling before kill attempt number seven. After Boots & Coots attempted its second well kill attempt on November 15, 2015, and before its well kill attempt on November 18 2015, and for additional kill attempts thereafter, Boots & Coots performed transient modeling.
>
> Q: DOES BOOTS & COOTS HAVE THE TRANSIENT MODELING RECORDS RELATED TO ITS SS-25 KILL ATTEMPTS?
>
> A: Only for the December 22, 2015, well kill. Danny Walzel had conducted the transient modeling for well kill prior to December 22, 2015. However, the transient modeling was done on his laptop. This laptop was stolen from him, along with other personal items, in late December 2015. Mr. Walzel reported the theft to the police. Mr. Walzel's transient modeling was not saved anywhere else, nor was it sent to anyone else.

With these passages in mind, please answer the following questions.

RESPONSE 2:

SoCalGas objects to this request to the extent it asks no question to which SoCalGas can respond.

QUESTION 3:

Provide the police report of the theft that Mr. Walzel reported to the police.

RESPONSE 3:

SoCalGas objects to this request on the grounds it is vague and ambiguous, particularly with respect to the term "police report." SoCalGas further objects to this request it seeks documents not in SoCalGas' possession. Subject to and without waiving the foregoing objections, SoCalGas responds as follows. The Houston Police Department provided Mr. Walzel with a document regarding the reported theft of Mr. Walzel's laptop and other belongings, provided here bearing the following bates number: AC_CPUC_SED_DR_57_0000001.

ORDER INSTITUTING INVESTIGATION ON THE COMMISSION'S OWN MOTION INTO THE OPERATIONS AND PRACTICES OF SOUTHERN CALIFORNIA GAS COMPANY WITH RESPECT TO THE ALISO CANYON STORAGE FACILITY AND THE RELEASE OF NATURAL GAS, AND ORDER TO SHOW CAUSE WHY SOUTHERN CALIFORNIA GAS COMPANY SHOULD NOT BE SANCTIONED FOR ALLOWING THE UNCONTROLLED RELEASE OF NATURAL GAS FROM ITS ALISO CANYON STORAGE FACILITY (I.19-06-016)

SOUTHERN CALIFORNIA GAS COMPANY

(DATA REQUEST SED-SCG-57 DATED MARCH 26, 2020)

SOCALGAS RESPONSE DATED MAY 7, 2020

QUESTION 4:

Did SoCalGas disclose the information in these passages to Blade Energy Partners (Blade) during Blade's Root Cause Analysis?

RESPONSE 4:

SoCalGas objects to this request to the extent it is vague and ambiguous regarding the terms "the information in these passages." SoCalGas further objects to this request to the extent it assumes Blade specifically asked SoCalGas to produce "transient modeling" in connection with the SS-25 well control efforts. SoCalGas further objects to this request to the extent it seeks information that is equally available to SED, as SED was copied on all data request responses provided to Blade Energy Partners in the course of Blade's investigation prior to issuing its Root Cause Analysis report. Subject to and without waiving the foregoing objections, SoCalGas responds as follows.

Regarding the details described in the testimony excerpted by SED in the passage above, SoCalGas first became aware of this information cited in the excerpted passage on February 21, 2020, after Blade Energy Partners had issued its Root Cause Analysis Report.

QUESTION 5:

If the answer to question 4 is yes, provide documentation showing this, including the dates and the Blade data requests to which this information responded.

RESPONSE 5:

N/A. See response to Question 4.

QUESTION 6:

If the answer to question 4 is no, please explain why not.

RESPONSE 6:

See response to Question 4.

QUESTION 7:

When did SoCalGas first learn of the information provided in these passages?

RESPONSE 7:

SoCalGas objects to this request to the extent it is vague and ambiguous due to the compound nature of the question. Subject to and without waiving the foregoing objection, SoCalGas responds as follows. See response to Question 4.

QUESTION 8:

Provide documentation showing the answer to question 7.

RESPONSE 8:

SoCalGas objects to this question to the extent it is vague and ambiguous and unintelligible to the extent it seeks documentation that SoCalGas was not aware of a fact. Subject to and without waiving the foregoing objection, SoCalGas responds as follows.

Please see SoCalGas Reply Testimony, Ex. III-4 (Danny Walzel Depo. (Feb. 21, 2020).)

QUESTION 9:

Beginning October 23, 2015 and continuing until well SS-25 was successfully killed, did SoCalGas have any procedures, plans, protocols, or other requirements in place that it be provided with records related to a well kill such as the well kills for SS-25, including transient modeling records?

RESPONSE 9:

SoCalGas objects to this question to the extent it is vague and ambiguous with respect to the phrases "such as the well kills for SS-25," and "transient modeling records." Subject to and without waiving the foregoing objections, SoCalGas responds as follows. No.

QUESTION 10:

If the answer to question 9 is yes, please provide all such requirements, and identify the page number and quoted excerpt or excerpts that support the answer.

RESPONSE 10:

N/A. Please see response to Question 9.

QUESTION 11:

Given that SoCalGas must comply with the safety requirements of California Public Utilities Code Section 451, please answer the following:

a. Does SoCalGas find it acceptable the assertion in Mr. Walzel's testimony that "Mr. Walzel's transient modeling was not saved anywhere else, nor was it sent to anyone else"?
b. Does SoCalGas take the position that it was appropriate for transient modeling of the SS-25 well kill attempts to not have been saved anywhere else than Mr. Walzel's laptop, and not to have been sent to anyone else?

RESPONSE 11:

a. SoCalGas objects to this question on the grounds it is vague, ambiguous and unintelligible with respect to the phrase "find it acceptable the assertion" and relation to Section 451 of the California Public Utilities Code. SoCalGas further objects to this request to the extent it calls for a legal conclusion. SoCalGas additionally objects to this request to the extent it constitutes an incomplete hypothetical.

b. SoCalGas objects to this question on the grounds it is vague and ambiguous with respect to the term "appropriate" and relation to Section 451 of the California Public Utilities Code. SoCalGas further objects to this request to the extent it calls for a legal conclusion. SoCalGas further objects to this request to the extent that it assumes that regulations and/or industry standards require that well control efforts necessarily require transient modeling.

QUESTION 12:

How many transient models were created for the kill attempts of SS-25?

RESPONSE 12:

SoCalGas objects to this question on the grounds it is vague, ambiguous and unintelligible with respect to the phrase "[h]ow many transient models." Subject to and without waiving the foregoing objections, SoCalGas responds as follows. SoCalGas understands this question to ask for the number of discrete models that were created in connection with the seven top kills attempted on SS-25. SoCalGas understands from Boots & Coots that Boots & Coots used software to prepare one discrete transient model in connection with top kill attempts 3-6, and a second discrete model for top kill attempt 7.

QUESTION 13:

Please list the number of transient models that were created for each well kill attempt of SS-25. Please be sure to include the date each model was completed, and the kill attempt for which each model was used.

RESPONSE 13:

SoCalGas objects to this question to the extent it is vague and ambiguous with respect to the phrase "number of transient models." Subject to and without waiving the foregoing objection, SoCalGas responds as follows.

As described in SoCalGas' Reply Testimony, Boots & Coots performed transient kill modeling before its November 18, 2015 kill attempt and for each kill attempt thereafter.

However, the laptop containing the modeling for kill attempts 3-6 was stolen from Mr. Walzel's vehicle after he returned to Houston, and the laptop was never recovered. (*See*, SoCalGas' Reply Testimony Chapter IV (Walzel/Haghshenas) at 3.) Therefore, SoCalGas cannot provide the detail sought for the modeling that was conducted in support of top kill attempts 3-6. Transient modeling prepared in connection with the 7th kill attempt was prepared on or around December 16, 2015 and completed prior to the 7th kill attempt on December 22, 2015.

QUESTION 14:

Other than Mr. Walzel, did any other Boots & Coots employee, SoCalGas personnel member, or any other individual develop or produce, or help develop or help produce a transient model that was used to kill SS-25?

RESPONSE 14:

SoCalGas objects to this question to the extent it is vague and ambiguous with respect to the phrases "develop or produce" and "help develop and produce." Subject to and without waiving the foregoing objections, SoCalGas responds as follows. SoCalGas understands this request to seek information regarding the transient modeling prepared in connection with top kill attempts 3-7. Yes, another Boots & Coots employee prepared modeling in connection with the 7th top kill attempted on SS-25.

QUESTION 15:

If so, please identify each individual, the model they developed or produced, or helped develop or produce, the date the model was produced, and the kill for which the model was produced.

RESPONSE 15

SoCalGas objects to this question to the extent it is vague and ambiguous with respect to the phrases "develop or produce" and "help develop and produce." Subject to and without waiving the foregoing objections, SoCalGas responds as follows.

SoCalGas understands this request to seek information regarding the transient modeling prepared in connection with top kill attempts 3-7. In December 2015, Dr. Haghshenas of Boots & Coots helped develop a transient model in connection with the 7th top kill attempted on SS-25.

QUESTION 16:

Please provide each model identified in response to the prior question.

RESPONSE 16:

SoCalGas objects to this request to the extent it seeks information that is not in the custody or control of SoCalGas or Boots & Coots. SoCalGas further objects to this request as vague and ambiguous regarding the term "model." Subject to and without waiving the foregoing objections, SoCalGas responds as follows. As noted in SoCalGas' Reply Testimony Chapter IV (Walzel / Haghshenas), and acknowledged by SED in Question 2 of this data request, only the transient kill modeling prepared in connection with the December 22, 2015 top kill attempt is within the possession, custody, or control of Boots & Coots. Therefore, SoCalGas interprets this request as seeking the transient model prepared in connection with Boots & Coots' seventh well kill attempt. However, the "model" itself cannot be reviewed without access to licensed modeling software. To the extent that SED seeks transient modeling data related to the seventh kill attempt, please see documents previously provided to SED: AC_CPUC_0173909 – AC_CPUC_0173913; AC_CPUC_0173168 – AC_CPUC_0173172.

QUESTION 17:

Did Mr. Walzel participate in all of the Boots & Coots well kill attempts?

RESPONSE 17:

SoCalGas objects to this request as vague and ambiguous, particularly with respect to the term "participate." Subject to and without waiving the foregoing objection, SoCalGas responds as follows.

No. As described in SoCalGas' Reply Testimony, Mr. Walzel contributed to Boots & Coots' well control efforts beginning on October 25, 2015 and until he departed from Aliso Canyon on December 14, 2015.

QUESTION 18:

Did Mr. Walzel take any notes related to the transient models that were not on his stolen laptop?

RESPONSE 18:

SoCalGas objects to this request as vague and ambiguous regarding the term "notes related to the transient models." Subject to and without waiving the foregoing objection, SoCalGas responds as follows. SoCalGas interprets "notes" as notes taken by Mr. Walzel and not correspondence. No. SoCalGas understands from Boots & Coots that all notes, if any, taken by Mr. Walzel would have been transcribed on his laptop that was later stolen from Mr. Walzel's vehicle.

QUESTION 19:

If so, please provide all such notes.

RESPONSE 19:

N/A. See response to Question 18.

QUESTION 20:

Please confirm that all transient models were actually SAVED on Mr. Walzel's stolen laptop.

RESPONSE 20:

SoCalGas objects to this question on the basis that it is vague and ambiguous and unintelligible with respect to the capitalization of the word SAVED. Subject to and without waiving the foregoing objections, SoCalGas responds as follows.

SoCalGas understands from Boots & Coots that transient modeling prepared in support of well kill attempts 3-6 were saved on the laptop that was stolen from Mr. Walzel's vehicle.

QUESTION 21:

Did SoCalGas authorize the use of Mr. Walzel's transient models for each of the well kill attempts?

RESPONSE 21:

SoCalGas objects to this question on the basis that it is vague and ambiguous and unintelligible with respect to the phrase "authorize the use of." Subject to and without waiving the foregoing objections, SoCalGas responds as follows.

The transient modeling helped inform the kill plans prepared by Boots & Coots. SoCalGas approved the kill plans that were prepared by Boots & Coots and ultimately used to implement each top kill attempt.

QUESTION 22:

Was a different transient model created for each well kill attempt?

RESPONSE 22:

SoCalGas objects to this request to the extent it is duplicative of Questions 12 and 13. Subject to and without waiving the foregoing objection, SoCalGas responds as follows. See response to Questions 12 and 13.

QUESTION 23:

If so, please identify each well kill attempt for which a transient model was used.

RESPONSE 23:

SoCalGas objects to this question to the extent it seeks information that is already in the possession of SED. SoCalGas further objects to this request to the extent it is duplicative of Questions 12 and 13. Subject to and without waiving the foregoing objections, SoCalGas responds as follows. See responses to Questions 12 and 13 herein. As stated in SoCalGas' Reply Testimony Chapter IV (Walzel / Haghshenas), transient modeling was performed for each well kill performed by Boots & Coots after Boots & Coots' second attempt.

QUESTION 24:

If not, why not?

RESPONSE 24:

SoCalGas objects to this question to the extent it is vague, ambiguous, and unintelligible to the extent it purports to ask a question without a premise. Subject to and without waiving the foregoing objection, SoCalGas responds as follows.
See responses to Questions 22 and 23.

QUESTION 25:

Did SoCalGas review Mr. Walzel's transient models?

RESPONSE 25:

SoCalGas reviewed and approved the kill plans that were prepared by Boots & Coots and ultimately used to implement each top kill attempt. The transient modeling helped inform the kill plans prepared by Boots & Coots.

QUESTION 26:

Did SoCalGas approve each of Mr. Walzel's transient models before the well kill attempt for which they were used?

RESPONSE 26:

SoCalGas objects to this question to the extent it is vague and ambiguous, particularly in reference to Question 21 of this data request, which asks whether SoCalGas "authorize[d]" the use of Mr. Walzel's transient models. SoCalGas further objects to this request to the extent it is duplicative of Question 21 herein. Subject to and without waiving the foregoing objections, SoCalGas responds as follows. SoCalGas interprets this question to ask the same question posed in Question 21 herein. Accordingly, see SoCalGas' response to Question 21.

QUESTION 27:

If not, why not?

RESPONSE 27:

SoCalGas objects to this question to the extent it is vague, ambiguous, and unintelligible to the extent it purports to ask a question without a premise. Subject to and without waiving the foregoing objections, SoCalGas responds as follows. See responses to Questions 21, 25 and 26.

QUESTION 28:

If SoCalGas approved of each of Mr. Walzel's transient models before the well kill attempt for which they were used, describe SoCalGas's review process of Mr. Walzel's transient models?

RESPONSE 28:

SoCalGas objects to this request to the extent it is vague and ambiguous, particularly with respect to the term "review process." Subject to and without waiving the foregoing objections, SoCalGas responds as follows. See responses to Questions 21, 25, and 26.

ORDER INSTITUTING INVESTIGATION ON THE COMMISSION'S OWN MOTION INTO THE OPERATIONS AND PRACTICES OF SOUTHERN CALIFORNIA GAS COMPANY WITH RESPECT TO THE ALISO CANYON STORAGE FACILITY AND THE RELEASE OF NATURAL GAS, AND ORDER TO SHOW CAUSE WHY SOUTHERN CALIFORNIA GAS COMPANY SHOULD NOT BE SANCTIONED FOR ALLOWING THE UNCONTROLLED RELEASE OF NATURAL GAS FROM ITS ALISO CANYON STORAGE FACILITY (I.19-06-016)

SOUTHERN CALIFORNIA GAS COMPANY

(DATA REQUEST SED-SCG-57 DATED MARCH 26, 2020)

SOCALGAS RESPONSE DATED MAY 7, 2020

QUESTION 29:

If SoCalGas approved of each of Mr. Walzel's transient models before the well kill attempt for which they were used, please identify the individual from SoCalGas who approved of Mr. Walzel's transient models?

RESPONSE 29:

SoCalGas objects to this request to the extent it is vague and ambiguous with respect to the use of the term "approved of." Subject to and without waiving the foregoing objection, SoCalGas responds as follows. N/A. See responses to Questions 21, 25 and 26.

QUESTIONS 30:

Please define in detail the process behind creating a transient well model.

a. For example, what are the inputs?
b. What are the outputs?
c. Etc.

RESPONSE 30:

SoCalGas objects to this question on the grounds it is vague and ambiguous with respect to the request to "define" a "process," and unintelligible at subpart (c) of the question. SoCalGas further objects to this request to the extent that it seeks information that is equally available to SED and does not require discovery from SoCalGas nor its testifying witnesses.

QUESTION 31:

Consistent with industry practice, please state all steps and calculations necessary to produce a transient well model.

RESPONSE 31:

SoCalGas objects to this question to the extent it is vague and ambiguous with respect to the phrase, "Consistent with industry practice" – this phrase renders the question posed unintelligible. SoCalGas further objects to this request to the extent that it seeks information that is equally available to SED and does not require discovery from SoCalGas nor its testifying witnesses.

QUESTION 32:

Please state all steps and calculations that were taken to produce the transient well models that Mr. Walzel's testimony asserts that were done for the well SS-25 kill attempts.

RESPONSE 32:

SoCalGas objects to this question on the grounds it is vague and ambiguous and unintelligible with respect to the phrase "the transient well models that Mr. Walzel's testimony asserts that were done for the well SS-25 kill." Subject to and without waiving the foregoing objections, SoCalGas responds as follows.

Based on conversations with Boots & Coots, SoCalGas understands that Mr. Walzel prepared modeling for kill attempts 3-6 using Drillbench. The preparation of the model included the following general steps: (1) define the wellbore parameters, including the trajectory, casing, drill pipe and tubing; (2) define the kill fluid properties; (3) define reservoir properties, such as the reservoir fluid, and the reservoir capabilities for the blowout condition; (4) define the flow path, and surface condition; and (5) define the temperature profile in the wellbore.

QUESTION 33:

Did SoCalGas or any entity that it hired conduct transient modeling related to its SS-25 kill attempts after December 22, 2015?

ORDER INSTITUTING INVESTIGATION ON THE COMMISSION'S OWN MOTION INTO THE OPERATIONS AND PRACTICES OF SOUTHERN CALIFORNIA GAS COMPANY WITH RESPECT TO THE ALISO CANYON STORAGE FACILITY AND THE RELEASE OF NATURAL GAS, AND ORDER TO SHOW CAUSE WHY SOUTHERN CALIFORNIA GAS COMPANY SHOULD NOT BE SANCTIONED FOR ALLOWING THE UNCONTROLLED RELEASE OF NATURAL GAS FROM ITS ALISO CANYON STORAGE FACILITY (I.19-06-016)

SOUTHERN CALIFORNIA GAS COMPANY

(DATA REQUEST SED-SCG-57 DATED MARCH 26, 2020)

SOCALGAS RESPONSE DATED MAY 7, 2020

RESPONSE 33:

SoCalGas objects to this question on the basis that it is vague and ambiguous with respect to the phrase "transient modeling related to its SS-25 kill attempts." Subject to and without waiving the foregoing objection, SoCalGas responds as follows. SoCalGas interprets this request as seeking whether SoCalGas or any entity that it hired conducted transient modeling to assist with SS-25 top kill attempts after December 22, 2015. No, the final top kill attempt was executed on December 22, 2015.

QUESTION 34:

If the answer to question 33 is yes, please provide the transient modeling records showing the answer.

RESPONSE 34:

N/A. See response to Question 33.

QUESTION 35:

If the answer to question 33 is yes, please explain why such models were conducted.

RESPONSE 35:

N/A. See response to Question 33.

QUESTION 36:

If the answer to question 33 is no, why not?

RESPONSE 36:

N/A. See response to Question 33.

ORDER INSTITUTING INVESTIGATION ON THE COMMISSION'S OWN MOTION INTO THE OPERATIONS AND PRACTICES OF SOUTHERN CALIFORNIA GAS COMPANY WITH RESPECT TO THE ALISO CANYON STORAGE FACILITY AND THE RELEASE OF NATURAL GAS, AND ORDER TO SHOW CAUSE WHY SOUTHERN CALIFORNIA GAS COMPANY SHOULD NOT BE SANCTIONED FOR ALLOWING THE UNCONTROLLED RELEASE OF NATURAL GAS FROM ITS ALISO CANYON STORAGE FACILITY (I.19-06-016)

SOUTHERN CALIFORNIA GAS COMPANY

(DATA REQUEST SED-SCG-57 DATED MARCH 26, 2020)

SOCALGAS RESPONSE DATED MAY 7, 2020

QUESTION 37:

Were any other records related to SoCalGas's SS-25 kill attempts on Mr. Walzel's stolen laptop?

RESPONSE 37:

SoCalGas objects to the question to the extent it is vague and ambiguous with respect to the phrase "any other records" – the predicate has not been established. SoCalGas further objects to this request to the extent that it seeks information that is not in the possession, custody or control of Boots & Coots, or SoCalGas. Subject to and without waiving the foregoing objection, SoCalGas responds as follows.

SoCalGas interprets this question to ask whether Mr. Walzel retained information other than the transient kill models referenced in SoCalGas' Reply Testimony, Chapter IV (Walzel / Haghshenas) on page 3, on his laptop. Mr. Walzel's laptop was stolen over four years ago, and has not since been recovered. SoCalGas has inquired with Boots & Coots, and without having access to Mr. Walzel's stolen laptop, neither Boots & Coots nor SoCalGas is able to respond to this request.

QUESTION 38:

If the answer to question 37 is yes, please list them.

RESPONSE 38:

SoCalGas objects to this request on the ground it is overly broad and unduly burdensome. Subject to and without waiving the foregoing objections, SoCalGas responds as follows. Mr. Walzel's laptop was stolen over four years ago, and has not since been recovered. SoCalGas has inquired with Boots & Coots, and without having access to Mr. Walzel's stolen laptop, neither Boots & Coots nor SoCalGas is able to respond to this request.

ORDER INSTITUTING INVESTIGATION ON THE COMMISSION'S OWN MOTION INTO THE OPERATIONS AND PRACTICES OF SOUTHERN CALIFORNIA GAS COMPANY WITH RESPECT TO THE ALISO CANYON STORAGE FACILITY AND THE RELEASE OF NATURAL GAS, AND ORDER TO SHOW CAUSE WHY SOUTHERN CALIFORNIA GAS COMPANY SHOULD NOT BE SANCTIONED FOR ALLOWING THE UNCONTROLLED RELEASE OF NATURAL GAS FROM ITS ALISO CANYON STORAGE FACILITY (I.19-06-016)

SOUTHERN CALIFORNIA GAS COMPANY

(DATA REQUEST SED-SCG-57 DATED MARCH 26, 2020)

SOCALGAS RESPONSE DATED MAY 7, 2020

QUESTION 39:

For each of the records listed in response to question 37, please state whether the record was saved elsewhere (e..g, a main server, on portable drive, etc.), or sent to another person. For each record that was saved elsewhere or sent to another person, please identify where the record was saved and to whom the record was sent.

RESPONSE 39:

SoCalGas objects to this request on the grounds the question is overly broad and unduly burdensome. Subject to and without waiving the foregoing objection, SoCalGas responds as follows.

N/A. See response to Question 38.

QUESTION 40:

Please describe the purpose of each record listed in response to question 37.

RESPONSE 40:

N/A. See response to Question 38.

QUESTION 41:

Was Mr. Walzel's stolen laptop recovered?

RESPONSE 41:

No. See responses to Questions 13 and 37.

QUESTION 42:

If the answer to question 41 is yes, were any of the transient models on it?

RESPONSE 42:

N/A. See response to Question 41.

QUESTION 43:

If the answer to question 41 is yes, were any other records related to SoCalGas's SS-25 kill attempts on it?

RESPONSE 43:

N/A. See response to Question 41.

QUESTION 44:

From what exact location was Mr. Walzel's laptop stolen?

RESPONSE 44:

7138 Farm to Market 1960 Rd. W, Houston Texas, 77070.

QUESTION 45:

When it was stolen, was Mr. Walzel's laptop inside a secure space that was somehow protected against property inside of it being stolen?

RESPONSE 45:

SoCalGas objects to this request on the ground it is vague and ambiguous with respect to the phrases "secure space" and "somehow protected against property inside of it being stolen." Subject to and without waiving the foregoing objections, SoCalGas responds as follows.

Mr. Walzel's laptop was locked inside of his truck.

QUESTION 46:

If the answer to question 45 is yes, please describe the secure space, and all protections that the space had in place to protect against stolen property.

RESPONSE 46:

SoCalGas objects to this request to the extent it is unduly burdensome pursuant to Rule 10.1 of the Commission's Rules of Practice and Procedure, and the "burden, expense, or intrusiveness of that discovery clearly outweighs the likelihood that the information sought will lead to the discovery of admissible evidence." Subject to and without waiving the foregoing objection, SoCalGas responds as follows. Please see Response to Question 45.

QUESTION 47:

If Mr. Walzel's laptop was not inside a secure space when stolen, why not?

RESPONSE 47:

N/A. See responses to Questions 45 and 46.

QUESTION 48:

For prior SoCalGas well kill attempts (both for SS-25 and others), have any transient modeling records been stolen from SoCalGas or its employees or contractors?

RESPONSE 48:

SoCalGas objects to the question to the extent it is vague and ambiguous with respect to the phrase "transient modeling records." SoCalGas objects to this request to the extent it seeks information that is beyond the scope of this proceeding as determined by the Assigned Commissioner's Scoping Memo and Ruling dated September 26, 2019. Subject to and without waiving the foregoing objection, SoCalGas responds as follows.

Aside from the transient modeling that was contained on Mr. Walzel's stolen laptop, SoCalGas is not aware of any other property theft in connection with the SS-25 incident.

QUESTION 49:

If so, please list them.

RESPONSE 49:

SoCalGas objects to this question on the grounds it is vague and ambiguous to the extent it poses a request without any reference. Subject to and without waiving the foregoing objection, SoCalGas responds as follows: N/A. Please see response to Question 48.

QUESTION 50:

For prior well kill attempts, has SoCalGas ever allowed its contractor to keep transient modeling records, but not save the records anywhere other than their laptop, and not send the records to anyone else?

RESPONSE 50:

SoCalGas objects to this request on the grounds it is vague and ambiguous with respect to the phrase "transient modeling records," and compound, argumentative, and overly broad and unduly burdensome to the extent it is not limited to any time frame to which SoCalGas may tailor its response. Subject to and without waiving the foregoing objections, SoCalGas responds as follows.

The use of transient modeling is not a widely utilized practice in the industry for controlling well failures by top kill. Aside from the SS-25 incident, SoCalGas has never worked with a contractor that prepared transient kill modeling for a well control operation at Aliso Canyon.

QUESTION 51:

If so, please list all such instances.

RESPONSE 51:

SoCalGas objects to this question to the extent it makes a request without any reference. Subject to and without waiving the foregoing objection, SoCalGas responds as follows: N/A. Please see response to Question 50.

QUESTION 52:

With regards to the well kill attempts of SS-25, did Boot & Coots use transient modeling for any earlier attempt to inform the decision making related to any later attempt?

RESPONSE 52:

SoCalGas objects to this request to the extent it is vague and ambiguous with respect to the terms "earlier attempt" and "later attempt" and the phrase "inform the decision making related to." Subject to and without waiving the foregoing objections, SoCalGas responds as follows. Yes.

QUESTION 53:

What else was with Mr. Walzel's laptop at the time it was stolen? Please be specific in answering this question. For example, if other equipment, notes, or other things were stolen, please describe them in detail.

RESPONSE 53:

SoCalGas objects to this request to the extent it is unduly burdensome pursuant to Rule 10.1 of the Commission's Rules of Practice and Procedure, and the "burden, expense, or intrusiveness of that discovery clearly outweighs the likelihood that the information sought will lead to the discovery of admissible evidence." SoCalGas further objects to this request to the extent it seeks information that is beyond the scope of this

proceeding as determined by the Assigned Commissioner's Scoping Memo and Ruling dated September 26, 2019. SoCalGas additionally objects to this question to the extent it is compound, unintelligible, and internally inconsistent to the extent it asks SoCalGas to identify what items were "with Mr. Walzel's laptop at the time it was stolen," but later asks SoCalGas to identify items that "were stolen."

QUESTION 54:

Were any of the other things that were with Mr. Walzel's laptop at the time it was stolen also stolen along with the laptop?

RESPONSE 54:

SoCalGas objects to this request to the extent it is unduly burdensome pursuant to Rule 10.1 of the Commission's Rules of Practice and Procedure, and the "burden, expense, or intrusiveness of that discovery clearly outweighs the likelihood that the information sought will lead to the discovery of admissible evidence." SoCalGas further objects to this request to the extent it seeks information that is beyond the scope of this proceeding as determined by the Assigned Commissioner's Scoping Memo and Ruling dated September 26, 2019. SoCalGas additionally objects to this question to the extent it is duplicative of Question 53 hereinabove.

QUESTION 55:

If the answer to question 54 is yes, which things were stolen, and which were not?

RESPONSE 55:

SoCalGas objects to this request to the extent it is unduly burdensome pursuant to Rule 10.1 of the Commission's Rules of Practice and Procedure, and the "burden, expense, or intrusiveness of that discovery clearly outweighs the likelihood that the information sought will lead to the discovery of admissible evidence." SoCalGas further objects to this request to the extent it seeks information that is beyond the scope of this proceeding as determined by the Assigned Commissioner's Scoping Memo and Ruling dated September 26, 2019. SoCalGas also objects to this request to the extent it is duplicative of Questions 53 and 54. SoCalGas additionally objects to this question to

the extent it is unintelligible in its reference to Question 54, which does not seek a response that can be further parsed as requested in this question.

QUESTION 56:

Please identify the words in the requested police report that support the answers provided in response to questions 54 and 55.

RESPONSE 56:

SoCalGas objects to this request as vague and ambiguous, particularly with reference to the term "police report." SoCalGas objects to this request to the extent it assumes SoCalGas has possession, custody, or control over a police report. Subject to and without waiving the foregoing objections, SoCalGas responds as follows.

See response to Question 3.

QUESTION 57:

What else relating to SS-25 was stolen when Mr. Walzel's laptop was stolen?

RESPONSE 57:

SoCalGas objects to this request on the grounds it is vague and ambiguous as the phrase "relating to." SoCalGas further objects to this question to the extent this question is duplicative of Questions 37 and 43. Subject to and without waiving the foregoing objections, SoCalGas responds as follows. SoCalGas interprets this request as asking whether any items related to Boots & Coots' well control efforts on SS-25, aside from any materials on Mr. Walzel's stolen laptop, were also stolen. No.

QUESTION 58:

Did Mr. Wenzel [*sic*] use an internet model to do his transient model calculations?

a. If yes, what internet service provided the model? Please provide the website address.

b. If yes, did Mr Wenzel [*sic*] enter data, run the model and download results and/or a report to his laptop?
c. If yes, does Mr. Wenzel [*sic*] have an online account with the service identified in response to a. above?
1. If yes, are the results and/or reports that were generated stored in his online account?
a. If yes, please provide the results/reports.

RESPONSE 58:

SoCalGas objects to this request to the extent it is vague and ambiguous with respect to the terms "internet model." Subject to and without waiving the foregoing objections, SoCalGas responds as follows.

a-c. Mr. Walzel performed transient kill modeling using a licensed software called Drillbench. The transient kill modeling performed by Mr. Walzel is not available on an online platform.

QUESTION 59:

Was the transient model that Mr. Wenzel [*sic*] used a commercial product or something created by him, Boots & Coots or someone else?
a. If it was a commercial product, what is the name of the product and where can it be purchased or downloaded?
b. If it was created, please identify the person or company who created the model.

RESPONSE 59:

a-b. SoCalGas objects to this request to the extent it is vague and ambiguous with respect to the phase "transient model that Mr. Wenzel [*sic*] used." Subject to and without waiving the foregoing objections, SoCalGas responds as follows. Mr. Walzel performed transient kill modeling using a licensed software called Drillbench. Drillbench is available for purchase from the company Schlumberger.

ORDER INSTITUTING INVESTIGATION ON THE COMMISSION'S OWN MOTION INTO THE OPERATIONS AND PRACTICES OF SOUTHERN CALIFORNIA GAS COMPANY WITH RESPECT TO THE ALISO CANYON STORAGE FACILITY AND THE RELEASE OF NATURAL GAS, AND ORDER TO SHOW CAUSE WHY SOUTHERN CALIFORNIA GAS COMPANY SHOULD NOT BE SANCTIONED FOR ALLOWING THE UNCONTROLLED RELEASE OF NATURAL GAS FROM ITS ALISO CANYON STORAGE FACILITY (I.19-06-016)

SOUTHERN CALIFORNIA GAS COMPANY

(DATA REQUEST SED-SCG-57 DATED MARCH 26, 2020)

SOCALGAS RESPONSE DATED MAY 7, 2020

QUESTION 60:

Is the transient model a spreadsheet model? If yes, provide a copy in native format with any instructions that are available.

RESPONSE 60:

SoCalGas objects to this request to the extent it is vague and ambiguous with respect to the demand to "provide a copy in native format." Subject to and without waiving the foregoing objection, SoCalGas responds as follows.

See responses to Questions 58 and 59.

AUTO THEFT DIVISION

ORDER INSTITUTING INVESTIGATION ON THE COMMISSION'S OWN MOTION INTO THE OPERATIONS AND PRACTICES OF SOUTHERN CALIFORNIA GAS COMPANY WITH RESPECT TO THE ALISO CANYON STORAGE FACILITY AND THE RELEASE OF NATURAL GAS, AND ORDER TO SHOW CAUSE WHY SOUTHERN CALIFORNIA GAS COMPANY SHOULD NOT BE SANCTIONED FOR ALLOWING THE UNCONTROLLED RELEASE OF NATURAL GAS FROM ITS ALISO CANYON STORAGE FACILITY (I.19-06-016)

SOUTHERN CALIFORNIA GAS COMPANY

(DATA REQUEST SED-SCG-57 DATED MARCH 26, 2020)

SOCALGAS SUPPLEMENTAL RESPONSE DATED MAY 19, 2020

SoCalGas provides the following Responses to the Safety and Enforcement Division (SED) data request dated March 26, 2020 in I.19-06-016. The Responses are based upon the best available, nonprivileged information that SoCalGas was able to locate through a diligent search within the time allotted to respond to this request, and within SoCalGas' possession, custody, or control. SoCalGas' responses do not include information collected or modeled by Blade Energy Partners' during its Root Cause Analysis Investigation. SoCalGas reserves the right to supplement, amend or correct the Responses to the extent that it discovers additional responsive information.

SoCalGas objects to the instructions submitted by SED and to the continuing and indefinite nature of this request on the grounds that they are overbroad and unduly burdensome. Special interrogatory instructions of this nature and continuing interrogatories are expressly prohibited by California Code of Civil Procedure Section 2030.060(d) and 030.060(g), respectively. SoCalGas will provide responsive documents in existence at the time of its response. Should SED seek to update its request, SoCalGas will respond to such a request as a new data request in the future.

SoCalGas submits these Responses, while generally objecting to any Request that fails to provide a defined time period to which SoCalGas may tailor its Response, and to the extent that any Request is overly broad, vague, ambiguous, unduly burdensome, assumes facts, or otherwise fails to describe with reasonable particularity the information sought. SoCalGas further submits these Responses without conceding the relevance of the subject matter of any Request or Response. SoCalGas reserves the right to object to use of these Responses, or information contained therein, in any dispute, matter or legal proceeding. Finally, at the time of this Response, there are no pending oral data requests from SED to SoCalGas.

SoCalGas understands from Boots & Coots that transient modeling prepared in support of well kill attempts 3-6 were saved on the laptop that was stolen from Mr. Walzel's vehicle.

<u>QUESTION 21:</u>

Did SoCalGas authorize the use of Mr. Walzel's transient models for each of the well kill attempts?

ORDER INSTITUTING INVESTIGATION ON THE COMMISSION'S OWN MOTION INTO THE OPERATIONS AND PRACTICES OF SOUTHERN CALIFORNIA GAS COMPANY WITH RESPECT TO THE ALISO CANYON STORAGE FACILITY AND THE RELEASE OF NATURAL GAS, AND ORDER TO SHOW CAUSE WHY SOUTHERN CALIFORNIA GAS COMPANY SHOULD NOT BE SANCTIONED FOR ALLOWING THE UNCONTROLLED RELEASE OF NATURAL GAS FROM ITS ALISO CANYON STORAGE FACILITY (I.19-06-016)

SOUTHERN CALIFORNIA GAS COMPANY

(DATA REQUEST SED-SCG-57 DATED MARCH 26, 2020)

SOCALGAS SUPPLEMENTAL RESPONSE DATED MAY 19, 2020

RESPONSE 21 (DATED MAY 7, 2020):

SoCalGas objects to this question on the basis that it is vague and ambiguous and unintelligible with respect to the phrase "authorize the use of." Subject to and without waiving the foregoing objections, SoCalGas responds as follows.

The transient modeling helped inform the kill plans prepared by Boots & Coots. SoCalGas approved the kill plans that were prepared by Boots & Coots and ultimately used to implement each top kill attempt.

SUPPLEMENTAL RESPONSE 21 (DATED MAY 19, 2020):

SoCalGas provides this supplemental response pursuant to an agreement reached with SED at the parties' May 8, 2020 meet-and-confer. SoCalGas maintains and incorporates by reference the objections interposed in its initial response dated May 7, 2020. Subject to and without waiving SoCalGas' objection, SoCalGas responds as follows. SoCalGas authorized Boots & Coots personnel to take all actions that were reasonable and necessary to bring SS-25 under control. While SoCalGas did not specifically and expressly request or authorize Boots & Coots to perform transient modeling for each top kill attempt, SoCalGas would have authorized Boots & Coots' use of transient modeling to the extent it was, in Boots & Coots' expert judgement, appropriate and advisable under the circumstances.

QUESTION 25:

Did SoCalGas review Mr. Walzel's transient models?

RESPONSE 25 (DATED MAY 7, 2020):

SoCalGas reviewed and approved the kill plans that were prepared by Boots & Coots and ultimately used to implement each top kill attempt. The transient modeling helped inform the kill plans prepared by Boots & Coots.

ORDER INSTITUTING INVESTIGATION ON THE COMMISSION'S OWN MOTION INTO THE OPERATIONS AND PRACTICES OF SOUTHERN CALIFORNIA GAS COMPANY WITH RESPECT TO THE ALISO CANYON STORAGE FACILITY AND THE RELEASE OF NATURAL GAS, AND ORDER TO SHOW CAUSE WHY SOUTHERN CALIFORNIA GAS COMPANY SHOULD NOT BE SANCTIONED FOR ALLOWING THE UNCONTROLLED RELEASE OF NATURAL GAS FROM ITS ALISO CANYON STORAGE FACILITY (I.19-06-016)

SOUTHERN CALIFORNIA GAS COMPANY

(DATA REQUEST SED-SCG-57 DATED MARCH 26, 2020)

SOCALGAS SUPPLEMENTAL RESPONSE DATED MAY 19, 2020

SUPPLEMENTAL RESPONSE 25 (DATED MAY 19, 2020):

SoCalGas provides this supplemental response pursuant to an agreement reached with SED at the parties' May 8, 2020 meet-and-confer. SoCalGas evaluated the outputs of the transient modeling prepared by Mr. Walzel to the extent the modeling outputs were incorporated into the well kill plans Boots & Coots prepared in advance of each top kill attempt. However, SoCalGas did not review the transient modeling that resided only on Mr. Walzel's laptop and required licensed software to review.

QUESTION 26:

Did SoCalGas approve each of Mr. Walzel's transient models before the well kill attempt for which they were used?

RESPONSE 26 (DATED MAY 7, 2020):

SoCalGas objects to this question to the extent it is vague and ambiguous, particularly in reference to Question 21 of this data request, which asks whether SoCalGas "authorize[d]" the use of Mr. Walzel's transient models. SoCalGas further objects to this request to the extent it is duplicative of Question 21 herein. Subject to and without waiving the foregoing objections, SoCalGas responds as follows. SoCalGas interprets this question to ask the same question posed in Question 21 herein. Accordingly, see SoCalGas' response to Question 21.

SUPPLEMENTAL RESPONSE 26 (DATED MAY 19, 2020):

SoCalGas provides this supplemental response pursuant to an agreement reached with SED at the parties' May 8, 2020 meet-and-confer. SoCalGas maintains and incorporates by reference the objections interposed in its initial response dated May 7, 2020. Subject to and without waiving SoCalGas' objections, SoCalGas responds as follows. SoCalGas authorized Boots & Coots personnel to take all actions that were reasonable and necessary to bring SS-25 under control. While SoCalGas did not specifically and expressly request or authorize Boots & Coots to perform transient modeling for each top kill attempt, SoCalGas would have authorized and approved Boots & Coots' use of transient modeling to the extent it was in Boots &

Coots' expert judgement that it was appropriate and advisable under the circumstances.

QUESTION 27:

If not, why not?

RESPONSE 27 (DATED MAY 7, 2020):

SoCalGas objects to this question to the extent it is vague, ambiguous, and unintelligible to the extent it purports to ask a question without a premise. Subject to and without waiving the foregoing objections, SoCalGas responds as follows. See Responses to Questions 21, 25 and 26.

SUPPLEMENTAL RESPONSE 27 (DATED MAY 19, 2020):

SoCalGas provides this supplemental response pursuant to an agreement reached with SED at the parties' May 8, 2020 meet-and-confer. SoCalGas maintains and incorporates by reference the objections interposed in its initial response dated May 7, 2020. Subject to and without waiving SoCalGas' objections, SoCalGas responds as follows. SoCalGas authorized Boots & Coots personnel to take all actions that were reasonable and necessary to bring SS-25 under control. While SoCalGas did not specifically and expressly request or authorize Boots & Coots to perform transient modeling for each top kill attempt, SoCalGas would have authorized and approved Boots & Coots' use of transient modeling to the extent it was in Boots & Coots' expert judgement that it was appropriate and advisable under the circumstances.

QUESTION 28:

If SoCalGas approved of each of Mr. Walzel's transient models before the well kill attempt for which they were used, describe SoCalGas's review process of Mr. Walzel's transient models?

ORDER INSTITUTING INVESTIGATION ON THE COMMISSION'S OWN MOTION INTO THE OPERATIONS AND PRACTICES OF SOUTHERN CALIFORNIA GAS COMPANY WITH RESPECT TO THE ALISO CANYON STORAGE FACILITY AND THE RELEASE OF NATURAL GAS, AND ORDER TO SHOW CAUSE WHY SOUTHERN CALIFORNIA GAS COMPANY SHOULD NOT BE SANCTIONED FOR ALLOWING THE UNCONTROLLED RELEASE OF NATURAL GAS FROM ITS ALISO CANYON STORAGE FACILITY (I.19-06-016)

SOUTHERN CALIFORNIA GAS COMPANY

(DATA REQUEST SED-SCG-57 DATED MARCH 26, 2020)

SOCALGAS SUPPLEMENTAL RESPONSE DATED MAY 19, 2020

RESPONSE 28 (DATED MAY 7, 2020):

SoCalGas objects to this request to the extent it is vague and ambiguous, particularly with respect to the term "review process." Subject to and without waiving the foregoing objections, SoCalGas responds as follows. See Responses to Questions 21, 25, and 26.

SUPPLEMENTAL RESPONSE 28 (DATED MAY 19, 2020):

SoCalGas provides this supplemental response pursuant to an agreement reached with SED at the parties' May 8, 2020 meet-and-confer. SoCalGas maintains and incorporates by reference the objection interposed in its initial response dated May 7, 2020. Subject to and without waiving SoCalGas' objection, SoCalGas responds as follows. Please see SoCalGas' Supplemental Responses to Questions 21, 25, 26, and 27.

QUESTION 29:

If SoCalGas approved of each of Mr. Walzel's transient models before the well kill attempt for which they were used, please identify the individual from SoCalGas who approved of Mr. Walzel's transient models?

RESPONSE 29 (DATED MAY 7, 2020):

SoCalGas objects to this request to the extent it is vague and ambiguous with respect to the use of the term "approved of." Subject to and without waiving the foregoing objection, SoCalGas responds as follows. N/A. See Responses to Questions 21, 25 and 26.

SUPPLEMENTAL RESPONSE 29 (DATED MAY 19, 2020):

SoCalGas provides this supplemental response pursuant to an agreement reached with SED at the parties' May 8, 2020 meet-and-confer. SoCalGas maintains and incorporates by reference the objections interposed in its initial response dated May 7, 2020. Subject to and without waiving SoCalGas' objection, SoCalGas responds

as follows. Please see SoCalGas' Supplemental Responses to Questions 21, 25, 26, and 27.

QUESTION 53:

What else was with Mr. Walzel's laptop at the time it was stolen? Please be specific in answering this question. For example, if other equipment, notes, or other things were stolen, please describe them in detail.

RESPONSE 53 (DATED MAY 7, 2020):

SoCalGas objects to this request to the extent it is unduly burdensome pursuant to Rule 10.1 of the Commission's Rules of Practice and Procedure, and the "burden, expense, or intrusiveness of that discovery clearly outweighs the likelihood that the information sought will lead to the discovery of admissible evidence." SoCalGas further objects to this request to the extent it seeks information that is beyond the scope of this proceeding as determined by the Assigned Commissioner's Scoping Memo and Ruling dated September 26, 2019. SoCalGas additionally objects to this question to the extent it is compound, unintelligible, and internally inconsistent to the extent it asks SoCalGas to identify what items were "with Mr. Walzel's laptop at the time it was stolen," but later asks SoCalGas to identify items that "were stolen."

SUPPLEMENTAL RESPONSE 53 (DATED MAY 19, 2020):

SoCalGas provides this supplemental response pursuant to an agreement reached with SED at the parties' May 8, 2020 meet-and-confer. SoCalGas maintains and incorporates by reference the objections interposed in its initial response dated May 7, 2020. Subject to and without waiving SoCalGas' objections, SoCalGas responds as follows. SoCalGas interprets this request as asking for a list of tangible items that were stolen from Mr. Walzel's vehicle, aside from Mr. Walzel's laptop. In responding to this request, SoCalGas specifically excludes items that may have been "with Mr. Walzel's laptop" at the time it was stolen, but which were not actually stolen (*e.g.*, Mr. Walzel's vehicle itself). Based on discussions with Boots & Coots' counsel, SoCalGas understands that Mr. Walzel's computer bag was stolen, which contained Mr. Walzel's laptop, passport, checkbook, an external hard drive, and some papers.

ORDER INSTITUTING INVESTIGATION ON THE COMMISSION'S OWN MOTION INTO THE OPERATIONS AND PRACTICES OF SOUTHERN CALIFORNIA GAS COMPANY WITH RESPECT TO THE ALISO CANYON STORAGE FACILITY AND THE RELEASE OF NATURAL GAS, AND ORDER TO SHOW CAUSE WHY SOUTHERN CALIFORNIA GAS COMPANY SHOULD NOT BE SANCTIONED FOR ALLOWING THE UNCONTROLLED RELEASE OF NATURAL GAS FROM ITS ALISO CANYON STORAGE FACILITY (I.19-06-016)

SOUTHERN CALIFORNIA GAS COMPANY

(DATA REQUEST SED-SCG-57 DATED MARCH 26, 2020)

SOCALGAS SUPPLEMENTAL RESPONSE DATED MAY 19, 2020

QUESTION 55:

If the answer to question 54 is yes, which things were stolen, and which were not?

RESPONSE 55 (DATED MAY 7, 2020):

SoCalGas objects to this request to the extent it is unduly burdensome pursuant to Rule 10.1 of the Commission's Rules of Practice and Procedure, and the "burden, expense, or intrusiveness of that discovery clearly outweighs the likelihood that the information sought will lead to the discovery of admissible evidence." SoCalGas further objects to this request to the extent it seeks information that is beyond the scope of this proceeding as determined by the Assigned Commissioner's Scoping Memo and Ruling dated September 26, 2019. SoCalGas also objects to this request to the extent it is duplicative of Questions 53 and 54. SoCalGas additionally objects to this question to the extent it is unintelligible in its reference to Question 54, which does not seek a response that can be further parsed as requested in this question.

SUPPLEMENTAL RESPONSE 55 (DATED MAY 19, 2020):

SoCalGas provides this supplemental response pursuant to an agreement reached with SED at the parties' May 8, 2020 meet-and-confer. SoCalGas maintains and incorporates by reference the objections interposed in its initial response dated May 7, 2020. Subject to and without waiving SoCalGas' objections, SoCalGas responds as follows. SoCalGas interprets this request as asking for a list of tangible items that were stolen from Mr. Walzel's vehicle, aside from Mr. Walzel's stolen laptop. In responding to this request, SoCalGas specifically excludes items that may have been "with Mr. Walzel's laptop" at the time it was stolen, but which were not actually stolen (*e.g.*, Mr. Walzel's vehicle itself). Based on discussions with Boots & Coots' counsel, SoCalGas understands that Mr. Walzel's computer bag was stolen, which contained Mr. Walzel's laptop, passport, checkbook, an external hard drive, and some papers.

ORDER INSTITUTING INVESTIGATION ON THE COMMISSION'S OWN MOTION INTO THE OPERATIONS AND PRACTICES OF SOUTHERN CALIFORNIA GAS COMPANY WITH RESPECT TO THE ALISO CANYON STORAGE FACILITY AND THE RELEASE OF NATURAL GAS, AND ORDER TO SHOW CAUSE WHY SOUTHERN CALIFORNIA GAS COMPANY SHOULD NOT BE SANCTIONED FOR ALLOWING THE UNCONTROLLED RELEASE OF NATURAL GAS FROM ITS ALISO CANYON STORAGE FACILITY (I.19-06-016)

SOUTHERN CALIFORNIA GAS COMPANY

(DATA REQUEST SED-SCG-57 DATED MARCH 26, 2020)

SOCALGAS SUPPLEMENTAL RESPONSE DATED MAY 19, 2020

QUESTION 56:

Please identify the words in the requested police report that support the answers provided in response to questions 54 and 55.

RESPONSE 56 (DATED MAY 7, 2020):

SoCalGas objects to this request as vague and ambiguous, particularly with reference to the term "police report." SoCalGas objects to this request to the extent it assumes SoCalGas has possession, custody, or control over a police report. Subject to and without waiving the foregoing objections, SoCalGas responds as follows.

See Response to Question 3.

SUPPLEMENTAL RESPONSE 56 (DATED MAY 19, 2020):

SoCalGas provides this supplemental response pursuant to an agreement reached with SED at the parties' May 8, 2020 meet-and-confer. SoCalGas maintains and incorporates by reference the objections interposed in its initial response dated May 7, 2020. Subject to and without waiving SoCalGas' objections, SoCalGas responds as follows. The document SoCalGas previously produced with Bates number AC_CPUC_SED_DR_57_0000001 represents the record that the Houston Police department provided Mr. Walzel at the time he reported the theft of his laptop. The Houston Police Department did not detail in this record the items that were stolen from Mr. Walzel's vehicle. Neither Boots & Coots nor SoCalGas are in possession of any other report prepared by the Houston Police Department that provides any more detail than provided in document AC_CPUC_SED_DR_57_0000001.

ORDER INSTITUTING INVESTIGATION ON THE COMMISSION'S OWN MOTION INTO THE OPERATIONS AND PRACTICES OF SOUTHERN CALIFORNIA GAS COMPANY WITH RESPECT TO THE ALISO CANYON STORAGE FACILITY AND THE RELEASE OF NATURAL GAS, AND ORDER TO SHOW CAUSE WHY SOUTHERN CALIFORNIA GAS COMPANY SHOULD NOT BE SANCTIONED FOR ALLOWING THE UNCONTROLLED RELEASE OF NATURAL GAS FROM ITS ALISO CANYON STORAGE FACILITY (I.19-06-016)

SOUTHERN CALIFORNIA GAS COMPANY

(DATA REQUEST SED-SCG-57 DATED MARCH 26, 2020)

SOCALGAS RESPONSE DATED MAY 7, 2020

SoCalGas provides the following Responses to the Safety and Enforcement Division (SED) data request dated March 26, 2020 in I.19-06-016. The Responses are based upon the best available, nonprivileged information that SoCalGas was able to locate through a diligent search within the time allotted to respond to this request, and within SoCalGas' possession, custody, or control. SoCalGas' responses do not include information collected or modeled by Blade Energy Partners' during its Root Cause Analysis Investigation. SoCalGas reserves the right to supplement, amend or correct the Responses to the extent that it discovers additional responsive information.

SoCalGas objects to the instructions submitted by SED and to the continuing and indefinite nature of this request on the grounds that they are overbroad and unduly burdensome. Special interrogatory instructions of this nature and continuing interrogatories are expressly prohibited by California Code of Civil Procedure Section 2030.060(d) and 030.060(g), respectively. SoCalGas will provide responsive documents in existence at the time of its response. Should SED seek to update its request, SoCalGas will respond to such a request as a new data request in the future.

SoCalGas submits these Responses, while generally objecting to any Request that fails to provide a defined time period to which SoCalGas may tailor its Response, and to the extent that any Request is overly broad, vague, ambiguous, unduly burdensome, assumes facts, or otherwise fails to describe with reasonable particularity the information sought. SoCalGas further submits these Responses without conceding the relevance of the subject matter of any Request or Response. SoCalGas reserves the right to object to use of these Responses, or information contained therein, in any dispute, matter or legal proceeding. Finally, at the time of this Response, there are no pending oral data requests from SED to SoCalGas.

QUESTION 1:

For this data request, please refer to the SoCalGas reply testimony, Chapter IV, "Prepared Reply Testimony of Danny Walzel and Dr. Arash Haghshenas on Behalf of Southern California Gas Company".

a. Please articulate the exact role that Danny Walzel assumed to kill well SS-25.

b. Please provide all invoices and other documents from Boots & Coots to SoCalGas for work done during the time of the well SS-25 leak that show the role Mr. Walzel assumed in killing well SS-25
c. Please articulate the exact role that Dr. Hagshenas assumed to kill well SS-25.
d. Please provide all invoices and other documents from Boots & Coots to SoCalGas for work done during the time of the well SS-25 leak that show the role Dr. Haghshenas assumed in killing well SS-25

RESPONSE 1:

a. SoCalGas objects to this request on the grounds it is vague and ambiguous, particularly with respect to the terms "role" and "assumed," and seeks information that is already within SED's possession or equally available to SED (see transcript of SED's examination under oath of Mr. Walzel, attached to SED's Opening Testimony). Subject to and without waiving the foregoing objections, SoCalGas responds as follows.

Mr. Walzel contributed to Boots & Coots' well control efforts beginning on October 25, 2015, and until he departed from Aliso Canyon on December 14, 2015. During this period Mr. Walzel held the position of Senior Well Control Engineer. Mr. Walzel was responsible for rigging-up equipment, preparing modeling in connection with the kill attempts, and preparing and physically implementing the pumping operations during kill attempt numbers 2–6. SoCalGas notes that Mr. Walzel was made available to SED on August 8, 2018 for an Examination Under Oath (EUO) at the California Public Utilities Commission's San Francisco Office. Further information regarding Mr. Walzel's role was provided to SED's five questioners during that EUO.

b. SoCalGas objects to this request on the grounds it is vague and ambiguous and unintelligible to the extent it seeks invoices "that show the role Mr. Walzel assumed in killing well SS-25" "during the time of the well SS-25 leak." SoCalGas further objects to this request to the extent it is overly broad and unduly burdensome to the extent it seeks "all invoices and other documents." SoCalGas further objects to this request to the extent it seeks documents already in SED's possession. Subject to and without waiving the foregoing objections, SoCalGas responds as follows. SoCalGas assumes

this question seeks the Boots & Coots Daily Reports that SoCalGas previously provided to SED. Please see electronic documents previously produced to SED (AC_CPUC_SED_DR_16_0025631 – AC_CPUC_SED_DR_16_0025808).

c. SoCalGas objects to this request on the grounds it is vague and ambiguous, particularly with respect to the terms "role" and "assumed." Subject to and without waiving the foregoing objections, SoCalGas responds as follows.

Dr. Haghshenas was involved in the SS-25 well control efforts beginning December 2, 2015[1] and ending February 18, 2016. During this period Dr. Haghshenas conducted transient modeling for the 7th top kill attempt. Dr. Haghshenas also prepared a model and ran simulations for the relief well used to control SS-25.

d. SoCalGas objects to this request on the grounds it is vague and ambiguous and unintelligible to the extent it seeks invoices "that show the role Dr. Haghshenas assumed in killing well SS-25" "during the time of the well SS-25 leak." SoCalGas further objects to this request to the extent it is overly broad and unduly burdensome to the extent it seeks "all invoices and other documents." SoCalGas further objects to this request to the extent it seeks documents already in SED's possession. Subject to and without waiving the foregoing objections, SoCalGas responds as follows. SoCalGas understands this question to seek the Boots & Coots Daily Reports. Please see documents previously produced to SED (AC_CPUC_SED_DR_16_0025631 – AC_CPUC_SED_DR_16_0025808).

QUESTION 2:

Please refer to the following passages in the Chapter IV reply testimony, page 3 to answer rest of the questions in this data request, except for questions 32 and 33.

> Q: DID BOOTS & COOTS PERFORM TRANSIENT KILL MODELING PRIOR TO KILL ATTEMPT #7?

[1] SoCalGas notes that a typographical error appears in SoCalGas' Reply, Chapter IV (Walzel/Haghshenas) at page 2, line 3. The date "December 7" should be replaced with "December 2," as stated in this response.

> A: Yes. Boots & Coots performed transient kill modeling before kill attempt number seven. After Boots & Coots attempted its second well kill attempt on November 15, 2015, and before its well kill attempt on November 18 2015, and for additional kill attempts thereafter, Boots & Coots performed transient modeling.
>
> Q: DOES BOOTS & COOTS HAVE THE TRANSIENT MODELING RECORDS RELATED TO ITS SS-25 KILL ATTEMPTS?
>
> A: Only for the December 22, 2015, well kill. Danny Walzel had conducted the transient modeling for well kill prior to December 22, 2015. However, the transient modeling was done on his laptop. This laptop was stolen from him, along with other personal items, in late December 2015. Mr. Walzel reported the theft to the police. Mr. Walzel's transient modeling was not saved anywhere else, nor was it sent to anyone else.

With these passages in mind, please answer the following questions.

RESPONSE 2:

SoCalGas objects to this request to the extent it asks no question to which SoCalGas can respond.

QUESTION 3:

Provide the police report of the theft that Mr. Walzel reported to the police.

RESPONSE 3:

SoCalGas objects to this request on the grounds it is vague and ambiguous, particularly with respect to the term "police report." SoCalGas further objects to this request it seeks documents not in SoCalGas' possession. Subject to and without waiving the foregoing objections, SoCalGas responds as follows. The Houston Police Department provided Mr. Walzel with a document regarding the reported theft of Mr. Walzel's laptop and other belongings, provided here bearing the following bates number: AC_CPUC_SED_DR_57_0000001.

ORDER INSTITUTING INVESTIGATION ON THE COMMISSION'S OWN MOTION INTO THE OPERATIONS AND PRACTICES OF SOUTHERN CALIFORNIA GAS COMPANY WITH RESPECT TO THE ALISO CANYON STORAGE FACILITY AND THE RELEASE OF NATURAL GAS, AND ORDER TO SHOW CAUSE WHY SOUTHERN CALIFORNIA GAS COMPANY SHOULD NOT BE SANCTIONED FOR ALLOWING THE UNCONTROLLED RELEASE OF NATURAL GAS FROM ITS ALISO CANYON STORAGE FACILITY (I.19-06-016)

SOUTHERN CALIFORNIA GAS COMPANY

(DATA REQUEST SED-SCG-57 DATED MARCH 26, 2020)

SOCALGAS RESPONSE DATED MAY 7, 2020

QUESTION 4:

Did SoCalGas disclose the information in these passages to Blade Energy Partners (Blade) during Blade's Root Cause Analysis?

RESPONSE 4:

SoCalGas objects to this request to the extent it is vague and ambiguous regarding the terms "the information in these passages." SoCalGas further objects to this request to the extent it assumes Blade specifically asked SoCalGas to produce "transient modeling" in connection with the SS-25 well control efforts. SoCalGas further objects to this request to the extent it seeks information that is equally available to SED, as SED was copied on all data request responses provided to Blade Energy Partners in the course of Blade's investigation prior to issuing its Root Cause Analysis report. Subject to and without waiving the foregoing objections, SoCalGas responds as follows.

Regarding the details described in the testimony excerpted by SED in the passage above, SoCalGas first became aware of this information cited in the excerpted passage on February 21, 2020, after Blade Energy Partners had issued its Root Cause Analysis Report.

QUESTION 5:

If the answer to question 4 is yes, provide documentation showing this, including the dates and the Blade data requests to which this information responded.

RESPONSE 5:

N/A. See response to Question 4.

QUESTION 6:

If the answer to question 4 is no, please explain why not.

RESPONSE 6:

See response to Question 4.

QUESTION 7:

When did SoCalGas first learn of the information provided in these passages?

RESPONSE 7:

SoCalGas objects to this request to the extent it is vague and ambiguous due to the compound nature of the question. Subject to and without waiving the foregoing objection, SoCalGas responds as follows. See response to Question 4.

QUESTION 8:

Provide documentation showing the answer to question 7.

RESPONSE 8:

SoCalGas objects to this question to the extent it is vague and ambiguous and unintelligible to the extent it seeks documentation that SoCalGas was not aware of a fact. Subject to and without waiving the foregoing objection, SoCalGas responds as follows.

Please see SoCalGas Reply Testimony, Ex. III-4 (Danny Walzel Depo. (Feb. 21, 2020).)

QUESTION 9:

Beginning October 23, 2015 and continuing until well SS-25 was successfully killed, did SoCalGas have any procedures, plans, protocols, or other requirements in place that it be provided with records related to a well kill such as the well kills for SS-25, including transient modeling records?

RESPONSE 9:

SoCalGas objects to this question to the extent it is vague and ambiguous with respect to the phrases "such as the well kills for SS-25," and "transient modeling records." Subject to and without waiving the foregoing objections, SoCalGas responds as follows. No.

QUESTION 10:

If the answer to question 9 is yes, please provide all such requirements, and identify the page number and quoted excerpt or excerpts that support the answer.

RESPONSE 10:

N/A. Please see response to Question 9.

QUESTION 11:

Given that SoCalGas must comply with the safety requirements of California Public Utilities Code Section 451, please answer the following:

a. Does SoCalGas find it acceptable the assertion in Mr. Walzel's testimony that "Mr. Walzel's transient modeling was not saved anywhere else, nor was it sent to anyone else"?
b. Does SoCalGas take the position that it was appropriate for transient modeling of the SS-25 well kill attempts to not have been saved anywhere else than Mr. Walzel's laptop, and not to have been sent to anyone else?

RESPONSE 11:

a. SoCalGas objects to this question on the grounds it is vague, ambiguous and unintelligible with respect to the phrase "find it acceptable the assertion" and relation to Section 451 of the California Public Utilities Code. SoCalGas further objects to this request to the extent it calls for a legal conclusion. SoCalGas additionally objects to this request to the extent it constitutes an incomplete hypothetical.

b. SoCalGas objects to this question on the grounds it is vague and ambiguous with respect to the term "appropriate" and relation to Section 451 of the California Public Utilities Code. SoCalGas further objects to this request to the extent it calls for a legal conclusion. SoCalGas further objects to this request to the extent that it assumes that regulations and/or industry standards require that well control efforts necessarily require transient modeling.

QUESTION 12:

How many transient models were created for the kill attempts of SS-25?

RESPONSE 12:

SoCalGas objects to this question on the grounds it is vague, ambiguous and unintelligible with respect to the phrase "[h]ow many transient models." Subject to and without waiving the foregoing objections, SoCalGas responds as follows. SoCalGas understands this question to ask for the number of discrete models that were created in connection with the seven top kills attempted on SS-25. SoCalGas understands from Boots & Coots that Boots & Coots used software to prepare one discrete transient model in connection with top kill attempts 3-6, and a second discrete model for top kill attempt 7.

QUESTION 13:

Please list the number of transient models that were created for each well kill attempt of SS-25. Please be sure to include the date each model was completed, and the kill attempt for which each model was used.

RESPONSE 13:

SoCalGas objects to this question to the extent it is vague and ambiguous with respect to the phrase "number of transient models." Subject to and without waiving the foregoing objection, SoCalGas responds as follows.

As described in SoCalGas' Reply Testimony, Boots & Coots performed transient kill modeling before its November 18, 2015 kill attempt and for each kill attempt thereafter.

However, the laptop containing the modeling for kill attempts 3-6 was stolen from Mr. Walzel's vehicle after he returned to Houston, and the laptop was never recovered. (*See*, SoCalGas' Reply Testimony Chapter IV (Walzel/Haghshenas) at 3.) Therefore, SoCalGas cannot provide the detail sought for the modeling that was conducted in support of top kill attempts 3-6. Transient modeling prepared in connection with the 7th kill attempt was prepared on or around December 16, 2015 and completed prior to the 7th kill attempt on December 22, 2015.

QUESTION 14:

Other than Mr. Walzel, did any other Boots & Coots employee, SoCalGas personnel member, or any other individual develop or produce, or help develop or help produce a transient model that was used to kill SS-25?

RESPONSE 14:

SoCalGas objects to this question to the extent it is vague and ambiguous with respect to the phrases "develop or produce" and "help develop and produce." Subject to and without waiving the foregoing objections, SoCalGas responds as follows. SoCalGas understands this request to seek information regarding the transient modeling prepared in connection with top kill attempts 3-7. Yes, another Boots & Coots employee prepared modeling in connection with the 7th top kill attempted on SS-25.

QUESTION 15:

If so, please identify each individual, the model they developed or produced, or helped develop or produce, the date the model was produced, and the kill for which the model was produced.

RESPONSE 15

SoCalGas objects to this question to the extent it is vague and ambiguous with respect to the phrases "develop or produce" and "help develop and produce." Subject to and without waiving the foregoing objections, SoCalGas responds as follows.

SoCalGas understands this request to seek information regarding the transient modeling prepared in connection with top kill attempts 3-7. In December 2015, Dr. Haghshenas of Boots & Coots helped develop a transient model in connection with the 7th top kill attempted on SS-25.

QUESTION 16:

Please provide each model identified in response to the prior question.

RESPONSE 16:

SoCalGas objects to this request to the extent it seeks information that is not in the custody or control of SoCalGas or Boots & Coots. SoCalGas further objects to this request as vague and ambiguous regarding the term "model." Subject to and without waiving the foregoing objections, SoCalGas responds as follows. As noted in SoCalGas' Reply Testimony Chapter IV (Walzel / Haghshenas), and acknowledged by SED in Question 2 of this data request, only the transient kill modeling prepared in connection with the December 22, 2015 top kill attempt is within the possession, custody, or control of Boots & Coots. Therefore, SoCalGas interprets this request as seeking the transient model prepared in connection with Boots & Coots' seventh well kill attempt. However, the "model" itself cannot be reviewed without access to licensed modeling software. To the extent that SED seeks transient modeling data related to the seventh kill attempt, please see documents previously provided to SED: AC_CPUC_0173909 – AC_CPUC_0173913; AC_CPUC_0173168 – AC_CPUC_0173172.

QUESTION 17:

Did Mr. Walzel participate in all of the Boots & Coots well kill attempts?

RESPONSE 17:

SoCalGas objects to this request as vague and ambiguous, particularly with respect to the term "participate." Subject to and without waiving the foregoing objection, SoCalGas responds as follows.

No. As described in SoCalGas' Reply Testimony, Mr. Walzel contributed to Boots & Coots' well control efforts beginning on October 25, 2015 and until he departed from Aliso Canyon on December 14, 2015.

QUESTION 18:

Did Mr. Walzel take any notes related to the transient models that were not on his stolen laptop?

RESPONSE 18:

SoCalGas objects to this request as vague and ambiguous regarding the term "notes related to the transient models." Subject to and without waiving the foregoing objection, SoCalGas responds as follows. SoCalGas interprets "notes" as notes taken by Mr. Walzel and not correspondence. No. SoCalGas understands from Boots & Coots that all notes, if any, taken by Mr. Walzel would have been transcribed on his laptop that was later stolen from Mr. Walzel's vehicle.

QUESTION 19:

If so, please provide all such notes.

RESPONSE 19:

N/A. See response to Question 18.

QUESTION 20:

Please confirm that all transient models were actually SAVED on Mr. Walzel's stolen laptop.

RESPONSE 20:

SoCalGas objects to this question on the basis that it is vague and ambiguous and unintelligible with respect to the capitalization of the word SAVED. Subject to and without waiving the foregoing objections, SoCalGas responds as follows.

SoCalGas understands from Boots & Coots that transient modeling prepared in support of well kill attempts 3-6 were saved on the laptop that was stolen from Mr. Walzel's vehicle.

QUESTION 21:

Did SoCalGas authorize the use of Mr. Walzel's transient models for each of the well kill attempts?

RESPONSE 21:

SoCalGas objects to this question on the basis that it is vague and ambiguous and unintelligible with respect to the phrase "authorize the use of." Subject to and without waiving the foregoing objections, SoCalGas responds as follows.

The transient modeling helped inform the kill plans prepared by Boots & Coots. SoCalGas approved the kill plans that were prepared by Boots & Coots and ultimately used to implement each top kill attempt.

QUESTION 22:

Was a different transient model created for each well kill attempt?

RESPONSE 22:

SoCalGas objects to this request to the extent it is duplicative of Questions 12 and 13. Subject to and without waiving the foregoing objection, SoCalGas responds as follows. See response to Questions 12 and 13.

QUESTION 23:

If so, please identify each well kill attempt for which a transient model was used.

RESPONSE 23:

SoCalGas objects to this question to the extent it seeks information that is already in the possession of SED. SoCalGas further objects to this request to the extent it is duplicative of Questions 12 and 13. Subject to and without waiving the foregoing objections, SoCalGas responds as follows. See responses to Questions 12 and 13 herein. As stated in SoCalGas' Reply Testimony Chapter IV (Walzel / Haghshenas), transient modeling was performed for each well kill performed by Boots & Coots after Boots & Coots' second attempt.

QUESTION 24:

If not, why not?

RESPONSE 24:

SoCalGas objects to this question to the extent it is vague, ambiguous, and unintelligible to the extent it purports to ask a question without a premise. Subject to and without waiving the foregoing objection, SoCalGas responds as follows.
See responses to Questions 22 and 23.

QUESTION 25:

Did SoCalGas review Mr. Walzel's transient models?

RESPONSE 25:

SoCalGas reviewed and approved the kill plans that were prepared by Boots & Coots and ultimately used to implement each top kill attempt. The transient modeling helped inform the kill plans prepared by Boots & Coots.

QUESTION 26:

Did SoCalGas approve each of Mr. Walzel's transient models before the well kill attempt for which they were used?

RESPONSE 26:

SoCalGas objects to this question to the extent it is vague and ambiguous, particularly in reference to Question 21 of this data request, which asks whether SoCalGas "authorize[d]" the use of Mr. Walzel's transient models. SoCalGas further objects to this request to the extent it is duplicative of Question 21 herein. Subject to and without waiving the foregoing objections, SoCalGas responds as follows. SoCalGas interprets this question to ask the same question posed in Question 21 herein. Accordingly, see SoCalGas' response to Question 21.

QUESTION 27:

If not, why not?

RESPONSE 27:

SoCalGas objects to this question to the extent it is vague, ambiguous, and unintelligible to the extent it purports to ask a question without a premise. Subject to and without waiving the foregoing objections, SoCalGas responds as follows. See responses to Questions 21, 25 and 26.

QUESTION 28:

If SoCalGas approved of each of Mr. Walzel's transient models before the well kill attempt for which they were used, describe SoCalGas's review process of Mr. Walzel's transient models?

RESPONSE 28:

SoCalGas objects to this request to the extent it is vague and ambiguous, particularly with respect to the term "review process." Subject to and without waiving the foregoing objections, SoCalGas responds as follows. See responses to Questions 21, 25, and 26.

ORDER INSTITUTING INVESTIGATION ON THE COMMISSION'S OWN MOTION INTO THE OPERATIONS AND PRACTICES OF SOUTHERN CALIFORNIA GAS COMPANY WITH RESPECT TO THE ALISO CANYON STORAGE FACILITY AND THE RELEASE OF NATURAL GAS, AND ORDER TO SHOW CAUSE WHY SOUTHERN CALIFORNIA GAS COMPANY SHOULD NOT BE SANCTIONED FOR ALLOWING THE UNCONTROLLED RELEASE OF NATURAL GAS FROM ITS ALISO CANYON STORAGE FACILITY (I.19-06-016)

SOUTHERN CALIFORNIA GAS COMPANY

(DATA REQUEST SED-SCG-57 DATED MARCH 26, 2020)

SOCALGAS RESPONSE DATED MAY 7, 2020

QUESTION 29:

If SoCalGas approved of each of Mr. Walzel's transient models before the well kill attempt for which they were used, please identify the individual from SoCalGas who approved of Mr. Walzel's transient models?

RESPONSE 29:

SoCalGas objects to this request to the extent it is vague and ambiguous with respect to the use of the term "approved of." Subject to and without waiving the foregoing objection, SoCalGas responds as follows. N/A. See responses to Questions 21, 25 and 26.

QUESTIONS 30:

Please define in detail the process behind creating a transient well model.

a. For example, what are the inputs?
b. What are the outputs?
c. Etc.

RESPONSE 30:

SoCalGas objects to this question on the grounds it is vague and ambiguous with respect to the request to "define" a "process," and unintelligible at subpart (c) of the question. SoCalGas further objects to this request to the extent that it seeks information that is equally available to SED and does not require discovery from SoCalGas nor its testifying witnesses.

QUESTION 31:

Consistent with industry practice, please state all steps and calculations necessary to produce a transient well model.

RESPONSE 31:

SoCalGas objects to this question to the extent it is vague and ambiguous with respect to the phrase, "Consistent with industry practice" – this phrase renders the question posed unintelligible. SoCalGas further objects to this request to the extent that it seeks information that is equally available to SED and does not require discovery from SoCalGas nor its testifying witnesses.

QUESTION 32:

Please state all steps and calculations that were taken to produce the transient well models that Mr. Walzel's testimony asserts that were done for the well SS-25 kill attempts.

RESPONSE 32:

SoCalGas objects to this question on the grounds it is vague and ambiguous and unintelligible with respect to the phrase "the transient well models that Mr. Walzel's testimony asserts that were done for the well SS-25 kill." Subject to and without waiving the foregoing objections, SoCalGas responds as follows.

Based on conversations with Boots & Coots, SoCalGas understands that Mr. Walzel prepared modeling for kill attempts 3-6 using Drillbench. The preparation of the model included the following general steps: (1) define the wellbore parameters, including the trajectory, casing, drill pipe and tubing; (2) define the kill fluid properties; (3) define reservoir properties, such as the reservoir fluid, and the reservoir capabilities for the blowout condition; (4) define the flow path, and surface condition; and (5) define the temperature profile in the wellbore.

QUESTION 33:

Did SoCalGas or any entity that it hired conduct transient modeling related to its SS-25 kill attempts after December 22, 2015?

ORDER INSTITUTING INVESTIGATION ON THE COMMISSION'S OWN MOTION INTO THE OPERATIONS AND PRACTICES OF SOUTHERN CALIFORNIA GAS COMPANY WITH RESPECT TO THE ALISO CANYON STORAGE FACILITY AND THE RELEASE OF NATURAL GAS, AND ORDER TO SHOW CAUSE WHY SOUTHERN CALIFORNIA GAS COMPANY SHOULD NOT BE SANCTIONED FOR ALLOWING THE UNCONTROLLED RELEASE OF NATURAL GAS FROM ITS ALISO CANYON STORAGE FACILITY (I.19-06-016)

SOUTHERN CALIFORNIA GAS COMPANY

(DATA REQUEST SED-SCG-57 DATED MARCH 26, 2020)

SOCALGAS RESPONSE DATED MAY 7, 2020

RESPONSE 33:

SoCalGas objects to this question on the basis that it is vague and ambiguous with respect to the phrase "transient modeling related to its SS-25 kill attempts." Subject to and without waiving the foregoing objection, SoCalGas responds as follows. SoCalGas interprets this request as seeking whether SoCalGas or any entity that it hired conducted transient modeling to assist with SS-25 top kill attempts after December 22, 2015. No, the final top kill attempt was executed on December 22, 2015.

QUESTION 34:

If the answer to question 33 is yes, please provide the transient modeling records showing the answer.

RESPONSE 34:

N/A. See response to Question 33.

QUESTION 35:

If the answer to question 33 is yes, please explain why such models were conducted.

RESPONSE 35:

N/A. See response to Question 33.

QUESTION 36:

If the answer to question 33 is no, why not?

RESPONSE 36:

N/A. See response to Question 33.

ORDER INSTITUTING INVESTIGATION ON THE COMMISSION'S OWN MOTION INTO THE OPERATIONS AND PRACTICES OF SOUTHERN CALIFORNIA GAS COMPANY WITH RESPECT TO THE ALISO CANYON STORAGE FACILITY AND THE RELEASE OF NATURAL GAS, AND ORDER TO SHOW CAUSE WHY SOUTHERN CALIFORNIA GAS COMPANY SHOULD NOT BE SANCTIONED FOR ALLOWING THE UNCONTROLLED RELEASE OF NATURAL GAS FROM ITS ALISO CANYON STORAGE FACILITY (I.19-06-016)

SOUTHERN CALIFORNIA GAS COMPANY

(DATA REQUEST SED-SCG-57 DATED MARCH 26, 2020)

SOCALGAS RESPONSE DATED MAY 7, 2020

QUESTION 37:

Were any other records related to SoCalGas's SS-25 kill attempts on Mr. Walzel's stolen laptop?

RESPONSE 37:

SoCalGas objects to the question to the extent it is vague and ambiguous with respect to the phrase "any other records" – the predicate has not been established. SoCalGas further objects to this request to the extent that it seeks information that is not in the possession, custody or control of Boots & Coots, or SoCalGas. Subject to and without waiving the foregoing objection, SoCalGas responds as follows.

SoCalGas interprets this question to ask whether Mr. Walzel retained information other than the transient kill models referenced in SoCalGas' Reply Testimony, Chapter IV (Walzel / Haghshenas) on page 3, on his laptop. Mr. Walzel's laptop was stolen over four years ago, and has not since been recovered. SoCalGas has inquired with Boots & Coots, and without having access to Mr. Walzel's stolen laptop, neither Boots & Coots nor SoCalGas is able to respond to this request.

QUESTION 38:

If the answer to question 37 is yes, please list them.

RESPONSE 38:

SoCalGas objects to this request on the ground it is overly broad and unduly burdensome. Subject to and without waiving the foregoing objections, SoCalGas responds as follows. Mr. Walzel's laptop was stolen over four years ago, and has not since been recovered. SoCalGas has inquired with Boots & Coots, and without having access to Mr. Walzel's stolen laptop, neither Boots & Coots nor SoCalGas is able to respond to this request.

ORDER INSTITUTING INVESTIGATION ON THE COMMISSION'S OWN MOTION INTO THE OPERATIONS AND PRACTICES OF SOUTHERN CALIFORNIA GAS COMPANY WITH RESPECT TO THE ALISO CANYON STORAGE FACILITY AND THE RELEASE OF NATURAL GAS, AND ORDER TO SHOW CAUSE WHY SOUTHERN CALIFORNIA GAS COMPANY SHOULD NOT BE SANCTIONED FOR ALLOWING THE UNCONTROLLED RELEASE OF NATURAL GAS FROM ITS ALISO CANYON STORAGE FACILITY (I.19-06-016)

SOUTHERN CALIFORNIA GAS COMPANY

(DATA REQUEST SED-SCG-57 DATED MARCH 26, 2020)

SOCALGAS RESPONSE DATED MAY 7, 2020

QUESTION 39:

For each of the records listed in response to question 37, please state whether the record was saved elsewhere (e..g, a main server, on portable drive, etc.), or sent to another person. For each record that was saved elsewhere or sent to another person, please identify where the record was saved and to whom the record was sent.

RESPONSE 39:

SoCalGas objects to this request on the grounds the question is overly broad and unduly burdensome. Subject to and without waiving the foregoing objection, SoCalGas responds as follows.

N/A. See response to Question 38.

QUESTION 40:

Please describe the purpose of each record listed in response to question 37.

RESPONSE 40:

N/A. See response to Question 38.

QUESTION 41:

Was Mr. Walzel's stolen laptop recovered?

RESPONSE 41:

No. See responses to Questions 13 and 37.

QUESTION 42:

If the answer to question 41 is yes, were any of the transient models on it?

RESPONSE 42:

N/A. See response to Question 41.

QUESTION 43:

If the answer to question 41 is yes, were any other records related to SoCalGas's SS-25 kill attempts on it?

RESPONSE 43:

N/A. See response to Question 41.

QUESTION 44:

From what exact location was Mr. Walzel's laptop stolen?

RESPONSE 44:

7138 Farm to Market 1960 Rd. W, Houston Texas, 77070.

QUESTION 45:

When it was stolen, was Mr. Walzel's laptop inside a secure space that was somehow protected against property inside of it being stolen?

RESPONSE 45:

SoCalGas objects to this request on the ground it is vague and ambiguous with respect to the phrases "secure space" and "somehow protected against property inside of it being stolen." Subject to and without waiving the foregoing objections, SoCalGas responds as follows.

Mr. Walzel's laptop was locked inside of his truck.

ORDER INSTITUTING INVESTIGATION ON THE COMMISSION'S OWN MOTION INTO THE OPERATIONS AND PRACTICES OF SOUTHERN CALIFORNIA GAS COMPANY WITH RESPECT TO THE ALISO CANYON STORAGE FACILITY AND THE RELEASE OF NATURAL GAS, AND ORDER TO SHOW CAUSE WHY SOUTHERN CALIFORNIA GAS COMPANY SHOULD NOT BE SANCTIONED FOR ALLOWING THE UNCONTROLLED RELEASE OF NATURAL GAS FROM ITS ALISO CANYON STORAGE FACILITY (I.19-06-016)

SOUTHERN CALIFORNIA GAS COMPANY

(DATA REQUEST SED-SCG-57 DATED MARCH 26, 2020)

SOCALGAS RESPONSE DATED MAY 7, 2020

QUESTION 46:

If the answer to question 45 is yes, please describe the secure space, and all protections that the space had in place to protect against stolen property.

RESPONSE 46:

SoCalGas objects to this request to the extent it is unduly burdensome pursuant to Rule 10.1 of the Commission's Rules of Practice and Procedure, and the "burden, expense, or intrusiveness of that discovery clearly outweighs the likelihood that the information sought will lead to the discovery of admissible evidence." Subject to and without waiving the foregoing objection, SoCalGas responds as follows. Please see Response to Question 45.

QUESTION 47:

If Mr. Walzel's laptop was not inside a secure space when stolen, why not?

RESPONSE 47:

N/A. See responses to Questions 45 and 46.

QUESTION 48:

For prior SoCalGas well kill attempts (both for SS-25 and others), have any transient modeling records been stolen from SoCalGas or its employees or contractors?

RESPONSE 48:

SoCalGas objects to the question to the extent it is vague and ambiguous with respect to the phrase "transient modeling records." SoCalGas objects to this request to the extent it seeks information that is beyond the scope of this proceeding as determined by the Assigned Commissioner's Scoping Memo and Ruling dated September 26, 2019. Subject to and without waiving the foregoing objection, SoCalGas responds as follows.

Aside from the transient modeling that was contained on Mr. Walzel's stolen laptop, SoCalGas is not aware of any other property theft in connection with the SS-25 incident.

QUESTION 49:

If so, please list them.

RESPONSE 49:

SoCalGas objects to this question on the grounds it is vague and ambiguous to the extent it poses a request without any reference. Subject to and without waiving the foregoing objection, SoCalGas responds as follows: N/A. Please see response to Question 48.

QUESTION 50:

For prior well kill attempts, has SoCalGas ever allowed its contractor to keep transient modeling records, but not save the records anywhere other than their laptop, and not send the records to anyone else?

RESPONSE 50:

SoCalGas objects to this request on the grounds it is vague and ambiguous with respect to the phrase "transient modeling records," and compound, argumentative, and overly broad and unduly burdensome to the extent it is not limited to any time frame to which SoCalGas may tailor its response. Subject to and without waiving the foregoing objections, SoCalGas responds as follows.

The use of transient modeling is not a widely utilized practice in the industry for controlling well failures by top kill. Aside from the SS-25 incident, SoCalGas has never worked with a contractor that prepared transient kill modeling for a well control operation at Aliso Canyon.

QUESTION 51:

If so, please list all such instances.

RESPONSE 51:

SoCalGas objects to this question to the extent it makes a request without any reference. Subject to and without waiving the foregoing objection, SoCalGas responds as follows: N/A. Please see response to Question 50.

QUESTION 52:

With regards to the well kill attempts of SS-25, did Boot & Coots use transient modeling for any earlier attempt to inform the decision making related to any later attempt?

RESPONSE 52:

SoCalGas objects to this request to the extent it is vague and ambiguous with respect to the terms "earlier attempt" and "later attempt" and the phrase "inform the decision making related to." Subject to and without waiving the foregoing objections, SoCalGas responds as follows. Yes.

QUESTION 53:

What else was with Mr. Walzel's laptop at the time it was stolen? Please be specific in answering this question. For example, if other equipment, notes, or other things were stolen, please describe them in detail.

RESPONSE 53:

SoCalGas objects to this request to the extent it is unduly burdensome pursuant to Rule 10.1 of the Commission's Rules of Practice and Procedure, and the "burden, expense, or intrusiveness of that discovery clearly outweighs the likelihood that the information sought will lead to the discovery of admissible evidence." SoCalGas further objects to this request to the extent it seeks information that is beyond the scope of this

proceeding as determined by the Assigned Commissioner's Scoping Memo and Ruling dated September 26, 2019. SoCalGas additionally objects to this question to the extent it is compound, unintelligible, and internally inconsistent to the extent it asks SoCalGas to identify what items were "with Mr. Walzel's laptop at the time it was stolen," but later asks SoCalGas to identify items that "were stolen."

QUESTION 54:

Were any of the other things that were with Mr. Walzel's laptop at the time it was stolen also stolen along with the laptop?

RESPONSE 54:

SoCalGas objects to this request to the extent it is unduly burdensome pursuant to Rule 10.1 of the Commission's Rules of Practice and Procedure, and the "burden, expense, or intrusiveness of that discovery clearly outweighs the likelihood that the information sought will lead to the discovery of admissible evidence." SoCalGas further objects to this request to the extent it seeks information that is beyond the scope of this proceeding as determined by the Assigned Commissioner's Scoping Memo and Ruling dated September 26, 2019. SoCalGas additionally objects to this question to the extent it is duplicative of Question 53 hereinabove.

QUESTION 55:

If the answer to question 54 is yes, which things were stolen, and which were not?

RESPONSE 55:

SoCalGas objects to this request to the extent it is unduly burdensome pursuant to Rule 10.1 of the Commission's Rules of Practice and Procedure, and the "burden, expense, or intrusiveness of that discovery clearly outweighs the likelihood that the information sought will lead to the discovery of admissible evidence." SoCalGas further objects to this request to the extent it seeks information that is beyond the scope of this proceeding as determined by the Assigned Commissioner's Scoping Memo and Ruling dated September 26, 2019. SoCalGas also objects to this request to the extent it is duplicative of Questions 53 and 54. SoCalGas additionally objects to this question to

the extent it is unintelligible in its reference to Question 54, which does not seek a response that can be further parsed as requested in this question.

QUESTION 56:

Please identify the words in the requested police report that support the answers provided in response to questions 54 and 55.

RESPONSE 56:

SoCalGas objects to this request as vague and ambiguous, particularly with reference to the term "police report." SoCalGas objects to this request to the extent it assumes SoCalGas has possession, custody, or control over a police report. Subject to and without waiving the foregoing objections, SoCalGas responds as follows.

See response to Question 3.

QUESTION 57:

What else relating to SS-25 was stolen when Mr. Walzel's laptop was stolen?

RESPONSE 57:

SoCalGas objects to this request on the grounds it is vague and ambiguous as the phrase "relating to." SoCalGas further objects to this question to the extent this question is duplicative of Questions 37 and 43. Subject to and without waiving the foregoing objections, SoCalGas responds as follows. SoCalGas interprets this request as asking whether any items related to Boots & Coots' well control efforts on SS-25, aside from any materials on Mr. Walzel's stolen laptop, were also stolen. No.

QUESTION 58:

Did Mr. Wenzel [*sic*] use an internet model to do his transient model calculations?

a. If yes, what internet service provided the model? Please provide the website address.

b. If yes, did Mr Wenzel [*sic*] enter data, run the model and download results and/or a report to his laptop?
c. If yes, does Mr. Wenzel [*sic*] have an online account with the service identified in response to a. above?
1. If yes, are the results and/or reports that were generated stored in his online account?
a. If yes, please provide the results/reports.

RESPONSE 58:

SoCalGas objects to this request to the extent it is vague and ambiguous with respect to the terms "internet model." Subject to and without waiving the foregoing objections, SoCalGas responds as follows.

a-c. Mr. Walzel performed transient kill modeling using a licensed software called Drillbench. The transient kill modeling performed by Mr. Walzel is not available on an online platform.

QUESTION 59:

Was the transient model that Mr. Wenzel [*sic*] used a commercial product or something created by him, Boots & Coots or someone else?
a. If it was a commercial product, what is the name of the product and where can it be purchased or downloaded?
b. If it was created, please identify the person or company who created the model.

RESPONSE 59:

a-b. SoCalGas objects to this request to the extent it is vague and ambiguous with respect to the phase "transient model that Mr. Wenzel [*sic*] used." Subject to and without waiving the foregoing objections, SoCalGas responds as follows. Mr. Walzel performed transient kill modeling using a licensed software called Drillbench. Drillbench is available for purchase from the company Schlumberger.

ORDER INSTITUTING INVESTIGATION ON THE COMMISSION'S OWN MOTION INTO THE OPERATIONS AND PRACTICES OF SOUTHERN CALIFORNIA GAS COMPANY WITH RESPECT TO THE ALISO CANYON STORAGE FACILITY AND THE RELEASE OF NATURAL GAS, AND ORDER TO SHOW CAUSE WHY SOUTHERN CALIFORNIA GAS COMPANY SHOULD NOT BE SANCTIONED FOR ALLOWING THE UNCONTROLLED RELEASE OF NATURAL GAS FROM ITS ALISO CANYON STORAGE FACILITY (I.19-06-016)

SOUTHERN CALIFORNIA GAS COMPANY

(DATA REQUEST SED-SCG-57 DATED MARCH 26, 2020)

SOCALGAS RESPONSE DATED MAY 7, 2020

QUESTION 60:

Is the transient model a spreadsheet model? If yes, provide a copy in native format with any instructions that are available.

RESPONSE 60:

SoCalGas objects to this request to the extent it is vague and ambiguous with respect to the demand to "provide a copy in native format." Subject to and without waiving the foregoing objection, SoCalGas responds as follows.

1 EXECUTIVE SUMMARY

This report presents the key results from a blowout and dynamic kill analysis performed for *SoCalGas, Porter 39A* well as part of relief well planning. The blowout rate and dynamic kill analysis is based on the worst-case discharge analysis. The analysis is based on the worst-case blowout scenario of 50 MMscfd. The blowout rate and dynamic kill analysis shall be revised in case of more data regarding the flow rate become available. The relief well intercepts Porter 39A between the packer and top of perforated liner. Simulation analysis indicates that successful dynamic kill operation is achieved by pumping 9.0 or 10.0 ppg kill fluids at the rate of 10 bpm. Due to the depleted zone and the presence of high permeability environment, significant losses are expected.

Target well data:		**Relief well data:**	
MD/TVD:	8,749 ft / 8,728 ft	MD/TVD:	8, 536 ft / 8,093 ft
Last casing:	7” @ 8,585 ft MD	Last casing/liner:	7” liner
Slotted liner ID:	4.8”	Interception depth:	8,550 ft of target well
		Max. DLS:	5.0 deg/100 ft
		Max. Inclination:	40.0°

Reservoir data:		**Estimated blowout condition :**	
Top of reservoir:	8,590 ft MD	Gas rate:	50 MMscfd
Reservoir top pressure:	2,400 psi	Condensate rate:	0 BPD
CGR:	0 bbl/MMscfd	FBHP:	1,060 psi
WGR:	0 bbl/MMscfd		

Summary of dynamic kill analysis	**No restriction**	**Restricted**
Number of relief wells:	1	1
Density of kill fluid:	9.0 ppg	9.0 ppg
Maximum pump rate:	10 bpm	10 bpm
Max. pump pressure:*	3,00 psi @ 5 bpm	800 psi @ 5 bpm
Minimum required pumping capability:*	50 HHP	100 HHP
Kill fluid volume to stop the influx:	150 bbls	120 bbls
Minimum required kill fluid volume:**	580 bbls	500 bbls

*: Pressure loss of 100 psi is considered through surface lines.

**: Does not consider losses during the dynamic kill operation.

SED SUR_REPLY_001692
AC_CPUC_SED_DR_16_0019668

Dynamic kill analysis indicates that the dynamic kill is dominated by the u-tube of kill fluid into the target well. The pump rate of 10.0 bpm allowed for the relief well full of kill fluid to stop the influx via u-tube effect. After the influx has stopped, losses are expected. Therefore, treatments for managing losses and maintaining hydrostatic pressure in the target well should be planned. Generally kill fluid volume equal to 4 times the volume of the target well is recommended.

The required pump rate capacity is within the capability of HQ-2000, also known as Grizzly pumps. Minimum of 2 pumps are recommended for performing the dynamic kill operation.

2 INTRODUCTION

2.1 Purpose of the Document

Following a well control event and broach of gas to the surface, *SoCalGas* is drilling a relief well for Porter 39A and resolve the situation. As part of relief well plan, Boots & Coots performs dynamic kill analysis to evaluate the required kill fluid properties and volume.

The objectives of the finished document are to:

A worst-case discharge scenario is established based on the current well condition. The dynamic kill analysis is performed for the worst-case scenario to evaluate the challenges associated with the operation.

Based on the results of dynamic kill analysis, Operator's management and expert consultants would be able to determine required equipment, facility, and surface layout of the operation.

Incident command team would be able to evaluate risk and plan for eliminating or mitigating associated risks to the relief well design and dynamic kill requirement.

A systematic approach to blowout control preparedness is the key to emergency response. The successful planning and execution of a complicated blowout intervention operation requires the careful coordination of several specialized technical disciplines. Furthermore, the development of a strategy is an iterative process. It requires evaluating alternative plans, analyzing risks, and making tradeoffs, prior to reaching agreement between the operator, partners, and regulatory authorities.

All blowouts and subsequent intervention techniques are inherently different. Management of Change may be required as the well condition changes or other unknown hazards are exposed.

2.2 Well Schematics

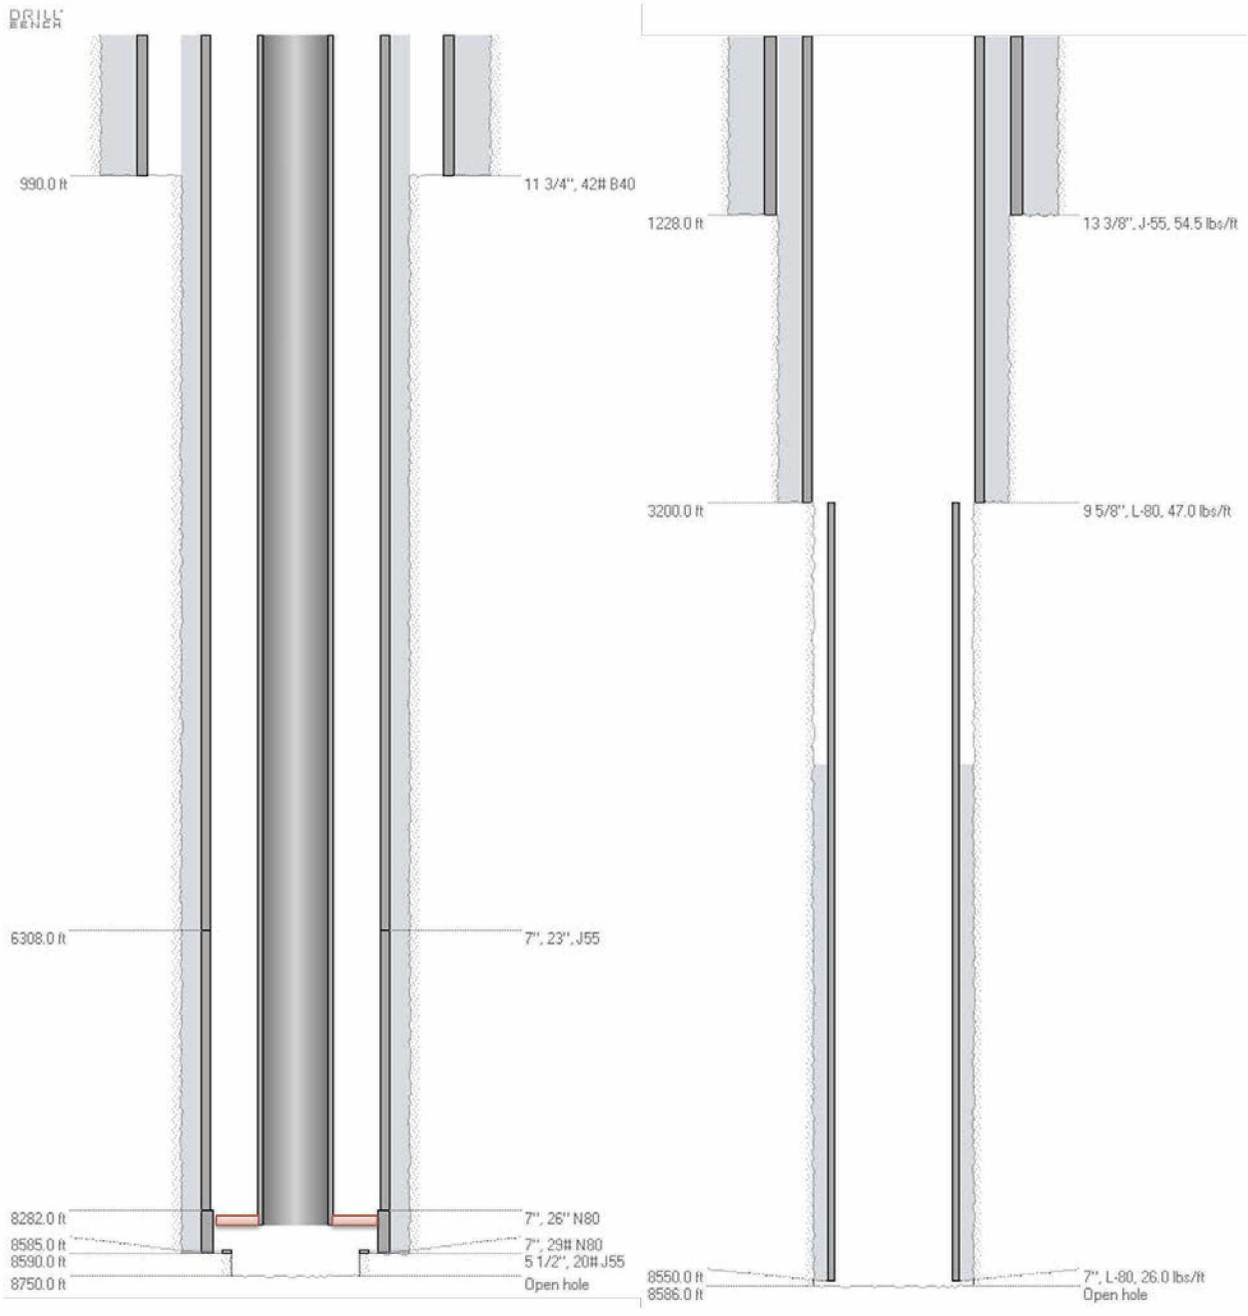

Figure 1 – Wellbore Schematic of the target well (left) and relief well (right)

SED SUR_REPLY_001695
AC_CPUC_SED_DR_16_0019671

2.3 Relief Well Casing Configuration

The casing design of the target well includes setting a 9 5/8" casing at 8,585 ft MD (8,567 ft TVD). The integrity of the target well at the bottomhole condition is questionable. Therefore, the risk of encountering gas while approaching the target well prior to planned interception may exist. Also, given the degree of depletion sever losses may occur before making full contact with the target well. Given both consideration, it is suggested to confirm that the integrity of the casing shoe for a wellbore evacuated by formation fluid.

Total wellbore evacuation and wellbore integrity analysis was performed to provide recommendations on setting depth of casing shoe. Reservoir pressure of 2,400 psi pressure was considered. The maximum expected surface pressure with full column of gas is less than 2,000 psi. The maximum pressure at the casing shoe of the 13 3/8" casing is 2,176 psi, which exceeds the expected fracture gradient. Therefore, it is recommended to set additional casing in the relief well to ensure the integrity of the relief well.

Fracture pressure and hydrostatic gas column pressure analysis indicated that additional casing may be required at the depth of 2,900 ft TVD or greater to support a full column of gas in the relief well. After considering the geological properties and relief well drilling operations, interval of 3,200 to 3,400 ft TVD is suggested for set ting a 9 5/8" casing, where competent formation is present. Also, the proposed depth does not interfere with relief well drilling operation. The maximum expected pressure at 3,200 ft TVD is 2,280 psi where fracture pressure of 2,560 psi is expected. As result a safety margin of 280 psi would be present. The safety margin for a shoe set at 3,400 ft TVD is 430 psi. **Table 1** summarizes the casing shoe depth analysis from well control perspective.

Table 1 – Casing shoe integrity analysis

Depth, ft TVD	*Expected fracture pressure (psi)*	*Maximum pressure (psi)*	*Safety margin (psi)*
2,900	2,320	2,265	55
3,000	2,400	2,270	130
3,100	2,480	2,275	205
3,200	2,560	2,280	280
3,300	2,640	2,285	355
3,400	2,720	2,290	430

SED SUR_REPLY_001696
AC_CPUC_SED_DR_16_0019672

2.4 Drill pipe and BHA Configuration

The drillstring in the relief well consists of 5,580 ft of 3 ½" drillpipe and 2,920 ft of 5" drillpipe.

2.5 Reservoir and Fluid Data

Table 2 presents the input data for the reservoir properties and characteristics. The reservoir fluid is considered to be gas with specific gravity of 0.65. Flow of condensate and water are not considered in the analysis. As the worst-case scenario, flow rate of 50 MMscfd is considered.

The reservoir pressure in the simulation is 2,400 psi. It is known that the production from the offset wells assist pressure depletion from Porter 39A. The effect of depletion is not considered to provide more conservative analysis.

Table 2 – Reservoir Data

Top reservoir depth, ft TVD	8,585
Reservoir temperature, ºF	160
Reservoir pressure, psi	2,400

AC_CPUC_SED_DR_16_0019673

3 BLOWOUT AND KILL ANALYSIS

The blowout simulation was performed worst case discharged rate of 50 MMscfd. A pump pressure loss of 100 psi at the surface is assumed and is an estimation of pressure loss incurred by pumping through surface piping to the relief well.

The dynamic kill operation consists of the following phases:

- The dynamic kill phase involves a constant pump rate from the relief well until the bottomhole pressure in the relief well exceeds the pore pressure of the reservoir and the influx stops. Initially, the flowing bottomhole pressure is significantly less than the hydrostatic pressure of the kill fluid in the relief well. Therefore, kill fluid u-tubes into the target well.
- The next phase begins when the bottomhole pressure is above the pore pressure. The pump rate will be reduced gradually to stabilize the bottomhole pressure without fracturing the formation in the relief well. The pumping pressure will need to be monitored carefully to keep a dynamic pressure profile below fracturing in the open wellbore.
- When a stable pressure response is seen while pumping at a fairly low rate, additional volumes of kill fluid should be pumped to ensure that all remnant hydrocarbons are removed from the wellbore. This is to avoid any restart of the blowout due to rising hydrocarbons in the wellbore.
- Finally, a static kill is achieved when all hydrocarbons have been removed from the wellbore and the pumping can be stopped.
- In Event of experiencing or expecting fluid loss, the kill fluid should be treated to mitigate losses.

The simulator used to perform the blowout estimation and the dynamic kill analysis was Drillbench Blowout Control (OLGA-ABC), a transient flow model based on OLGA computation engine. Based on the conservative assumptions used in the modeling, simulator generally provides conservative results for the kill rate and the required kill fluid volume.

3.1 Blowout rate estimation

The model was set up to provide gas blowout rate of 50 MMscfd. Roughness value of 0.0018 inch has been considered for tubular to estimate the blowout rate and frictional pressure calculations. **Table 3** presents the summary of the blowout condition.

Table 3 - Blowout rate estimation at seabed

Formation name	*Gas rate (MMscfd)*	*Condensate rate (BPD)*	*FBHP (psi)*
Tuntong-1	50	0	1,060

SED SUR_REPLY_001698
AC_CPUC_SED_DR_16_0019674

Figure 2 shows the wellbore condition during blowout. The plot on the left represents gas blowout rate in MMscf/day. The plot in middle top presents the annular pressure profile in the target well and the plot below it shows the annular velocity profile of the gas in the target well. Flowing bottomhole pressure and casing shoe pressure versus time are presented on the right side of the Figure 2. The bottomhole pressure is 1,060 psi.

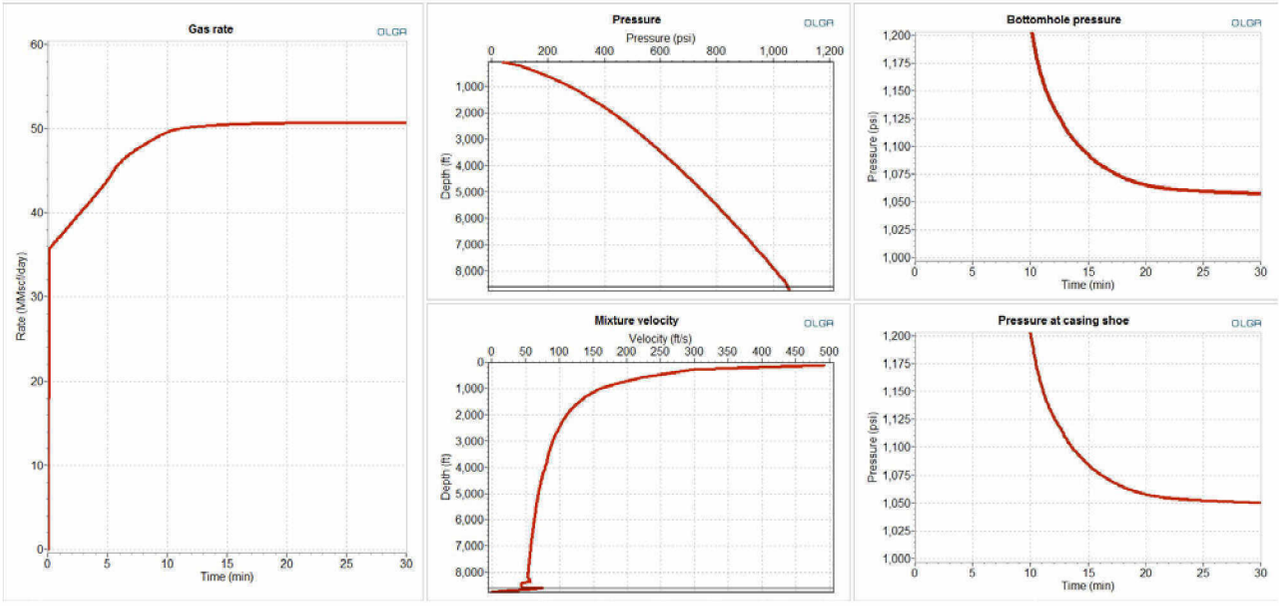

Figure 2 – Tuntong-1: Wellbore condition during blowout. Gas blowout rate reaches 935 MMscfd.

3.2 Dynamic Kill Results

Several different kill fluid densities and pump rate combinations were investigated. The drilling program calls for drilling fluid density in the range of 8.8 to 9.6 ppg. Kill fluid density of 9.0 ppg was considered as the lowest range for the kill fluid density. Simulation result indicted that successful dynamic kill can be achieved with 9.0 ppg kill fluid without excessive pumping requirement. Therefore dynamic kill analysis with heavier fluid was not considered.

Dynamic kill analysis was performed for two scenarios. The first scenario assumes no or minimum restriction in the wellbore of the target well. The second scenario considers a restriction in the annulus of the target well. The restriction could present either loss of packer seal or any other induced restriction immediately above the interception depth.

3.2.1 Scenario 1 – No restriction

The first scenario assumes that there is no restriction in the wellbore and the kill fluid is directly pumped in to the 7" by 2 7/8" annulus of the target well. **Figure 3** shows the snapshot of the dynamic kill simulation at the end of dynamic kill analysis. The influx stopped after 7 minutes of pumping or pumping 70 bbls of the kill

SED SUR_REPLY_001699
AC_CPUC_SED_DR_16_0019675

fluid. During the pumping period about 80 bbls of the kill fluid from the relief well u-tubes into the target well. Therefore, total of 150 bbls of kill fluid is required to stop the influx. The instantaneous u-tube rate may reach 50 bpm and it is not possible to keep the target well full of kill fluid.

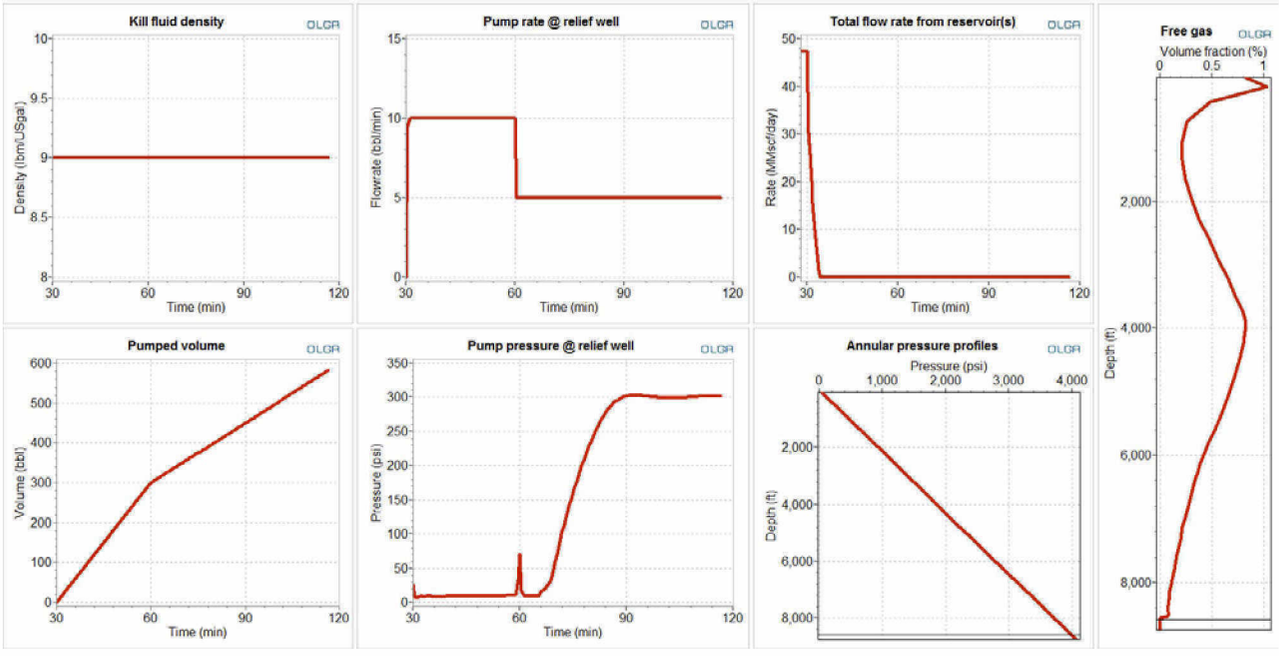

Figure 3 – Influx from the reservoir stops after pumping 150 bbls of 9.0 ppg kill fluid at the rate of 10 bpm.

After the relief well is full of kill fluid, the pumping rate was reduced to 5 bpm to circulate the remnant of the gas out of the wellbore. The maximum expected pressure during the dynamic kill simulation is 300 psi. The required hydraulic power for pumping the kill fluid is 50 HHP. Minimum kill fluid volume of 580 bbls is required. Additional kill fluid should be considered to expected losses and additional bottoms-up to ensure gas free environment in the target well.

3.2.2 Scenario 2 – Restricted flow

Previous pumping operations indicated sudden increase in pump pressure, which was associated to either a restriction in the annulus or screening effect at the sand face. Although the nature of the flow restriction is not known, the simulation was set up to consider for a restriction above the interception point. Equivalent pressure drop through restriction while pumping 9.0 ppg kill fluid at 5 bpm would be about 400 psi. A restriction in the flow was constructed in the annulus of the target well immediately above the interception point. The clearance between the restriction and the ID of the casing is 0.2 inch. The second scenario assumes that there is a 0.2" which was selected based on the observed pressure spike after pumping 70 bbls of fluid through the tubing during previous operations. The actual nature of the pressure spike is not known. **Figure 4** shows the snapshot of the dynamic kill simulation at the end of dynamic kill analysis. The influx stopped after 6 minutes of pumping or pumping 60 bbls of the kill fluid. During the pumping period

SED SUR_REPLY_001700
AC_CPUC_SED_DR_16_0019676

about 60 bbls of the kill fluid from the relief well u-tubes into the target well. Therefore, total of 120 bbls of kill fluid is required to stop the influx.

After the relief well is full of kill fluid, the pumping rate was reduced to 5 bpm to circulate the remnant of the gas out of the wellbore. The maximum expected pressure during the dynamic kill simulation is 800 psi. The required hydraulic power for pumping the kill fluid is 100 HHP. Minimum kill fluid volume of 500 bbls is required. Additional kill fluid should be considered to expected losses and additional bottoms-up to ensure gas free environment in the target well.

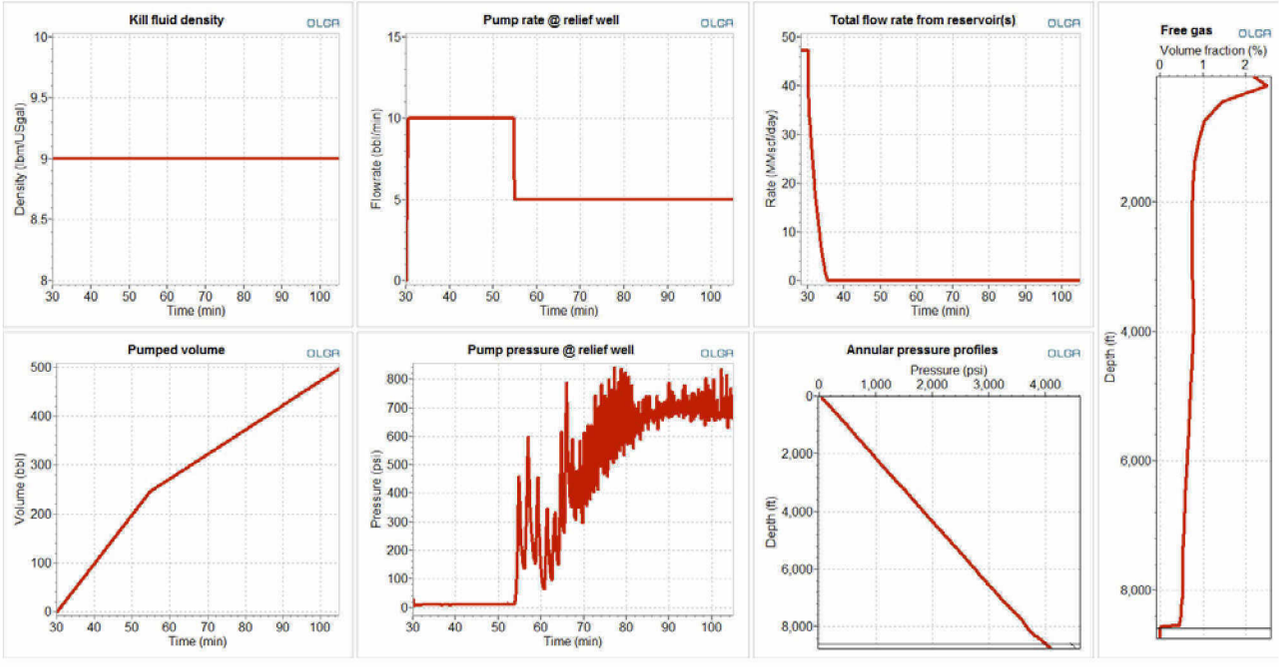

Figure 4 – Influx from the reservoir stops after pumping 120 bbls of 9.0 ppg kill fluid at the rate of 10 bpm.

Southern California Gas Company

A Sempra Energy utility

GAS STANDARD

FIELD PROCEDURE – EMERGENCY INCIDENTS – UNDERGROUND STORAGE WELLS	SOCALGAS: 183.0080

PURPOSE **This Company Procedure provides guidelines for prioritizing these well emergencies and responding to them. Annual meetings are held with field personnel to review the contents of this procedure and the related well emergency job instructions for each field. Surface and subsurface well problems in underground storage fields may occur at any time. Depending on the severity of the problem, a well emergency may exist.**

1. FACTORS IN DETERMINING ACTION

1.1. The appropriate response and reaction plan to an emergency well incident depends on the type of emergency and whether there is an immediate or potential threat to lives and property. It is important that those persons responsible for responding to well emergencies are able to quickly assess the extent of the problem and clearly understand what must be done. An emergency plan for storage field wells is available in the main office at each facility in a location designated by the Storage Field Engineer. The plan clearly defines organization relationships and responsibilities. The plan states who is responsible for performing specific duties and who has decision-making authority for specific actions in the plan.

In addition to the type and severity of the well emergency, the following are considered:

1.2. **Public safety** is the primary concern. Hazardous areas and buildings are evacuated, and the public is restricted from them. Proper liaison with the fire and police departments is essential for the protection of the public.

1.3. **Employee safety** is of major concern to the Company. As with normal work conditions, all work is performed with maximum regard for safety.

1.4. **Protection of property** is second only to the safety of the public and employees. It is essential that all sources of ignition be eliminated for prevention of fires and explosions.

1.5. **Inconvenience to the public** is also important. Depending on the location and severity of the problem, the well emergency may or may not be an inconvenience to the public. When possible and practical, every effort is made to reduce or eliminate any inconvenience caused the public as a result of an emergency well incident.

1.6. **Relative costs** are important factors but not sufficient reason to risk any endangerment to employees or the public.

SED SUR_REPLY_001705

AC_CPUC_SED_DR_35_0000001

2. TYPES OF WELL EMERGENCIES

Well emergencies are identified and prioritized on the basis of severity and the potential danger to lives and property.

2.1. **Priority 1 Emergency**

Loss of well control (i.e., uncontrolled flow of fluids from a well or wells) which may result or has resulted in a fire, explosion, or other hazardous situation. This type of incident is an immediate threat to the public, employee safety and/or property. Typical causes of this type of emergency are:

2.1.1. Failure of wellhead equipment.

2.1.2. Internal erosion or corrosion of piping or wellhead equipment caused by sand and/or reservoir fluids.

2.1.3. Damage to piping and/or well equipment by earthquakes, landslides, hydrates, sabotage, or accidents.

2.1.4. Severe shallow casing leak in a well.

2.1.5. Emergencies such as the unintentional release of hazardous substances may pose a threat to people and/or the environment for proper guidance contact the Storage Environmental and/or Safety Representative.

2.2. **Priority 2 Emergency**

Major gas migration incidents where the location or dispersion of the gaseous emission minimize immediate hazards. This situation is normally detected by increased pressure and/or production from collection or observation wells or by abnormal surface gas emissions. This type of incident requires immediate attention with the realization that it could develop into a Priority 1 emergency if not remedied promptly. Typical causes of this type of problem are:

2.2.1. Water-shut-off (WSO) or casing shoe leaks in storage wells.

2.2.2. Casing failure or casing leak in casing flow gas well.

2.2.3. Damage to well by earthquake, fault movement or landslide.

2.2.4. Stabilized reservoir pressure that exceeds established limits.

Copyright © Southern California Gas Company. All rights reserved.

SED SUR_REPLY_001706

AC_CPUC_SED_DR_35_0000002

2.2.5. Excessive gas pressure in the surface casing annulus of a well.

3. APPROPRIATE ACTION

3.1. The following is a summary of the actions taken, as appropriate, by the first Company management employee at the site of any well emergency. Notification of responsible personnel is made as soon as possible after primary safety concerns are met.

3.1.1. Determine area limits of escaping gas and whether hydrogen sulfide contamination or release of any other hazardous substance is suspected.

3.1.2. If ignition has not occurred, determine if ignition is a possibility.

3.1.3. Evacuate from and restrict entry into hazardous areas, particularly buildings, if the concentration of gas indicates ignition is a possibility.

3.1.4. Eliminate sources of ignition.

3.1.5. When appropriate, establish communications with fire and/or police departments on the scene as soon as possible (refer to document **STANDARD 183.0030** *Contact with Fire and Police Departments and Public Agencies).*

3.1.6. Responses to news media inquiries during emergency incidents are made in accordance with document **STANDARD 183.55**, *Responding to News Media During Emergency Incidents*.

3.2. Prioritize the emergency according to the guidelines given in Section 2 of this Company Procedure.

3.3. After determining the priority level, follow the appropriate action plan. When required, on-call personnel are contacted.

Action Plan — Priority 1

3.4. Immediately notify station representative on duty.

3.5. Immediately notify Operations Control and apprise them of current situation.

3.6. Immediately notify Storage Field Engineer.

3.7. The station representative notifies senior Storage Management.

Copyright © Southern California Gas Company. All rights reserved.

SED SUR_REPLY_001707

AC_CPUC_SED_DR_35_0000003

3.8. Storage Management notifies the responsible Environmental Representative.

3.9. The Storage Field Engineer notifies Storage Engineering.

3.10. Operations Control notifies the Senior Storage On-Call Manager. The Senior Storage On-Call Manager decides whether to notify the Message Center in accordance with document **STANDARD 183.05,** *Reports to the Message Center*. In addition, Operations Control notifies the Senior Storage On-Call Manager when the Emergency Response Center is opened.

3.11. The Storage Field Engineer, station personnel and Storage Engineering personnel develop an action plan to control the well(s).

3.12. The Storage Engineering Manager is responsible for the overall action plan to gain control of a well during a Priority 1 emergency.

3.13. When appropriate, early consideration is given to contacting experts in the handling of out-of-control wells. The Storage Engineering Manager or the Storage On-Call Manager is responsible for authorizing this contact.

Action Plan — Priority 2

3.14. Immediately notify the Storage Field Engineer who in turn notifies the Storage Engineering Manager.

3.15. Immediately notify station representatives.

3.16. The station representative notifies the senior Storage management representative.

3.17. The Storage Field Engineer, Storage Engineering Staff and station representatives develop the action plan to locate and control the well leak(s). The plan may include but is not limited to the following:

- Contact service companies used for well kill operations and arrange to have necessary equipment brought to the field immediately.
- Contact the Engineering Analysis Center and request the lab truck at the site as soon as possible.
- Arrange for additional wireline trucks from designated contractors (see section 4, paragraph 4.2.).
- Check well surface pressures and note any abnormal conditions.
- Vent excess surface casing pressures.

Copyright © Southern California Gas Company. All rights reserved.

SED SUR_REPLY_001708

AC_CPUC_SED_DR_35_0000004

- Begin running temperature surveys as necessary to identify leaking well.
- Have production-logging trucks available on site to run noise logs in wells suspected of leaking.
- Perform bar-hole leakage surveys around all active and abandoned wells with in 600 feet of a suspected leak and note any irregularities.
- Once leakage source(s) is (are) determined, proceed immediately with efforts to control the leakage.
- Continue accelerated monitoring procedures to determine if source of leakage has been effectively controlled.

4. EMERGENCY PLANS FOR WELL EMERGENCIES

Before a well emergency incident occurs, it is important that effective emergency plans are established by each storage facility and fully understood by all parties involved. The plan defines the responsibilities for the tasks involved and indicates who has decision-making authority for specific actions in the plan. The emergency plans include the following information:

4.1. Who to notify if a well emergency occurs (see Section 3 of this document).

4.2. A list of contractors, service companies, and telephone numbers to call for equipment and materials necessary for well kill operations, such as:

4.2.1. Well kill fluid.

4.2.2. Pump trucks.

4.2.3. Vacuum trucks.

4.2.4. Tanks for storage of kill fluid.

4.2.5. Wire Line Survey contractors (including temperature/noise logging equipment).

4.1. A geologic structure map for the field showing the surface and bottomhole locations for all wells and the wellbore directional path.

4.2. For each well site, a plot plan showing:

4.2.1. Well location.

Copyright © Southern California Gas Company. All rights reserved.

SED SUR_REPLY_001709

AC_CPUC_SED_DR_35_0000005

4.2.2. Where the tanks and pumping equipment are placed.

4.2.3. A diagram showing the location of the kill piping, valve location, connection size and type, and particularly the location of all surface safety valves.

4.3. For each well:

4.3.1. A current well mechanical diagram showing all information pertinent to the well's current condition and the capacities of tubing and casing.

4.3.2. A diagram of wellhead showing all operating valves, their positions, sizes and pressure ratings.

4.3.3. A normal well kill plan (see Document **STANDARD 224.045**, *Routine Well Kills)*.

4.4. A diagram showing the location of all emergency equipment such as: fire extinguishers, fire hydrants, shovels, etc.

4.5. A piping diagram showing the entire kill system for the field.

5. REPORTING OF WELL INCIDENTS

The requirements of document **183.05**, *Reports to the Message Center,* are met if applicable.

PURPOSE: **Provide direction in killing a gas storage well in a routine situation.**

1. PLANNING

1.1. Prior to killing the well, review the well file and discuss kill with the **Storage Field Engineer** to ensure that a means of pressure communication exists between the tubing and tubing/casing annulus. Schedule any required wireline work prior to well killing operations.

1.2. Contact and inform the proper **Station personnel** of the scheduled time for the kill. This will allow the **Station personnel** to schedule any necessary piping modifications and to make arrangements for the displaced gas.

1.3. If necessary, make arrangements to have a portable tank moved to the well site, Allow sufficient time to place the tank and install return line prior to the kill.

1.4. Make arrangements with a drilling fluids company and vacuum truck service to have the kill fluid mixed and delivered prior to the kill.

1.5. Make arrangements to have portable radios available for communication when the valve that is used to control gas flow from the well is more than 100 feet from the wellhead.

2. PREPARATION (Guideline)

2.1. Portable Tank Installation

Move a portable liquids storage tank to the well site. If a workover rig will be moved onto the well after it is killed, consult with **drilling representatives** for proper placement of tank.

2.2. Piping Modifications

If piping modifications are required:

2.2.1. Install choke valve and return line at remote casing kill valve and bleed gas pressure off casing according to region job instructions. The casing kill lateral must remain in place until well is killed.

2.2.2. Check the manufacturer's instructions to ensure correct installation of the choke valve. On some wells the choke valve can be installed on the casing withdrawal line, but flow through the casing withdrawal line must not be restricted. There must be a valve in the withdrawal line downstream from the choke that can be closed to isolate the wellhead.

2.2.3. Run a two-inch return line from the choke valve to the portable tank.

Copyright ©2014 Southern California Gas Company. All rights reserved.

SED SUR REPLY 001712
AC_CPUC_SED_DR_17_0000128

Confidential and Protected Materials Pursuant to PUC Section 583, GO 66-D, and D.17-09-023

2.2.4. Install gauges to measure the tubing and casing wellhead pressures.

2.2.5. Grease all valves that will be affected by the kill operation. Be sure they operate properly and do not leak.

2.3. Kill Fluid

2.3.1. The kill fluid is mixed and hauled to the well site prior to killing the well. The quantity of kill fluid delivered to the well must be at least 120% of the well volume.

2.3.2. The kill fluid should be filtered whenever possible.

2.3.3. The viscous pill is delivered to the site just before the kill begins. The pill volume must be at least the volume of the well below the circulating depth plus ten barrels, but not more than the volume of the well below the circulating depth plus tubing volume plus ten barrels.

3. WELL KILL USING CONSTANT TUBING PRESSURE METHOD

3.1. Where a pump truck is used, rig up the line from pump discharge to the wellhead with a block valve that is convenient to operate. The line can be rigged up to either the Unibolt or the tubing kill valve.

3.1.1. Calibrate zero point on pressure recorder.

3.1.2. Test pumps and lines to 500 psi above wellhead pressure against the temporary block valve for 15 minutes.

3.1.3. Calibrate pressure recorder with pressure gauge at test pressure.

3.1.4. Bleed off pressure and re-calibrate zero point on pressure recorder.

3.2. Record original shut in casing pressure (OSICP). Connect vacuum truck containing viscous pill to pump intake. With casing shut in, pump viscous pill at two barrels per minute.

3.2.1. After viscous pill is pumped, shut down the pump.

3.2.2. Disconnect pump intake line from vacuum truck and connect to tank containing kill fluid.

3.2.3. If the viscous pill is not of sufficient volume to fill the volume of the well below the circulating depth and the tubing volume, pump enough kill fluid to fill the tubing to the surface.

Copyright ©2014 Southern California Gas Company. All rights reserved.

SED SUR REPLY 001713
AC_CPUC_SED_DR_17_0000129

Confidential and Protected Materials Pursuant to PUC Section 583, GO 66-D, and D.17-09-023

3.2.4. Close the master valve. Leave all valves closed for 45 minutes to one hour, or as determined by the **Storage Field Engineer**, to allow the viscous pill to fill pore space adjacent to the wellbore.

3.3. Open master valve and pump kill fluid at a constant rate. Allow casing pressure to increase to 50-75 psi above OSICP. Open the remote casing withdrawal valve just enough to maintain this pressure. If casing pressure does not start to increase after 20 barrels of kill fluid is pumped, stop pumping and shut-in well for 30 - 45 minutes to allow the formation to "heal," then attempt it again.

3.4. During the first portion of the kill with casing pressure 50 - 75 psi above OSICP, tubing pressure should be zero.

3.4.1. As the fluid level in the annulus increases, tubing pressure will increase.

3.4.2. When tubing pressure reaches a pressure P as defined below, disregard casing pressure and manipulate the remote casing withdrawal valve to maintain tubing pressure at P.

3.4.3. P is calculated using Equation 1. P represents the pressure drop in the tubing assuming an average value for density and viscosity of the fluid and friction factor in the tubing.

$$P = \frac{L * Q^2}{2 * D^5} \qquad \text{Equation 1}$$

where:

P = tubing pressure (psig)

L = measured depth of tubing (feet)

D = internal diameter of tubing (inches)

Q = pump rate (barrels per minute)

3.5. Continue pumping at a constant rate while maintaining tubing pressure at P until casing pressure is down to withdrawal line pressure. Record total volume pumped and casing pressure at this time.

3.5.1. Close the operating withdrawal valve and flow gas through the return line to the portable tank, still maintaining tubing pressure at P by manipulating the temporary choke valve. It may be necessary to reduce the pump rate to have a tolerable flow rate at the portable tank.

3.5.2. When fluid returns are obtained, record the total volume pumped and circulate at least 10% of the well volume to ensure no gas cut mud is present.

Copyright ©2014 Southern California Gas Company. All rights reserved.

SED SUR REPLY 001714
AC_CPUC_SED_DR_17_0000130

Confidential and Protected Materials Pursuant to PUC Section 583, GO 66-D, and D.17-09-023

3.6. If the fluid returns are gas cut, continue circulating but keep the flow choked back so that tubing pressure does not drop below P. Where returns are going into the same tank that the pump intake is pulling from, monitor the fluid before it reaches the pump intake. Stop pumping when gas cut fluid reaches the pump intake and shut the well in.

3.6.1. When it is not urgent that the well be completely dead, wait until the gas comes out of solution from the fluid in the tank. This may take a day or more depending on the volume and viscosity of the fluid.

3.6.2. If the well must be dead as soon as possible, it will be necessary to bring fresh fluid to continue circulating.

3.6.3. In either case, when pumping commences again, there will be a gas bubble in the annulus. Do not blow this gas down quickly, as this will allow more gas entry from the formation. Choke the flow while pumping to maintain tubing pressure at P.

3.7. It is necessary to estimate the quantity of gas vented to the atmosphere. If casing pressure is between 400 psi and 800 psi when venting to the atmosphere begins, use Equation 2 to estimate the quantity of gas. If casing pressure is outside this range, the Storage Field Engineer should be asked to determine the quantity of gas.

$$V = \frac{Pc(V_2 - V_1)}{2800} \qquad \text{Equation 2}$$

where:

V	=	volume of gas vented to atmosphere (MCF at standard conditions)
Pc	=	casing pressure at the moment when venting to the atmosphere begins (psi)
V_2	=	total volume of fluid pumped at the moment fluid returns are obtained, including volume of pill (barrels)
V_1	=	total volume of fluid pumped at the moment venting to the atmosphere begins, including pill (barrels)

Report the volume of gas vented to the atmosphere to appropriate **Station personnel**.

4. WELL KILL USING SCHEDULE METHOD

Copyright ©2014 Southern California Gas Company. All rights reserved.

SED SUR_REPLY_001715
AC_CPUC_SED_DR_17_0000131

Confidential and Protected Materials Pursuant to PUC Section 583, GO 66-D, and D.17-09-023

4.1. The schedule method assumes that as the liquid is pumped down the tubing or casing an equivalent head of fluid is being displaced out the other side and a constant bottom hole pressure is maintained.

4.2. The schedule method does not consider any fluid lost to the formation and does not give any direct surface indication of bottom hole pressure. Accurate volume measurement of the fluid being pumped is essential.

4.3. Where a pump truck is used, rig up the line from pump discharge to the wellhead with a block valve conveniently located for ease of operation. The line can be rigged up to either the Unibolt, tubing kill valve, or casing kill valve dependent upon the type of kill (tubing, casing).

4.3.1. Calibrate zero point on pressure recorder.

4.3.2. Test pumps and lines to 500 psi above wellhead pressure against the temporary block valve for 15 minutes.

4.3.3. Calibrate pressure recorder with pressure gauge at test pressure.

4.3.4. Bleed off pressure and re-calibrate zero point on pressure recorder.

4.4. Record original shut-in casing pressure (OSICP). Connect vacuum truck containing viscous pill to pump intake. With casing shut-in, pump viscous pill at two barrels per minute.

4.4.1. If the viscous pill volume is less than the volume to fill the well below the circulating depth and the tubing, pump enough kill fluid to fill the tubing to the surface.

4.4.2. Close the master valve. Leave all valves closed for 45 minutes to one hour, or as determined by the **Storage Field Engineer**, to allow the viscous pill to fill pore space adjacent to the wellbore.

4.5. Kill Schedule Calculation Procedures

4.5.1. Determine total volume to fill tubing and casing above circulating depth.

4.5.2. Determine wellhead pressure assuming tubing and casing both are filled with gas above the pill (assume top of pill is liner top).

4.5.3. Prepare a kill schedule following the example in Table A.

4.5.4. Open master valve and pump kill fluid at a constant rate of approximately 3 bpm. Allow casing/tubing pressure, whichever is used for returns, to increase approximately 50 psi above OSIP; or, after 20 barrels of kill fluid have been

Copyright ©2014 Southern California Gas Company. All rights reserved.

SED SUR REPLY 001716
AC_CPUC_SED_DR_17_0000132

Confidential and Protected Materials Pursuant to PUC Section 583, GO 66-D, and D.17-09-023

pumped, open the return line valve just enough to allow a pressure decrease equivalent to the volume of liquids pumped (see kill schedule). If return line pressure does not increase after pumping 20 barrels of kill fluid, stop pumping and close all valves for 30 minutes to allow the formation to "heal," then repeat the procedure. Pressure on the pump side will fall to zero shortly after pumping begins (a volume of 30 - 40 barrels) and remain at zero until returns arrive.

4.6. Continue pumping until return line pressure is down to withdrawal line pressure. Record total volume pumped and return line pressure at this time.

4.6.1. Close the operating withdrawal valve and flow gas through the return line to the portable tank. It may be necessary to reduce the pump rate to have a tolerable flow rate at the portable tank.

4.6.2. When fluid returns are obtained, record the total volume pumped and continue circulating at least 10% of the well volume to ensure no gas cut mud is present.

4.7. If the fluid returns are gas cut, continue circulating until fluid is gas free. Where returns are going into the same tank that the pump intake is pulling from, monitor the fluid before it reaches the pump intake. Stop pumping when gas cut fluid reaches the pump intake and close the well in.

4.7.1. When it is not urgent that the well be completely dead, wait until the gas comes out of solution from the fluid in the tank. This may take a day or more depending on the volume and viscosity of the fluid.

4.7.2. If the well must be dead as soon as possible, it will be necessary to bring fresh fluid to continue circulating.

4.7.3. In either case, when pumping commences again, there will be a gas bubble in the annulus. Do not blow this gas down quickly, as this will allow more gas entry from the formation. Choke the flow while pumping to maintain tubing pressure at P.

4.8. It is necessary to estimate the quantity of gas vented to the atmosphere. If casing pressure is between 400 psi and 800 psi when venting to the atmosphere begins, use Equation 2 to estimate the quantity of gas. If casing pressure is outside this range, the **Storage Field Engineer** should determine the quantity of gas.

$$V = \frac{Pc(V_2 - V_1)}{2800} \qquad \text{Equation 2}$$

where:

V = volume of gas vented to atmosphere (MCF at standard conditions)

Pc = casing pressure at the moment when venting to the atmosphere begins (psi)

V_2 = total volume of fluid pumped at the moment fluid returns are obtained, including volume of pill (barrels)

V_1 = total volume of fluid pumped at the moment venting to the atmosphere begins, including pill (barrels)

Report the volume of gas vented to the atmosphere to the Station.

TABLE A
Example Well Kill Schedule

SIWHP = 1500 PSIG

Total Well Capacity = 200 Bbls.

$$\frac{(1500+50)\text{psi}}{(200-20)\text{bbl}} = 8.61 \text{ psi/bbl}$$

Therefore, bleed off approximately 8.61 psi of pressure for each barrel of kill fluid pumped. The returns should arrive at surface when wellhead pressure reads zero (psig).

SIWHP (PSIG)	LIQUID PUMPED * (BBLS)
1500	0
1500	20
1378	40
1205	60
1034	80
862	100
690	120
518	140
346	160
174	180
0	200

*Pumping at approximately 3 bbl/min

5. Circulating Fluid with a Wireline Plug Installed in the Tubing (No-Go) Profile Nipple

5.1. Install gauges on the tubing and casing. Set a wireline plug in the profile nipple below the sliding sleeve. Open the sliding sleeve. Reduce the tubing pressure by 200 psi. If the casing pressure also falls, the sleeve is verified open and communication between tubing and casing has been established.

5.2. Calculate the well volume above the wireline plug and packer and record the equalized wellhead pressure.

5.3. Block both surface safety valves open and remove the high pressure pilot, low pressure pilot and sacrificial probes etc. and lateral piping. Install temporary piping on either the kill or injection lateral and connect it to a tubing and a casing wellhead valve. Install temporary piping on the opposite tubing and casing wellhead valves and route them to the inlet of a portable separator. Connect the "Gas Out" of the separator through an adjustable choke to the withdrawal piping and the "Liquid Out" of the separator to an empty fluid tank.

5.4. The goal of this method is to replace gas pressure with hydrostatic head. It is important to keep differential pressure across the wireline plug constant while circulating gas out of the well. This is done by dividing the wellhead pressure (psi) and calculated fluid volume by 20, then pump fluid and reduce gas pressure in equal increments. Gas is flowed from the casing through the separator to the withdrawal line while fluid is pumped into the tubing until fluid returns on the casing is achieved.

Refer to the example below:

Pressure	Volume
2250	50
2137.5	75
2025	100
1912.5	125
1800	150
1687.5	175
1575	200

Company Operations Standard

Well Operations - Well Kill	SCG:	224.0030

PURPOSE **A well kill may be required to perform workover operations, to stop gas loss due to a casing, wellhead, or shoe leak, or to perform wireline or wellhead work that cannot be performed otherwise.**

1. POLICY

1.1. The **Storage Field Engineer** is responsible for well kills. Responsibility may be delegated to certain other **Company** personnel in some circumstances. The person in charge, in accordance with pre-arranged kill plans immediately handles emergency kill jobs. The **Storage Operations Manager** and **Storage Engineering Manager** are informed of such incidents as soon as practical.

2. RESPONSIBILITIES & QUALIFICATIONS

2.1. FACILITIES OPERATIONS

2.1.1. Storage Field personnel operate all surface valves. On routine kills, notify the **Storage Field Engineer** at least two days prior to killing the well to allow time for piping modifications and to make arrangements to accept the displaced gas through the withdrawal system.

3. DEFINITIONS

3.1. Not Applicable

4. PROCEDURE

4.1. OVERVIEW

4.1.1. This document provides guidelines for routine, planned kill jobs. Emergency kills that are performed because of unplanned conditions that may result in uncontrolled discharge of gas require special procedures for each case. Special kill plans for emergency conditions are prepared by **Storage Engineering.**

4.1.2. Killing a well involves circulating a fluid into the well that provides a higher hydrostatic pressure than the reservoir gas pressure, effectively resulting in zero pressure at the surface.

4.2. FLUID

4.2.1. The fluid used to kill a well must be of sufficient density to provide a 200 to 500 psi overbalance over the reservoir pressure and viscous enough to prevent excessive fluid loss to the formation.

Copyright ©2011 Southern California Gas Company. All rights reserved.

SED SUR_REPLY_001722
AC_CPUC_SED_DR_17_0000138

Confidential and Protected Materials Pursuant to PUC Section 583, GO 66-D, and D.17-09-023

4.2.1.1. The fluid must be designed to minimize formation damage. This requires low solids content to prevent pore plugging.

4.2.1.2. The fluid must have high enough salinity to prevent swelling and dispersion of formation clays.

4.2.1.3. The best fluid to use is formation water produced from the zone to be killed if it has high enough density to provide the 200 to 500 psi overbalance. When a higher density is required, use KCI or CaCl2 water to the needed density. The KCI or CaCl2 will generally prevent clay swelling or dispersion even at low concentrations. See **STANDARD 224.05**, *Blowout Prevention Equipment Configuration, Installation, Testing and Operation*, for the method of calculating the required fluid density.

4.2.1.4. A viscous pill may sometimes be used when killing a well to prevent excessive fluid loss to the formation. However, at Aliso Canyon and Honor Rancho when the reservoir is at high inventory, a viscous pill may not be necessary. Adequate viscosity for a pill can be obtained by mixing two pounds of HEC polymer per barrel of fluid. The remainder of the kill fluid should be viscosified by adding 1.0 pounds of HEC per barrel of fluid. The kill fluid should also contain biocide, corrosion inhibitor, oxygen scavenger and foam retardant in amounts recommended by the Storage Engineering Department.

4.2.1.5. Do not use a HEC viscous pill at the Playa Del Rey field because stubborn emulsion problems will develop. Kill fluid at Playa Del Rey should also contain 3% Misol or A-Sol G15 by volume to minimize emulsion formation. Misol is currently available from MTS Stimulation Services and is the preferred chemical. A-Sol G15 is a Welchem product available from BJ Services.

4.3. EQUIPMENT (Figure 1)

4.3.1. Pump

4.3.1.1. The pump used to kill the well must be capable of pumping against the shut-in wellhead pressure plus 500 psi. It should be capable of at least a three-barrel-per minute rate at the highest wellhead pressure. The pump should be equipped with a calibrated pressure recorder.

AC_CPUC_SED_DR_17_0000140

Confidential and Protected Materials Pursuant to PUC Section 583, GO 66-D, and D.17-09-023

4.3.2. Lines and Valves

4.3.2.1. When a pump truck is used to kill the well, all lines from the pump truck to the wellhead must be at least 5,000 psi pressure rating. Install a valve of at least 5,000 psi pressure rating between the line from the pump truck and the wellhead or remote kill valve.

4.3.2.2. The well may also be killed through the Company kill line.

4.3.2.3. Install choke valve of at least 5,000 psi pressure rating on the casing kill side or other suitable location that will allow casing pressure to be bled down to atmosphere without having the low pressure sensor prevent flow by closing the surface safety valve.

4.3.2.4. A return line of at least 1,000 psi pressure rating is installed between the choke valve and the tank used to hold fluid returns.

4.3.3. All components between the wellhead and the choke valve must have a pressure rating that is equivalent to or exceeds that of the wellhead.

4.4. PROCEDURES

4.4.1. The preparations and kill operations are carried out in accordance with **STANDARD 224.045**, *Routine Well Kills*.

5. RECORDS

5.1. Record the pressure during a kill operation on a pressure chart.

5.1.1. Measure and record the total volume of fluid used.

5.1.2. The volume of gas vented to atmosphere is estimated and reported to the Storage Field Engineer.

5.2. If the well is killed by a **Rig Supervisor**, attach these records to the Daily Activity Report. If the well is killed by someone other than a **Rig Supervisor**, retain these records in the field well file.

Company Operations Standard

Blowout Prevention Equipment Configuration, Installation, Testing and Operation	SCG:	224.05

PURPOSE **To ensure that effective blowout prevention equipment and practices are used during drilling and workover operations.**

1. POLICY

1.1. This document sets the mandatory Company responsibilities and requirements with respect to the appropriate configuration, installation and testing of blowout prevention equipment (BOPE) used during drilling and workover operations. BOPE requirements are mandated by the California Division of Oil, Gas and Geothermal Resources (D.O.G.G.R.) regulations (Title 14) and referenced in the DOGGR manual ***Blowout Prevention in California***. All Rig Supervisors and Storage Field Engineers are to be familiar with this Company Gas Standard.

1.2. Primary well control is achieved during drilling and workover operations by maintaining a hydrostatic pressure in the wellbore that exceeds reservoir pressure. Adequate hydrostatic pressure is achieved through the proper design of drilling and workover fluid as well as through operational procedures to ensure that a sufficient column of fluid exists in the well at all times. Adequate and fail safe functioning blowout prevention equipment must be maintained in the event of loss of primary well control which has the potential to occur at any time during operations. Rig personnel must be familiar with safe operating practices and fully trained to operate the BOPE if necessary.

1.3. A copy of the D.O.G.G.R. manual ***Blowout Prevention in California*** shall be on location for reference whenever BOPE equipment is in use.

2. RESPONSIBILITIES

2.1. Storage Engineering Manager

2.1.1. The Storage Engineering Manager is responsible for supervising and advising Storage Field Engineers.

2.2. Storage Field Engineers

2.2.1. The Storage Field Engineers are responsible for preparing detailed work programs based on evaluation of known or anticipated conditions. They design and recommend to the Storage Engineering Manager all equipment, materials and procedures used.

2.2.2. Supervising and advising Rig Supervisors.

2.2.3. Keeping the Storage Engineering Manager informed of operations and obtaining approvals of practices that deviate from this procedure.

AC_CPUC_SED_DR_17_0000143

Confidential and Protected Materials Pursuant to PUC Section 583, GO 66-D, and D.17-09-023

2.3. Rig Supervisor

2.3.1. The Rig Supervisor is responsible for planning and supervising the work outlined in the well program.

2.3.2. Ensuring that all work is performed safely in accordance with established Company guidelines and industry standards.

2.3.3. Ensuring that blowout prevention equipment is properly installed, inspected, tested and operated at all times.

2.3.4. Ensuring that rig crews are adequately trained to control the well at all times, including detection and proper response to well kicks and maintenance of proper fluid columns.

2.3.5. Keeping the Storage Field Engineer informed of potential hazards or operational difficulties and assisting as necessary in resolving such situations.

2.3.6. Seeking advice and counsel from the Storage Field Engineers, Storage Engineering Manager, other Rig Supervisors or staff personnel.

3. WELL CLASSIFICATION

3.1. STORAGE ZONE WELLS

3.1.1. BOPE classification of wells planned for drilling or workover operations in the storage zone are based on selection guidelines from the DOGGR manual ***Blowout Prevention in California (Chapter 2).***

3.1.2. The Storage Engineering Manager may specify additional preventers and/or safety measures, but shall always meet minimum D.O.G.G.R. classification requirements.

3.1.3. The required BOPE classification for workover operations in each storage field is summarized in Table 1. Note that the BOPE classification for each field is based on the maximum pressure for the field even though the well work operations may occur at lower pressure in the range. Reservoir pressure range, well depth range, and gradient are included for reference.

Table 1

Classification of Storage Zone Wells, by Field (Workover Operations)

AC_CPUC_SED_DR_17_0000144

Confidential and Protected Materials Pursuant to PUC Section 583, GO 66-D, and D.17-09-023

Storage Fields	Pressure Range (psig)	Well Depth Range, MD (ft.)	Gradient psi/ft	At Maximum Reservoir Pressure
Aliso Canyon	2000 - 3602	7100 - 9400	0.522	III - 5,000
Honor Rancho	1100 - 4411	9000 - 11000	0.465	III - 5,000
La Goleta	1570 - 2050	3900 - 4300	0.529	III - 3,000
Playa Del Rey	850 - 1710	5800 - 7100	0.465	III - 3,000

3.1.4. Additional Class III BOPE Requirements

3.1.4.1. The choke manifold shall have a minimum of two adjustable chokes and three independently valved outlet lines. See Figure 1 for choke manifold configuration. All fittings on this manifold shall meet or exceed D.O.G.G.R. guidelines for choke manifold components and shall be mounted on a single unit.

3.1.4.2. All hydraulic connections from the actuating unit to the preventer are to be large enough to supply hydraulic fluid rapidly without excessive friction loss, and shall be no less then 1" (nominal) diameter.

3.1.4.3. A complete functional test of the BOPE shall be performed after installation, after partial or complete disassembly and prior to continuing operations potentially dependent upon the functionality of the BOPE. Testing shall be in accordance with field testing requirements set forth in Section 3.6 of this document.

3.1.4.4. Closure checks of the annular preventer may be performed at a reduced closure pressure, typically 700 psi, in order to prevent abnormal wear of the packing material. Following completion of the routine checks, the regulator shall be immediately restored to its normal working pressure, typically 1500 psi. This may only be done provided the hydraulic actuating system has tested satisfactorily at or above the normal working pressure.

3.1.4.5. Two auxiliary pump-in components are needed. One 2" line will be tied into the kill side of the well or lower mud cross and extend

Copyright ©2013 Southern California Gas Company. All rights reserved.

SED SUR_REPLY_001729
AC_CPUC_SED_DR_17_0000145

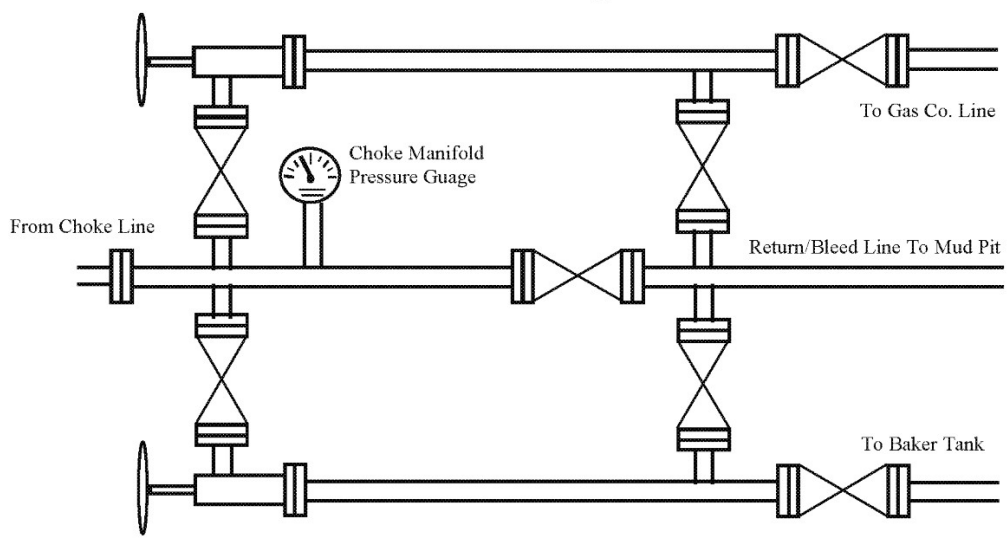
Confidential and Protected Materials Pursuant to PUC Section 583, GO 66-D, and D.17-09-023

outside the rig substructure where a secondary kill pump such as a cement truck can be connected. This extended kill line will be positioned such that it is not necessary to go under the substructure to operate it. A check valve and a block valve will be installed at the end of this line and all components will be rated to 5000 psi. This line will be staked to the ground to prevent whipping. This block valve will be clearly marked with a sign that states "EMERGENCY KILL". An additional 1" pump in valve will be available on the accumulator where a secondary pressure supply can be connected. This valve will be fitted with a bull plug and clearly marked with a sign that states "AUXILIARY PUMP IN"

3.1.4.6. The DOGGR may require the use of a Class III B BOPE, in the event that drilling operations are planned in the storage zone during workover operations

Figure 1

Choke Manifold Configuration



3.2. NON STORAGE ZONE WELLS

3.2.1. BOPE classification of wells planned for drilling or workover operations in non storage zone wells are based on selection guidelines from the DOGGR manual ***Blowout Prevention in California (Chapter 2).***

3.2.2. Non storage zone wells are defined as existing wells in the storage field that are not drilled through the storage zone. Non storage zone wells have known

Copyright ©2013 Southern California Gas Company. All rights reserved.

SED SUR_REPLY_001730
AC_CPUC_SED_DR_17_0000146

Confidential and Protected Materials Pursuant to PUC Section 583, GO 66-D, and D.17-09-023

conditions of pressure and not able to sustain production to surface without a form of artificial lift. Wells in the Aliso Canyon shallow zone, Honor Rancho water injection zone, and Montebello oil production zone are defined as non storage zone wells. The required BOPE classification for workover operations in non storage zone wells is Class II 3000 psi.

3.3. ADDITIONAL CLASS II BOPE REQUIREMENTS

3.3.1. For wells or well operations that fall within the D.O.G.G.R. Class II classification requirements, the following additional specific Company provisions shall also apply. Supplementary measures beyond those outlined below may be required or utilized as appropriate.

3.3.2. Additional Class II BOPE Requirements

3.3.2.1. Wells with potential to encounter abnormally high zone pressures.

Where any possibility of encountering an abnormally charged zone or zones exists, BOPE Class II stack arrangement shall minimally consist of an API type "RA" (annular and ram-type preventer combination) arrangement. This includes shallow zone wells where such shallow zone has the potential to have communication with a storage zone through unexpected or unknown leaks.

3.3.2.2. Wells with no potential of encountering abnormally high zone pressures.

Only wells or well operations meeting D.O.G.G.R. Class II BOPE prerequisites that have no potential of encountering abnormally high zone pressures and no potential of encountering zones charged by storage zone leaks shall be eligible for API type "A" arrangement, where the use of a single annular preventer is specified. An example of operations where Class II type "A" arrangements would be permissible is on a shallow zone observation well with known pressures, where casing would not be penetrated into zones of potentially unknown or unexpected pressure.

3.4. FLUIDS

3.4.1. General

Density of the drilling or workover fluid shall be maintained such that a safe over-balance pressure condition exists at all times. A minimum safe over-balance condition is generally defined as 10% greater then the maximum

Copyright ©2013 Southern California Gas Company. All rights reserved.

SED SUR_REPLY_001731
AC_CPUC_SED_DR_17_0000147

Confidential and Protected Materials Pursuant to PUC Section 583, GO 66-D, and D.17-09-023

possible Bottom Hole Pressure (BHP), but not high enough to cause consistent fluid loss. This minimum over-balance requirement is waived when conditions warrant it, such as during under-balanced drilling or well testing, provided adequate precautions are taken for safe operations under these abnormal conditions and the methodology was set forth in the approved well program.

3.4.2. BHP Determination for Zones of Known Pressure

BHP (or Zone Pressure) for wells in potential communication with a reservoir of known pressure can be determined based on the Shut-in-Well-Head-Pressure (SIWHP) of that well, or a geologically similar well, and then by increasing the SIWHP according to Figure 2 to compensate for the static column of gas in a shut-in well. The BHP is then increased by a minimum 10% safety factor and used for determination of fluid density. Because storage reservoir pressures can change significantly during a drilling or work-over operation, the SIWHP of the well or a geologically similar well shall be checked no less than once per week, and recorded on the daily safety report. The fluid density shall be adjusted as necessary to maintain safe operating conditions.

3.4.3. BHP Determination for Zones of Unknown Pressure

BHP for wells in potential communication with an oil or gas reservoir of unknown pressure shall be determined by multiplying the True Vertical Depth (TVD) by a maximum formation pressure gradient corresponding to the discovery pressure of the field. See reference Table 1 for a Maximum Pressure Gradient for individual fields. A 10% safety factor is then added to determine a minimum safe over-balance pressure and the corresponding fluid density.

SED SUR_REPLY_001732
AC_CPUC_SED_DR_17_0000148

Confidential and Protected Materials Pursuant to PUC Section 583, GO 66-D, and D.17-09-023

Figure 2
Mud Density Calculation for Gas Wells

Step 1

Find Zone Pressure of a Gas Well:

Zone Pressure = (0.000025 x TVD x SIWHP) + SIWHP

TVD = True vertical depth at top of storage zone

SIWHP = Shut-in wellhead pressure

Step 2

Determine Safety Margin:

Safety Margin = Zone Pressure X 0.10

Under most conditions a safety margin of 10% will be adequate. The safety margin may be set higher at the discretion of the Rig Supervisor and Storage Field Engineer . If the "Calculated Safety Margin" is less than 250 psi and the well has contact with a storage zone, a "Minimum Safety Margin" of 250 psi shall be used. The Safety Margin should not be less than 250 psi unless approved by the Storage Field Manager.

Step 3

Find Working BHP

Working BHP = Zone Pressure + Safety Margin

Working Bottom Hole Pressure is the pressure desired to be exerted by the mud column.

Step 4

Find Desired Minimum Mud Density:

Mud Density (ppg) = 19.25 x Working BHP ÷ TVD

Copyright ©2013 Southern California Gas Company. All rights reserved.

AC_CPUC_SED_DR_17_0000149

Confidential and Protected Materials Pursuant to PUC Section 583, GO 66-D, and D.17-09-023

3.5. BLOWOUT PREVENTION EQUIPMENT

3.5.1. General Requirements

3.5.1.1. The BOPE shall be capable of shutting in and containing the well pressure under all situations to prevent the escape or leakage of fluids from the well.

3.5.1.2. All equipment, including preventers, mud crosses, wellhead equipment, manifolds, lines and valves that may be exposed to wellbore pressure during either normal or well control operations must be of sufficient working pressure rating to contain the maximum anticipated surface pressure.

3.5.1.3. A full opening safety valve is to be located on the rig floor. The valve shall be equipped with a wrench to operate it and all necessary crossovers appropriate to thread into each type of pipe being run, where such pipe can act as a pressure control string or kill string.

3.5.1.4. All chicksan and armored hoses shall be of a minimum 5,000 psi rated working pressure.

3.5.1.5. All BOPE equipment shall meet or exceed D.O.G.G.R. requirements for the classification usage required by the well conditions and as called out in the well program.

3.5.2. Blowout Preventer Installation

3.5.2.1. All BOPE equipment shall be in good working condition meeting or exceeding D.O.G.G.R. requirements and manufacturer's maintenance requirements. BOPE equipment includes, but is not limited to: accumulators, rams, controls, valves, fittings, gauges, manifolds and all hoses and bolts associated with the complete BOPE system.

3.5.2.2. Flanges and all other sealing surfaces are to meet or exceed API 6A requirements. Ring gaskets shall be kept in their boxes until ready for use and shall be stored in a manner to prevent mechanical and/or chemical deterioration.

3.5.2.3. Blowout Preventer Support

Adequately cemented surface casing of strength adequate to support the blowout preventers shall be used for BOPE support as required by D.O.G.G.R. field rules.

Copyright ©2013 Southern California Gas Company. All rights reserved.

SED SUR_REPLY_001734
AC_CPUC_SED_DR_17_0000150

Confidential and Protected Materials Pursuant to PUC Section 583, GO 66-D, and D.17-09-023

3.5.2.4. Size and Materials

The bore of all preventers, spools and mud crosses is to be of sufficient size to accommodate the largest equipment to be run into the casing below the preventers and must meet or exceed specifications as set forth in American Petroleum Institute (API) Specification No. 6A.

3.5.2.5. Drill Collar Lifting Subs

All drill collar lifting subs used on pipe lowered below the blind rams shall be threaded on top with a standard thread configuration such that the pipe using the lifting sub may be fished or circulated through. This requirement eliminates the use of bails or lifting eyes on lifting subs used in this manner.

3.5.3. Pre Rig-Up Testing and Certification

3.5.3.1. Dimensional and Mechanical Integrity

At the discretion of the Storage Field Engineer, certification of dimensional, hydrostatic or mechanical integrity tests may be required prior to operations. Where pre rig-up hydrostatic pressure testing is performed in lieu of on-site tests, the hydrostatic pressure testing will be accordance with Section 4.6 - TESTING REQUIRMENTS. These tests may also have witness requirements whereby a **Gas Company** employee or representative witnesses the testing and certification process. Testing may also require a complete tear down of the equipment for dimensional and mag-particle inspection of components. All testing or inspection criteria and methodology shall be accordance with D.O.G.G.R., API and equipment manufacturer's recommendations. Where requirements vary, the stricter guideline or requirement shall be adhered to.

3.6. TESTING REQUIREMENTS

3.6.1. General Testing Requirements

3.6.1.1. The goal of field testing is to establish and document that the BOPE can withstand the fluid and gas pressures that may occur during containment of a blowout, and to ensure that equipment utilized by the Gas Company fully complies with California Division of Oil and Gas requirements. All testing procedures are to meet or exceed the requirements of the D.O.G.G.R. as specified in Section 5 of the D.O.G.G.R. publication *Blowout Prevention in California*.

Copyright ©2013 Southern California Gas Company. All rights reserved.

SED SUR_REPLY_001735
AC_CPUC_SED_DR_17_0000151

Confidential and Protected Materials Pursuant to PUC Section 583, GO 66-D, and D.17-09-023

3.6.1.2. Notification of the D.O.G.G.R. shall be done in accordance with permit requirements and in ample time to have an inspector on location as necessary. When a D.O.G.G.R. representative witnesses a test, the representative will sign the tour sheet in accordance with D.O.G.G.R. requirements and note the witnessed operation in the daily report. If a D.O.G.G.R. representative waives a witnessing requirement, the date and time of the waiver, the nature of the waived witnessing requirement and the names of the Gas Company and D.O.G.G.R. representatives responsible for the waiver shall be noted on the tour sheet and in the daily report.

3.6.2. Hydrostatic Pressure Testing

3.6.2.1. All testing or inspection criteria and methodology shall be in accordance with D.O.G.G.R. API and equipment manufacturer's recommendations. Where requirements vary, the stricter guideline or requirement shall apply. BOPE tests performed on a storage zone well or on a shallow-zone well where abnormal pressures may be encountered (such as work performed on a possibly gas-charged shallow zone) shall include a chart of BOPE pressure test(s).

3.6.2.2. Hydrostatic pressure test charts shall bear the time and date of the test, safe working pressure, the actual test pressure, serial number or other identifying number of the item tested and the printed name and signature of the personnel completing the test. When a pressure test is done on a specific wellhead or BOPE stack for a specific well, the name of the well shall also appear on the chart.

3.6.2.3. Where pre rig-up hydrostatic pressure testing is performed in lieu of on-site tests, the hydrostatic pressure testing will be charted and the charts furnished to the Supervising Engineer and/or the Rig Consultant prior to the start of operations that are dependent upon the functionality of the tested equipment.

3.6.2.4. Hydrostatic pressure test of components to be used in the well shall be in accordance with API hydrostatic testing guidelines as follows:

- A primary pressure-holding period
- Reduction of the pressure to zero
- A secondary pressure-holding period

The timing of the secondary holding period shall not start until the test pressure has stabilized and the equipment and the

SED SUR_REPLY_001736
AC_CPUC_SED_DR_17_0000152

Confidential and Protected Materials Pursuant to PUC Section 583, GO 66-D, and D.17-09-023

pressure monitoring devices have been isolated from the pressure source.

3.6.2.5. Calibrated pressure gages and recording equipment shall be used during testing. Recorder graphs shall be signed, dated and made traceable to the equipment being tested.

3.7. OPERATIONAL REQUIREMENTS

3.7.1. General Operating Requirements

3.7.1.1. Equipment alone cannot prevent a blowout. Proper training and good operational practices are also required for safe operations. This Section sets forth the minimum requirements for training, certification and operational practices. If any difference exists between this document and any other state, federal or local operational requirements, the stricter requirement shall be adhered to.

3.7.1.2. A Rig Supervisor, Storage Field Engineer, or Contract Tool Pusher who has completed semi annual Gas Company BOPE safety training must be present at the rig site whenever the well is open to the storage zone and the crew is working.

3.7.1.3. Blowout prevention practice drills and training sessions shall be conducted at least once each week for each crew. Drills shall be noted on the Tour Sheet and in the Daily Activity Report and should include the nature of the training and the response time as applicable.

3.7.1.4. Training shall, minimally, ensure that rig personnel have:

3.7.1.4.1. A clear understanding of the purpose and method of operation of each preventer and all associated equipment.

3.7.1.4.2. Ability to recognize the warning signs that accompany a kick, and knowledge of the actions that should be taken when such warning signs exist.

3.7.1.4.3. A clear understanding of each crew member's station and duties in the event a kick occurs during any operation, including during drilling, tripping pipe, when drill collars are in the preventers and when pipe is out of the hole

3.7.2. Specific Operating Requirements

Copyright ©2013 Southern California Gas Company. All rights reserved.

SED SUR_REPLY_001737
AC_CPUC_SED_DR_17_0000153

Confidential and Protected Materials Pursuant to PUC Section 583, GO 66-D, and D.17-09-023

3.7.2.1. Prior to Pulling Pipe from the Well

3.7.2.1.1. With the pumps shut down, determine if the well is flowing or losing fluid. If either is occurring, take appropriate action before pulling out of the well.

3.7.2.1.2. During drilling operations, the Driller shall make an entry on the Tour Sheet, prior to pulling out, regarding the status of the well; whether it is flowing, losing fluid or standing full.

3.7.2.1.3. During drilling operations, the drilling fluid density, along with the density and volume of any pills pumped, shall be noted prior to starting out of the well.

3.7.2.2. Pulling Pipe

3.7.2.2.1. When pulling pipe, the fluid lost due to the loss of pipe volume must be compensated for in a manner such that the bottom hole pressure (BHP) does not fall below the minimum safe over-balance pressure as determined by Section 3.4 of this document.

3.7.2.2.2. If fluid is added beyond the calculated displacement of the pipe or tools removed from the well, the Driller shall make an entry on the tour sheet detailing the amount of fluid added and amount of time over which the fluid was lost to the zone. This information will also be entered in the daily activity report.

3.7.2.2.3. The Driller will record the time, to the nearest minute, that the last pipe or tool was removed from the well.

3.7.2.2.4. In order to track the volume of fluid added to the well, the well shall not be filled continuously unless a trip tank is used.

3.7.2.2.5. If a well is open to a storage or production zone and is to be unattended overnight, a kill string shall be run into the well. The kill string shall be of adequate length such that the weight of the string is greater than the maximum possible upward force that may be exerted on it. The maximum upward force is determined by multiplying the cross sectional area of the kill string by the pressure exerted on it. The kill string shall have the safety valve

SED SUR_REPLY_001738
AC_CPUC_SED_DR_17_0000154

Confidential and Protected Materials Pursuant to PUC Section 583, GO 66-D, and D.17-09-023

installed and closed and the BOPE shall be closed on the kill string.

3.7.2.2.6. Choke and kill lines shall remain connected to the BOPE stack at all times when the well is open to a permeable zone.

3.7.2.2.7. During drilling operations a usable drill pipe or tubing pressure at high and low kill rate pump speeds shall be known at all times. A high rate is generally considered to be in the 3 - 4 BPM (Barrel Per Minute) and low kill rate speed is generally in the 1 - 2 BPM range.

- When drilling, determine the drill pipe pressure at the designated kill rate at least once per day. Record this information on the Tour Sheet and on the Daily Mud Report.

- During workover operations, determine the tubing pressure at the designated kill rate when the rig first moves onto the well, and whenever a change occurs that would affect the rate, such as a tubing, casing or pump change. Record this information on the Tour Sheet, post it at the rig site and record it in the Daily Activity Report.

3.7.2.3. Fluid Maintenance

3.7.2.3.1. If a reasonable possibility exists that a permeable zone may be encountered with pore pressures exceeding the BHP used for determining the minimum safe over-balance, weight material must be maintained at the drill site in sufficient quantity to increase the density of the drilling fluid by 5 lb./cf.

3.7.2.3.2. Drilling fluids shall be tested at least once per shift to determine viscosity and density. The results are to be recorded on the Daily Mud Report.

3.7.2.3.3. BOPE Operational Inspections

Copyright ©2013 Southern California Gas Company. All rights reserved.

SED SUR_REPLY_001739
AC_CPUC_SED_DR_17_0000155

Confidential and Protected Materials Pursuant to PUC Section 583, GO 66-D, and D.17-09-023

All BOPE must be routinely inspected. The inspections must meet or exceed the D.O.G.G.R. requirements as specified in the D.O.G.G.R. manual *Blowout Prevention in California*, Sections 2 - 6. All inspections shall be logged in the Tour Sheet.

3.7.2.4. Emergency Operations

In the event of a kick, emergency actions should immediately be undertaken in accordance with established well control methods. At the first opportunity after immediate actions are completed, the **Storage Field Engineer** shall be notified in order to provide any assistance necessary and to be aware of the situation. All kicks are to be logged in the Tour Sheet and in the Daily Activity Report.

4. RECORDS

4.1. All BOPE tests are recorded on a pressure recording chart and kept by the Storage Field Engineer for the duration of the job.

Company Operations Standard

Operation of Underground Storage Wells	SCG:	224.02

PURPOSE **This document contains guidelines for the operation of underground storage wells. These guidelines are designed to ensure safety, efficiency and compliance with regulations as set forth in both Title 8, Division 1, Chapter 4, Subchapter 14 and Title 14, Division 2, Chapter 4 of the California Administrative Code. The intent is to ensure that all operating and downhole safety equipment used for the production of oil and gas is maintained in good condition to safeguard life, health, property and natural resources**

1. POLICY AND SCOPE

1.1. Storage operating personnel will operate, maintain and test all surface and subsurface well equipment to insure safe operations and compliance with all Company and state regulations

2. RESPONSIBILITIES

2.1. The **Storage Operations Manager** is responsible for all well operations.

3. DEFINITIONS

Not applicable

4. PROCEDURE

4.1. **Well Operations**

4.1.1. Well and operator identification

4.1.1.1. Each well location has a sign posted in a conspicuous place identifying the Company name, name or number of the lease, and the well name. A 24-hour emergency phone number is posted at the well location or field enclosure. In addition, any wells suspected of containing hazardous materials are identified as such.

4.1.2. Well safety devices for gas storage injection and/or withdrawal wells

4.1.2.1. Surface safety devices

4.1.2.1.1. Each well includes the following surface devices:

- Automatic fail-close valve installed in the wellhead withdrawal lines.

Copyright ©2012 Southern California Gas Company. All rights reserved.

SED SUR_REPLY_001742
AC_CPUC_SED_DR_17_0000158

Confidential and Protected Materials Pursuant to PUC Section 583, GO 66-D, and D.17-09-023

- High-low pressure sensors installed in all flowlines to shut-in the well upon sensing abnormal pressures. High-pressure sensors are not required in any field equipped with flowlines rated to withstand the maximum reservoir pressure encountered under operating conditions.
- Fire detecting fusible plugs installed in pneumatic shut-in control lines at the wellhead.
- Remote, manually operated, quick operating shut-in controls located a recommended minimum of 100 feet from the wellhead.
- Sacrificial sand probes connected to safety valves and designed to shut-in flow from the well in case of excess sand production or corrosive fluid production. The probes should be at points with a high probability of erosion such as the automatic shut-in valve flange or the smallest diameter piping or fitting leaving the wellhead.

4.1.3. Testing and inspection of safety devices

4.1.3.1. All installed well safety devices are tested or inspected (under static conditions) semiannually. Semiannual inspections or tests are completed within the anniversary months established for each well. Testing includes the following:

4.1.3.1.1. Flowline pressure sensors tested for proper pressure settings.

4.1.3.1.2. Automatic wellhead safety valves tested for reliable operating and holding pressure.

4.1.3.2. Each **Storage Operations Manager** or designee maintains records of the present status and history of each installed safety device, as well as dates, details and results of inspections, tests, repairs, reinstallation, and replacements. These records are available to **the Division of Oil, Gas and Geothermal Resources** personnel during business hours.

4.1.4. Enclosures

Copyright ©2012 Southern California Gas Company. All rights reserved.

SED SUR_REPLY_001743
AC_CPUC_SED_DR_17_0000159

Confidential and Protected Materials Pursuant to PUC Section 583, GO 66-D, and D.17-09-023

4.1.4.1. Facilities, oil and gas (including storage) wells are enclosed according to Company guidelines to prohibit or restrain access as necessary to protect life and property. Any site suspected of containing hazardous materials is identified at the enclosure. This is inclusive of the entire storage facility and is directed by the **Storage Operations Manager** or designee.

4.2. **Wellhead Valve Configuration**

4.2.1. Closing wellhead kill valves

4.2.1.1. Each storage / injection well has an operating and kill side. Normally, wellhead valves on the kill side remain in the open position. However, during wireline operations, preworkover preparation, or routine maintenance, the kill valves may be temporarily closed under the authority of the **Storage Field Engineer.**

4.2.1.2. The **Director of Storage, Storage Engineering Manager or Storage Operations Manager** approves closure of kill valves beyond these routine operations. If, under emergency conditions, these personnel are unavailable, the Region person on-call is responsible for authorizing kill valve operations.

4.2.2. Operating block valves and tubing master valves

4.2.2.1. Closing block valves located on the kill line prevents flow from the well through wellhead kill valves. These block valves are located a recommended minimum of 100 feet from the wellhead. Tubing master valves normally remain in the open position. However, these valves can be closed as needed for wireline or maintenance operations. During installation or removal of the wireline lubricator, the wellhead kill valve and the master valve should be closed during blowdown operations to minimize gas vented to the atmosphere.

4.2.3. Closure of wellhead valves

4.2.3.1. Wellhead valves containing wellhead pressure (e.g., remote kill valves) should never be left closed against the atmosphere. An end-closure device such as a tapped blind flange with a needle valve, or a unibolt is installed over the valve opening to provide a redundant seal.

4.2.4. Killed well valve configuration

Copyright ©2012 Southern California Gas Company. All rights reserved.

SED SUR_REPLY_001744
AC_CPUC_SED_DR_17_0000160

Confidential and Protected Materials Pursuant to PUC Section 583, GO 66-D, and D.17-09-023

4.2.4.1. Before or after a workover, while the well is killed, the **Storage Field Engineer** is responsible for setting the configuration of the wellhead valves. The **Storage Field Engineer** ensures that provisions are made to prevent surface gas line pressure from exerting gas pressure on a killed well when such pressure applied on top of a column of kill fluid could potentially cause down hole casing damage. All surface piping that is connected to the wellhead should be vented while the well is full of fluid. During workover operations, the **Rig Supervisor** is responsible for the setting of all valves.

4.3. **Well Flow**

4.3.1. Producing the well from the kill side, with the exception of kill fluid unloading or temporary well testing operations, is allowed only if temporary piping is adequately protected with high and low pressure sensors and automatic shut-in valves are installed adjacent to the wellhead. During these temporary operations, provisions are made to kill the well through wellhead valves not involved in the flow.

4.4. **Sacrificial Probes**

4.4.1. When a sacrificial probe fails, the well is taken out of service and investigated to determine the cause of failure. The cause of failure should be diagnosed and corrected prior to returning the well to service.

4.5. **Critical Wells**

4.5.1. The following criteria define a "critical" well:

4.5.1.1. A well capable of flowing on its own and located within 300 feet of the following:

4.5.1.1.1. Any building intended for human occupancy that is not necessary for the operation of the underground storage facility.

4.5.1.1.2. Any airport runway.

4.5.1.2. A well capable of flowing on its own and located within 100 feet of the following:

4.5.1.2.1. Any dedicated public street, highway, or nearest rail of an operating railway.

Copyright ©2012 Southern California Gas Company. All rights reserved.

SED SUR_REPLY_001745
AC_CPUC_SED_DR_17_0000161

Confidential and Protected Materials Pursuant to PUC Section 583, GO 66-D, and D.17-09-023

4.5.1.2.2. Any navigable body of water or watercourse perennially covered by water.

4.5.1.2.3. Any public recreational facility such as a golf course, amusement park, picnic ground, campground, or any other area of periodic high-density population.

4.5.1.2.4. Any officially recognized wildlife preserve.

4.5.1.3. Any other wells as designated by the **Division of Oil, Gas and Geothermal Resources**. Also, in certain cases the Gas Company may designate a well as "sensitive" due to safety or environmental concerns. These "sensitive" wells fall under the same operational guidelines set forth for critical wells, with the exception of the **Division of Oil, Gas and Geothermal Resources** reporting requirements.

4.5.2. Operation of critical wells

4.5.3. Besides the requirements set forth for all wells, critical wells are subject to additional operational requirements which include the following:

4.5.3.1. A surface controlled, subsurface safety valve installed at a depth of 50 feet or more below the ground level. For shut-in wells capable of flowing on their own, installation of a tubing plug can substitute for a subsurface tubing safety valve. If for any reason a subsurface safety valve is removed from a well, a replacement subsurface safety valve or tubing plug should be promptly installed. A packer is in place to seal the tubing/casing annulus at or below the valve or plug setting depth.

4.5.4. Testing and inspection of critical well safety devices

4.5.4.1. All installed well safety devices are tested or inspected (under static conditions) semiannually. Each semiannual inspection or test is completed within the anniversary months established for each well. Testing includes the following:

4.5.4.1.1. Subsurface safety devices tested for reliable operation.

4.5.4.1.2. Tubing plugs or packers tested for holding pressure.

4.5.4.2. The **Storage Field Engineer** or **Storage Operations Manager** notifies the **Division of Oil, Gas and Geothermal Resources**

district office before tests are conducted. Test failures not immediately repaired or corrected and not witnessed by a **Division of Oil, Gas and Geothermal Resources** inspector should be reported to the **Division of Oil, Gas and Geothermal Resources** within 24 hours.

5. RECORDS

5.1. All pertinent data regarding well operations and wellhead conditions are collected and recorded on the station daily log or the daily gas withdrawal/injection data sheet. Sacrificial probes that have failed are inspected by the **Storage Field Engineer**. The **Storage Operations Manager** or designee also maintains records on sacrificial probe installation, failure and replacement.

PURPOSE **Gas Storage Operations monitors, verifies, and reports the gas inventory in underground storage reservoirs by following the methods identified in this gas standard.**

1. POLICY AND SCOPE

1.1. Gas Storage Operations require monitoring and inventory verification for safe long-term management of underground gas storage operations. While no single method can be used to precisely monitor and verify the gas inventory in underground storage reservoirs, the three engineering methods in general use are summarized in sections 4.1 – 4.3.8.1. Only combining and analyzing available field data can gas volume verification be obtained. Based on this analysis, gas volume changes or losses are recognized, estimated and reported.

2. DEFINITIONS

When gas storage operations are initiated in an oil or gas reservoir, there is an initial gas content in the reservoir prior to injection. Initial gas content is generally composed of both free gas and solution gas. Additional gas is added to the initial gas content by injection, and the combination comprises the Total Storage Volume. This volume is categorized as follows:

2.1. **Cushion Gas**

The volume of gas which is required in underground storage field to maintain minimum field pressure.

2.2. **Recoverable Cushion Gas**

This is defined as the volume of gas that can be economically recovered from the reservoir below the base gas pressure. This volume varies, depending upon economic conditions.

2.3. **Non-Recoverable "Cushion Gas"**

This is the volume of gas left in the reservoir after all recoverable gas volumes are removed and is not considered a part of Total Storage Inventory. This gas is capitalized and depreciated over the life of the project.

2.4. **Working Gas**

Volume of gas present in an underground storage field, which is available for withdrawal, although not all of the working gas may be utilized in a given year due to cycle volume constraints. This volume is in addition to the cushion gas volume.

Copyright ©2010, 2012, 2014 Southern California Gas Company. All rights reserved.

SED SUR_REPLY_001749
AC_CPUC_SED_DR_17_0000165

Confidential and Protected Materials Pursuant to PUC Section 583, GO 66-D, and D.17-09-023

2.5. **Effective Working Gas**

This volume is defined as the working gas which is withdrawn and re-injected in a complete injection and withdrawal cycle. Ideally, the effective working gas volume is synonymous with the working gas volume. However, limitations by wells, compression facilities, or gas availability may limit effective working gas volume.

2.6. **Total Storage Inventory**

This is the sum of both the working and recoverable cushion gas volumes.

3. RESPONSIBILITY

The responsibilities for shut-ins, along with analyzing data, verifying gas inventory, and reporting changes or losses are specified in **Standard 224.0020,** *Gas Inventory Verification – Shut-In.*

3.1. At least once every two years the validity of the reported inventory for each storage field is evaluated using the methodologies outlined in this gas standard. A report is prepared that verifies that the reported inventory is within the range that would be expected from the reservoir analysis. Corrective action is taken if necessary. The report is prepared under the direction of the Storage Engineering Manager and approved by the Director of Storage. The report is directed to the **Director – Customer Billing Operations** and copied to the **Measurement Data Operations Manager** and the **Director – Transmission & System Operations**.

4. PROCEDURE

4.1. MONITORING

4.1.1. Monitoring of the storage reservoir ensure the reservoir functions, according to expectations, and integrity tests verify the gas inventory is present and available for delivery. Effective monitoring requires a thorough understanding of the reservoir system. This system is defined as the reservoir rock and wellbores, which respond to pressure changes as a result of gas injection and withdrawal.

4.1.2. Monitoring of the reservoir system is conducted in both storage and non-storage zone wells and at surface observation points.

4.1.2.1. Storage Zone Wells – Performance reviews utilize information collected during individual well and reservoir tests. Parameters such as back pressure curve shifts, changes in deliverability and field performance are investigated.

AC_CPUC_SED_DR_17_0000166

Confidential and Protected Materials Pursuant to PUC Section 583, GO 66-D, and D.17-09-023

4.1.2.1.1. Surface pressures on each well are measured and recorded weekly using a calibrated test gauge. These include tubing pressure, casing pressure, annuli pressures, and, if applicable, safety valve control line pressures. The mode of well operation (injection, withdrawal or shut-in) at the time of pressure measurement is also recorded. Note that the ***C.D.O.G.G.R. (California Division Of Oil, Gas, and Geothermal Resources)*** requires a monthly average casing and tubing pressure be submitted as part of the monthly production report.

4.1.2.1.2. A plot of the weekly surface casing and the innerstring annuli pressures versus time is maintained for each well. Hardcopy plots are created, marked and filed when an abnormal pressure is encountered. A pressure is considered abnormal when it may be large enough to force gas into a normally pressured water sand, either at the surface casing shoe or through any other known casing holes or leak-paths.

4.1.2.1.3. When abnormally high annular pressures are detected, diagnostic steps are taken to determine the source of pressure build up. This includes tests to eliminate surface valves and downhole tubing as possible sources of leakage. Zero pressure is abnormal in a well that has had a history of annular pressure and is investigated for the possibility of a closed valve.

4.1.2.1.4. All wells with continuing zero pressure readings are checked quarterly for closed valves and noted on the pressure plot. Blowdowns are also noted when they occur.

4.1.2.1.5. Wellhead inspections are performed on a monthly basis. Any leaks from wellhead flanges and valves are reported and corrected.

AC_CPUC_SED_DR_17_0000167

Confidential and Protected Materials Pursuant to PUC Section 583, GO 66-D, and D.17-09-023

4.1.2.1.6. Subsurface temperature surveys are conducted on each well in according to the following schedule: semi-annually in La Goleta and Playa del Rey storage fields and annually in the Aliso Canyon and Honor Rancho storage fields.

4.1.2.1.7. Surveys are done in accordance with CDOGGR regulations. Wells that have been killed are not exempt from this requirement and must be surveyed according to the schedule. Results of surveys are reported according to **Standard 224.001**, *Standardized Well Activities Reporting.*

4.1.2.1.8. Additional surveys will be run without regard to this schedule at the first indication of unusual or abnormal well conditions, i.e., anomalous pressure, surface gas emissions or other indications of well problems.

4.1.2.1.9. Wireline retrievable tubing obstructions such as tubing plugs, subsurface safety valves, subsurface chokes or tubing stops are removed once each year to perform a temperature survey of the casing shoe and cap rock seal. Ideally, this is done at high reservoir pressure when shoe leaks are most noticeable on temperature surveys. Under certain conditions it may not be possible or advisable to remove the wireline retrievable obstruction.

4.1.2.1.10. Subsurface surveys using wireline conductor cable equipment are made to investigate anomalies discovered by temperature surveys. Conductor cable surveys include temperature surveys, noise logs, spinner surveys, and radioactive tracer surveys.

4.1.2.1.11. In the case of well casing leaks above the shoe, radioactive tracer surveys are typically used to verify the location of gas movement through the leak. In the case of shoe or cap rock leaks, these additional surveys are used to verify that a leak exists and to qualitatively estimate a leakage rate.

SED SUR_REPLY_001752
AC_CPUC_SED_DR_17_0000168

Confidential and Protected Materials Pursuant to PUC Section 583, GO 66-D, and D.17-09-023

4.1.2.1.12. Gas cap observation wells are used to monitor reservoir pressure. If possible one or more wells completed in the gas cap are selected for observation purposes. These wells are not used for injection and are put on withdrawal only for peak load conditions. Surface pressure measurements on the tubing and casing of each gas cap observation well are made and recorded weekly.

4.1.2.1.13. A plot of these pressures versus inventory is kept in the office of the **Storage Field Engineer** and is updated weekly. Anomalous well pressures or behavior are reported to Storage Engineering Staff.

4.1.2.1.14. Reservoir shut-ins are generally on a schedule stated in **Standard 224.0020,** *Gas Inventory Verification – Shut-In* or when determined as necessary by the Storage Field Engineer.

4.1.2.2. Non-storage Zone Wells

Non-storage zone wells monitored include both Company wells and wells owned by others in overlying and underlying zones and in other fields within two miles of the storage reservoir boundary, where applicable. These wells are categorized as follows:

4.1.2.2.1. Pressure observation wells are located in overlying and underlying permeable formations, or adjacent to the storage reservoir but across assumed confining boundaries, such as faults, permeability pinchouts, below the gas-liquid contact or beyond the spill point of the storage zone's confining structure. Although normally static, these wells may have artificial lift mechanisms for removal of gas and fluids.

4.1.2.2.2. Gas collection wells are located where known gas migration from the storage zone is intercepted and collected. These wells are normally equipped with operating artificial lift mechanisms so that both liquids and gas can be produced, causing a pressure sink in the reservoir near the wellbore.

4.1.2.2.3. In some fields, shallow water observation wells have been drilled into aquifer zones existing in the first permeable sand above the shoe of the surface casing.

Copyright ©2010, 2012, 2014 Southern California Gas Company. All rights reserved.

SED SUR_REPLY_001753
AC_CPUC_SED_DR_17_0000169

Confidential and Protected Materials Pursuant to PUC Section 583, GO 66-D, and D.17-09-023

These wells are shut-in at the surface and gas concentrations in the wellbore are measured weekly.

4.1.2.2.4. If gas loss is expected, performance reviews of wells operated by other producers in either overlying zones or in adjacent fields may be made by reviewing production reports from these operators.

4.1.2.2.5. Performance of Company-owned observation and collection wells are also closely monitored. Wellhead inspections and temperature surveys are performed on the pressure observation wells and the gas collection wells.

4.1.2.2.6. Pressure observation wells

- Surface pressures on all tubing and casing strings are measured weekly using a calibrated test gauge.
- A plot of pressure versus time for each well is kept by the Storage Field Engineer. Bottom-hole pressure surveys are run as needed on pressure observation wells.
- If a substantial increase in reservoir pressure is noted or a significant gas buildup occurs, an attempt may be made to produce the well. Produced gas is sampled and analyzed for both hydrocarbon and helium content.

4.1.2.2.7. Gas collection wells

- Surface pressures on all casing strings and safety valve control lines are recorded weekly using a calibrated test gauge. The mode of well operation (producing, shut-in) at the time of pressure measurement is also recorded.
- A plot of pressure vs. time for each surface casing and innerstring annulus is generated and kept by the **Storage Field Engineer**.
- Bottom-hole pressure surveys are run on gas collection wells as needed. These surveys follow a shut-in period to allow pressure

stabilization after production. If the well is equipped with a standing valve, the valve is pulled prior to the bottom-hole pressure survey and is reinstalled upon completion of the survey.

- The Storage Field Engineer develops production schedules. The Storage Field Engineer maintains plots of bottomhole pressure versus time and records of produced gas, oil and water.

4.1.2.2.8. Shallow water observation wells

- Shallow water observation wells are closed-in at the surface and gas concentrations in the wellbore is measured periodically.

4.1.2.2.9. Surface Observations

- Surface observations are conducted by Station Personnel under the direction of local management and the resident Storage Field Engineer assigned to each Facility.

- Frequency and type of observations are determined and prescribed by local O&M procedures based on conditions particular to each Facility.

- In the event of major seismic activity or the occurrence of a significant gas loss or migration problem as identified by the Storage Field Engineer, local management with the assistance of the Storage Engineering Group will conduct inspections of certain well cellars, surrounding surface locations and previously abandoned wellbores as deemed necessary.

4.2. BOTTOM-HOLE PRESSURE DETERMINATION

4.2.1. Each of the three major methods used to verify gas storage inventory, as explained in Section 5, requires the determination of bottom-hole pressures. The method used to determine bottom-hole pressure must be consistent from year to year. The most accurate method to determine bottom-hole pressure is to measure the pressure with a pressure bomb. In certain applications the bottom-hole pressure can be calculated from the shut-in wellhead pressure. For wells completed in the gas cap and having full gas columns, the bottom-hole pressure is calculated from the equation:

$$P_{BHP} = P_{WH} \exp\left(\frac{0.01875 \times SG \times D}{Z_{avg} T_{avg}}\right)$$

Where:

P_{BHP} = Bottom-hole pressure, psia.

P_{WH} = Wellhead pressure, psia.

SG = Gas specific gravity.

D = True vertical depth in feet.

T_{avg} = Average wellbore temperature between surface and bottom-hole, degrees Rankine.

Z_{avg} = Average gas compressibility factor from charts, tables or computer programs (dependent on P_{avg}, T_{avg} and gas gravity).

P_{avg} = Average pressure between surface and bottom-hole, psia or $P_{avg} = (P_{BHP} + P_{WH}) / 2$

NOTE: The above equation could yield incorrect results if the well exhibits a significant fluid level.

4.3. INVENTORY VERIFICATION – SHUT IN

4.3.1. Three primary methods for inventory verification of gas storage fields are referenced and summarized below:

4.3.1.1. Calculation of gas content based on volumetric data and average reservoir pressure; Volumetric Determination is explained in

Copyright ©2010, 2012, 2014 Southern California Gas Company. All rights reserved.

SED SUR_REPLY_001756
AC_CPUC_SED_DR_17_0000172

Applied Petroleum Reservoir Engineering; by Craft, B. C. and Hawkins, M. F.; Englewood Cliffs, N.J.: Prentice- Hall, 1959.

4.3.1.2. Calculation of effective gas content using the simple gas material balance, hysteresis curve, and P/Z curve methods; Material Balance is explained in Natural Gas Engineering by Ikoku, C. V.; Tulsa, Oklahoma: Penn Well Publishing, 1980.

4.3.1.3. Verification of storage inventory by comparing measured reservoir pressures with calculated pressures obtained using the single cell material balance or reservoir simulation methods; Numerical Simulation or Reservoir Modeling is explained in Modern Reservoir Engineering —A Simulation Approach by Crichlow, H. B.; Englewood Cliffs, N.J.: Prentice- Hall, 1977 and the Intercomp Beta II User Manual.

4.3.2. The most common inventory verification method used in mature gas storage projects that are known to have effective geologic closure is the hysteresis curve or P/Z versus inventory plot. Typically, it is adjusted annually for known gas losses and liquid production. Any shift between points plotted at similar pressures following a shut-in is further investigated.

4.3.2.1. Tracking known gas losses and transfers as they occur assist with inventory verification.

4.3.2.2. Recommended shut-in time durations for effective reservoir stabilization are listed below

4.3.2.2.1. Aliso Canyon -14 days

4.3.2.2.2. Honor Rancho -12 days

4.3.2.2.3. Goleta- 5 days

4.3.2.2.4. Playa del Rey – 4 days

4.3.3. Data collected during a shut-in period includes accurate measurements of reservoir pressure on each available well. Bottom-hole pressures can be calculated from surface pressures or measured directly. Gas gravity is determined using gas samples from individual, representative wells.

4.3.4. The **Storage Field Engineer** chooses the type and frequency of data to be collected during shut-ins.

4.3.5. Calculation of gas content based on volumetric data and average reservoir pressure from shut-in.

Copyright ©2010, 2012, 2014 Southern California Gas Company. All rights reserved.

SED SUR_REPLY_001757

4.3.5.1. Average reservoir pressures used in this calculation are obtained during shut-in periods required for reservoir pressure stabilization. Reservoir pore volumes available for gas storage are calculated from either geologic information, material balances using production and pressure information obtained during primary field production, or in some cases from pressure and production data obtained during gas storage operations. Elements of these calculations are described below:

4.3.5.2. Average reservoir pressures are calculated in an appropriate way for each storage reservoir. To be reliable, the method for each field should stay consistent for all years. Various methods of calculation include the following:

4.3.5.2.1. The average reservoir pressure for Honor Rancho, La Goleta, and Playa del Rey are determined by calculating the arithmetic average of the bottom-hole pressure in the gas cap wells. In these fields the pressure of each well is measured or computed at a specified subsea datum approximately at the midpoint of the zone. The datum and reservoir temperature used for these fields are as follows:

- Honor Rancho - 8,300 feet subsea, 190°F
- La Goleta - 4,200 feet subsea, 150°F
- Playa del Rey - 6,100 feet subsea, 210°F
- A volumetrically weighted average reservoir pressure is used for Aliso Canyon. The pressures in this field are computed at a specified subsea depth approximately at the midpoint of the zone. The datum depth for this field and the reservoir temperature are as follows:
    - Aliso Canyon - 5,400 feet subsea, 180°F

4.3.6. Reservoir pore volume calculated from geologic information uses data obtained during the drilling and completion of the well, such as electric logs or core information to calculate the total pore volume of the reservoir. These calculations are based on the following equations:

4.3.6.1. Gas reservoirs

Copyright ©2010, 2012, 2014 Southern California Gas Company. All rights reserved.

SED SUR_REPLY_001758
AC_CPUC_SED_DR_17_0000174

Confidential and Protected Materials Pursuant to PUC Section 583, GO 66-D, and D.17-09-023

4.3.6.1.1. Equation: $V = Ah\phi (1-S_w)$

Where:

$V =$ Reservoir gas pore volume in cubic feet

$A =$ Gas zone area in square feet

$h =$ Average gas zone thickness in feet determined from electric logs or cores

$\phi =$ Porosity fraction determined from porosity logs or core analysis

$S_w =$ Water saturation from log, core analysis

4.3.6.2. Oil reservoirs

4.3.6.2.1. Equation: $V = Ah\phi(1-S_w) + A_1h_1\phi (1- S_{1w}-s_o)$

Where:

$A =$ Primary gas cap area in square feet

$A_1 =$ Secondary gas cap area in square feet

$h_1 =$ Average secondary gas zone thickness in feet

$s_o =$ Residual oil saturation

4.3.6.2.2. In most portions of an oil zone storage reservoir, oil saturation is determined from core analysis or can be considered equivalent to residual oil saturation and can be estimated from the 16" normal resistivity curve using the following relationships.

Equation: Residual oil saturation = $(1-s_{xo})$

$$s_{xo} = \sqrt{\frac{Rmf}{R_{xo}\phi 2}}$$

Where:

AC_CPUC_SED_DR_17_0000175

Confidential and Protected Materials Pursuant to PUC Section 583, GO 66-D, and D.17-09-023

R_{xo} = Resistivity of 16" normal or resistivity of flushed zone.

S_{xo} = Water saturation of mud filtrate within the flushed zone.

ø = Porosity

Rmf = Resistivity of mud filtrate.

4.3.6.3. Gas reservoir pore volume calculated using material balance equations:

These calculations utilize production and pressure data in the following equations:

4.3.6.3.1. Equation for constant volume gas reservoirs using primary production:

$$V = \frac{P_{SC} G_P T}{T_{SC}} \left(\frac{1}{P_i / Z_i - P_f / Z_F} \right)$$

Where water production and influx are assumed negligible and where:

V = Gas pore volume in reservoir cubic feet.

P_{sc} = 14.7 psia

G_p = Gas produced in standard cubic feet.

T = Reservoir temperature in degrees Rankin (°R).

R_{sc} = 520°R

P_i = Initial pressure, psia.

P_f = Final pressure, psia.

Z_i = Initial gas compressibility factor.

Z_f = Final gas compressibility factor.

Copyright ©2010, 2012, 2014 Southern California Gas Company. All rights reserved.

SED SUR_REPLY_001760
AC_CPUC_SED_DR_17_0000176

Confidential and Protected Materials Pursuant to PUC Section 583, GO 66-D, and D.17-09-023

4.3.6.3.2. Equation for constant volume gas reservoirs using storage production

$$V = \frac{P_{SC} G_P T}{T_{SP}} \left(\frac{1}{P_1 / Z_1 - P_2 / Z_2} \right)$$

Where water production and influx are assumed negligible

G_p = SCF of gas produced or injected between pressure points P1 and P2.

P1 and P2 = The first and second stabilized average reservoir pressures bounding the production or injection period considered.

Z1 and Z2 = Gas compressibility factors for P1 and P2.

T = Reservoir temperature in degrees Rankine

4.3.6.4. Oil reservoirs pore volume calculations

4.3.6.4.1. Equation: The 'Reservoir Gas Pore Volume' is equal to the 'Original Gas Cap Pore Volume' plus the 'Secondary Gas Cap Pore Volume' plus the 'Space created by Water Production'.

Or:

$$V = GB_{gi} = \left(NB_{oi} - \left(N - N_p \right) B_o \right) + W_p B_w$$

Where:

G = Original gas pore volume, standard cubic feet (determined from either geologic data or an appropriate form of the material balance equation).

B_{gi} = Gas formation volume factor in reservoir cubic feet per standard cubic feet at discovery pressure.

Copyright ©2010, 2012, 2014 Southern California Gas Company. All rights reserved.

SED SUR_REPLY_001761
AC_CPUC_SED_DR_17_0000177

Confidential and Protected Materials Pursuant to PUC Section 583, GO 66-D, and D.17-09-023

N = Initial oil in place in stock tank barrels (determined from either geologic data or an appropriated form of the material balance equation).

N_p = Cumulative oil production in stock tank barrels.

B_{oi} = Oil formation volume factor in reservoir cubic feet per stock tank barrel at discovery pressure.

Bo = Oil formation volume factor at existing pressure in reservoir cubic feet per stock tank barrel.

W_p = Water production in stock tank barrels.

B_w = Water formation volume factor, reservoir cubic feet per stock tank barrel (approximates 5.615).

4.3.6.4.2. Simplifying assumptions used in the above equation are that no storage gas goes into solution in the oil and that there is no water influx into the storage reservoir. These simplifying assumptions are seldom true. However, the equation can be modified based on a judgment of the volume of gas which may go into solution in the reservoir oil and a judgment of aquifer activity surrounding the storage reservoir. When modified by these judgment factors, the equation provides a method for approximating a limit for the reservoir gas pore volume available for storage operations. An upper limit is established when it is assumed that all the residual oil is re-saturated with gas. Generally, only a fraction of the oil becomes saturated and so the calculation has little usage beyond setting limits.

4.3.6.4.3. The values of G and N are not generally expected to be obtained with an accuracy greater than +/- 20%. However, this is not a major drawback since the methods are used to establish guidelines and set limits.

4.3.6.5. Calculation of gas content.

Copyright ©2010, 2012, 2014 Southern California Gas Company. All rights reserved.

SED SUR_REPLY_001762
AC_CPUC_SED_DR_17_0000178

Confidential and Protected Materials Pursuant to PUC Section 583, GO 66-D, and D.17-09-023

4.3.6.5.1. After the gas pore volume has been calculated, or approximated, by one of the methods indicated above, the gas content at the measured reservoir pressure is determined using the gas law as follows:

PV = ZNRT

Where:

P = Average reservoir pressure, psia

V = Gas pore volume in reservoir cubic feet

T = Temperature of reservoir, (°F + 460) degrees Rankine

Z = Compressibility factor, dependent on P, T, and gas gravity, from charts or tables.

N = pound moles (where one pound mole =379.41 cubic feet @ 60°F and 14.7 psia).

R = 10.735 universal gas constant for above units.

Solving for gas content;

$$Volume(mscf) = \frac{(0.03533)PV}{ZT}$$

4.3.7. Calculation of effective gas content using the simple gas material balance and hysteresis curve (P/Z curve) methods.

4.3.7.1. Pressure changes, with rapid gas injection or withdrawal during selected operating periods, can show the relationship between effective gas content and the storage inventory. Effective gas content is the gas which, within a given time, causes a measurable pressure response to injection or withdrawal operations. Not all gas in the reservoir yields such a response within the given time interval. The difference between effective gas content at a given pressure (P_1) and the metered inventory is non-effective gas. Part of this non-effective gas can be due to the lack of pressure equilibrium within the reservoir. Any gas migration out of the storage reservoir also contributes to the non-effective gas. Either one of the two equations, or the graphical solutions presented below are used to calculate the effective gas content.

Copyright ©2010, 2012, 2014 Southern California Gas Company. All rights reserved.

AC_CPUC_SED_DR_17_0000179

Confidential and Protected Materials Pursuant to PUC Section 583, GO 66-D, and D.17-09-023

4.3.7.1.1. Calculations with negligible water movement are made using the following equation:

$$\text{Effective Gas Content at P1, Q1} = \left(\frac{\Delta Q}{\frac{P_1}{Z_1} - \frac{P_2}{Z_2}} \right) \left(\frac{P_1}{Z_1} \right)$$

Where:

P_1 = Pressure at the first operational point considered.

P_2 = Pressure at the second operational point considered.

Q_1 = Net storage volume at the first operational point considered.

ΔQ = The net change in gas inventory between the two operational points considered.

4.3.7.1.2. Calculations with significant water movement of a known rate are made using the following equations:

$$Q_1 = \left(\Delta Q - \left(We \times \frac{P_2}{14.7} \times \frac{520}{T_R} \times \frac{1}{Z_R} \right) \right) \frac{\frac{P_1}{Z_1}}{\left(\frac{P_1}{Z_1} - \frac{P_2}{Z_2} \right)}$$

Where terms are defined as above, and where:

We = Water influx in cubic feet.

T_R = Reservoir temperature, degrees Rankine.

Z_R = Z at T_R and P_2.

Confidential and Protected Materials Pursuant to PUC Section 583, GO 66-D, and D.17-09-023

4.3.8. Graphical solutions

4.3.8.1. The hysteresis curve is a plot of reservoir pressure versus storage inventory. This curve utilizes the compressibility factor of non-ideal gas. It is most effective in a constant volume reservoir since it assumes no water movement into or away from the storage reservoir; and no movement of gas into or out of solution in the reservoir oil. Actually, after sufficient storage history, the hysteresis curve becomes a qualitative/quantitative tool for inventory when a storage field is operated in a consistent manner and storage cycle volumes are relatively consistent over time. Under these conditions, aquifer movement and movement of gas into and out of solution is relatively constant and effectively drops from the equation.

4.4. REPORTING GAS INVENTORY LOSSES

4.4.1. Calculated operational losses

4.4.1.1. Gas losses due to compressor, piping system or well blowdowns and wireline surveys are calculated by Storage Operations personnel and reported to Measurement monthly. These reports are reviewed by the Storage Field Engineer.

4.4.1.2. Estimates of losses related to workovers and well blowdowns are prepared by the Storage Field Engineer after a well has been killed. These estimated losses are reported monthly to Gas Measurement.

4.4.2. Losses from known well and surface facility leaks

4.4.2.1. Some small losses from valves, compressors, field piping, threaded well casing connections and well casing mechanical devices such as cementing stage collars, and some small casing leaks are inherent to **Storage Field Operations**. These leaks are estimated and reported as follows:

4.4.2.1.1. Minor surface facility leakage is surveyed in each storage field periodically. Leakage surveys include wellhead valves and fittings, instrumentation, well piping, field piping, surface production facilities and the compressor station. Surveys are made more frequently if facility modifications are made which might change leakage rates.

4.4.2.1.2. During these surveys, measurements are obtained on representative minor atmospheric leaks and then

SED SUR_REPLY_001765
AC_CPUC_SED_DR_17_0000181

Confidential and Protected Materials Pursuant to PUC Section 583, GO 66-D, and D.17-09-023

extrapolated to an estimated annual leakage rate for the field.

4.4.2.1.3. Subsurface leakage from wells is estimated by the **Storage Field Engineer** and reported to **Storage Engineering Staff.**

4.4.2.1.4. Leakage from well casings is estimated by establishing a leakage rate using the radioactive tracer survey. The number of days of leakage is estimated by using subsurface temperature survey data. Casing shoe or Water Shut-Off (WSO) leakage is estimated by reviewing temperature, noise and radioactive tracer surveys, pressure draw-down and the overlying wells' gas production during the time of the leak.

4.4.2.1.5. In cases where leakage rates are not quantifiable, an average rate of 30 Mcf/d may be used. Engineering judgment is then applied and an average daily loss rate selected. The number of days the leak was occurring is determined by taking one-half the difference in the number of days between the last normal and the first abnormal temperature survey.

4.4.2.2. Surface facility leakage and subsurface leakage are quantified annually by the **Storage Field Engineer** who reports the results to the **Storage Engineering Manager** and **Measurement Data Operations**.

4.4.3. Reservoir losses

4.4.3.1. Reservoir losses are categorized as those associated with Company-operated wells completed in the storage reservoir and general reservoir losses.

4.4.3.1.1. Losses associated with the Company-operated wells include losses through failures in the cement between the cap rock and well casing. These losses are also known as "shoe leaks," "WSO" leaks and "stage collar" leaks.

AC_CPUC_SED_DR_17_0000182

Confidential and Protected Materials Pursuant to PUC Section 583, GO 66-D, and D.17-09-023

4.4.3.1.2. General reservoir losses include losses through abandoned wells or breakdown of some portion of the trapping mechanism. This type of loss is not directly detected by surveys of Company-operated wells in the storage zone.

4.4.3.1.3. Quantification of reservoir losses utilizes industry accepted methods of inventory verification.

4.4.4. Reservoir losses are quantified annually by the **Storage Field Engineer** who reports results to the **Storage Engineering Manager** and **Measurement Data Operations.**

4.4.5. Gas storage field measurement audits

4.4.5.1. When Storage Engineering identifies a consistent discrepancy in the pressure or P/Z versus Inventory relationship of 1 Bcf or 3% of the working inventory volume, whichever is less, at a storage field that cannot be explained by known leaks such as gas vented to the atmosphere, liquid production or other reservoir changes, they request an audit of the gas measurement systems at the storage field by the Measurement, Regulation and Control (MRC) group of Gas Engineering.

4.4.5.2. MRC investigates the following parameters with assistance from Storage personnel.

4.4.5.2.1. MRC Design Team obtains the most current drawings and block flow diagrams for the storage field.

4.4.5.2.2. MRC Design and Storage Field personnel inspect the facility to determine the accuracy of current drawings.

4.4.5.2.3 MRC Design and Storage Field personnel identify any changes in metering or gas processes that have occurred since the drawings were last issued.

4.4.5.3 MRC reviews Storage Field Ledger calculations in order to verify they agree with updated drawings and block flow diagrams. MRC documents any errors found in the Ledger formulas and advised MDO of any required Ledger formula revisions.

4.4.5.4 MRC in conjunction with the drawing confirmation prepares a list of the meters, instrument configuration and associated transducer ranges.

4.4.5.4.1 MRC compares this listing to information in the Measurement Collection System (MCS) for those sites that MCS re-calculates the volumes and notes any discrepancies and impact of those discrepancies on measurement accuracy.

4.4.5.4.2 MRC compares information in the Instrument Configuration for those site where the Scada Pack calculates the volumes and notes any discrepancies and impact of those discrepancies on measurement accuracy.

4.4.5.5 MRC Measurement Technology reviews Storage Field calibration and meter inspection results to insure adherence to the Gas Standards and System Instructions listed below. Any discrepancies or errors will be documented and impact on measurement noted.

- **Standard 223.0360** Instrument Maintenance – Storage Field and Transmission Facilities
- **Standard 185.0455** Flow Measuring Devices – Field Maintenance
- **Standard 185.0475** Orifice Meters and Orifice Plates - Field Inspection and Maintenance
- **Form 4682-B** Orifice Meter Order
- **Standard 185.0452** Daniel Ultrasonic Meter - Operation and Maintenance
- **Standard 185.0425** Rotary Meters - Field Maintenance, Inspection and Repair
- **Standard 185.0530** Turbine Meters - Operation, Maintenance and Spin Test
- **Standard 185.0474** Control Microsystems SCADAPACK
- **Standard 185.0457** Totalflow Inspection and Calibration Requirements for 6610, 6413, 6713 & X-Series
- **Standard 185.0458** Totalflow Inspection and Calibration Requirements for 6611, 6414, 6714 & X-Series
- **Standard 185.0461** Galvanic Gas Micro - Installation and Field Maintenance
- **Standard 185.0515** Temperature Devices – Maintenance

4.4.5.6 Storage Field Orifice Meter or Ultrasonic Meter (USM) inspections will be witnessed by MRC Measurement Technology to confirm conformance to applicable Gas Standards listed in Section 4.4.5.5. A borescope inspection may be recommended if metering inspection results warrant further investigation.

4.4.5.7 MRC Measurement Technology to review the last 12 months of MCS Hourly data for each Storage Field Meter on the Ledger to verify meters are operating within their minimum and maximum ranges.

4.4.5.7.1 Verify operating Orifice Differential Pressure (DP) are 9" w.c. or greater on average, Beta ratio within the range of 0.2 to 0.6 and orifice plate thickness and bevels in accordance with AGA 3

4.4.5.7.2 MRC Measurement Technology will also review borescope inspection results. Impact on measurement accuracy will be noted for any negative findings.

4.4.5.8 MRC Technology to issue final report to Storage Field, MRC and MDO summarizing all findings, quantifying all measurement errors and detailing any revisions required to MCS Ledgers or Company Drawings.

4.4.5.8.1 Report will also recommend any follow-up actions required by Storage Field, MRC Design or MDO.

4.4.5.9 The final report results are reviewed and signed off on by:

- Director of Storage
- Storage Engineering Manager
- Storage Operations Manager
- Measurement Regulation and Control (MRC) Manager
- Contract and Compliance Manager - Measurement Data Operations (MDO)
- Storage Technical Services Manager (TSM)

1 Background

The Legal Division of the California Public Utilities Commission issued a Data Request to Blade Energy Partners (Blade) on April 2, 2020. Data Request No: SED 63 is related the Preliminary Investigation of Southern California Gas Company's Aliso Canyon Storage Facility.

The CPUC questions (from file: "I1906016 SED DR 63 Final.pdf") are included verbatim followed by the Blade responses to the questions.

The passages are from the document titled: Chapter III, Prepared Reply Testimony of L. William Abel on behalf of Southern California Gas Company (U 904 G) (file name: "3_Ch. III - Abel (A Final).pdf").

2 Questions and Responses

2.1 Question 1

1. On page 12, "Blade's modeling simply represents an academic exercise to calculate the kill fluid density and pump rate that theoretically *could have* killed SS-25, and fails to account for several important safety considerations that impacted Boots & Coots' well kill efforts. First, as Boots & Coots explained to SED during SED's August 2018 examination, the first step upon arriving at a well control event is to secure the area and ensure the safety of personnel. [Footnote omitted.]. Indeed, as discussed in SoCalGas' opening testimony, safety is a paramount consideration in any well control operation, and the response to the SS-25 leak was no different—extensive measures were implemented to mitigate the risk of ignition. [Footnote omitted]. Second, in designing a well kill plan, a well control company must take extreme caution not to implement a well kill operation that may worsen the leak, and thereby increase the risk of ignition, or jeopardize the success of subsequent kill attempts. Boots & Coots appropriately considered these factors, and made adjustments to its kill operations accordingly." With this passage on mind, please answer:

2.1.1 Questions and Blade Responses

a. Does Blade agree that, "Blade's modeling simply represents an academic exercise to calculate the kill fluid density and pump rate that theoretically could have killed SS-25?"

   No.

b. If Blade disagrees with this statement, please state the reasons for disagreeing.

   Blade's efforts to model the kill operations were not an academic exercise—it was specifically to ascertain why the top kill well-control efforts were unsuccessful and why it took 111 days to stop the gas from the Aliso Canyon gas storage reservoir from escaping to the atmosphere. As discussed in the Blade Report [1] (page 229), Blade conducted a transient kill simulation study to evaluate the likelihood of success of the actual kill attempts. Blade intentionally used the same field data that were available to the onsite well control personnel during the time of well kill operations for this evaluation. According to Blade's modeling, all the SS-25 kill attempts were predicted to be unsuccessful.

   It is not clear to Blade how Boots and Coots selected the pump rates and kill fluid densities for each kill attempt. The kill fluid densities did not change materially until kill attempt #7.

c. Does Blade take the position that its modeling would have successfully killed well SS-25?

   Because of the modeling and kill attempt operational uncertainties, no one can guarantee a successful well kill strictly based on modeling results. Modeling to determine a plan for the pumping operations is the first important component of a well kill plan. The modeling uses available data and reasonable engineering assumptions for unknown data. In fact, the advantage of modeling is that it allows for evaluation of uncertainties in the data and assumptions. The second component of a kill operation is to carry out the pumping operations according to the plan developed through modeling. If the modeling results are flawed, or if the pumping operation does not go as planned, a well kill attempt will likely be unsuccessful.

Blade takes the position that kill modeling is necessary to properly plan a kill operation where early success in killing the well is of high importance. Such modeling could include transient kill modeling or other analytical approaches that take into account pressure, kill fluid properties, flow rates and restrictions in the flow path. There was no evidence provided to Blade that kill modeling or other analytical approaches were undertaken for kill attempts #1 through #6.

Furthermore, Blade contends that by the time of kill attempt #2, the complexity of the kill operation should have been well understood. Twenty days were available to gather data on the well conditions during the time interval between kill attempts #1 and #2. Diagnostic logs were run in the well showing temperature anomalies and possible leak depths. By then it was clear that there was a leak in the 7 in. casing at some shallow depth; and this was documented in the daily reports. This time period was adequate to conduct kill modeling. Gas was flowing from the reservoir up through the 7 in. casing × 2 7/8 in. tubing annulus and then outside of the 7 in. casing. The gas was escaping into the surrounding formation and some was migrating to the surface. This was not a standard top kill operation based on the available data.

The following are examples of data and assumptions that could have been made regarding the leak severity, leak depth, and flow path:

- The SoCalGas SS-25 daily report for October 24, 2015 [2] stated "At this time, It [sic] appears that we had a wellhead seal leak and/or a very shallow 7" production casing leak."
- The temperature log run on November 8, 2015 [3], showed cooling anomalies at 365 ft and 890 ft indicating the possible depths of gas expansion and cooling associated with a leak.
- The Boots & Coots daily report on November 13, 2015 (Add Energy Report [4], page 89, AC_BLD_0031392), stating that after pumping junk shots down the 2 7/8 in. × 7 in. annulus, brine was observed after 5 bbl were pumped.
- Both Add Energy [4] (page 9, AC_BLD_0031312) and Blade [5] (page 51) estimated the SS-25 gas flow rate using data that was available at the time of the leak. Add Energy stated on page 7, "This estimated flow rate is not dependent of the flow path from the bottom of the tubing to surface, but only calculated based on pressures and the inflow performance relation (IPR) estimated from well tests."

A kill design is based on the well parameters such as geometry, flow path restrictions, and gas flow rate as well as the kill parameters including kill fluid density, pump rate, fluid volume, and surface pump pressure. Kill modeling is an effective way of accounting for these variables and their uncertainties and then screening well kill plans to determine which plans may be successful and which are likely to be unsuccessful thereby maximizing the chances of success. Kill modeling is safer, more efficient, and less risky than pumping multiple unsuccessful kill attempts. The risk of unsuccessful kill attempts includes damage to the site and the well's surface equipment that can limit additional kill attempts. The modeling allows learnings from each kill attempt to be incorporated into the next one. The seven unsuccessful kill attempts at SS-25 resulted in a large and deep crater around the wellhead and conductor casing creating a hazardous condition and required waiting for the relief well to stop the gas flow from SS-25 to the atmosphere.

Question 1 includes a comment on safety considerations and the following statement:

> Second, in designing a well kill plan, a well control company must take extreme caution not to implement a well kill operation that may worsen the leak, and thereby increase the risk of ignition, or jeopardize the success of subsequent kill attempts.

Blade agrees with this statement. This is exactly why kill modeling is a necessary component of designing a successful well kill plan. However, evidence indicates that this did not happen at SS-25. The use of higher density fluids, as predicted by the kill modeling, would not have compromised safety during the kill attempts. Specifically, kill attempt #2 resulted in the formation of the crater around the wellhead and conductor. Similarly designed, unsuccessful kill attempts continued after kill attempt #2. During kill attempt #6, the flow line from the 7 in. casing and tubing head broke, monitoring devices were damaged, and the pump line to the casing head broke. The pump line tee broke off because of wellhead movement and the 11 3/4 in. × 7 in. annulus valve backed out during kill attempt #7 allowing the annulus to vent gas at surface and enlarge the crater. The additional kill attempts continued even when the well and surface conditions had deteriorated from after kill attempt #2.

Blade was provided with what appear to be some graphical results of modeling for kill attempt #7, the final SS-25 top kill attempt on December 22, 2015 [6] [7]. Kill modelling was not mentioned in the August 8, 2018, Examination Under Oath of Mr. Danny Walzel and Mr. James Kopecky [8] (pages SED 00635 – SED 00786). It is clearly stated in this document that Boot & Coots did not calculate the well flow rate which is a key variable needed for developing a kill plan (pages SED 00736 – SED 00737).

It appears from data provided to Blade that kill modeling was performed in preparation for kill attempt #7, unlike the lack of any modeling prior to the previous six kill attempts. But by this time the surface conditions had deteriorated from previous attempts and wellhead movement and safety concerns prevented the kill fluids from being pumped according the plan. Kill attempt #7 appeared to come close to killing the well, but it was terminated because of undesirable movement of the wellhead and pump lines that broke during the job. It is important to note that the kill attempt #7 fluid densities were similar to the results from the Blade transient kill models for the previous kill attempts.

d. If so, what is the factual basis for such a position?

As discussed in Question 1 c, modeling by itself cannot ensure a successful well kill.

e. Were the adjustments to kill operations that Mr. Abel mentions disclosed to Blade during its Root Cause Analysis?

Blade had access to historical kill data including:

- Some pre-job procedures
- SoCalGas daily operations reports
- Boots & Coots daily operations reports
- Halliburton post-job reports
- DOGGR daily operations summary reports

However, the rationale and the factors considered in designing the kill attempts were not made available to Blade.

The subject of kill modeling was raised many times with SoCalGas during the RCA. Multiple data requests were sent to SoCalGas regarding the kill attempts, rationale behind the kill attempts, and associated kill data. Consequently, Blade requested a discussion meeting and suggested the Boots & Coots personnel who were onsite and were associated with planning and executing the kill attempts join the discussion meeting [9]. Such a meeting never occurred.

f. If so, did Blade consider whether Boots & Coots appropriately considered all factors and made correct adjustments to its kill operations?

As discussed in the response to Question 1 e, the rationale for the well kill adjustments were not disclosed to Blade.

Although requested, Blade did not have direct access to the Boots & Coots personnel to determine if Boots & Coots appropriately considered all factors and made correct adjustments to its kill operations. Our review of the Boots & Coots well kill plans for attempts #2 – 6 did not document the rationale for the kill attempts. The 2018 Boots & Coots Examination Under Oath [8] did not have the details required to ascertain whether Boots & Coots considered all factors.

In Blade's view, kill attempt #7 had significant adjustments to the kill plan from previous kill attempts, and it was similar to the results of the Blade modeling.

g. Provide any documents and necessary additional context to support the answers provided.

Two documents were provided by SoCalGas to Blade that appear to be graphical results of kill modeling. These graphs appear to be generated within Schlumberger's *Drillbench* software. This is industry standard well control modeling software and the same software that Blade used in its kill analysis. Images of the documents are included in Figure 1 and Figure 2.

Figure 2 shows an AOF (absolute open flow) of 25 MMscf7/D and a gas flow rate of 15 MMscf/D. Blade estimated the well was flowing approximately 57 MMscf/D on December 22, 2015, [5] *SS-25 Well Nodal-Analysis with Uncontrolled Leak Estimation*, page 51. The final kill attempt #7 was pumped on December 22, 2015.

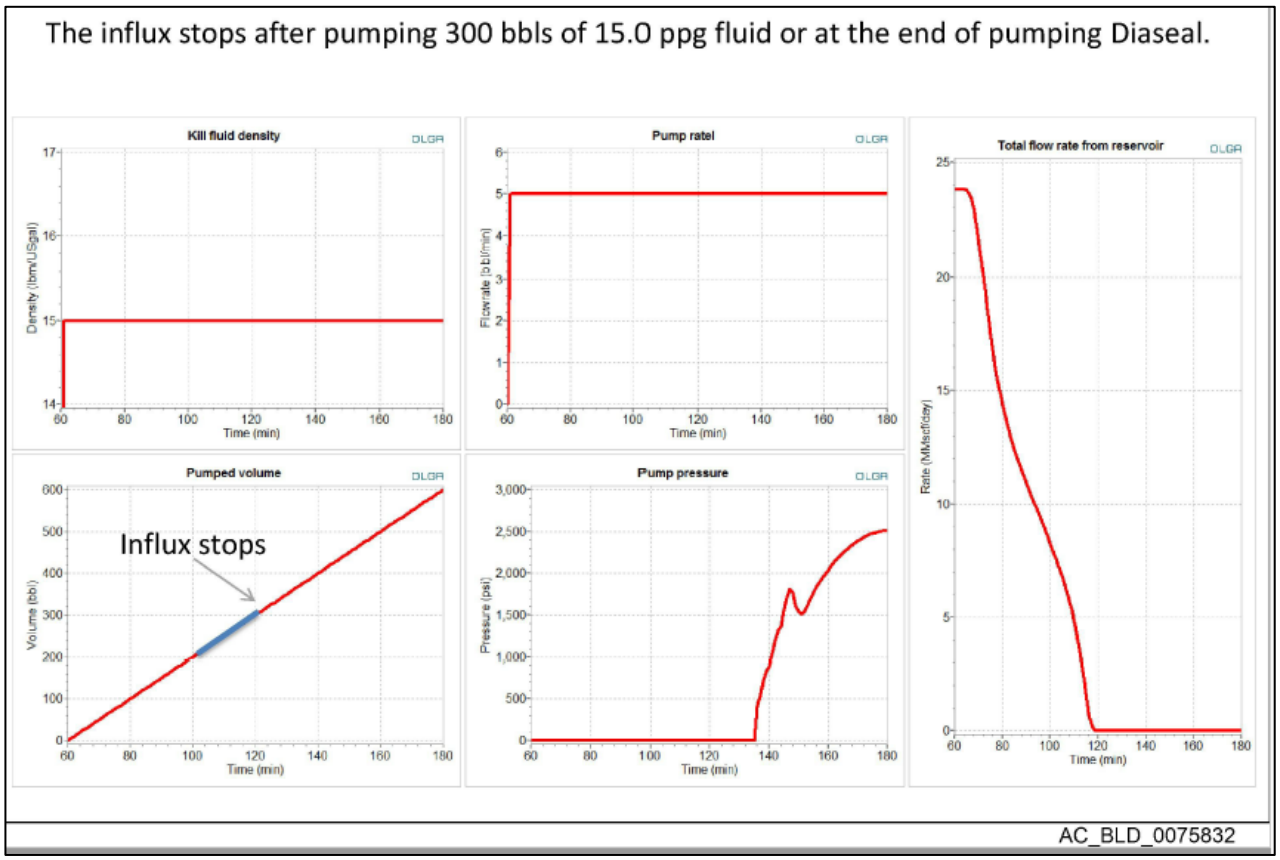

Figure 1: Kill Modeling Graphical Results

Snapshot of pumping 15.0 ppg WBM at the rate of 3 bpm

Basis of simulation:		Results:	
Reservoir pressure:	2,200 psi	Gas flow rate:	15 MMscfd
AOF:	25 MMscfd	Max pump pressure:	1,450 psi
SITP:	1,400 psi	Kill fluid volume:	65 bbls
Depth of exit point:	450 ft MD	Fracture occurs:	105 bbls
Restriction at exit point:	Yes	Top of fluid level in the annulus:	5,500 ft MD
Kill fluid density:	15.0 ppg		
Kill fluid viscosity:	25 cP

2.2 Question 2

2. Please refer to the following passage on page 12 of Mr. Abel's testimony: Mr. Walzel testified that while the SS-25 wellhead equipment was rated to 5,000 PSI, given the unknown condition of the leak, Boots & Coots set a "safety limit" or "safety factor" well below the working pressure of the equipment. [Footnote omitted]. I believe that it was prudent for Boots & Coots to have set a safety factor so as not to risk damaging the wellhead." With this passage in mind, please answer:

2.2.1 Questions and Blade Responses

a. Does Blade's modeling consider risk to damaging the wellhead?

Yes. Blade considered the wellhead rated working pressure of 5,000 psi. The Blade kill simulations for all of the kill attempts resulted in a maximum predicted pump pressure of 3,644 psi for kill attempt #2 with decreasing maximum pump pressure for subsequent kill attempts because the reservoir pressure was declining with time. The maximum predicted pump pressure of 3,644 psi is below the "safety limit" set by Boots and Coots of 4,000 psi. The field was on withdrawal during the kill attempts so the reservoir pressure was dropping.

b. What is Blade's view as to whether this alleged "safety factor" below the working pressure of the equipment was prudent so as not to risk damaging the wellhead?

Blade agrees that it is prudent to use a safety factor to avoid damage to the wellhead and surface equipment. Blade's simulations showed that the wellhead pressures would not have exceeded 3,644 psi with the higher fluid densities. The model results honored the wellhead safety factor.

c. In Blade's view, given what could have been known about the condition of well SS-25 and other related factors by Boots & Coots at the time of its well kill attempts, could Boots & Coots have known whether the pump rate and fluid density it used was inadequate to kill well SS-25?

Yes, well kill modeling would have demonstrated that the pump rate and fluid density were inadequate to kill well SS-25.

Data were available on October 23, 2015, October 24, 2015 (when the first kill attempt was pumped), and November 8, 2015 (when a temperature, pressure, and spinner survey was run). These data could have been used for kill modeling to determine whether the planned kill attempt was likely to kill the well. A summary of the data available includes the following:

- October 23, 2015: The wellbore geometry was known, i.e., casing internal diameter, tubing outside and inside diameter, packer depth, ported mandrel with slots depth, perforations depth, etc. It could have been assumed that the flow path was from the perforations, up the casing, through the tubing to the ported mandrel slots, exit the slots, up the 7 in. casing × 2 7/8 in. tubing annulus until the flow exited the 7 in. casing leak into the surface casing × production casing annulus. The tubing was shut in at surface diverting the flow up the annulus. The gas at surface during kill attempt #1 indicated the leak was shallow enough to broach to surface. The flowing casing pressure of approximately 270 psi on October 23, 2015, gave information on the back pressure the leak was flowing against without needing to know the exact flow path of the gas to surface.
- October 23, 2015: The reservoir pressure was available from the pressure monitoring well SS-5 and the historical SS-25 well test data were available. As described in the Blade Report [1] pages 127 – 134, the well test data could have been used to determine the well deliverability based on the bottom hole pressure (BHP) to estimate the gas flow rate. The flow rate decreased with time because the field was being produced to reduce the BHP.
- October 23, 2015: While the size of the hole in the casing was unknown, the area of the casing × tubing annulus cross section could have been used as the size of the hole in the casing as a worst case (which in fact turned out to be correct because the 7 in. casing was parted).
- October 24, 2015: Kill attempt #1 reported gas at surface after pumping 89 bbl of fluid down the casing. This indicated a shallow leak as documented in the SoCalGas SS-25 daily report for October 24, 2015 [2] "At this time, It appears that we had a wellhead seal leak and/or a very shallow 7" production casing leak."
- November 8, 2015: A production log survey [3] (temperature, pressure, and spinner) was run and it showed cooling anomalies at approximately 365 ft and at 890 ft. Assumptions for modeling could have used these two depths as possible leak depths. The analysis from the temperature survey was dated November 12, 2015. As it turned out the leak was at 892 ft, the lower temperature anomaly depth. Blade modeled a leak at 440 ft and determined the

parameters to kill the well at a 440 ft leak were approximately the same as a leak at 892 ft [10] SS-25 Transient Well Kill Analysis, page 35.

- November 13, 2015: Junk shots were pumped during kill attempt #2. After 5 bbl of brine was pumped down the annulus, brine was observed from the fissures (Add Energy Report [4], page 89).

Blade believes that kill modeling using the well data described in Question 2 c. would have shown that the reported fluids pumped (volume, density, and rate) during kill attempts #2 through 6 would not have killed the well. A summary of the Blade analysis of the actual kill attempts are included in a supplementary report [10] *SS-25 Transient Well Kill Analysis*, page 20.

2.3 Question 3

3. Please refer to the following passage on page 13 of Mr. Abel's testimony, "Further, Boots & Coots' pumping operations were implemented not only in consideration of the pressure rating of the surface equipment, but also based on observation of the wellhead's physical response to pumping operations. Mr. Walzel described that during certain pumping operations, the SS-25 wellhead was "moving around a lot," which at times caused Boots & Coots to slow or stop pumping operations an [sic], in one case, broke the flow lines on the 7 inch tubing and casing, and the nipple on the wellhead. [Footnote omitted] While it does not appear that Blade's modeling accounted for these safety considerations, Boots & Coots appropriately tailored its kill operations—in real-time—to limit the potential risk of further damaging the well and compromising safety."

2.3.1 Questions and Blade Responses

a. Does Blade agree that Blade's modeling did not account for the considerations such as those identified above?

Blade's modeling assumed the fluids would be pumped at the rates, volumes, and density that would kill the well according to the kill modeling. It should be noted that any interruption in the planned pumping schedule such as slowing or stopping pumping will likely result in an unsuccessful kill attempt. Modeling results are the basis of pre-job planning. Safety considerations encountered during the kill attempts may interrupt and abort an attempt. However, the usage of heavier fluids, planned using the modeling results, may have reduced the well head movement.

Although requested, Blade did not have direct access to the Boots & Coots personnel to determine what Boots & Coots had considered and the rationale for kill operations. The 2018 Boots & Coots Examination Under Oath [8] did not have the details required to ascertain whether Boots & Coots considered all factors.

b. If not, did SoCalGas provide Blade with this information when Blade was doing its Root Cause Analysis?

Information that Boots & Coots appropriately tailored its kill operations—in real-time—to limit the potential risk of further damaging the well and compromising safety was not provided to Blade. As discussed in Question 1 e., Blade requested data regarding kill planning, modeling, and operations many times, but such data were not provided.

Safety considerations always take precedence when carrying out the field operations. The planning of a kill operation includes the modeling results to know how to plan the equipment, the personnel, the physical layout, and the fluids for the field operations. Safety considerations are

normally discussed at the pre-job meeting in the field. While the pumping is underway, changes in the plan can occur if things are not going according the plan or if there is a reason to change the operation because of a safety consideration. Events like wellhead movement and broken lines are reasons why the pumping plan could change.

It also needs to be pointed out that the modeling is based on an assumed pump rate and fluid density to maintain a bottom hole pressure because of fluid friction and, if the pump rate is reduced or stopped, the loss of friction pressure may allow the well to start flowing again. If this happens, the kill attempt is likely to be unsuccessful. The well, surface equipment, and pumping equipment need to be in a condition that allows the pumping operation to continue without interruption to have a chance of a successful kill. A review of data from kill attempts #2 through 6 reported no indications that safety issues would have compromised the ability to kill the well with heavier fluids at the pump rates resulting from the Blade modeling.

This shows the importance of using kill modeling, which considers the normal variables and accounts for other limitations, to provide results that maximize the chances of success to kill the well on the first attempt. The well and surface conditions are usually going to be the best for the earlier kill attempts.

c. If not, did Blade provide SoCalGas with the opportunity to provide Blade with this information when Blade was doing its Root Cause Analysis?

Blade made multiple data requests for data related to kill operations and kill modeling in addition to a request for a face-to-face meeting with the Boots & Coots personnel with first-hand knowledge of the SS-25 kill operations. A meeting with Blade and Boots & Coots could not be arranged. This was discussed in Question 1 e.

d. Provide any context necessary in support of these answers.

Blade data requests to SoCalGas related to killing the SS-25 well includes the following:

- Data Request February 11, 2016 [11]
- Data Request May 4, 2016 [12]
- Data Request June 29, 2018 [13]
- Data Request August 29, 2018 [14]
- Data Request October 26, 2018 [15]
- Data Request December 19, 2018 [9]
- Data Request January 2, 2019 [16]

2.4 Question 4

4. Please refer to the following passage on page 13 of Mr. Abel's testimony: "Second, Blade had the benefit of gathering more precise data points that were not available to Boots & Coots while planning, modeling, and executing its well kill attempts: 1) the precise depth and severity of damage to the production casing, and 2) the flow path of the gas from the 7" casing leak to the surface. Indeed, computer modeling is sensitive to the well geometry (i.e., leak depth, severity, and flow path), which means that more precise information will produce more accurate modeling outputs. However, precise flow path geometry is typically unavailable during an active leak response. . .While Blade was able to determine that the production casing had completely parted 892 feet after extracting and examining the

7" casing, Boots & Coots could only estimate the flow path geometry based on real-time observation and analysis of pumping operations. Second, after extracting the 7" casing, Blade had the advantage of using a video camera to analyze the 11-3/4" casing an observe holes—which Blade determined were the "likely consequence of the axial rupture" of the 7" casing. [Footnote omitted.]. The existence of holes in the surface casing is significant because it impacts the flow path of the leak and, in turn, the accuracy of the transient modeling. Accordingly, while Blade was able to extract the 7" casing to gather additional data to incorporate into its modeling, Boots & Coots could not have done the same. The practical impact of this disparity in information is that Blade's modeling was refined by additional data points that were not available to Boots & Coots." With this passage in mind, please answer.

2.4.1 Questions and Blade Responses

a. Does Blade agree that each of the points raised in this passage were available to Blade, but Boots & Coots could not have gathered such information at the time it was attempting the well kills of SS-25?

No.

b. If not, which data points does Blade view that Boots & Coots could have attained?

Assumptions regarding the leak path and leak depth were made within a few days of the leak event on October 23, 2015, and likely within hours because a wellbore schematic (WBS) with well details information was needed for kill planning. Examples of the evolution of wellbore schematics prepared post October 23, 2015, include wellbore schematics from SoCalGas, a Boots & Coots WBS from a December 16, 2015, presentation, a WBS from an Add Energy Report released in February, 2016, (work done prior to February), and a Blade WBS with final data. Log surveys run on November 8, 2015, were also available that indicated possible leak depths. A review of these documents shows there were no material changes to the leak path and there would be no impact on modeling results. Refer to Figure 3 through Figure 8.

Precise data of the leak location and leak path were not needed for transient kill modeling.

Figure 3 shows a rough sketch of SS-25 with an indication of the leak flow path to surface [17] (page 79, AC_CPUC_0000101). Figure 4 shows more details of the suspected gas flow path. The sketches indicate a leak in the 7 in. production casing with the leak path outside the 11 3/4 in. casing to surface [18].

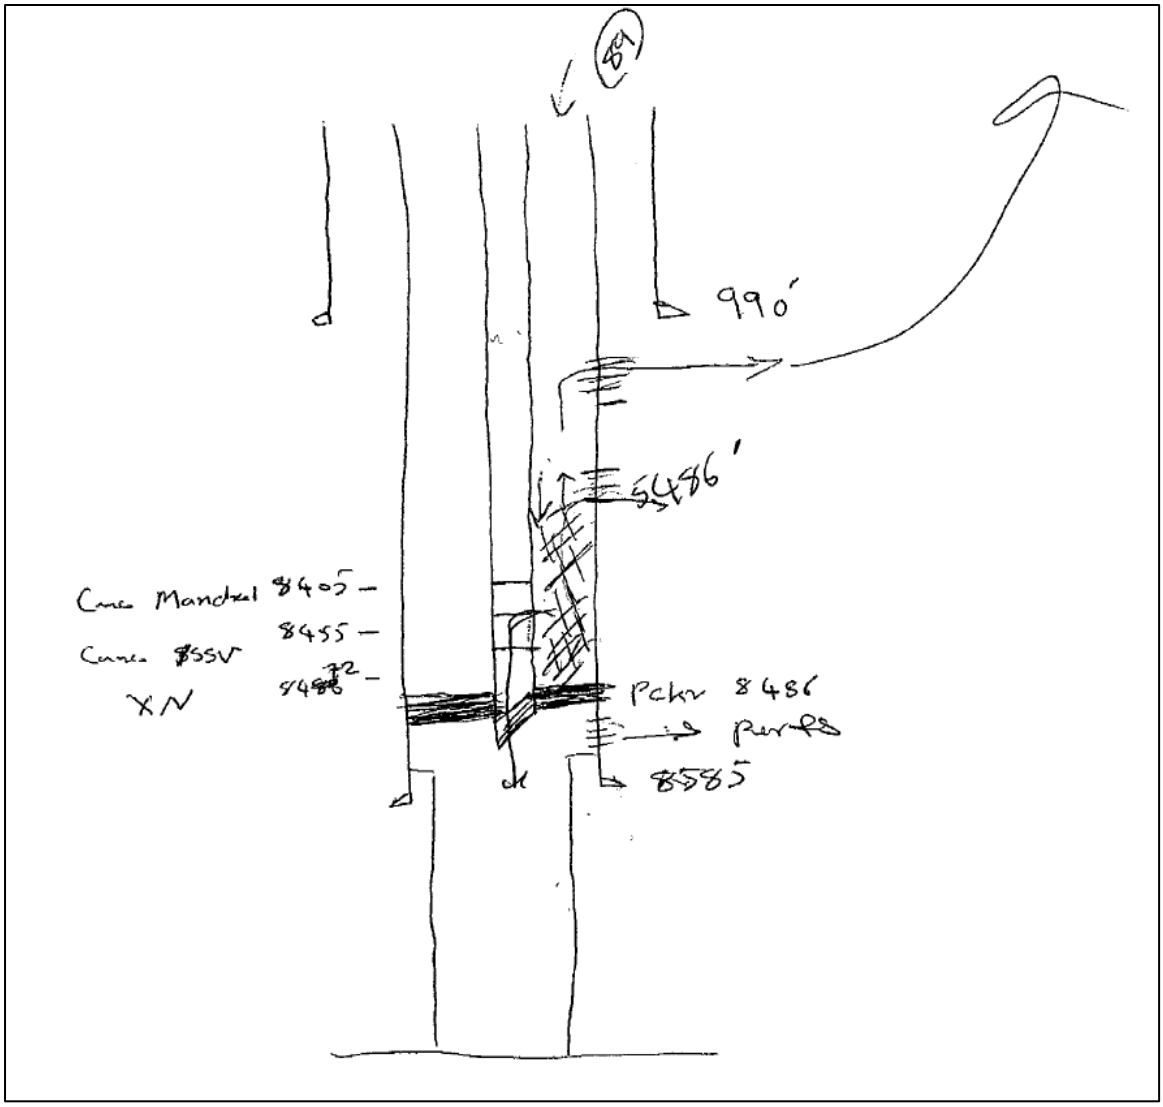

Figure 3: SoCalGas Wellbore Schematic of SS-25 (circa October 24, 2015)

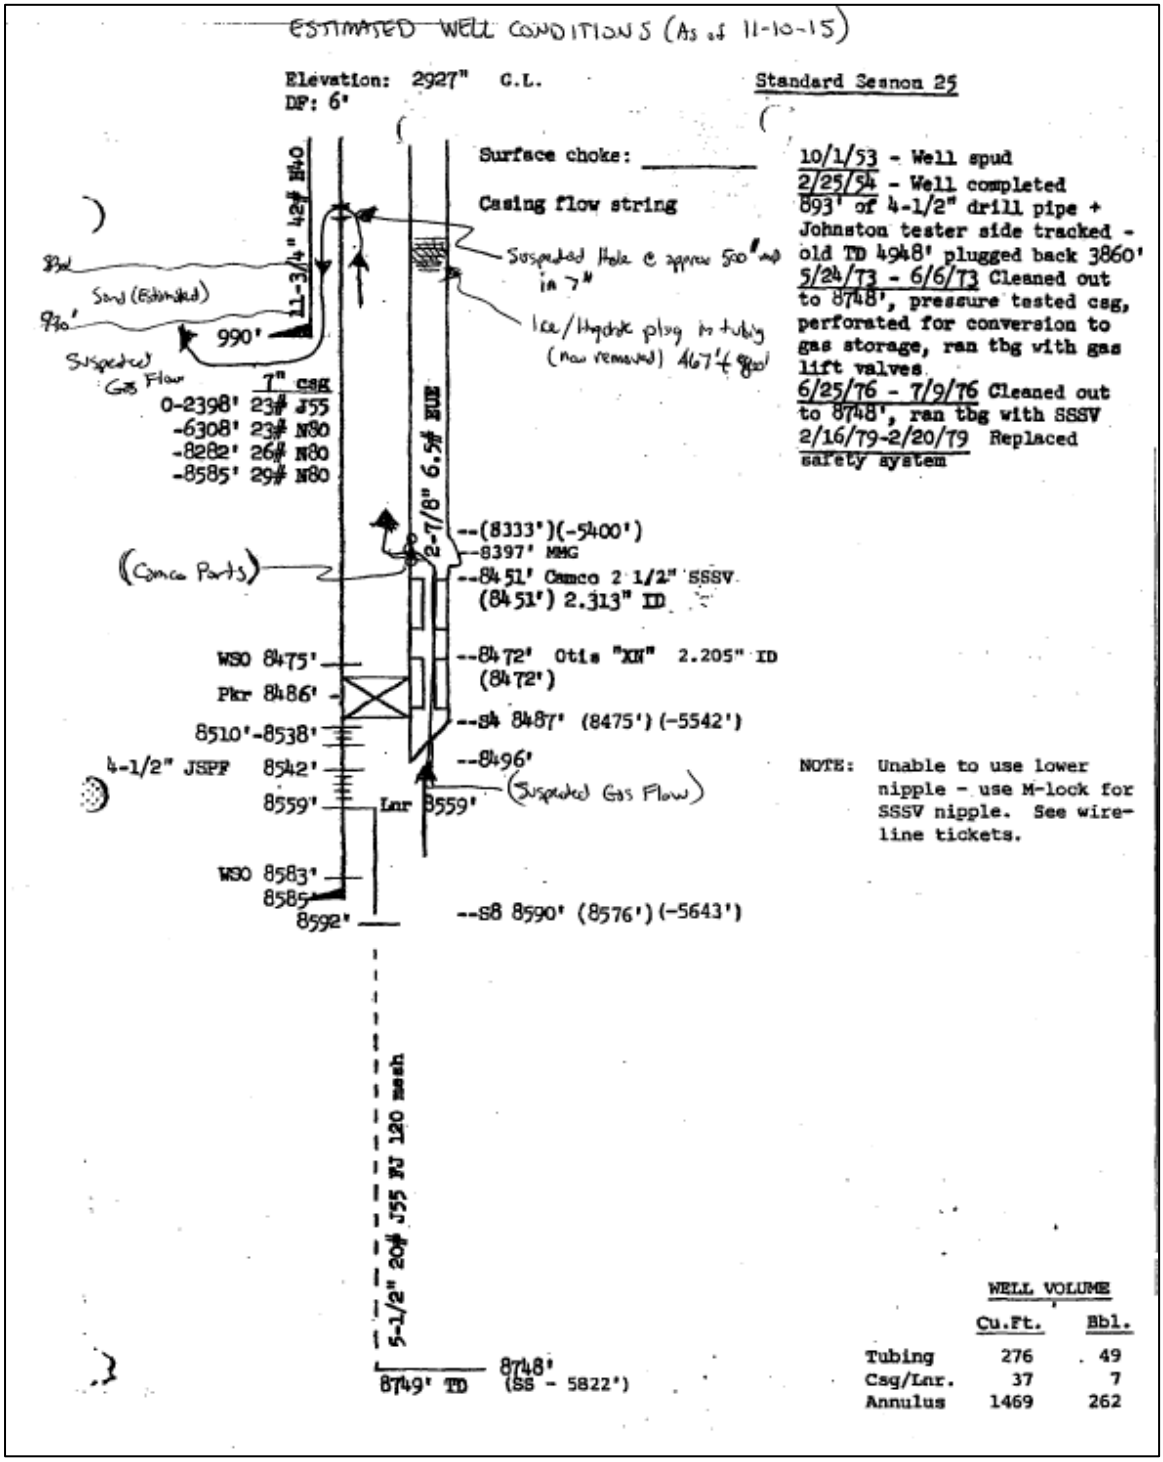

Figure 4: SoCalGas Wellbore Schematic of SS-25 (November 10, 2015)

On November 8, 2015, a production log including temperature, pressure, and spinner surveys was run [3]. It showed temperature anomalies with comments and a possible leak depth at 890 ft near the 11 3/4 in. shoe depth (Figure 5). The leak depth turned out to be correct and was confirmed when the casing was recovered.

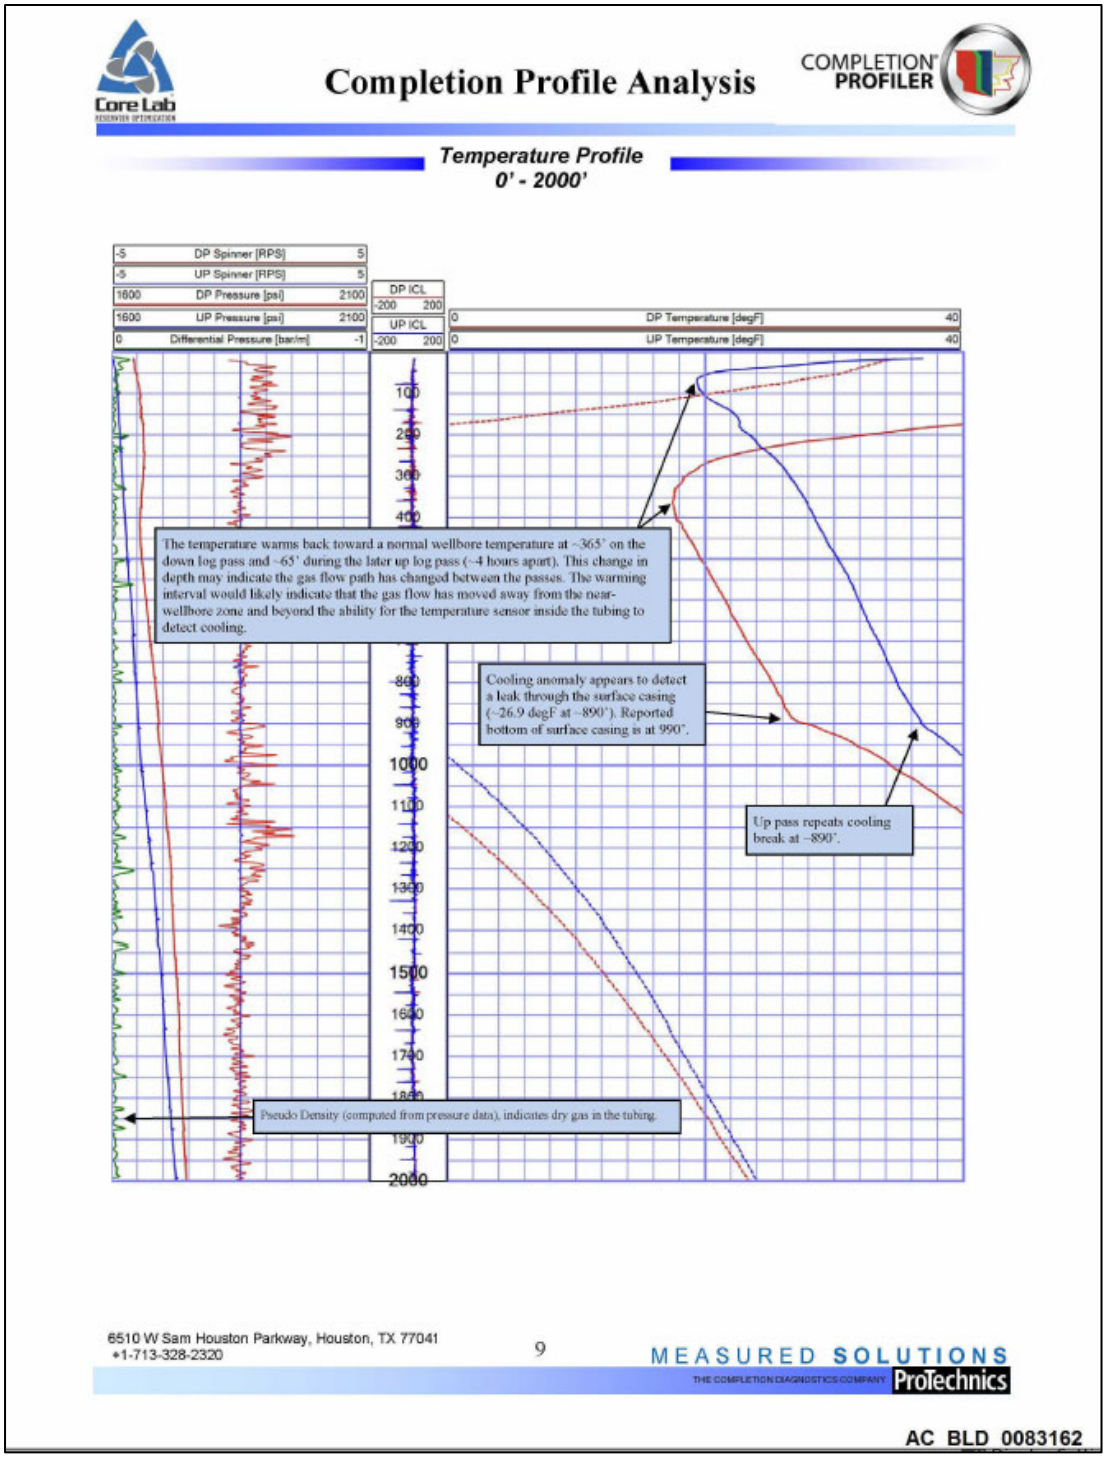

Figure 5: Temperature Profile (November 8, 2015)

Figure 7 shows the Boots & Coots version of the WBS with gas flow paths from a presentation dated December 16, 2015 [19].

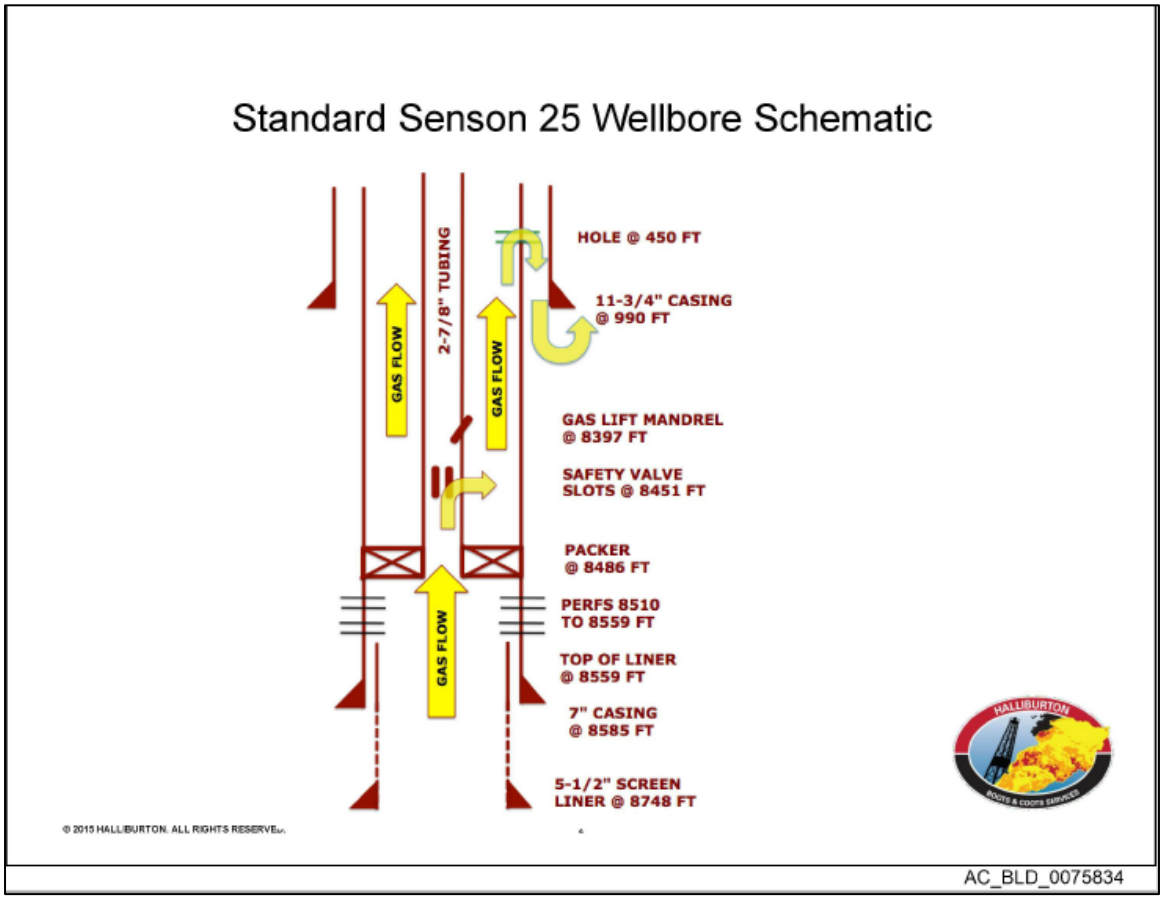

Figure 6: Boots & Coots Wellbore Schematic (December 16, 2015)

Figure 7 shows the WBS from the Add Energy Report released in February 2016 [4] (page 34, AC_BLD_0031337). The gas flow paths are indicated by the red arrows. A leak depth at 440 ft was estimated by Add Energy.

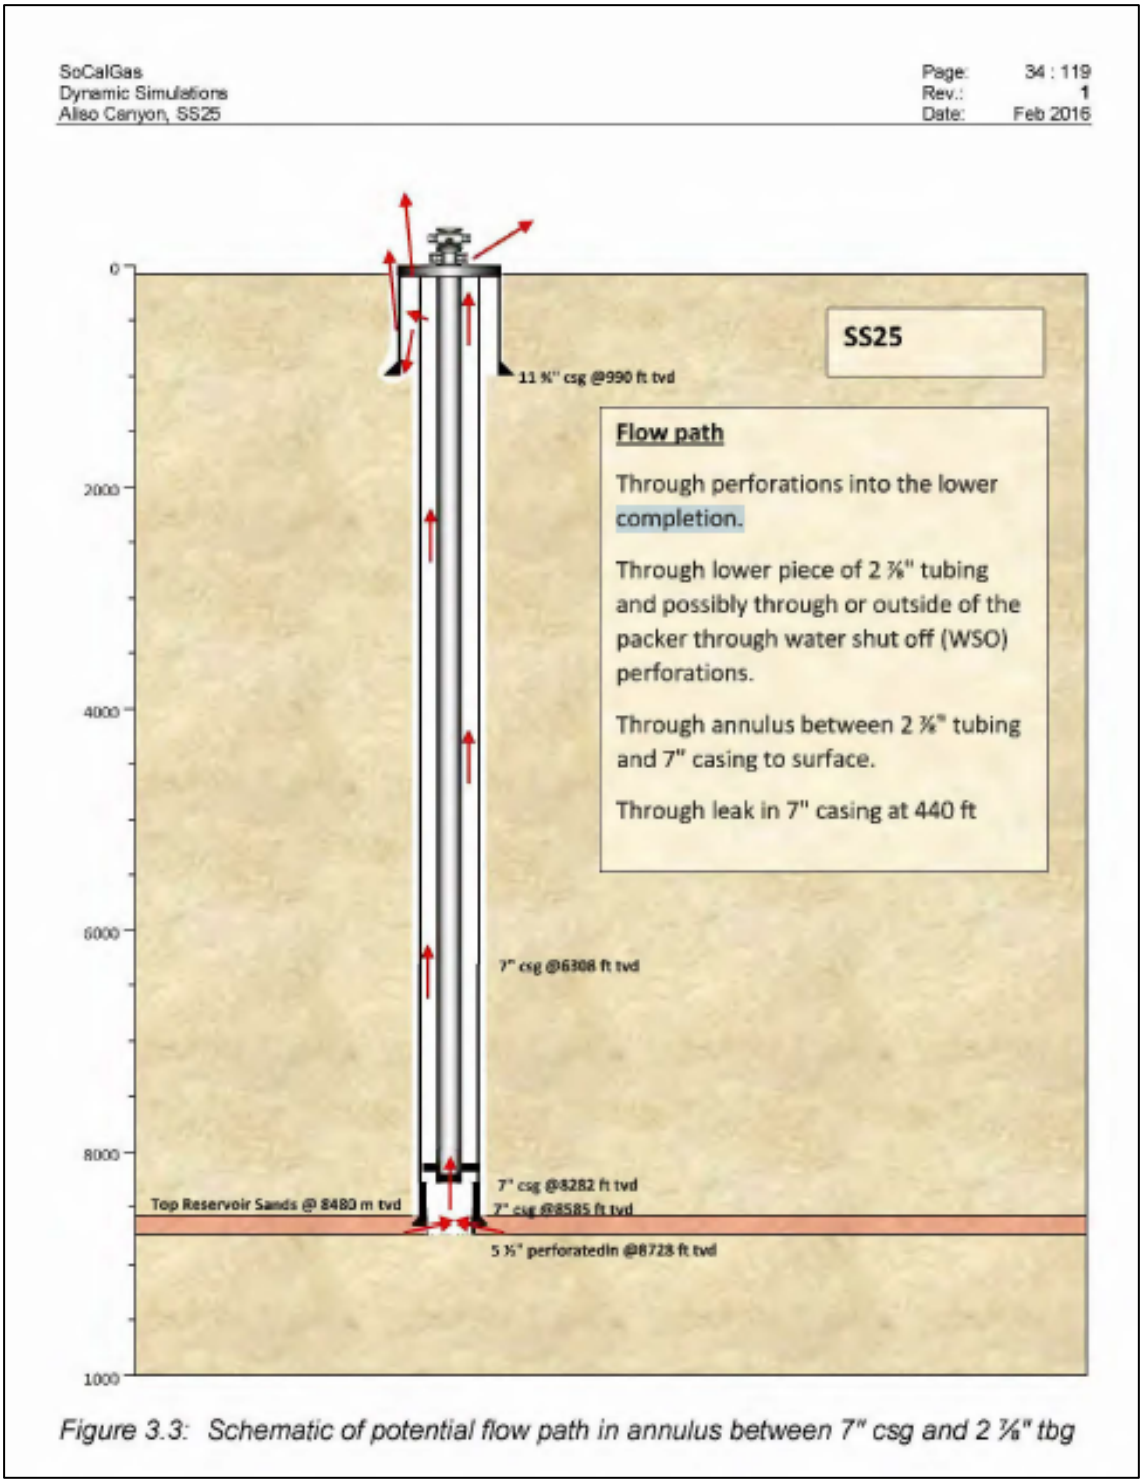

Figure 7: Add Energy Wellbore Schematic

Figure 8 shows the WBS for SS-25 prepared by Blade with the parted 7 in. casing at 892 ft.

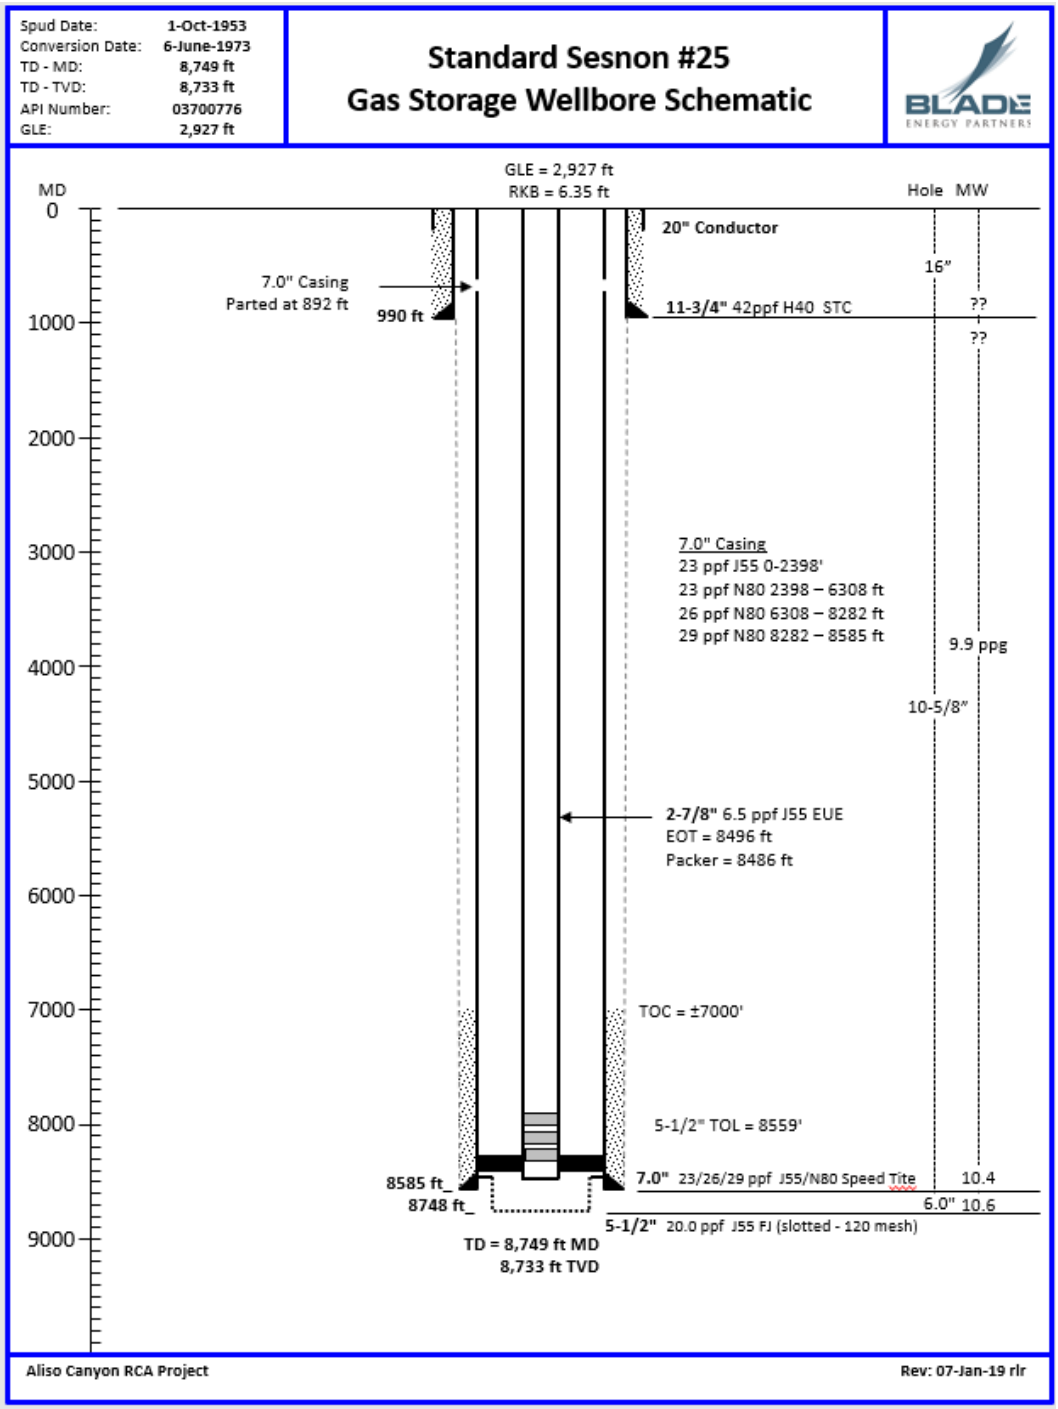

Figure 8: Blade Wellbore Schematic

An estimate of the depth of the leak was available from the temperature survey run on November 8, 2015 [3]. The survey showed temperature anomalies at 890 ft and 365 ft (Figure 5). Blade modeling shows flow from either depth resulted in no change in the pump rate and fluid density required to kill the well [10] *SS-25 Transient Well Kill Analysis*, page 35. The severity of the leak could have been assumed as the cross-sectional area of the casing × tubing annulus which turned

out to be correct with parted 7 in. casing. The flow path pressure restriction from the leak to surface was inferred by Blade based on the 7 in. casing surface flowing pressure of approximately 270 psi on October 23, 2015. The 7 in. casing flowing pressure takes into account the restrictions in the flow path to surface and the holes in the surface casing were not relevant.

The holes in the 11 3/4 in. casing were discovered in August 2018 after the 7 in. casing was extracted. The majority of the Blade kill modeling was done in 2016, some two years before the holes were discovered. The Blade kill modeling has never considered the holes in the 11 3/4 in. casing directly. The effect of the holes on the flow and pressure from the leak depth to surface is accounted for in the flowing casing pressure. The flowing casing pressure was known at the time of the event on October 23, 2015. Knowing the existence of the 11 3/4 in. holes was not relevant and was immaterial for the modeling.

The Add Energy Report [4] in 2016, had correctly predicted the flow path, ". . . the pressure in the outer annulus reached the fracture pressure of the 11 3/4" casing shoe with the consequence that flow paths were created outside of this casing to surface." (Add Energy Report page 9, AC_BLD_0031312) In the absence of any additional data, Add Energy had a near correct interpretation of the leak path, leak rates, and even the complexities of the hydrates forming. The Add Energy Report includes a discussion of potential flow paths (page 32, AC_BLD_0031335) where a possible shallow hole in the 11 3/4 in. casing is mentioned two times. Add Energy didn't have any of the benefits that Blade had with the actual physical failure, subsequent inspection and temperature logging data, nor any downhole video camera data. Notably, Add Energy estimated a flow rate 80 MMSCF/d at the time of the first kill attempt; they stated the methodology as, "(This estimated flow rate is not dependent of the flow path from the bottom of the tubing to surface, but only calculated based on pressures and the inflow performance relation (IPR) estimated from well tests)." (Add Energy Report page 7, AC_BLD_0031310). Add Energy's findings were not groundbreaking academic research but were an obvious extensions of industry standard modeling. Further, the Add Energy Report also assumed a shallow 7 in. casing leak location.

The knowledge of the exact 7 in. casing leak location and the presence of 11 3/4 in. holes does not impact the modeling. All of the required data was available during the kill attempts to conduct such modeling.

c. If Blade lists an answer to question 4b, explain why Boots & Coots could have attained these data points.

A key parameter required for kill modeling with realistic results, not mentioned in the passage, is the SS-25 gas flow rate. The gas flow rate, and the other data mentioned in Question 4 b. were available with reasonable certainty to conduct kill modeling. The data needed for modeling, including the estimate of the gas flow rate, a key parameter for kill modeling, are discussed in detail in response to Question 2 c.

d. In Blade's view, with the data that Boots & Coots had at the time it was attempting to kill well SS-25, could Boots & Coots successfully have killed well SS-25?

Yes, assuming that available data and reasonable assumptions had been used for the kill modeling (and assuming that the pumping was carried out according to plan developed through modeling), Boots & Coots could likely have killed SS-25. By "reasonable" we mean that assumptions were made based on engineering analysis, experience, and judgment. In addition, uncertainties in the input data should have been evaluated using the modeling to determine the sensitivities to a

given parameter. Conservative assumptions are normally made in designing kill plans to improve the chances for a successful outcome.

Blade evaluated each kill attempt using reasonable assumptions of bottom hole pressure and gas flow rate and modeling showed the well could have been killed with 12 ppg or 15 ppg drilling fluid pumped between 5 and 10 bpm depending on the specific kill attempt. The bottom hole pressure was changing with time, correspondingly, the kill parameters changed. Details of the kill scenarios are included in the Blade supplementary report *SS-25 Transient Well Kill Analysis* [10] (pages 27 – 31).

The Blade modeling planned killing the well with weighted drilling fluid which is better suited to prevent gas migration and leak-off into the formation than the low-density clear fluid that was used in kill attempts #2 – 6. Boots & Coots used 15 ppg drilling fluid in the final kill attempt #7 which was consistent with the Blade modeling results. This is discussed in the supplementary report SS-25 Transient Well Kill Analysis [10] (page 38).

e. If so, on which attempt?

Kill attempt #2 (the first Boots & Coots attempt) or kill attempt #3 were possible to achieve a successful kill assuming proper modeling was done with valid input data and a successful pumping operation according to the modeling results. This is discussed in the Blade Report [1] (page 4). A pumping operation with no interruptions is extremely important to prevent the well from flowing once it was killed during the kill operation. If the pumping fluid friction pressure is lost or reduced during the kill operation, the kill attempt will likely fail. It should be noted that operational uncertainties are not accounted for in modeling.

f. If the answer to Question 4 d is yes, why?

The well and site were in the best condition of all of the kill attempts for kill attempt #2. However, the SoCalGas November 13, 2015, daily report [2] shows there was a pump shut down during the job which interrupted the planned kill operation and resulted in an unsuccessful kill attempt.

Unfortunately, the surface conditions deteriorated during and after kill attempt #2. A quote from a DOGGR report [20] describes the damage caused by the kill attempt.

> Overall, this was the day that the well actually blew out in the conventional sense. Previously, it was not clear that the well was in a blowout situation. But after this pumping job, a blowout vent opened 20' from the wellbore and began shooting debris 75' into the air.

g. In Blade's view, with the data that Boots & Coots had and could have attained at the time it was attempting to kill well SS-25, could Boots & Coots successfully have killed well SS-25?

See Question 4 d.

h. If so, on which attempt?

See Question 4 e.

i. If the answer to question g is yes, why?

See Question 4 f.

2.5 Question 5

5. Please refer to the following passage of page 14 of Mr. Abel's testimony.

Lastly, Blade's model disregarded other key variables in pertinent well control operations. Blade's primary design variables were fluid density and pump rate. Other parameters such as viscosity, fluid stability, availability, and toxicity must also be considered. Further, not only must a kill operation stop the gas flow, the well must be stable when the kill fluid column is in a static state (i.e., after pumping stops). The pressure profile and corresponding tubular and wellbore integrity (which changes with depth) must also be considered and not exceeded. Because the Blade Report did not analyze these additional parameters, it is unknown if the fluid characteristics proposed by Blade (and alleged by SED) would have killed the well.

With this passage in mind, please answer:

2.5.1 Questions and Blade Responses

a. Does Blade agree that its model disregarded other key variables in pertinent well control operations?

No.

b. Why or why not?

The parameters fluid stability, availability, and toxicity are not input data to a kill model. Blade used fluid viscosity in the modeling analysis. Fluid viscosity is an important parameter used to estimate the friction pressure calculations which affect the pressure profile in the fluid flow path in the wellbore and the surface pump pressure.

c. Provide additional context and facts as necessary.

Fluid stability is important to ensure the solids in the weighted kill fluid (drilling fluid) remain suspended when the fluid is static. This would be a requirement that would be part of the specifications and requirements communicated to the supplier of the kill fluid when the fluid is ordered. The fluid properties would be confirmed before the fluid was pumped to ensure stability and other properties. This is a common requirement when dealing with fluids where the density is controlled by adding solids to the fluid.

Fluids with the proper density and flow properties are available from numerous suppliers. The kill fluids being discussed are also referred to as drilling fluid and are commonly used in oilfield drilling and workover operations. The fluid used by Boots & Coots in kill attempt #7 was 15 ppg water-based fluid that was procured and made available for the kill attempt. Blade identified similar densities for fluids for kill #2 through #6. A well kill model would have revealed that 12 ppg or 15 ppg fluid could have been used earlier in the kill attempts. As discussed in Question 4 d, using a drilling fluid as the kill fluid has several advantages over a clear fluid related to preventing gas migration and fluid leak-off into the formation.

Boots & Coots pumped barite pills as part of kill attempts #3, 4, and 5. However, because the well was not killed, the gas flow prevented the barite from settling and forming a competent plug or bridge in the annulus. A barite pill needs several hours in a static condition to settle.

It is not clear why toxicity is mentioned. It is not something that affects the modeling or the killing operations. Water-based fluids are commonly made up of non-toxic materials and there would be no reason to include toxic materials in a kill fluid.

d. Does Blade agree that "it is unknown if the fluid characteristics proposed by Blade (and alleged by SED) would have killed the well?

Yes, because the fluid characteristics along with the fluid densities and pump rates modeled by Blade were not used in a kill attempt and operational uncertainties are not reflected in modeling.

e. Why or why not?

The main parameter of the fluid used to kill a well is density with sufficient additives to maintain a stable fluid at surface and downhole conditions. The fluids proposed based on the Blade modeling included water-based fluids with 12 ppg or 15 ppg density and are standard-commonly available fluids with known flow properties.

f. Provide additional context and facts as necessary.

Not only are the fluid characteristics important; as discussed, the requirement for a successful well kill is to determine the fluid density and pump rate required to kill the well by stopping the influx of gas and then pumping the kill fluid in the same manner that it was modeled. If there are interruptions in the pumping, the kill is likely to be unsuccessful.

2.6 Question 6

6. Please refer to the following passage of pages 14 and 15 of Mr. Abel's testimony.

In sum, Blade's post-hoc transient modeling was an academic exercise that cannot fairly be compared to Boots & Coots' task of working on site under real-time constraints, and dealing with practical, field-level concerns (e.g., severe weather, wellhead condition, and safety of personnel). Even assuming Blade's transient modeling generated reasonable outputs, there is no basis for SED to claim that Boots & Coots should have killed SS-25 sooner—particularly as early as the second attempt (on November 13, approximately 3 weeks after the leak commenced)—when Blade needed 5-6 weeks to model a well kill, [Footnote omitted] not including time spent on the investigation and casing removal. Boots & Coots' approach of increasing pump rate and fluid density over well kill attempts 2 through 7 reflects a measured and logical process that did not compromise the safety in the process of bringing the well under control.

With this passage in mind, please answer:

2.6.1 Questions and Blade Responses

a. Does Blade view that its transient modeling generated reasonable outputs?

Yes.

b. Why?

Blade used available data (as described in the response to Question 2 c.) to construct its model. This model demonstrated that the well could be killed using 12 ppg or 15 ppg fluids pumped at reasonable rates.

c. Does Blade maintain that there is a basis for the claim that Boots & Coots should have killed SS-25 sooner?

Blade is not in a position to determine if Boots & Coots should have killed SS-25 sooner.

d. Why or why not?

As discussed previously, there are two components of a well kill required to result in a successful outcome. The first is a plan based on available data and reasonable assumptions if data is not available. Blade contends that because of the obvious complexity of the well control situation, kill

modeling was needed to develop a plan that maximized the chances of a successful kill. The second part is implementation of the pumping operations in the field. The fluid density and fluid pump rate have to match or exceed the plan and pumping must be completed without interruptions. When both components are done correctly, there is a good chance the kill will be successful. If either component is not right, a failed kill attempt is likely.

e. Does Blade maintain that there is a basis for the claim that Boots & Coots should have killed SS-25 as early as the second attempt, even if Blade needed 5 to 6 weeks to model a well kill (excluding investigation and casing removal time)?

The statement that Blade needed 5 to 6 weeks to model a well kill was taken out of context.

The accurate statement is "So for us [Blade] it took much longer; four, five, six weeks to analyze all of the seven kills." [21] (page 1058:14 – 16). Blade modeling included a detailed assessment of gas flowrates and history matching. This level of accuracy was not required for kill modeling prior to kill attempts.

Blade believes that more accurate kill modeling, using data available as early as the second kill attempt, would have led to a better well kill plan. Such modeling would have taken less than a week to complete. *Drillbench* software is intended to be used prior to well kill operations. A properly designed well kill plan, if implemented correctly, would have increased the chances of success. However, operational uncertainties are not reflected in modeling.

f. Why or why not?

See Question 6 d.

g. Even if Blade needed 5 to 6 weeks to model a well kill, does Blade maintain that Boots & Coots needed that long to do its own transient modeling at the time of the SS-25 incident?

No and again, the statement that Blade needed 5 to 6 weeks to model a well kill was taken out of context as discussed in Question 6 e.

h. Why or why not?

Blade is not in a position to know how long it would take Boots & Coots to do transient modeling. However, for engineers familiar with the *Drillbench* software could conduct such analysis with reasonable assumptions within a few days.

The data obtained by Blade for modeling was collected through numerous data requests over an extended time period.

i. Does Blade agree that Boots & Coots approach of increasing pump rate and fluid density over well kill attempts 2 through 7 reflects a measured and logical process that did not compromise the safety in the process of bringing the well under control?

Not necessarily.

j. If Blade disagrees with any portion of Mr. Abel's statement mentioned in question 6i, please identify each such portion.

Blade disagrees with the following portions of Mr. Abel's statement:

- "In sum, Blade's post-hoc transient modeling was an academic exercise that cannot fairly be compared to Boots & Coots' task of working on site under real-time constraints, and

dealing with practical, field-level concerns (e.g., severe weather, wellhead condition, and safety of personnel)."

- "Even assuming Blade's transient modeling generated reasonable outputs, there is no basis for SED to claim that Boots & Coots should have killed SS-25 sooner—particularly as early as the second attempt (on November 13, approximately 3 weeks after the leak commenced)—when Blade needed 5-6 weeks to model a well kill, [Footnote omitted] not including time spent on the investigation and casing removal."
- "Boots & Coots' approach of increasing pump rate and fluid density over well kill attempts 2 through 7 reflects a measured and logical process that did not compromise the safety in the process of bringing the well under control."

k. Please explain why Blade disagrees with each portion of Mr. Abel's statement identified in response to Question 6 j.

For the first bullet point of Question 6 j., see our answers to Question 1 b.

For the second bullet point of Question 6 j., see our answers to Question 6 e.

For the third bullet point of Question 6 j., our answer is as follows:

Based on kill attempt data and reports provided to Blade, the fluid density did not increase during kill attempts #2 through 6. The majority of the kill fluid pumped was 9.4 ppg brine and 8.34 ppg fresh water with some 18 ppg barite pills. This assertion is supported by Mr. Walzel with Boots & Coots. He stated ". . . I think the fluid weights stayed the same." in the *SED CPUC Opening Testimony Supporting Attachments* document [8] (page SED 00717:18 – 19). The fluid density did increase to 15 ppg for kill attempt #7. The data does show the pump rate increased from 8 to 9 bpm for kill attempts #2, 3, and 4 to 13 bpm for kill attempts #5 and 6. The pump rate for kill attempt #7 was 5.8 bpm.

As discussed in the Blade Report [1] (page 4), "Based on the data reviewed by Blade, the well-control company appeared to have designed the kill attempts solely by calculating a kill fluid density that was higher than the static bottom hole pressure." The result was that the well was not killed and the surface conditions continued to deteriorate. The well was brought under control in February 2016 from the relief well, not from top kill attempts in November and December of 2015.

l. Provide additional context and facts in support of the question 6 responses as necessary.

Not applicable. See the discussion in Question 6 a – k responses.

Re: Aliso Canyon Storage Facility Leak Response

Dear Mr. Portillo:

As you know, Boots & Coots ("B&C") has been retained to assist the Southern California Gas Company ("SoCalGas") in its response to the gas leak at one of its gas storage wells (SS-25) located at the Aliso Canyon Storage facility. Because the incident may lead to legal or regulatory proceedings, on behalf of SoCalGas, we request that B&C take steps to preserve all documents and other evidence that relates to well SS-25 and to SoCalGas' and its consultants' response to the leak. This request includes electronic documents, such as e-mails, Microsoft Word documents, spreadsheets, databases, etc. Please make sure that document retention policies relating to relevant documents are suspended, including any automatic e-mail deletion protocols.

In addition, attorneys from SoCalGas' Law Department have been, and will continue to be, assisting SoCalGas in investigating the circumstances surrounding the leak and supplying legal advice relating to SoCalGas' response efforts. Latham & Watkins LLP ("L&W") has also been retained to assist SoCalGas in these efforts. Attorneys from the Law Department or L&W may from time to time be in contact with B&C as part of their ongoing legal investigation and analysis. Any conversations or communications with, or documents or work requested by or provided to, attorneys for SoCalGas or L&W are covered by the attorney-client privilege and should be kept confidential and shared only with members of the Law Department, L&W or SoCalGas employees working with counsel.

Please feel free to contact me or Marlin Howes in SoCalGas' Law Department if you have questions regarding this letter.

Very truly yours,

Michael G. Romey
of LATHAM & WATKINS

AMENDMENT NO. 1 TO HAZARDOUS WORK CONTRACT (AGREEMENT 5660044243)

The following is Amendment No. 1 ("Amendment") to a Hazardous Work Contract (Agreement No. 5660044243), dated October 25, 2015 ("Agreement"), between Southern California Gas Company ("Company") and HALLIBURTON ENERGY SERVICES, INC. This Amendment has an effective date of 12/1/2015 ("Amendment Effective Date").

The parties agree to amend the Agreement as follows:

- Increase funding by [redacted] for a new not-to-exceed funding limitation of [redacted]

THE SATISFACTORY COMPLETION OF THE SERVICES/WORK PERFORMED UNDER THIS AMENDMENT REFLECTS THE FOLLOWING CHANGE IN THE TOTAL AMOUNT DUE UNDER THE AGREEMENT.

PREVIOUS AGREEMENT AMOUNT:	[redacted]
AMENDMENT AMOUNT:	[redacted]
REVISED AGREEMENT AMOUNT:	[redacted]

Other than as specifically modified above, the Agreement shall remain in full force and effect and is hereby ratified, approved and confirmed. This Amendment shall be subject to all of the terms and conditions of the Agreement as amended, as if it were a part thereof, including, without limitation, any provision with respect to choice of law, venue, and/or jurisdiction.

Requisition Summary

Requisition Nbr 3140003177 Halliburton - SS25 Work

Created on	Dec 3, 2015	Originator	Carla Brandy	Company	Southern California Gas
Requestor	Todd Van De Putte	Total Amt	[redacted]	Contingency	0
Comments	This change order is requested to increase the amount of funding for this agreement due to the length of the work being performed on SS25 and the inclusion of a relief well. PLEASE NOTE THAT ALL WORK DONE BY HALLIBURTON WHETHER OR NOT BOOTS AND COOTS DIVISION OR NOT WILL BE COVERED UNDER THIS AGREEMENT. Halliburton requires us to use the hazardous work terms and conditions that are part of this agreement to cover the work they do. Directional drilling and control of well work are included under this agreement.

Southern California Gas Company Standard Services Agreement

PROJECT:	Standard Senson 25	
		MAIL ORIGINAL INVOICE TO
CONTRACTOR:	HALLIBURTON ENERGY SERVICES	Southern California Gas Company
	P O BOX 301341, DALLAS, TX, 75303-1341, United States of America	**ACCOUNTS PAYABLE**
		P .O. BOX 30777 **Los Angeles, CA - 90030**

This Standard Service Agreement ("Agreement") is made effective as of October 30, 2015 between Southern California Gas Company ("Company") and HALLIBURTON ENERGY SERVICES ("Contractor").

The Parties hereby agree as follows:

1. SCOPE

Contractor shall perform, at its own proper cost and expense, in the most substantial and skillful manner, to the satisfaction of Company, the following generally described services ("Services"):

Boots & Coots' have been requested by SoCalGas to submit a proposal for the evolving well control situation on Standard Senson 25. Due to the ever changing conditions at the well, it is hard to give a definitive work scope. Boots & Coots will help provide workable and safe solutions:

- Mobilize one (1) Sr. Well Control Engineer, one (1) Sr. Well Control Specialists, and one (1) Well Control Specialist from Houston to California for Well Control services and forward planning.
- Upon arrival on location they will meet with the SoCalGas command team to discuss ongoing planning requirements and deliverables and determine the level of rates applicable for this specific well event

Note: It is difficult to estimate the number of days required for a successful completion of the project, due to uncertainty with well conditions and necessary equipment. Boots & Coots personnel will only work under safe and assessed conditions with the correct control and mitigation measures in place.

Confidential and Protected Materials Pursuant to PUC Section 583, GO 66-D, and D.17-09-023

The main focus is to not allow the situation to worsen or escalate. Work through the situation in a safe, chronological order for the successful killing operation.

The service will be on a daily rate on a portal to portal basis from our base in Houston as per the pricing table included in this proposal.

In the unlikely event of the situation degrading or worsening it may be necessary to mobilize other specialized well control support.

All information regarding the project will remain confidential as always with our services.

2. PROJECT LOCATION

Aliso Canyon
12801 Tampa Avenue
Northridge, CA 91326

3. AUTHORIZED REPRESENTATIVES

Company designates the individual or individuals named below as Company Representatives for all matters relating to the performance of the Services. The actions taken by the Company Representatives shall be deemed acts of the Company. Company may at any time upon written notice to Contractor change the designated Company Representative.

Company Representative: Todd Van De Putte

Contractor designates the individual or individuals named below as Contractor Representative for all matters relating to the performance of Services. The actions taken by Contractor Representative shall be deemed acts of Contractor. Contractor Representative or designated superintendent shall be at the jobsite at all times during the Services. Contractor may at any time upon written notice to Company change the designated Contractor Representative.

Contractor Representative: Leonardo J. Portillo

4. COMPENSATION

Contractor shall be compensated for the Services at the rates set forth in the COMPENSATION SCHEDULE attached hereto in an amount Not-To-Exceed ("NTE") $[redacted] Contractor shall notify Company in writing when the costs incurred under this Agreement equal ninety percent (90%) of $[redacted] Company will not be required to pay Contractor for the Services in excess of the NTE amount unless and until, at Company's sole option, Company elects in writing to increase the NTE amount.

Contractor agrees to accept as full compensation for satisfactory performance of the Services the following labor rates and factors – SCHEDULE D – COMPENSATION.

Confidential and Protected Materials Pursuant to PUC Section 583, GO 66-D, and D.17-09-023

5. COMMENCEMENT AND COMPLETION OF SERVICES

This Agreement shall commence as of October 30, 2015 and shall be in full force and effect through December 31, 2015, unless terminated earlier or extended by Company in accordance with the terms of this Agreement. Contractor agrees to commence and perform the Services in accordance with the requests of Company Representative identified herein. The nature of the Services is such that timely performance is critical to the orderly progress of related work and to the operating schedule of Company.

6. INVOICING INSTRUCTIONS

All invoices submitted must reference the Agreement number (5660044243) and the Invoice Contact (Todd Van De Putte) and have complete support documentation of all charges incurred, including any data required to calculate fees or variable rate changes, plus support documentation for any authorized reimbursable expenses by category.

Contractor may submit invoices via e-mail to:

SCG Accounts Payable: AP_Invoices_SCG@semprautilities.com

7. PAYMENT

Company shall make payment Net 30 Days after receipt and approval of an undisputed invoice to the following address:

P O BOX 301341, DALLAS, TX, 75303-1341, United States of America

Company offers additional discounted payment terms to Contractor pursuant to Contractor's enrollment through Ariba's online platform, which is Company's approved third-party payment platform. If Contractor is enrolled in Ariba's online platform as of the Effective Date, such discounted payment terms shall supersede those set forth in this Section during the period that Contractor maintains its enrollment. If Contractor enrolls in the Ariba online platform and selects certain discounted payment terms after the Effective Date, such discounted payment terms shall supersede those set forth in this Section as of the date of Contractor's enrollment in the Ariba online platform until the date that Contractor is no longer enrolled therein.

8. AUTOMATED CLEARINGHOUSE (ACH) PAYMENT METHOD

Upon enrollment by Contractor, Company shall make payments as automated clearinghouse transactions. Prior to Contractor's enrollment, Company shall make all payments by check to Contractor's address set forth above.

SED SUR_REPLY_001812

Confidential and Protected Materials Pursuant to PUC Section 583, GO 66-D, and D.17-09-023

9. SAFETY NOTICE

If applicable, Company shall provide Contractor with SCHEDULE C - SEMPRA UTILITIES SAFETY NOTICE attached hereto. Contractor shall initial this notice where required and comply with its terms.

10. COMPLETE AGREEMENT

This Agreement, including all Schedules attached hereto and which are incorporated by reference, constitutes the complete and entire Agreement between the parties and supersedes any previous communications, representations or agreements, whether oral or written, with respect to the subject matter hereof. There are no additions to, or deletions from, or changes in, any of the provisions hereof, and no understandings, representations or agreements concerning any of the same, which are not expressed herein. **THE PARTIES HEREBY AGREE THAT NO TRADE USAGE; PRIOR COURSE OF DEALING OR COURSE OF PERFORMANCE UNDER THIS AGREEMENT SHALL BE A PART OF THIS AGREEMENT OR SHALL BE USED IN THE INTERPRETATION OR CONSTRUCTION OF THIS AGREEMENT.** The following Schedules are attached hereto and incorporated herein by this reference:

SCHEDULE A - GENERAL TERMS AND CONDITIONS

SCHEDULE B - REIMBURSABLE EXPENSES

SCHEDULE C - SAFETY NOTICE FOR CONTRACTORS

SCHEDULE B
REIMBURSABLE EXPENSES

All invoices for reimbursable expenses shall include the Agreement Number, an itemized listing supported by copies of the original bills, invoices, expense accounts and other miscellaneous supporting data. All authorized travel either to San Diego/Los Angeles or from San Diego/Los Angeles to other locations shall be approved in writing in advance by Company Representative. Travel time shall NOT be reimbursed except for travel during normal/regular business hours.

1. **Auto Mileage**

Auto mileage shall be reimbursed at $0.55 per mile, or at the current rate as specified by the United States Internal Revenue Service.

2. **Air Travel**

Airfares shall be reimbursed based on the most direct route at coach class travel rates. Upgrading (coach to a higher class) of airline tickets shall only be reimbursed when approved by Contract Manager, and only when the business schedule requires immediate travel and only higher class accommodations are available. Downgrading (exchange) of airline ticket where Contractor receives financial or personal gain shall NOT permitted. If a trip is postponed, reservations shall be canceled immediately. Contractor shall provide copies of passenger receipts to Company to receive travel expense reimbursement. Travel arrangements shall be made as early as possible (preferably three [3] weeks) to take advantage of advance reservation rates.

3. **Combining Business Travel with Personal Travel**

Contractor may combine personal travel with Company business only if the personal travel does NOT increase the reimbursable cost to Company.

4. **Air Travel Insurance**

Company shall NOT pay for air travel insurance.

5. **Accommodations**

Company shall reimburse hotel room fees at preferred corporate or contract rates. Company may reimburse hotel room fees at the standard rate based on single room occupancy in cases where a corporate or contract rate is NOT available.

6. **Laundry**

Any laundry and dry cleaning charges shall ONLY be paid if Contractor is on travel for Company assignment for a period in excess of six (6) consecutive days.

AC_CPUC_0164711
SED SUR_REPLY_001818

Confidential and Protected Materials Pursuant to PUC Section 583, GO 66-D, and D.17-09-023

7. **Entertainment**

Company shall NOT pay for the rental of premium channel movies, use of health club facilities or other forms of entertainment.

8. **Meals**

Meals shall be reimbursed on an actual cost basis up to a maximum of $50.00 (Fifty Dollars) per day of travel. Itemized receipts are required and shall be submitted for all meals in the form of a credit card receipt or cash register tape. Company shall NOT pay for alcoholic beverages. In lieu of itemizing meal expenses and submitting receipts, Contractor may claim a standard $31.00 (Thirty-One Dollars) per diem for the duration of the business travel.

9. **Telephone Usage**

Contractor shall submit support documentation regarding all telephone calls charged to Company. The support documentation shall include the name of the party being called and the purpose of the call. Company shall NOT pay for additional business calls unless directly related to this Agreement. Personal telephone calls shall NOT be reimbursed.

10. **Ground Transportation**

Public transportation shall be utilized whenever possible, however if necessary, rental car expenses shall be reimbursed for authorized travel only. Cab fare (on a shared basis whenever possible) is reimbursable. Receipts shall be required to document all ground transportation charges.

11. **Car Rental**

If authorized, Company shall reimburse reasonable car rental charges including gas actually purchased for authorized travel ONLY. Contractor shall be required to rent at an economy car level classification or equivalent, unless the size or purpose of the group using the vehicle dictates a larger size in accordance with the following table:

Travelers	Classification
1-2	Economy/Compact
3	Medium/Intermediate
4-5	Full Size/Standard
6-8	Van

Contractor shall fuel rental cars prior to rental return as rental companies normally add a large surcharge to refueling services.

12. **Parking**

Confidential and Protected Materials Pursuant to PUC Section 583, GO 66-D, and D.17-09-023

Contractor shall be reimbursed at cost for reasonable parking expenses incurred in the performance of Services while on Company business.

13. **Tolls and Fees**

Contractor shall be reimbursed at cost for reasonable transportation-related toll and fees incurred in the performance of Services while on Company business.

14. **Baggage Handling**

Contractor shall be reimbursed for baggage handling service fees at standard reasonable rates.

15. **Other Business Expenses**

Any business supplies, equipment rental, reprographics and facsimile expenses shall be reimbursed at cost when traveling on Company business.

16. **Non-Allowable Expenses**

Company shall NOT provide any reimbursement for travel expenses for family members, personal items, charitable contributions, or for any other type of reimbursable.

	Cell:		

This Notice is to be issued to each Contractor at a pre–job meeting or other pre–work conference or the safety tailgate meeting before commencing work on the first day of the project. One Notice may be used for multiple projects if the projects present similar hazards or risks as determined by the Legal Representative. Specific safety issues shall be discussed. The Contractor will initial that he/she understands each section and sign the completed Notice. The Notice is to be discussed by the Contractor with each employee who will be working on the job. The Contractor will receive a copy of the Notice, with the original being filed in the appropriate facility office.

1. **Emergency Notification System.** The emergency notification system at this facility or property includes:

_____

and will be used to announce serious or life threatening conditions on site (i.e., fire, earthquake, or emergency evacuation). The competent employee making the announcement will give necessary information regarding type and location of the emergency. Contractors are required to follow instructions given.

In the event of an emergency evacuation, contractors are required to move in an orderly fashion to the Emergency Staging Area located at:

_____

Attached is a facility map that shows emergency exits and staging area. Contractors are required to account for all personnel, report personnel count, and report any missing persons with last known location, injuries, or other issues to the site emergency coordinator. Contractors are not to leave the emergency staging area until instructed to do so.

_____ Applicable_____ Not Applicable

Initials: _____

2. **Facility Phones.** Outside phone lines can be accessed by dialing "9" or _____ and the number you desire including area code if outside of calling area. *If it becomes necessary to secure site phone lines, the Contractor will notify the Company's facility manager or representative*. Note: Company phone usage by the Contractor is limited to urgent or emergency needs. Cell phone usage is prohibited in many areas of Storage Fields and Compressor Stations.

_____ Applicable_____ Not Applicable

Initials: _____

Confidential and Protected Materials Pursuant to PUC Section 583, GO 66-D, and D.17-09-023

3. **Personal Protective Equipment.** The Contractor is responsible for providing its employees with all the required personal protective equipment (e.g., hard hats, safety glasses, gloves, hearing protection, personal fall protection, etc.).

Initials: _____

4. **No Smoking.** Smoking is not permitted in any Company building or vehicle. Designated smoking areas are:

_____

Initials: _____

5. **Non-English Speaking Personnel.** Non-English speaking personnel are the Contractor's responsibility and must have an English speaking / English-reading interpreter with them at all times.

Initials: _____

6. **Contractors' Injury and Illness Prevention Program.** Contractors when required shall have a written Injury and Illness Prevention Program per Title 8, California Code of Regulations, General Industry Safety Orders, Section 3203. The Company reserves the right to request proof (at any time) of the Injury and Illness Prevention Program.

Initials: _____

NOTE: Receipt of the Contractor's Injury and Illness Prevention Plan and/or the safety and health plan only signifies that the plans generally conform to the requirements of the contract and NOT Legal approval of the plans. It does not relieve the Contractor of the responsibility for providing employees with a safe and healthful work environment.

7. **Registration with Veriforce LLC**. Prior to commencement of DOT–covered work, the Contractor must register with Veriforce LLC (Legal DOT Drug and Alcohol program and OpQual compliance review agent) and complete an OpQual and Drug & Alcohol Program Compliance Review.

_____ Applicable_____ Not Applicable

Initials: _____

8. **Anti-Drug and Alcohol Misuses Prevention Program.** The Contractor shall have a written Anti-Drug and Alcohol Misuses Prevention Program. The Contractor shall have a written Anti-Drug and Alcohol Misuses Prevention Program that meets the requirements of all applicable regulations, including but not limited to 49 CFR, Part 40, Part 199, and Part 382, as it may apply. The Contractor shall ensure it, or its agent(s), i.e., Third Party Consortiums, comply with and conduct random drug and/or alcohol testing in accordance with 49 CFR Part 40, Part

AC_CPUC_0164716
SED SUR_REPLY_001823

Confidential and Protected Materials Pursuant to PUC Section 583, GO 66-D, and D.17-09-023

199, and Part 382, as it may apply. In addition, proper review, reporting, and enforcement of drugs and/or alcohol testing of incidents meeting the post-accident criteria of 49 CFR Part 40, Part 199, and Part 382 has been discussed. The Contractor shall notify the Company Drug and Alcohol Testing Program Administrator of any and all incidents requiring Post Accident Testing and reports compliance.

_____ Applicable_____ Not Applicable

Initials: _____

9. **Operator Qualification Program.** The Contractor shall have a written and accepted Operator Qualification Plan on file that meets the requirements of all applicable regulations, including but not limited to Title 49, Code of Federal Regulation Part 192.801 through 192.809. Contractors must identify the scope of work and covered services/tasks they will provide to the Company(s) prior to commencement of DOT–covered tasks. Contractors must contact the Operator Qualification Department (OpsQual–Admin@semprautilities.com) and register with Veriforce, LLC, the Company's Contractor Compliance Review Agent, to initiate a DOT compliance review. Contact the Operator Qualification Department for additional information.

_____ Applicable_____ Not Applicable

Initials: _____

10. **Hazardous Materials.** Safety Data Sheets are available for hazardous substances used at the Company's facilities. Contact the Legal Representative for assistance for copies of SDS if necessary.

• Proposition 65 chemicals may be present when working on Legal facilities and signs may be posted stating "WARNING: This area contains chemicals known to the State of California to cause cancer, and birth defects or other reproductive harm."

• Naturally Occurring Radioactive Materials (NORM) may be present in the gas and associated sludge and liquids in the pipelines.

• The Contractor must have prior approval from the Company's Environmental Services and Safety and Health departments before bringing on site any hazardous substances that might create an exposure to Legal Company employees or an impact to the environment.

• Prior to the start of a job or project, the Contractor will disclose any and all hazardous materials use with the Legal Representative.

NOTE 1: Within 5 working days prior to use, the Contractor must provide notice in advance of planned uses of any odor-producing substances (e.g., petroleum or chemical-based building materials, solvents or cleaners) and dust or smoke-producing activities that may cause Legal employee or public concerns or discomfort. An action plan must be coordinated with Legal representatives, including Safety and Health, and affected site

AC_CPUC_0164717
SED SUR_REPLY_001824

Confidential and Protected Materials Pursuant to PUC Section 583, GO 66-D, and D.17-09-023

management to prevent employee or public exposure and avoid unplanned interruption of work.

NOTE 2: Within 5 working days prior to use, where there is the potential for Legal employees to be exposed to hazardous materials used by contractor, Legal representative shall contact Safety and Health for a product review to ensure the safety of our Company employees and the public.

NOTE 3: In cases where Legal purchases hazardous materials for contractors to use, these products must go through the SEPA – Safety & Environmental Product Approval Process.

NOTE 4: In cases where the Contractor will be storing hazardous materials at Company facilities or project locations, it is the Legal representative's responsibility to inspect that area for proper storage of compatible materials.

_____ Applicable_____ Not Applicable

Initials: _____

11. **Asbestos–Containing Construction Materials.** No asbestos–containing construction materials (ACCM) shall be used for construction or left at Legal sites.

_____ Applicable_____ Not Applicable

Initials: _____

12. **Asbestos Containing Materials (ACM)**. If the facility where the Contractor will work has ACM, the Contractor understands the asbestos notification letter and applicable list of ACM and/or asbestos sample results provided by the Legal Representative, and understands not to disturb ACM or any material without asbestos content determined and documented unless specifically contracted and authorized by Legal for that work.

_____ Applicable_____ Not Applicable

Initials: _____

13. **Surface Coatings containing Lead or Other Metals.** Any potential lead (Pb) exposure hazards and lead and other metals in surface coating exposure hazards must be identified. All painted surfaces shall be assumed to contain lead and other metals unless shown otherwise by sampling and analysis. If lead or other metals are encountered, contractor and the Company will determine who will be responsible for removing them in compliance with applicable regulations. The Contractor may, at the discretion of the Company, disturb/remove less than 100 square feet of surface coatings containing lead, arsenic, cadmium, hexavalent chromium and/or mercury, providing the Contractor (a) submits their written Cal/OSHA compliant lead safety program to the Legal Representative prior to work on lead–containing materials, (b) generates no visible

AC_CPUC_0164718
SED SUR_REPLY_001825

Confidential and Protected Materials Pursuant to PUC Section 583, GO 66-D, and D.17-09-023

dust emissions, and (c) manages waste in accordance with regulations and requirements (if any) of Legal Environmental Services.

Below is a listing of potential lead containing materials or lead and other metals in surface-coatings:

_____

The contractor shall be provided with this notice (including lead concentrations when known):

Lead, as well as other metals including but not limited to arsenic, cadmium hexavalent chromium and mercury, are commonly present in paint at varying concentrations in painted surfaces. Therefore, as an employer, you are expected to comply with all applicable regulations for protection of the workers and the environment, including but not limited to Cal/OSHA, prior to and during disturbance or removal of lead or other metal containing paint. Lead, arsenic, cadmium and chromium VI are substances known to the State of California to cause cancer /or birth defects and other reproductive harm.

_____ Applicable_____ Not Applicable

Initials: _____

14. **Proposition 65 Chemicals**. The Contractor shall not create at the work site an environmental or occupational exposure to Proposition 65 listed chemicals unless the Contractor provides the required Proposition 65 warning to Legal and other persons who may be exposed. If the work site creates occupational exposure to Proposition 65 chemicals, contact the Field Environmental Representative or Safety and Health Department Hazard Communication Administrator for instructions on attaching information on Proposition 65 chemicals to this notice.

_____ Applicable_____ Not Applicable

Initials: _____

15. **Handling and Disposal of Contractor's Hazardous Materials.** Proper handling and disposal of hazardous materials that the Contractor brings on–site, including primary and secondary chemical labeling, location of the Contractor's SDS, is required of the Contractor.

_____ Applicable_____ Not Applicable

Initials: _____

16. **Confined Space Program.** The Contractor understands the requirement of working in permit required confined spaces and will comply with all applicable laws and regulations involving confined spaces. The Contractor will verify to the Legal Representative they have a

Confidential and Protected Materials Pursuant to PUC Section 583, GO 66-D, and D.17-09-023

permit required confined space program and have received information on Legal permit–required confined spaces that may be entered (including hazards, precautions) and will debrief after the entry with the Legal Representative regarding hazards of the entry.

_____ Applicable_____ Not Applicable

Initials: _____

17. **Hot Work Permit.** The Contractor understands the requirements to obtain an Legal hot work permit or to issue a hot work permit after Legal Representative approval and to comply with any permit requirements use of open flame, torch or welding equipment. The Contractor will comply with all the applicable laws and regulations required with these permits.

_____ Applicable_____ Not Applicable

Initials: _____

18. **Crane Lifting Plan.** The Contractor has lifting plan for cranes, including side booms if applicable, and will comply with all applicable laws and regulations involving cranes.

_____ Applicable_____ Not Applicable

Initials: _____

19. **Naturally Occurring Radioactive Materials – NORM.** The Contractor understands the requirement/guidelines of working with NORMs and will comply with all applicable laws and regulations dealing with safety and radiation.

_____ Applicable_____ Not Applicable

Initials: _____

20. **Safety Rules/Stop The Job.** The Contractor acknowledges that its employees must follow applicable safety rules while on Company facilities and properties. If an unsafe work condition or activity is identified, anyone working onsite has the authority to stop the job. All work will immediately cease once the Stop The Job is declared until the involved Contractor(s) have done a thorough investigation, remediated the unsafe situation, determined it is safe and communicated this to the SCG Representative and all affected employees. It is also the expectation that the Contractor's employees will abide by the Contractor's safety rules at all times. Known potential hazards at Company facilities and properties that have the potential to impact the Contractor's employees have been communicated to the Contractor. Such items may include but not limited to, equipment operations, energized electrical systems, fall hazards, etc.

_____ Applicable_____ Not Applicable

Confidential and Protected Materials Pursuant to PUC Section 583, GO 66-D, and D.17-09-023

Initials: _____

21. **Reporting of Incidents.** Contractor will immediately report to the Legal Representative any project–related incidents resulting in fires, hazardous situations, hazardous substance releases, OSHA recordable occupational injuries and illness, serious near misses, any injury or property damage involving the public and Stop The Job actions. A preliminary written report will be submitted within 10 working days followed with a final report within a reasonable time frame thereafter, to the Legal Representative, who will then forward it to the designated Field Safety Advisor.

_____ Applicable_____ Not Applicable

Initials: _____

22. **Agency Inspections.** Contractor will immediately notify Legal Representative of any governmental agency (Cal/OSHA, Health Dept. etc.) incident, complaint, inspection and any "Notice of Violation" or "Notice to Comply" issued by a government agency at the Contractor's job site. Any environmental related issue must be reported to the Environmental Representative. Contractor shall not provide any information to the government representative, unless otherwise instructed to by the Legal representative.

1 Background

The Legal Division of the California Public Utilities Commission issued a Data Request to Blade Energy Partners (Blade) on April 17, 2020. Data Request No: SED 82 is related the Preliminary Investigation of Southern California Gas Company's Aliso Canyon Storage Facility.

The CPUC questions (from file: "I1906016 SED Data Request 82 Final.pdf") are included verbatim followed by the Blade responses to the questions.

The questions are related to the document titled: *Chapter V, Prepared Reply Testimony of Travis Sera on behalf of Southern California Gas Company (U 904 G)* (file name: "5_Ch. V - Sera (A Final).pdf").

2 Questions and Responses

2.1 Question 1

1. On page 5, in the "Conclusion" section of the testimony, it states, "For the foregoing reasons, a failure analysis of any of the historical leaks described in the Blade Report would very likely not have informed or predicted the SS-25 incident." With this passage in mind, please answer the following:

2.1.1 Blade Responses

a. In Blade's expert opinion, does Blade agree with this conclusion?

No.

b. If not, why not?

One cannot conclude that the analysis of the historical leaks would not inform or predict the SS-25 incident because the historical leaks were not analyzed by SoCalGas according to data provided to Blade.

In the Executive Summary of Blade's Main report, page 2, Blade stated, "Based on the data available to Blade, no details regarding the nature or cause of these leaks and failures were available because no failure analyses were done. Forty percent of the gas storage wells reviewed by Blade had casing failures with an average of two casing failures per well. The FF-34A well file mentioned a study of the possible external casing corrosion problems in the southeastern portion of the field, but Blade was not able to locate any documentation related to this study [reference omitted]".

Prior to October 23, 2015, none of the historical leaks caused a release of gas into the atmosphere similar to SS-25. However, to conclude that the failure in the SS-25 production casing was somehow different from every other leak in the field requires an investigation and evaluation of historical leaks. In other words, the consequence of the SS-25 7 in. casing failure was different and much more severe, but the underlying cause may have been similar, or not, to previous casing failures. The data provided to Blade indicated casing failures were investigated to determine their location in the well; in almost all cases, the question of *where did the casing failure occur* was answered. But Blade did not find the answers to questions such as: *why did the casing failure occur*, *when will it occur again*, and *how can we prevent these failures*. Because of this information gap, any comparison of the SS-25 failure to other Aliso Canyon casing failures was partial and lacking.

The occurrence of casing corrosion was recognized by SoCalGas. As discussed in Blade Main Report on page 239 "The limitations of this reactive approach to well integrity management was identified by SoCalGas in 2014 as evidenced by the SIMP proposal in the 2016 General Rate Case Submission. OD corrosion on production casing was identified as a threat". The following statements are from that testimony [1, pp. PEB 18 - PEB 19] (verbatim):

> The primary threats to the SoCalGas well facilities that SIMP will address are internal and external corrosion, and erosion. [footnote omitted] Once an issue is identified, the initiation of critical repair work identified will immediately minimize safety risks.

> Presently, most major O&M and capital funded activities conducted on storage wells are typically reactive-type work, in response to corrosion or other problems identified through routine pressure surveillance and temperature surveys. . . . In most cases, situations like this can be indicative of production casing leaks from either internal or external corrosion where high pressure gas can migrate to the surface in a matter of hours. External corrosion has also been observed in other wells at the field.

Furthermore, in their rate case testimony (page 17), SoCal Gas stated the following (verbatim):

> A proactive, methodical, and structured approach, using state-of-the-art inspection technologies and risk management disciplines to address well integrity issues before they result in unsafe conditions, or become major situational or media incidents, is a prudent operating practice.

c. Provide any documentation necessary in support your answer.

See response to Question 1 b.

2.2 Question 2

2. Please refer to the following passage on pages 1 and 2 of the document identified at the outset of this data request:

"II. LEAKS DISTINGUISHED FROM RUPTURES.

Wall loss anomalies in pressure-containing tubular structures like pipes can fail by either leak or rupture once they grow to a critical size – i.e., a size that reduces the failure pressure equal to or below (≤) the operating pressure. Whether the structure fails by leak or rupture depends upon 1) the material properties of the structure, 2) the 1 [sic] size, shape, and orientation of the flaw, and 3) the level of stress applied to the flaw. As a general matter with regard to corrosion related wall loss, leaks are typically associated with deeper flaws that do not propagate in length after initial perforation of the full wall thickness. In contrast to leaks, ruptures are typically longer in axial length to a degree sufficient to promote a localized elevated stress state (often resulting in bulging) and eventual through-wall failure. Ruptures are distinguished from leaks in that the flaw propagates or extends beyond the initial dimension of the perforation, and typically in the axial direction for hoop stress-related failures."

For this question, please also refer to the following passage on page 2 of the document entitled "Root Cause Analysis of the Uncontrolled Hydrocarbon Release from Aliso Canyon SS-25" by Blade Energy Partners, dated May 16, 2019 (hereafter referred to as "Root Cause Analysis").

"The Aliso Canyon storage wells had numerous casing leaks. Blade reviewed 124 gas storage wells and identified 63 casing leaks, 29 tight spots, 4 parted casings, and 3 other types of failures. Based on the data available to Blade, no details regarding the nature of [sic] cause of these leaks and failures were available because no failure analyses were done."

With both of these passages in mind, please answer the following:

2.2.1 Blade Responses

a. Is the definition in the first passage of the term "leak" the same way as the term "leak" as defined in the Root Cause Analysis, including the passage from the Root Cause Analysis shown above?

No.

The term "leak" in the first passage of Question 2 (from Mr. Sera's testimony) indicates a failure mode. The Blade reports generally used the word "leak" to indicate a flow path or hole that allowed fluid flow from inside the casing to the outside. When the SS-25 casing failure was discussed, the word "rupture" was used to describe the type or mode of failure. Obviously, a rupture in the casing is also a leak that allows flow, but the converse is not always true. A leak is not necessarily a rupture. The two definitions of the word "leak" as discussed are consistent with commonly used definitions in the oil and gas industry for casing failure and failure analysis depending on the context.

b. If the answer to question 2a is no, how is the term "leak" defined in the Blade Root Cause Analysis?

The term "leak" as used in the Blade Root Cause Analysis is consistent with the definitions commonly used in the oil and gas industry for failure and failure analysis, and is used appropriately throughout the Blade Main Report and Supplementary Reports. The term "rupture" was used in the discussion of the failure mode in the RCA. For example, the first paragraph of the Executive Summary on page 1 of the Blade Main Report, states: "The Standard Sesnon 25 (SS-25) well was shut in at 3:30 PM on October 23, 2015; a leak was discovered at 3:15 PM. The 7 in. production casing had axially ruptured and circumferentially parted. This resulted in a blowout and gas release into the atmosphere, which lasted for 111 days, until the well was eventually killed via a relief well on February 11, 2016." Here the term "a leak" is the general term indicating a flow path from inside the casing to the atmosphere while the terms "axially ruptured and circumferentially parted" defined specific failure modes.

The discussion of failed casing in the Blade Main Report and Supplementary Reports used the general term "leak" to reflect the fact that casing leaks were identified but no details regarding the nature or cause of these leaks and failures were available because no failure analyses were done based on the data available to Blade. For example, the fourth paragraph of the Executive Summary on page 2 of the Blade Main Report, states: "The Aliso Canyon storage wells had numerous casing leaks. Blade reviewed 124 gas storage wells and identified 63 casing leaks, 29 tight spots, 4 parted casings, and 3 other types of failures. Based on the data available to Blade, no details regarding the nature or cause of these leaks and failures were available because no failure analyses were done."

c. If the answer to question 2a is no, what are the differences in the two definitions of leak from the document above and the Blade Root Cause Analysis?

The differences are articulated in the responses to Question 2 a. and 2 b.

d. Provide any additional context or documentation necessary to support your answers.

Mr. Sera has described two possible failure modes; a leak failure mode and a rupture failure mode. Aliso Canyon casing leaks could have been either. The failure mode can only be distinguished through failure analysis of casing leaks. During in-service casing failures, the amount gas released does not provide foregone conclusions on the failure mode. In the case of surface or near surface pipelines, relating quantity of release to failure mode is valid. But the same is *not* true for wells. In pipelines, the gas has to travel only a short distance to reach the atmosphere. Usually the gas rates speak to the size of the opening. In wells, the amount of gas released is a function of the size of the opening, pressure within the casing, pressure and permeability of the surrounding material, post-leak operations, and many other factors. In many cases, the leak is hundreds or thousands of feet below ground level. The amount of gas released in wells does not

indicate whether the casing has corroded, parted, split, collapsed, nor burst. Only through investigation and analyses, can the failure mode be determined.

1 Background

The Legal Division of the California Public Utilities Commission issued a Data Request to Blade Energy Partners (Blade) on April 17, 2020. Data Request No: SED 82 is related the Preliminary Investigation of Southern California Gas Company's Aliso Canyon Storage Facility.

The CPUC questions (from file: "I1906016 SED Data Request 82 Final.pdf") are included verbatim followed by the Blade responses to the questions.

The questions are related to the document titled: *Chapter V, Prepared Reply Testimony of Travis Sera on behalf of Southern California Gas Company (U 904 G)* (file name: "5_Ch. V - Sera (A Final).pdf").

2 Questions and Responses

2.1 Question 1

1. On page 5, in the "Conclusion" section of the testimony, it states, "For the foregoing reasons, a failure analysis of any of the historical leaks described in the Blade Report would very likely not have informed or predicted the SS-25 incident." With this passage in mind, please answer the following:

2.1.1 Blade Responses

a. In Blade's expert opinion, does Blade agree with this conclusion?

No.

b. If not, why not?

One cannot conclude that the analysis of the historical leaks would not inform or predict the SS-25 incident because the historical leaks were not analyzed by SoCalGas according to data provided to Blade.

In the Executive Summary of Blade's Main report, page 2, Blade stated, "Based on the data available to Blade, no details regarding the nature or cause of these leaks and failures were available because no failure analyses were done. Forty percent of the gas storage wells reviewed by Blade had casing failures with an average of two casing failures per well. The FF-34A well file mentioned a study of the possible external casing corrosion problems in the southeastern portion of the field, but Blade was not able to locate any documentation related to this study [reference omitted]".

Prior to October 23, 2015, none of the historical leaks caused a release of gas into the atmosphere similar to SS-25. However, to conclude that the failure in the SS-25 production casing was somehow different from every other leak in the field requires an investigation and evaluation of historical leaks. In other words, the consequence of the SS-25 7 in. casing failure was different and much more severe, but the underlying cause may have been similar, or not, to previous casing failures. The data provided to Blade indicated casing failures were investigated to determine their location in the well; in almost all cases, the question of *where did the casing failure occur* was answered. But Blade did not find the answers to questions such as: *why did the casing failure occur*, *when will it occur again*, and *how can we prevent these failures*. Because of this information gap, any comparison of the SS-25 failure to other Aliso Canyon casing failures was partial and lacking.

The occurrence of casing corrosion was recognized by SoCalGas. As discussed in Blade Main Report on page 239 "The limitations of this reactive approach to well integrity management was identified by SoCalGas in 2014 as evidenced by the SIMP proposal in the 2016 General Rate Case Submission. OD corrosion on production casing was identified as a threat". The following statements are from that testimony [1, pp. PEB 18 - PEB 19] (verbatim):

> The primary threats to the SoCalGas well facilities that SIMP will address are internal and external corrosion, and erosion. [footnote omitted] Once an issue is identified, the initiation of critical repair work identified will immediately minimize safety risks.

> Presently, most major O&M and capital funded activities conducted on storage wells are typically reactive-type work, in response to corrosion or other problems identified through routine pressure surveillance and temperature surveys. . . . In most cases, situations like this can be indicative of production casing leaks from either internal or external corrosion where high pressure gas can migrate to the surface in a matter of hours. External corrosion has also been observed in other wells at the field.

Furthermore, in their rate case testimony (page 17), SoCal Gas stated the following (verbatim):

> A proactive, methodical, and structured approach, using state-of-the-art inspection technologies and risk management disciplines to address well integrity issues before they result in unsafe conditions, or become major situational or media incidents, is a prudent operating practice.

c. Provide any documentation necessary in support your answer.

See response to Question 1 b.

2.2 Question 2

2. Please refer to the following passage on pages 1 and 2 of the document identified at the outset of this data request:

"II. LEAKS DISTINGUISHED FROM RUPTURES.

Wall loss anomalies in pressure-containing tubular structures like pipes can fail by either leak or rupture once they grow to a critical size – i.e., a size that reduces the failure pressure equal to or below (≤) the operating pressure. Whether the structure fails by leak or rupture depends upon 1) the material properties of the structure, 2) the 1 [sic] size, shape, and orientation of the flaw, and 3) the level of stress applied to the flaw. As a general matter with regard to corrosion related wall loss, leaks are typically associated with deeper flaws that do not propagate in length after initial perforation of the full wall thickness. In contrast to leaks, ruptures are typically longer in axial length to a degree sufficient to promote a localized elevated stress state (often resulting in bulging) and eventual through-wall failure. Ruptures are distinguished from leaks in that the flaw propagates or extends beyond the initial dimension of the perforation, and typically in the axial direction for hoop stress-related failures."

For this question, please also refer to the following passage on page 2 of the document entitled "Root Cause Analysis of the Uncontrolled Hydrocarbon Release from Aliso Canyon SS-25" by Blade Energy Partners, dated May 16, 2019 (hereafter referred to as "Root Cause Analysis").

"The Aliso Canyon storage wells had numerous casing leaks. Blade reviewed 124 gas storage wells and identified 63 casing leaks, 29 tight spots, 4 parted casings, and 3 other types of failures. Based on the data available to Blade, no details regarding the nature of [sic] cause of these leaks and failures were available because no failure analyses were done."

With both of these passages in mind, please answer the following:

2.2.1 Blade Responses

a. Is the definition in the first passage of the term "leak" the same way as the term "leak" as defined in the Root Cause Analysis, including the passage from the Root Cause Analysis shown above?

No.

The term "leak" in the first passage of Question 2 (from Mr. Sera's testimony) indicates a failure mode. The Blade reports generally used the word "leak" to indicate a flow path or hole that allowed fluid flow from inside the casing to the outside. When the SS-25 casing failure was discussed, the word "rupture" was used to describe the type or mode of failure. Obviously, a rupture in the casing is also a leak that allows flow, but the converse is not always true. A leak is not necessarily a rupture. The two definitions of the word "leak" as discussed are consistent with commonly used definitions in the oil and gas industry for casing failure and failure analysis depending on the context.

b. If the answer to question 2a is no, how is the term "leak" defined in the Blade Root Cause Analysis?

The term "leak" as used in the Blade Root Cause Analysis is consistent with the definitions commonly used in the oil and gas industry for failure and failure analysis, and is used appropriately throughout the Blade Main Report and Supplementary Reports. The term "rupture" was used in the discussion of the failure mode in the RCA. For example, the first paragraph of the Executive Summary on page 1 of the Blade Main Report, states: "The Standard Sesnon 25 (SS-25) well was shut in at 3:30 PM on October 23, 2015; a leak was discovered at 3:15 PM. The 7 in. production casing had axially ruptured and circumferentially parted. This resulted in a blowout and gas release into the atmosphere, which lasted for 111 days, until the well was eventually killed via a relief well on February 11, 2016." Here the term "a leak" is the general term indicating a flow path from inside the casing to the atmosphere while the terms "axially ruptured and circumferentially parted" defined specific failure modes.

The discussion of failed casing in the Blade Main Report and Supplementary Reports used the general term "leak" to reflect the fact that casing leaks were identified but no details regarding the nature or cause of these leaks and failures were available because no failure analyses were done based on the data available to Blade. For example, the fourth paragraph of the Executive Summary on page 2 of the Blade Main Report, states: "The Aliso Canyon storage wells had numerous casing leaks. Blade reviewed 124 gas storage wells and identified 63 casing leaks, 29 tight spots, 4 parted casings, and 3 other types of failures. Based on the data available to Blade, no details regarding the nature or cause of these leaks and failures were available because no failure analyses were done."

c. If the answer to question 2a is no, what are the differences in the two definitions of leak from the document above and the Blade Root Cause Analysis?

The differences are articulated in the responses to Question 2 a. and 2 b.

d. Provide any additional context or documentation necessary to support your answers.

Mr. Sera has described two possible failure modes; a leak failure mode and a rupture failure mode. Aliso Canyon casing leaks could have been either. The failure mode can only be distinguished through failure analysis of casing leaks. During in-service casing failures, the amount gas released does not provide foregone conclusions on the failure mode. In the case of surface or near surface pipelines, relating quantity of release to failure mode is valid. But the same is *not* true for wells. In pipelines, the gas has to travel only a short distance to reach the atmosphere. Usually the gas rates speak to the size of the opening. In wells, the amount of gas released is a function of the size of the opening, pressure within the casing, pressure and permeability of the surrounding material, post-leak operations, and many other factors. In many cases, the leak is hundreds or thousands of feet below ground level. The amount of gas released in wells does not

indicate whether the casing has corroded, parted, split, collapsed, nor burst. Only through investigation and analyses, can the failure mode be determined.

INTEROFFICE CORRESPONDENCE

SOUTHERN CALIFORNIA gas COMPANY

TO Mr. N. D. Stevenson FROM J. D. Mansdorfer DATE April 2, 1985

SUBJECT 1985 Aliso Canyon Well Repair Activity

The rig schedule dated March 28, 1985, indicates that repair work on Aliso Canyon Frew 3, IW-62, IW-73 and IW-81 is being deferred beyond 1985. Deliverability of these wells at low inventory is as follows:

Well	Deliverability at 20 Bcf, MMcf/D
Frew 3	24
IW-62	37
IW-73	30
IW-81	42
	133

With these four wells and the wells that are "permanently" out of service, such as MA-3, 4 and 5; PF-1, 2 and 3 and IW-58, we are down to 90% capacity for the 1985-86 withdrawal season before running a single well survey in 1985.

The number of well leakage problems in a storage field during a given year seems to be somewhat proportional to the magnitude of the pressure reversal that year. Reservoir pressure at Aliso Canyon is the lowest it has been in 12 years. If inventory goes up to 50 Bcf or higher, I would expect to find a number of leaks this year. If we lose 3 good wells or 5 mediocre wells, we will be down to 80% capacity.

All four of the wells mentioned above have casing leaks and were recommended for inner strings or large tubing at a capital cost of approximately $350,000 each. The casing leak in each of the three IW wells are relatively small, the leak in Frew 3 is large. I propose that we perform a temporary fix on the three IW wells by installing a casing patch for a maintenance cost of $120,000 each. These maintenance dollars can be offset, if necessary, by deferring the shoe leak repair on SS-6. SS-6 is a poor well that contributes very little to deliverability at low inventory. We can noise log the well when inventory gets above 35 Bcf this year. If the severity of the shoe leak merits it, we can kill the well and leave it killed through withdrawal season without much effect on deliverability.

Because the three IW wells that are in need of repair are all located on drillsites, the repair work should be completed before withdrawal season. To accomplish this, I recommend that this work be scheduled for the time slot allotted to WEZU 20. WEZU 20 can be rescheduled for the time slot allotted to SS-6 because it is not located on a drillsite.

Another consideration is that to maintain the same peak day protection (deliverability) without IW-62, IW-73 and IW-81 we will have to inject an additional 2.8 Bcf of gas this year. This is from the published

Aliso Canyon deliverability curve. At 12% interest, the carrying cost of 2.8 Bcf of gas for a year is $1.34 million. Also, the cost to compress 2.8 Bcf of gas is $360,000.

Therefore, the additional cost to maintain a given level of deliverability this year without repairing these three wells will be $1.7 million. The cost to put the wells in service would be under $400,000.

SED SUR REPLY 001852

AC_CPUC_0023079

The Gas Company℠

Interoffice Memo

To: R. C. Wiegman

From: P. D. Yu

Date: February 20, 1992

Subject:

Well FF-34A Cathodic Protection

Storage Operations recommends the installation of cathodic protection in well FF-34A at an estimated cost of $25,000 to $30,000. Storage Operations has provided the necessary funds for this project in its 1992 budget and the Division is requested to oversee the installation as soon as it is operationally feasible.

Cathodic protection is recommended for this well in light of our discoveries of external casing corrosion during the workover in July of 1991. Metal loss averaging approximately 15% was indicated over the interval of 1000' to 4000' and the hole in the casing was discovered at 2104'. The cost of installing and maintaining the cathodic protection is minimal when compared to the potential cost ($400,000) of a workover should problems develop in the future.

Please inform me when a completion data for this project is anticipated. If you have any questions, do not hesitate to ask.

Cc: Neville, Dan
Subject: SIMP Well Documentation

Guys, P42B, SS44A and SS9 will be included in our pilot SIMP program for 2014. We will need to complete the establishment of the protocol documentation, an operation history and cost history for each well. Todd, we need to format why we moved on to each well such as SSSV issues, Wellhead Leak or questionable Liner Performance as well as what was begun on O&M and how the well moved to a capital workover category. Tom, we need to make sure that Schlumberger does a complete analysis of the USIT logs run in each case and put together our records retention and planned follow up on our findings. We can discuss more later. Tom

Executive Summary

On October 20, 2014, BHI Wireline Services, operating from Buckhannon WV completed a HR Vertilog magnetic flux leakage (MFL) casing inspection survey on the Southern California Gas Company Aliso Canyon Frew 2.

A total of 91 individual joints of casing were identified during the inspection survey. Within this report, the term "casing" is intended to mean the downhole tubulars which are the subject of the survey, and which may include well casings, liners or production tubing.

A total of 1976 metal loss features exceeding the 15% reporting threshold were identified during the HR Vertilog survey. Of the 1976 total metal loss features, 14 were identified as internal features, and 1962 were identified as external features.

A total of 3 metal loss features exhibited predicted depths exceeding 80% of wall thickness. The maximum depth among all metal loss features was 87%. Any metal loss features of 80% or greater body wall loss will have a 0 PSI burst pressure rating and should be considered to have possible total or near total body wall penetration.

A total of 3 metal loss features exhibited ERF values exceeding 1.0. The maximum ERF among all metal loss features was 1.500.

This Final Report is intended to serve as an overall summary of the inspection results. The accompanying InSight Data CD contains a comprehensive Feature List which represents the complete findings of the HR Vertilog casing survey.

Evaluation Comments

-0.66 ft Hardware - External casing head response.
477.31 ft Hardware - Bottom of 13 3/8" external casing.

The well records provided were used for the determination of where there were casing weight and grade changes. However, the average axial background did not seem to change in the N-80 pipe grade sections and appear to be in the J-55 pipe grade. There could be some overstatement of the burst pressures if there is J-55 casing sections in the areas designated as N-80.

There were several features detected within the connections. The metal mass change of the connections could have an adverse effect on the metal loss calculations of these features.

The area around 2835 ft may have total penetration based upon the discriminator responses.

In addition to the features that classed and reported, there were a significant amount of features present below the threshold throughout the survey.

1.2. Service Data

The BHI Wireline Services field services are summarized in the table below.

Table 2. Service Data

Service Information	
Job Date	October 20, 2014
Service Order	US091691
Recorded By	Grant Riffle
Witnessed By	Tom Egbert
Service Location	Buckhannon WV
Service Unit Number	4225
Logging Information	
Service	
Bottom Logged Interval	8100.00 feet
Top Logged Interval	-5.00 feet
Additional Services	
Remarks:	

1.3. Pressure Calculations

The following information was provided by Southern California Gas Company for use in pressure calculations.

Pressure Calculations:	
Burst Pressure Calculation	Modified B31G
Interaction Criteria	RP0102 - Fixed BW Ratio 6.0T x 6.0T

1.4. Equipment Data

The following BHI Wireline Services equipment assets were utilized in the performance of the inspection services.

Table 3. Equipment Data

Equipment Data	
Tool Series Number	7 to 9-5/8 Inch HRVRT 96 FL + 96 DIS Tool
Electronics Series Number	MuxDB
Interface Panel Series Number	4921
Calibration Reference Number

Subject: SIMP Draft Response

Hi Tom,

I used some of TIMP/DIMP language to formulate a very general response. I'll be diving into writing the plan with Amy's help using the DIMP and TIMP format. We can discuss and elaborate on each bullet point / chapter of SIMP in our monthly meetings that way everyone can chime in. please let me know if you have any comments or suggestions.

- Alignment with Industry Practices and Benchmarking:
  - The Storage Integrity Management Program is intended for existing gas storage wells only. The integrity assessment is designed to fit location and is well specific due to the diverse geological formation.(we can include a few examples to show the difference between each well and each field and a comparison to other wells in other states if necessary).
  - Schlumberger is working with other Natural Gas Storage Fields within the US to implement a similar program (Well Integrity Management). SoCal Gas will meet with Schlumberger in early 2015 to utilize their expertise.

- Threat Identification & Risk Assessment:

  - Storage is in the process of identifying the main threat categories and developing a risk assessment matrix and methodology similar to TIMP. This methodology provides a framework for the consistent application of threat specific identification criteria. These criteria integrate both casing data and engineering judgment to systematically determine whether or not a threat exists for a given well casing.

  - The effectiveness of the matrix will be tested on wells that have been already assessed (i.e. Frew 2). Once the matrix is complete a baseline assessment plan and consequently the integrity assessment will be established.

  - As the integrity management program matures, much of the detailed data will be gathered on a routine basis and stored in a database to facilitate integrated analysis. A priority will be placed on all data which is required to perform the threat identification and risk assessment. Additional data gathering occurs throughout the year during the pre-assessment and assessment phase for each integrity assessment.

- Preventative & Mitigation measures (P&M):
  - The P&M options include those measures already implemented and any additional measures that may be required to improve the effectiveness of the current maintenance program and/or reduce the probability and consequence of failure. (i.e. SSSV for wells susceptible to land slide, derate pressure).
- Remediation:

I1906046_SCG_SED_DR_01_0000058
SED SUR REPLY 001865

    - Anomalous conditions discovered through integrity assessment that could reduce the integrity of the casing will be remediated or mitigated. (i.e. squeeze cement and derate pressure)
- Record Keeping:
    - The storage and ready access to important records is an essential part of the Storage Integrity Management Program. Depending on the type of data, there are systems currently in place that are used to store and retrieve information such as well historical data, maps, and operating history. Appropriate personnel have access to the information as needed. Efforts are underway to improve these systems and provide a more useful tool for the Integrity Management purposes.

Subject: FW: Staffing Changes Within Storage in Response to SS-25

Hi Team,

Below are some staffing changes that has been made within storage to support the SS25 incident at Aliso. As you can see, my duties have been temporally reassigned to Aliso and Lissa Quon will be returning to storage to fill behind me as the TSM. Please let me know if you have any questions,

Cc: Furgerson, Scott P; Schneider, Douglas; Haines, Deanna; Prince, John B.; Garcia, John E.; Rawls, Wallace; Musich, Beth; Aspa, Jorge; Hayles, Leslie F.
Subject: Staffing Changes Within Storage in Response to SS-25

Team, the following staffing changes will be made within Storage immediately to assist with ongoing operations while also supporting the SS-25 incident at Aliso Canyon:

- Glenn la Fevers will be temporally relieved of his regular Aliso Canyon duties so he can focus on supporting Bret, Rodger and others responding to the SS-25 incident.
- Tim Bomberger will fill behind Glenn on a temporary basis. Tim will continue to support the Montebello operation remotely with assistance from Charles Jackle.
- Charles Jackle will also support Tom Egbert, and the initial SIMP activities at Aliso.
- Firas Hamze will be temporally relieved of his TSM duties so he can focus on supporting Glenn, Tim, and others at Aliso Canyon.
- Lissa Quon will return to Storage and fill behind Firas as the TSM on a temporary basis. *Welcome back Lisa!*
- Nadia Aftab will move into the SS-25 Incident Command Structure as the Planning Officer supporting Jimmie, Rodger, Bret and others.
- Tom McMahon will move into Storage reporting to me as the SIMP Project Manager.
  - Several individuals within Storage will be reassigned and report to Tom.
  - In addition, Tom will be quickly hiring Project Specialists, Reservoir Engineers, Technical Advisors, and Contract Administrators (both internally and externally).
  - Ramping-up SIMP throughout Storage is a high priority. I will be assisting Tom immediately in this effort.
  - More details of Tom's new organization will be announced over the next couple of weeks.
- Dan Neville will relocate to Aliso Canyon to focus on responding to SS-25 data requests while providing guidance, expertise, and support for SIMP and other Storage reservoir issues.
  - Dan's previous Goleta Native Gas responsibilities have been handed-off to Art Sanders and Ed Wiegman
  - Dan will continue to provide limited support to the Montebello initiative.
- Todd, Avi, Andy, and Hilary are directly supporting Bret and Rodger on the SS-25 incident.
- Amy and the rest of her remaining team are responding to data requests and supporting the Aliso operations as needed.

The situation at Aliso is fluid and other personnel reassignments and organizational changes may be necessary going forward.

I have transitioned off the SS-25 incident to focus on traditional Storage operations at Aliso and the other fields. Near term I will assist in ramping-up SIMP while continuing to support SS-25 on an as-needed basis.

Lastly, although there is a tremendous amount of activity surrounding SS-25, we cannot lose sight of the importance of the compliance and reliability functions at all of our fields. We must find a way to stay on top of our operations and responsibilities despite the personnel reassignments. I know I can count on your support.

Please contact me if you would like to discuss the employee moves or our go-forward plan in more detail. Thank you.

Storage Engineering 2014 Performance Goals

I. **Employee Safety**
   a. Aggressively manage safety to achieve zero OSHA, LTI, & CMVI's.
   b. Actively manage rig and associated contractor safety.

II. **System Reliability**
   a. Maintain the highest levels of well and reservoir reliability for gas injection, withdrawal and storage inventory.
      i. Develop and implement withdrawal recovery plans for Aliso Canyon and inventory recovery and maintenance plans for PDR.
      ii. Efficiently prioritize well work-overs and complete maintenance activities on schedule.
   b. Support community outreach efforts to mitigate public concerns surrounding storage field operations and major projects.

III. **Major Projects**
   a. GRC – Support Rate Case witness for Storage in the preparation of strong testimony and effectively respond to data requests.
   b. Well and Reservoir Upgrades – Successfully complete [redacted] budget comprising Storage Engineering capital projects on schedule.
   c. Goleta Native Gas – Support completion of one well and provide expertise and guidance as necessary to complete project by year end.
   d. 3DPM –Support successful design and testing of the enterprise-wide asset management solution for roll-out in Storage in 2015.

IV. **Operational Compliance and Well Integrity**
   a. Strive to achieve the highest levels of regulatory compliance.
      i. Satisfactorily address audit findings
   b. Develop and implement pilot Storage Integrity Management Plan (SIMP).

V. **Workforce Development**
   a. Ensure Storage Engineering vacancies are staffed with qualified internal and external candidates and expand organization for succession planning and SIMP Implementation.
   b. Implement a knowledge transfer plan for Storage Engineering.

VI. **Financial Performance**
   a. Achieve all reliability, operational, and project goals within Storage Engineering budget:
      [redacted]
   b. Support achievement of miscellaneous storage revenue goal of [redacted]

VII. **Personal Development**
   a. Continue to mentor new to Storage non-Petroleum engineering operations personnel on drilling, reservoir engineering and down-hole operations.

Subject: Storage Update

Hello Bret. It's been a while since we have talked or corresponded so I thought I would pass along a brief status update of Storage.

Safety

- We had our first OSHA and LTI after going incident free for two successive quarters
  - An employee at PDR crushed his knuckle while working on well grating
- Working very well with Robin Downs and the Safety Committee

Financials

- 2015 O&M and Capital budgets are essentially at plan after factoring in timing
- YTD April miscellaneous revenues are $400k above plan
- Q1 shareholder loss at Montebello is $1.1 million, year-end Outlook is in the range of a $3 million loss

2016 GRC

- SIMP O&M and capital supported at 100% of request by ORA
  - ORA supports a one-way balancing account not the two-way mechanism that was requested
- 2016 "routine" capital supported at 100% of request by ORA
- "Routine" O&M was supported by ORA at $360k above 2014 actual
  - The reduced spending from 2014 actuals did not support our higher estimate which lowered the 5-year trend methodology used as a forecast

Special Projects

- The plan is to conduct a flow test of Todd 2 at Goleta this summer
- A recommendation to Scott on a future course of action for Montebello is pending
- Work is in progress on potentially selling one of our gas lines to be used as a conduit for oil transportation by others as part of their East Whittier development project
- Discussions of our interest and potential involvement in a new "Long reach" strategy/project are in progress
- MCAs to address the Procurement and Contracting Audit findings are in progress
  - Scott and I recently met with the Honor Rancho leadership team to discuss expectations, other site meetings will follow

Workforce

- Jim Mansdorfer will retire at the end of May
- Tom Schroeder plans to retire near the end of the year
- Employee turnover and new hiring is continuing consistent with our replacement planning strategy

Other Items

- Work is in the planning stages for two new wells at Aliso and another at Goleta in 2015
- Many capital projects in progress
  - Engineering support critical to achieving goals
- The SIMP "pilot project" is progressing well

Let me know if I should schedule some time where we can get "caught-up" and talk more in-depth. Otherwise I will just have to catch you in the hallway sometime!

Subject: Re: Identical Wellhead

There is a wellhead binder in Azra's office that should have an SS25 wellhead schematic. The valves may have been changed out but the dimensions should still be accurate.
A comparison will need to be made to find another well in the field with the same casing set up
I would look for wells drilled in the SS lease in the early 1950s

On Dec 6, 2015, at 10:13 AM, Schwecke, Rodger <RSchwecke@semprautilities.com> wrote:
I need a location where we have installed an identical wellhead as on SS25. B&C would like to be able to measure the wellhead as they are evaluating options to pull the gas off the location.

2 SEPTEMBER 25, 2018 - 10:08 a.m.
3 * * * * *
4 BE IT REMEMBERED THAT, by
5 (Subpoena/Notice/Consent of the Witness), and
6 on Tuesday, September 25, 2018, commencing at
7 the hour of 10:08 a.m. thereof, at the
8 offices of the CALIFORNIA PUBLIC UTILITIES
9 COMMISSION, 505 Van Ness Avenue, Room 4003,
10 San Francisco, California 94102, before JASON
11 STACEY, CSR No. 14092, KARLY POWERS CSR No.
12 13991, REBEKAH L. DE ROSA CSR No. 8708
13 personally appeared
14 **(AMY KITSON, AVI RAZAVI)**,
15 called as a witness herein, who, being first
16 duly sworn, was thereupon examined and
17 interrogated as hereinafter set forth.
18 * * * * *
19 EXAMINATION
20 BY MR. GRUEN:
21 Q All right. So let's go on the
22 record. And just as a matter of
23 introductions, if everyone could go around
24 and state our name and our titles and who we
25 work for just for the record?
26 So I'll start. My name is Darryl
27 Gruen. I'm staff counsel at the California
28 Public Utilities Commission, and I'm

1 representing the Safety and Enforcement
2 Division.
3 MR. BRUNO: Hi. I'm Ken Bruno. I'm a
4 program manager of the Safety and Enforcement
5 Division.
6 MR. SHER: Nicholas Sher Legal CPUC.
7 MS. CLORFEINE: Sabina Clorfeine,
8 assistant general counsel for Southern
9 California Gas Company.
10 MR. STODDARD: Jack Stoddard with
11 Morgan Lewis. Outside counsel for SoCalGas.
12 WITNESS RAZAVI: Avi Razavi SoCalGas
13 underground storage data management.
14 WITNESS KITSON: Amy Kitson director of
15 storage risk management for SoCalGas.
16 MR. GRUEN: Great. Okay. So as I
17 mentioned, I'm staff counsel with the Legal
18 Division. I'm joined by Mr. Bruno and
19 Mr. Sher here for Safety Enforcement
20 Division, and we're doing an Examination
21 Under Oath today.
22 Ms. Kitson, I remember you came to
23 do an Examination Under Oath very much like
24 what we're doing today. And so the
25 Examination Under Oath is like a deposition,
26 which is a question-and-answer period where
27 the court reporters will be transcribing --
28 taking exact notes of the words we say so

1 that we have a record of what we've talked
2 about today.
3 The difference between this and a
4 deposition is there is no underlying
5 proceeding right now. We don't know whether
6 we're going to do a full-on investigation.
7 We're still gathering facts, but we may use
8 this information later on if Safety and
9 Enforcement Division elects to do a formal
10 proceeding if they choose to do that.
11 Do you both understand that?
12 WITNESS KITSON: A Yes.
13 WITNESS RAZAVI: A Yes.
14 Q When I ask questions, it is
15 important that you provide truthful and
16 complete answers to them. Please answer my
17 questions directly. If you do not understand
18 my question either because I've not
19 articulated it well or because I phrased it
20 poorly, please either ask me to repeat it or
21 just say you did not understand the question.
22 Please do not speculate or guess about what
23 the question is. Do you understand that?
24 WITNESS KITSON: A Yes.
25 WITNESS RAZAVI: A Yes.
26 Q And did either of you receive a
27 subpoena to appear today?
28 WITNESS KITSON: A Our counsel.

1 Q Okay. So if I can circulate copies
2 of the subpoenas to counsel just to review
3 and see if those are accurate copies of what
4 we served upon counsel for Ms. Razavi and Ms.
5 Kitson to appear today.
6 MS. CLORFEINE: Yes.
7 MR. STODDARD: Yes.
8 MR. GRUEN: If we could use those, and
9 hand those as exhibits to the court reporter.
10 I'll ask that those be marked as Exhibits 1
11 and 2 respectfully.
12 Why don't we have Ms. Kitson's
13 subpoena marked as Exhibit 1. And
14 Ms. Razavi's subpoena marked as Exhibit 2.
15 COURT REPORTER: Can we go off the
16 record for a moment?
17 MR. GRUEN: Off the record.
18 (Off the record.)
19 MR. GRUEN: All right. Back on the
20 record.
21 You are here under -- Ms. Kitson,
22 Ms. Razavi, you are here under compulsion of
23 subpoena and witness fees. That means that
24 the Safety and Enforcement Division has a
25 statutory authority to issue the subpoena to
26 compel the attendance of employees of
27 Southern California Company to testify. And
28 also for Southern California Gas to produce

1 documents as part of our supervisorial
2 authority of our utilities including
3 SoCalGas.
4 This means you're not here
5 voluntarily and the information you provide
6 us is not voluntary. You're answering
7 questions because we require it. Do you
8 understand all that?
9 WITNESS KITSON: A Yes.
10 WITNESS RAZAVI: A Yes.
11 Q OKAY. Do you understand that
12 Southern California Gas Company is prohibited
13 from retaliating against you for reporting
14 unsafe conditions to the Safety and
15 Enforcement Division?
16 WITNESS KITSON: A Yes.
17 WITNESS RAZAVI: A Yes.
18 Q Do you have any questions about
19 what any of that means?
20 WITNESS KITSON: A No.
21 WITNESS RAZAVI: A No.
22 Q Has anyone spoken with you about
23 the topics identified in the subpoena that we
24 subpoenaed you for today?
25 WITNESS KITSON: A Just my counsel.
26 WITNESS RAZAVI: A Yes. Counsel.
27 Q For you as well? Thank you.
28 Has anyone coached or advised you

1 generally about goals to achieve coming in
2 here today?
3 WITNESS KITSON: A No.
4 WITNESS RAZAVI: A No.
5 Q Okay. Has anyone suggested, said,
6 or implied that you give answers today that
7 in any way protect Southern California Gas
8 Company?
9 WITNESS KITSON: A No.
10 WITNESS RAZAVI: A No.
11 Q Okay. All right. So, Ms. Kitson,
12 I think you answered most of these questions.
13 So what I'll attempt to do as best I can is
14 to flag the set of questions either by giving
15 you a topic area that I intend to ask
16 questions about or perhaps circulating an
17 exhibit that the questions will focus upon
18 for this Examination Under Oath.
19 So the first set of questions are
20 really focused on background. And,
21 Ms. Kitson, since I believe we asked
22 basically the gist of these questions of you
23 last time, this will be for -- these
24 questions will be for you, Ms. Razavi. We
25 won't duplicate our efforts from last time
26 around.
27 So, Ms. Razavi, if you would, what
28 is your current job title?

1 WITNESS RAZAVI: A Underground storage
2 data manager.
3 Q Okay. What is your role in that
4 title?
5 A I manage the governance of records
6 and data and managing the technology piece
7 databases. And I also have the compliance
8 reporting piece.
9 Q Okay. What was the effective date
10 of your current position approximately?
11 A May 2016.
12 Q Okay. And what was your
13 position -- let me ask this: How long have
14 you worked for Southern California Gas
15 Company?
16 A Since 2012.
17 Q 2012. What was your position prior
18 to your current one?
19 A Storage field engineer.
20 Q Storage field engineer. And what
21 were the approximate dates of that position?
22 A November 2014 to May 2016.
23 Q Okay. What was your role as
24 storage field engineer?
25 A So I was brought into the
26 underground storage team to help with
27 implementation of the Storage Integrity
28 Management Program. I managed projects

1 related to the storage Integrity Management
2 Program.
3 Q Okay. And which projects -- which
4 fields did you manage projects related to the
5 Storage Integrity Management Program about?
6 A The projects encompass all fields.
7 All storage fields.
8 Q All four of them for Southern
9 California Gas Company?
10 A Yes.
11 Q Okay. All right. And prior to
12 your role as storage field engineer, what
13 role did you play? What title did you have?
14 Excuse me.
15 A Engineer 1 with the Storage
16 Technical Services Group.
17 Q And what were the dates
18 approximately of you serving in that title?
19 A Late 2013 to November 2014.
20 THE COURT REPORTER: I need to have you
21 speak up. I need to be able to hear you.
22 A Sure.
23 MS. CLORFEINE: Do you want to go off
24 the record real quick?
25 MR. GRUEN: Sure.
26 (Off the record.)
27 MR. GRUEN: Back on the record.
28 Q And I think you mentioned if I

1 heard correctly, your title from late 2013 to
2 November 2014 was Engineer 1 of the Field
3 Technical Services Group? Did I get that
4 right?
5 WITNESS RAZAVI: A Storage Technical
6 Services Group.
7 Q Storage Technical Services Group.
8 Thank you. And what were your duties during
9 that time as Engineer 1?
10 A Managing projects for all four
11 storage fields.
12 Q Okay. Thank you. I think you said
13 you started with SoCalGas in 2012?
14 A Yes.
15 Q So you had a title prior to your
16 title as Engineer 1 of the Storage Technical
17 -- I'm sorry. The Storage Services --
18 A Engineer 1.
19 Q It was also Engineer 1. Okay.
20 A Just to clarify, I was Engineer 1
21 in the Storage Technical Services Group from
22 late 2013 to November 2014.
23 Q Okay.
24 A Before that I was Engineer 2 from
25 September 2012 to late 2013.
26 Q Okay. What was your -- what were
27 you duties as Engineer 2?
28 A Data management, managing data

1 management projects.
2 Q Was that your first title and your
3 first position for Southern California Gas
4 Company?
5 A As a full-time employee, yes.
6 Q What did you do prior to your
7 full-time status as Engineer 2?
8 A I was a contractor for Southern
9 California Gas Company through a third-party
10 company.
11 Q Okay. Thank you. What were the
12 dates that you worked as a contractor for
13 Southern California Gas Company through a
14 third party?
15 A They're broken. So I -- from, I
16 believe, it was August of 2011 to about
17 December, I was a pipeline integrity engineer
18 contractor. Then I worked for Schlumberger
19 for a short period from December 2011 to
20 February, March of 2012. Then I came back to
21 the gas company as, again, a pipeline
22 integrity engineer as a contractor in 2012 up
23 until September of 2012, and then I became a
24 full-time employee.
25 Q Okay. Thank you. And during your
26 time -- so sounds like before you came back
27 -- before you came to the gas company as a
28 pipeline integrity engineer in 2012, your

1 last role was with Schlumberger from
2 December 2011 to -- was it February or March?
3 A Sometime around there. I can't
4 remember.
5 Q Okay. Approximately February or
6 March 2012?
7 A Yes.
8 Q Understood. What was your role
9 working for Schlumberger at that time?
10 A I was an engineer in training for
11 the hydraulic fracturing crew.
12 Q Engineer in training, I'm sorry,
13 for?
14 A Hydraulic fracturing.
15 Q Okay. Thank you. And your role
16 from August 2011 to December 2011 as a
17 pipeline integrity engineer contractor, what
18 did you do? What were your duties at that
19 time?
20 A Data mining in an effort to
21 digitize records.
22 Q Okay. Thank you. Okay. That's
23 helpful. Thank you, Ms. Razavi.
24 If I may, the next sets of
25 questions are intended to ask about well
26 history and well history data. And I'll be
27 clarifying -- asking clarification questions
28 about what that means. But when I say,

1 "Data," it's generally intended to ask
2 questions about well history files and the
3 data within them. Things of that sort.
4 So with that in mind if you could
5 tell me, are you familiar with well history
6 files? With that term?
7 A I'm familiar with the definition of
8 well history --
9 Q Okay.
10 A -- form.
11 Q Of a well history form? What does
12 that term mean to you? What's your
13 understanding of that term?
14 A When there's a workover activity,
15 there are daily reports. Meaning the
16 activities are captured in a particular form
17 that we submit those reports into the
18 Division of Oil and Gas and Geothermal
19 Resources. And they refer to that as a Well
20 History Form.
21 Q Okay. What -- okay. So what
22 about -- does Southern California Gas Company
23 keep data regarding the history of its wells?
24 A Yes.
25 Q And what is the term? Is there an
26 overarching term that's used in order to
27 identify the well history data that's
28 Southern California Gas Company keeps?

1 A I don't understand your question.
2 Q Okay. I'm trying to search for a
3 term that I can use today in order to capture
4 as an overarching term of well history data
5 that Southern California Gas Company has.
6 Whether it be a repository for it. Whether
7 it be particular documents that are kept for
8 each well that shows Southern California Gas
9 Company the history of its well data.
10 So I think what I'm struggling with
11 is the terms that Southern California Gas
12 Company whether it's you working for Southern
13 California Gas Company would use as sort of a
14 shorthand to describe those things.
15 Is there anything that you can
16 identify? Any terms that you can identify
17 that we can use today in order to capture
18 those concepts?
19 A Sure. A well file --
20 Q Well file.
21 A -- would encompass records and data
22 for a well to route its design history,
23 operations, and maintenance.
24 Q Thank you. Great. So I'll do the
25 best I can to stay on point to use the term
26 well file when I'm referring to those things
27 containing records. Just to be sure I
28 understood correctly, maintaining records and

1 data for a well throughout design history,
2 operations, and maintenance?
3 A Yes.
4 Q Is there anything else to your
5 knowledge that is included in a well file?
6 A Planning for the design activities,
7 information, geological information,
8 pertinent records to a well operation.
9 Q Pertinent records for a well
10 operation. Okay. Understood. Thank you.
11 Planning for design activities,
12 does that include permits?
13 A Yes.
14 Q Okay. In terms of pertinent
15 records, just to clarify that term a little
16 bit, what sorts of pertinent records would
17 you expect to be included in a well file?
18 A Again, design, construction,
19 diagrams, operations, maintenance activities,
20 inspection activities from the inception of a
21 well to the time the well is abandoned.
22 Q Understood. Okay. What about
23 things like testing? Any test records?
24 A Yes. Part of inspections.
25 Q What other records would be part of
26 inspection?
27 A Tests, logs.
28 Q Okay. Anything else?

1 A To the best of my recollection,
2 that's it.
3 Q Okay. Thank you. Okay. And is
4 there a repository that keeps all of Southern
5 California Gas Company's well files? By
6 repository, I mean is there one place in
7 which all of them are kept?
8 A Are you referring to hard copy
9 digitized copies?
10 Q I appreciate the question. And
11 I'll get there as well. That's a good
12 question. If I could, why not start with
13 hard copy. Is there one place where all of
14 the well files are kept?
15 A What timeframe?
16 Q Yeah. Prior to October 23rd, 2015.
17 A Sure. The hard copy records are at
18 each storage facility. And there are
19 duplicate copies at the Aliso Canyon
20 facility. The duplicate copies are not kept
21 up to date.
22 Q So prior to -- I appreciate your
23 clarification. For now why not say that the
24 questions that I'm asking are intended to ask
25 about the state of the well files prior to
26 October 23rd, 2015 unless I specify
27 otherwise.
28 A Okay.

1 Q Yeah. All right. So with regards
2 to the hard copy records at Aliso, those are
3 all kept in one -- is there a file cabinet?
4 Or is there something by which all of the
5 well files are kept?
6 A Yes. They're file cabinets.
7 Q Okay. And there are duplicates at
8 each facility. But those aren't up to date I
9 understand you to say. So with regards to
10 the duplicates, why are those kept since
11 they're not up to date?
12 A I'm not -- I don't know the
13 history.
14 Q Okay. But you're aware that some
15 duplicate are kept?
16 A Yes.
17 Q Okay. How many duplicates have you
18 seen give or take?
19 A What field?
20 Q Yeah.
21 A What storage field?
22 Q I am sorry. I see your question.
23 Let's stay with Aliso. At the Aliso Canyon
24 Storage Facility. Does that answer your
25 question?
26 A I haven't seen the Aliso Canyon
27 Storage Facility's duplicates of well file
28 copies.

1 Q Okay. When you say "duplicates,"
2 generally are you saying -- are the
3 duplicates kept in one location? Like a file
4 cabinet similar to how the other hard copy
5 up-to-date records are kept?
6 A Yes.
7 Q They are. Okay. Are there any
8 duplicates that are also not kept in one
9 location?
10 A Not that I'm aware of.
11 Q Okay. And which facilities --
12 which storage facilities to your knowledge
13 have duplicates of the well files?
14 A As a point of clarification, the
15 duplicate copies are kept at the Aliso Canyon
16 Facilities for the other storage facilities.
17 Q Oh, I see. Okay. For all of them?
18 A I don't know if it's for all of
19 them.
20 Q Okay.
21 A But I've seen some.
22 Q Okay. I see. I follow. That's
23 helpful. Thank you.
24 And if we wanted to ask for well
25 files, the -- I'm struggling. I guess it's
26 terminology I'm struggling with. In order to
27 identify the well files that are not the
28 duplicates, what term should I use? Should I

1 call that the "master set"? What would be
2 the right term to call the repository or the
3 file cabinet where the current well files
4 are?
5 A Just the well file.
6 Q Yeah.
7 A Yeah.
8 Q Just the well file?
9 A Just the well file.
10 Q Okay. And if I wanted to refer to
11 the set of duplicates, I should just call it
12 the duplicate well file?
13 A Yes.
14 Q Okay. Understood. Okay. So
15 sticking with the date prior to October 23rd
16 2015, how had SoCalGas's well-history files
17 -- or excuse me well files -- been used as
18 part of SoCalGas's Storage Integrity
19 Management Program?
20 A For which field?
21 Q Aliso.
22 A Okay. So I had a project in early
23 2015, to digitize those records and
24 centralize them in a database. And that was
25 part of the Storage Integrity Management
26 Program.
27 Q Thank you. Ms. Kitson, do you want
28 to add anything to that in terms of from your

1 perspective and your role, how had SoCalGas's
2 well files been used as part of SoCalGas's
3 Storage Integrity Management Program prior to
4 October 23rd, 2015.
5 WITNESS KITSON: A So I just add on to
6 what Avi said that we are doing that in
7 preparation not only for some -- for getting
8 our data into an electronic format to further
9 provide clarity for identification and risk
10 assessment that we were planning to do
11 following that activity.
12 Q Okay. Thank you. So when you were
13 incorporating, or I think you used the term
14 "digitizing," the well files as part of
15 SoCalGas's Storage Integrity Management
16 Program, with that context in mind, relative
17 to other elements in SoCalGas's Storage
18 Integrity Management Program, how would you
19 rank the importance of well history -- or
20 well files? Excuse me.
21 MR. STODDARD: Objection. I'm not
22 following what you mean by ranking of
23 importance in context.
24 MR. GRUEN: Okay.
25 MS. CLORFEINE: And, Mr. Gruen, if I
26 can just ask for clarification. We're
27 talking about Storage Integrity Management
28 Program. We're talking about SIMP going

1 forward as opposed to a regular O and M? I
2 just want to be clear.
3 MR. GRUEN: It's a good clarification.
4 I was that close to actually saying my prior
5 question just calling -- using the term SIMP
6 as a shorthand, which I appreciate. That's a
7 good point. Maybe I should use that term.
8 With regards to the objection -- so
9 just to clarify with Ms. Razavi and Ms.
10 Kitson. If I use the term "Storage Integrity
11 Management Program" for the record, will you
12 understand -- if I use the term "SIMP," will
13 you understand that to refer to the Storage
14 Integrity Management Program?
15 WITNESS KITSON: A Yes.
16 WITNESS RAZAVI: A Yes.
17 MR. GRUEN: Q Okay. Okay. Thank you.
18 With regards to the objection, let
19 me see if I can unpack a little bit what the
20 terms are. What I'm asking about.
21 Are you familiar with other elements
22 in SIMP in addition to well files?
23 WITNESS RAZAVI: A I don't understand
24 your question.
25 Q What other things are there in
26 SIMP?
27 A What do you mean by "things"?
28 Q Criteria? How does the program

1 work? I can open the question up for both of
2 you.
3 WITNESS KITSON: A Do you mind if I
4 answer?
5 Q Please do.
6 A So when I talk about this program,
7 I'll talk a little bit about -- I know you're
8 looking prior to October, 2015. But I'll
9 talk about how we set it up, and this was our
10 vision prior to 2015. All these things may
11 not have been in place at this moment in
12 time.
13 Q Okay.
14 A So for a Storage Integrity
15 Management Program or an Integrity Management
16 Program in general, we look at it as a
17 continuous process; right?
18 So it starts with data gathering
19 for identification and that merges into the
20 field activities, which could be, you know,
21 well logging in this case for other integrity
22 programs that do pipeline inspection.
23 And then that information along
24 with the data you gathered up front goes into
25 the decision making for either reassessment
26 intervals, continued evaluation, preventative
27 and mitigative measures. And Avi's group's
28 role is the hub of that.

1 So as all the data continuously
2 flows in and out through all those processes,
3 and then the cycle continues. So it's never
4 ending.
5 Q Okay.
6 A Does that help?
7 Q I think so. I may have some
8 clarification. Let me digest that point for
9 a second.
10 The reassessment intervals and
11 preventative mitigation measures, you're
12 actually using the data that you gather
13 through the field activities in order to
14 reassess something. Am I tracking that
15 right?
16 A Let me clarify a little bit more.
17 So some of the mitigation activities, for
18 example, are things that we were doing as a
19 company long ago. Our daily well inspection,
20 taking pressure reads, and other things. And
21 so an Integrity Management Program
22 incorporates not only things that we were
23 doing in the past, but also new things that
24 are either required by regulation or that
25 we've identified as part of our inspection.
26 What I mean by "reassessment
27 intervals," is specifically to the logging or
28 the inspection of that activity. So for

1 example if we run a well log and do our
2 repairs, and we then go look at when is the
3 next time we need to inspect that well.
4 And in the meantime while you're
5 waiting to re-inspect that well, there are
6 things that you can do to monitor that well
7 and maintenance activities.
8 Q Okay. I think what I'm trying to
9 get at with the question -- and maybe, Ms.
10 Kitson, you might be the best person to
11 answer, and I'll check. Please feel free to
12 weigh in.
13 Can you do all the things that you
14 mentioned as a part of SIMP without well
15 files and the information contained within
16 them?
17 A No. Data's a key part to integrity
18 management. And the data continues to grow
19 and get better as the program matures. So
20 that's part of it, you know, is integrating
21 the data and identifying maybe additional
22 data fields that you might need moving
23 forward. You know, capturing it and putting
24 it into a center repository.
25 Q Thank you. Okay. That's helpful.
26 WITNESS RAZAVI: A May I add to that?
27 Q Yes, please.
28 A A couple of items that I'd like to

1 at least note that were done prior to
2 October 2015. We had a regular program to
3 run temperature surveys on our wells. We had
4 weekly pressure monitoring. I had a project
5 specific for Storage Integrity Management
6 Program called, "Well Siting Enhancement
7 Program" to install continuous pressure
8 monitoring to get our wells to be able to
9 monitor the pressures on tubing casing and
10 the annuli continuously.
11 Q And just to unpack that to be sure
12 I'm understanding. So the Well Site
13 Enhancement Project monitored pressures on
14 casing and annuli. Put crudely for me to
15 understand that you're talking about the
16 pipes that run into the well. The internal
17 pipe and then the pipe that's surrounding an
18 internal one. Would that be a fair
19 layperson's understanding of the terms casing
20 annuli?
21 A Correct. The pipeline's tubing and
22 the casing.
23 Q Okay.
24 A And the space between them.
25 Q Okay. Thank you.]
26 And --
27 MS. CLORFEINE: So -- wait, just --
28 sorry, Mr. Gruen. Can we just clarify, we're

1 talking about down-hole --
2 WITNESS RAZAVI: Yes.
3 MS. CLORFEINE: -- tubing and casing.
4 WITNESS RAZAVI: Yes, definitely.
5 MR. GRUEN: Fair point. Thank you.
6 Q So in terms of the well site
7 enhancement project to monitor pressures on
8 casing and anuli, were -- did you keep
9 records of the monitored pressures on those
10 pieces of pipe?
11 WITNESS RAZAVI: A Yes.
12 Q Okay. And were those included in
13 the well files?
14 A Yes. They are kept in different
15 repositories. Because those are digitized
16 information.
17 Q Okay. And I haven't asked you
18 about digitized; I appreciate that. We've
19 only asked about hard copy, so I will get
20 there -- go ahead.
21 A As a point of clarification --
22 Q Yes.
23 A -- the continuous pressure
24 monitoring and the well site enhancement
25 project was for all the fields --
26 (Reporter clarification.)
27 MS. CLORFEINE: Site enhancement.
28 WITNESS RAZAVI: Well site enhancement

1 project.
2 Prior to October 23rd, 2015, the
3 first field that had the continuous
4 monitoring was the La Goleta storage field.
5 MR. GRUEN: Okay.
6 Q Can you give an understanding -- so
7 I think I'm hearing that the well site
8 enhancement project was a data-gathering
9 effort to gather the monitored pressures on
10 the casing and anuli and digitize those data
11 points.
12 Am I getting that right?
13 A No.
14 Q Okay.
15 A The purpose of the well site
16 enhancement project to install pressure
17 transmitters --
18 Q Okay.
19 A -- on down-hole pipes at the
20 surface facility so you're able to monitor
21 the pressure on the pipes that are running
22 down hole.
23 Q Okay. Okay.
24 And what was the date in which the
25 pressure transmitters with your installed on
26 La Goleta? Do you know, approximately?
27 A The project was closed out in
28 November of 2015. It started in early 2015.

1 Q Okay. And La Goleta -- go ahead.
2 A Sometime around March of 2015 is
3 when we started the project.
4 Q Okay.
5 A And completed it by November.
6 Q Okay. Did you -- did SoCalGas
7 start to install pressure transmitters on
8 other fields during the time it was working
9 on La Goleta doing that? Or was La Goleta
10 the first.
11 A La Goleta was the first.
12 Q Okay.
13 A Field under that project.
14 Q Okay.
15 WITNESS KITSON: A Well, and we had a
16 plan to do all fields.
17 (Crosstalk of witnesses.)
18 WITNESS KITSON: A It was the first in
19 the project plan to do all fields.
20 WITNESS RAZAVI: A Yes.
21 MR. GRUEN: Okay.
22 Do you want to ask.
23 MR BRUNO: Yes. Thank you, Mr. Gruen.
24 EXAMINATION
25 BY MR. BRUNO:
26 Q Ms. Razavi, we have a question.
27 Earlier you talked about duplicate and
28 original, I guess, hard copy for well files

1 and, if I understood you correctly, you said
2 duplicates are not up-to-date; is that
3 correct?
4 WITNESS RAZAVI: A Yes.
5 Q What is the purpose of the
6 duplicate files for the other storage fields
7 at Aliso Canyon?
8 A I don't know, because I wasn't part
9 of the team. But when I joined the team,
10 there were duplicates of records at the Aliso
11 Canyon storage field.
12 Q Did you every look at the
13 duplicates at any of them?
14 A Not personally; I did not.
15 Q Do you know if they stopped at a
16 point in time? Or were they just not
17 generally kept up over time?
18 A I don't know.
19 Q Do you know if Aliso Canyon had
20 duplicates at other storage fields?
21 A I don't know.
22 Q Do you know if it’s part of a
23 redundancy or resiliency plan? In other
24 words, something happens at a storage field,
25 your records are at a back-up facility?
26 A I don't know.
27 Q Whose job is it to keep the well
28 files up-to-date? Like, was that a role?

1 Was that -- was that a responsibility you
2 had?
3 A No. But what time frame are we
4 speaking?
5 Q I'm referring to the time frame
6 since you were, you know -- any time frame
7 that you worked for SoCalGas and familiar,
8 you know, with the well files.
9 A Well, I joined that group in 2014.
10 It’s typically each group's, that managing
11 projects', to manage the records for that
12 project. That's their responsibility to do
13 that.
14 Q I'm sorry. Would you say that
15 again? Whose responsibility?
16 A The underground storage group that
17 had ongoing projects and doing the operations
18 and maintenance on those wells, it was their
19 responsibility to keep the records for those
20 wells up-to-date.
21 Q Okay. So is it -- am I
22 understanding correctly that it’s everybody's
23 responsibility in the underground storage
24 group to keep the well files up-to-date
25 whenever they do something to that well?
26 A The group, the organization, is
27 formed in a way that every person has a role
28 and responsibility to keep the well files

1 up-to-date based on the projects that they
2 manage or they touch on that well.
3 Q Okay. I understand that. Thank
4 you, Ms Razavi.
5 Is there anyone in charge of
6 quality assurance or quality control for the
7 contents of the well files?
8 A What time frame?
9 Q The same time frame that you were
10 just referring to. I think you said 2014.
11 A Well, I joined to team November
12 2014.
13 Q Yeah. So the time frame you can
14 speak to.
15 A Can you repeat your question,
16 please?
17 Q Yes, ma'am.
18 Is there anyone at SoCalGas in
19 charge of overall quality assurance or
20 quality control of the well files?
21 MR. STODDARD: Can we just clarify --
22 just because your question started off about
23 duplicate well files. And this instance --
24 MR. BRUNO: Excuse me, Mr. Stoddard.
25 She asked me a follow-up question, and I'm
26 clarifying what she asked me.
27 MR. SHER: This has nothing to do with
28 duplicates whatsoever. I'm not sure why

1 you've --
2 MR. STODDARD: That's all -- I'm just
3 asking, because the first questions were
4 about why duplicates may not have been
5 up-to-date. And now he's saying it's
6 somebody's responsibility about the well
7 files. And I just wanted to clarify this was
8 about to the non-duplicate well files.
9 MR. SHER: Yes. If that's needed, this
10 is about non-duplicate well files.
11 MR. BRUNO: Yeah. And I'll affirm
12 that. It’s not duplicate well files.
13 Q And just to -- hopefully, I
14 answered your question. But I'm specifically
15 referring to was anyone in charge of the
16 overall quality assurance/quality control of
17 the -- let’s call it the source well file?
18 A Again, it’s based on the
19 organization. Every individual who touches
20 that well and has some sort of project for
21 that well is in charge of that record.
22 EXAMINATION
23 BY MR. SHER:
24 Q So, to be clear, there was no
25 supervisor that checks an individual's work
26 as to the well file they are responsible for?
27 WITNESS RAZAVI: A Well, again, that's
28 an organizational structure. So if I'm the

1 manager for a group that is managing projects
2 that produces record for that well, as a
3 supervisor, I'm looking over that individual
4 who's managing those projects. And we have a
5 record -- an information management policy
6 which each -- as a company, which each
7 supervisor actually certifies that their
8 employees are -- understand that policy.
9 Q In the group -- we're talking 2014
10 through 2016; is that correct, the time
11 period?
12 A I guess I'll defer to Ken.
13 MR. BRUNO: Yes, my name is Ken Bruno.
14 I was actually asking you any time
15 you can speak to. I believe you started with
16 2014. So it’s really up to you to state. Is
17 that accurate? You're referring to the time
18 frame 2014.
19 WITNESS RAZAVI: A To 2016.
20 MR. BRUNO: Okay.
21 MR. SHER: Q So with regards to that
22 time period, how many individuals were in the
23 group? And who were they?
24 WITNESS RAZAVI: A Oh, I can't
25 remember. I need to look at the
26 organizational structure to remember.
27 Q Is it more than five people?
28 A Yes.

1 Q Is it more than ten people?
2 A Well, the -- there were people that
3 were added to the organization. And there
4 were people who left the organization. So
5 the number varies depending on exactly what
6 time frame we're speaking to. So even
7 between November 2014 to November 2016, I
8 can't think of individuals who were with the
9 group and who left the group.
10 Q So how many supervisors are in that
11 group?
12 A Within that time frame?
13 Q Please.
14 A There were two, I believe.
15 Q Do you recall their names?
16 A Sure. Todd Van Deputte and Tom
17 Schroeder.
18 Q So let’s, for example, focus on Mr.
19 Van Deputte. Would one of his roles have
20 been to do quality control and assurance as
21 Mr. Ken Bruno was asking?
22 A No. He was responsible for the
23 work that was done on those wells and.
24 Q And when you say "those wells," are
25 there a limited set of wells? Or are you
26 talking about all the wells at Aliso Canyon?
27 A No. The wells that they actually
28 worked over on, he would be responsible for

1 the work that was done on those particular
2 wells. And they could be for multiple
3 fields. It all depends on the time frame and
4 work that we had going on.
5 Q But with regards to -- I think you
6 said Mr. Schroeder or Mr. Van Deputte are the
7 supervisors who would have had quality
8 control roles; is that correct?
9 A They were supervisors of the
10 organization. So it was Tom Schroeder who
11 had the drilling department, which was Todd
12 Van Deputte. So Todd Van Deputte managed the
13 rig work activity, so activities that
14 required a rig and reports that were produced
15 as a result of the workover were under his
16 umbrella. I can't remember who was a
17 supervisor at the time that had the
18 operations piece that would manage the day to
19 day operations of the wells.
20 Q So --
21 A But there were two -- so if you
22 think of the organization, there was a
23 manager, there was a rig group drilling
24 manager who would manage workover activities,
25 and then we had storage field engineers group
26 that kind of managed the day-to-day
27 activities of that well; operations, what
28 well comes on, goes off, pressure monitoring,

1 running --
2 Q So with all that in mind, which
3 individuals would have, in a supervisory
4 level, reviewed the well files for quality
5 control?
6 A I don't know. I don't know what
7 the process for quality assurance would be.
8 But I know the managers of which I was
9 reporting up, also to a manager, would
10 certify that their employees understand the
11 information management policy of the company.
12 Q If a well file was incomplete,
13 would the supervisor discover that the well
14 file was missing data?
15 A I don't know.
16 Q Should, in your experience, a
17 supervisor discover whether well file data is
18 missing?
19 A I don't know.
20 Q Whose responsibility -- if data is
21 missing, with whom does that responsibility
22 lie?
23 A The group that is doing the work on
24 that well.
25 Q Okay. Thank you.
26 MR. STODDARD: We've been -- we've been
27 going almost for an hour. Can we take a
28 break?

1 MR. BRUNO: Let me -- I've got a couple
2 more questions just so we can wrap this up.
3 MR. GRUEN: Then we'll do a break.
4 EXAMINATION
5 BY MR. BRUNO:
6 Q Ms. Razavi, you mentioned policies.
7 Is there a document that specifies those
8 policies?
9 WITNESS RAZAVI: A Yes.
10 Q Do you recall the name of that
11 document?
12 A Sure. We have an information
13 management policy.
14 Q Is it specific to Aliso Canyon?
15 A No. It’s actually a company-wide
16 policy.
17 Q Oh, Okay. And that's a policy you
18 were familiar with between that 2014-2016
19 time period?
20 A Yes.
21 Q Okay. Does it have anything in the
22 way of quality assurance/quality control, to
23 your knowledge?
24 A I can't remember.
25 Q Okay. Do you know if there is a,
26 sort of, check-in/check-out? In other words,
27 if somebody wants to look at a well file at
28 Aliso Canyon, do they have to sign something?

1 Is there some sort of system that they do so?
2 A During that time, I'm aware of a
3 check-in/check-out mechanism.
4 Q And could you please describe that
5 mechanism?
6 A It’s a file that if one were to
7 remove a well file, they would have to sign
8 their name.
9 Q And how about when they return a
10 well file?
11 A And they would have to sign their
12 name returning the well file back.
13 Q Does it also capture what they did
14 with the file?
15 A I don't know.
16 Q Do you know if the well files are
17 every audited from another part of the
18 company; internal audit, if you will?
19 A I don't know.
20 Q Do the people -- do the underground
21 storage folks that do workover activities or
22 what have you, operations and maintenance,
23 they both put information in the well files,
24 but they also look at the well files to see
25 what's in there? Or is it more of a
26 repository where they put records in it?
27 A They would need to review the well
28 file in order to do their workover activities

1 and plan for the job.
2 Q Thank you, Ms. Razavi.
3 And then the group -- I believe
4 it's a -- I believe we were talking about a
5 SIMP group that looks at data.
6 Do they also annotate if they check
7 out a well file or not?
8 A I don't know. Because we are going
9 towards digitized data. So now we have a lot
10 of our records in a digital format.
11 Q And did the -- I'm not going to go
12 deep into digitized records now.
13 A Mm-hm.
14 Q But did the digitized process start
15 out with the well file?
16 A It's in the process of getting
17 digitized. It takes time to digitize all the
18 well files.
19 Q Is that a starting point though?
20 In other words, everything in a well file for
21 a given well is a starting point for the
22 digitization process?
23 A Yes, I just want to clarify
24 something. So my current team, we are
25 working on digitizing the well files, and
26 we're also putting -- enhancing our structure
27 to be able to centralize those digitized
28 records that the SIMP group is generating.

1 Q Okay. That sounds like a
2 worthwhile process.
3 Thank you, Ms. Razavi.
4 MR. GRUEN: Okay. And to honor my
5 promise, do we want to take a five-minute
6 break?
7 WITNESS KITSON: That would be great.
8 MR. GRUEN: Okay. Off the record
9 before.
10 (Off the record.)
11 MR. GRUEN: Back on the record.
12 Continuing on with questions about
13 the well files. So I think you were asked
14 beforehand about a check-in/check-out about
15 the well files. Just a few other questions
16 about the nature of the well files.
17 Q Do you know if there was an index
18 or table of contents or something that was
19 used in order to give an overview of the well
20 files that existed?
21 WITNESS RAZAVI: A Not that I'm aware
22 of.
23 Q Okay. Regarding the check out
24 forms then, when were those
25 check-in/check-out forms started?
26 A I don't know.
27 Q When were they completed?
28 A I don't know.

1 Q Okay. Are they ongoing today?
2 A I don't believe so, because they
3 are digitized. We're moving towards
4 digitizing our records, so we have different
5 repositories for digitized records. Those
6 check-in/check-outs are hard copy files that
7 were historically used --
8 Q Okay.
9 A -- before the time I joined the
10 group.
11 Q Okay. Are the well files in hard
12 copy still kept today?
13 A There are some hard copy records in
14 addition to the digitized copies. But we're
15 striving to go all digitized.
16 Q Are you keeping the hard copy
17 versions of all the well files as you strive
18 to go digitized?
19 A The hard copies that are produced
20 and we received from vendors, depending on
21 the type of record, are also kept in the well
22 file.
23 Q Okay. So all of the hard copies of
24 the well files are still kept.
25 Am I understanding that right.
26 A They are.
27 Q Okay. Let’s go back to the
28 November 2014, November 2016 time frame that

1 we talked about earlier.
2 Do you have that in mind?
3 A It was November 2014 when I joined
4 the group up until 2016 when I morphed into
5 my new position.
6 Q Approximately what time in 2016?
7 A May 2016.
8 Q Thank you. So with that timeline
9 in mind, November 2014 to approximately May
10 2016; do you have that timeline in mind?
11 A Sure.
12 Q Okay. Thank you.
13 What are the hard copy well files
14 used for?
15 A During that time frame?
16 Q Mm-hm. Yes.
17 A For planning workover activities,
18 to my knowledge.
19 Q What kind of activities?
20 A Workover activities, or drilling or
21 abandonment --
22 Q Operations and maintenance?
23 A Operations and maintenance.
24 Q Day-to-day --
25 A Just activities.
26 Q So day-to-day decisions regarding
27 the running of the wells; would that be a
28 fair characterization?

1 A You need to be more specific.
2 Because, I mean, there are many records
3 within the well file. And, specifically, I'm
4 assuming you're referring to hard copy well
5 files?
6 Q Correct.
7 A So, again, it all depends on the
8 type of activity that you're referring to.
9 Q Well --
10 A A day-to-day activity would be a
11 different repository for different -- again,
12 it all depends.
13 Q Well, let me ask you, what
14 specific -- I would like you to enumerate, if
15 you would please, what different activities
16 the well files are used for, including any
17 piece of information that is in the well
18 file.
19 A The hard copy files?
20 Q Correct.
21 A To my knowledge -- again, I joined
22 the team in November 2014, up until sometime
23 in 2016, used for planning workover
24 activities for each well.
25 Q And operations and maintenance as
26 well? Or no?
27 A Well, maintenance is part of your
28 workover activities and also --

1 Q Okay.
2 A -- is maintenance.
3 Q Okay. And you said drilling and
4 plugging in abandonment as well?
5 A Yes.
6 Q Okay. Regarding duplicate files --
7 so I'm using the term "duplicate well files"
8 and "well files" --
9 A Mm-hm.
10 Q -- to distinguish the well files
11 that have the check-in/check-out system for
12 those that are duplicates of those well
13 files.
14 Do the duplicates match the well
15 files?
16 A I don't know.
17 Q Who would?
18 A I -- that I also don't know.
19 Q How many duplicates are there for
20 each well file?
21 A I don't know.
22 Q Who would know the answer to that
23 question?
24 A Maybe Todd Van Deputte.
25 Q Okay.
26 Ms. Kitson, do you know the answer
27 to the questions that I asked about the
28 duplicates?

1 WITNESS KITSON: A I do not.
2 Q Okay. Are the duplicates used for
3 any -- to your knowledge, back to
4 November 2014 to May 2016, were the
5 duplicates well files used for any of the
6 activities that you had just described to me?
7 WITNESS RAZAVI: A I don't know.
8 Q Who would be using well files
9 during the time frame November 2014 to May
10 2016?
11 A For what purpose?
12 Q The activities that you described
13 to me.
14 A For workover drilling and
15 abandonment, the work -- the drilling group
16 and the storage field engineers.
17 Q Plugging and abandoning, that's
18 included in the workover drilling and
19 abandonment.
20 Is there anyone else that would be
21 using the well files? Any other people
22 within SoCalGas who would be using the well
23 files?
24 A I don't know. That's all I have --
25 I'm aware of.
26 Q Okay. Have you ever heard of an
27 instance where a workover group or the
28 storage field engineers used to duplicate?

1 A I don't know.
2 Q Okay. I think you were asked about
3 an information management policy. You
4 actually raised it to us, and you were asked
5 about the information management policy. And
6 I think you had indicated that you were not
7 aware whether there was quality
8 assurance/quality control called out in that
9 information management policy.
10 Did I follow you correctly?
11 A I don't remember. I need to review
12 the policy again.
13 Q Understood. How would we ask for
14 that policy? What is it called?
15 A Information Management Policy.
16 Q Okay. And that's the policy you
17 were talking about, the information
18 management policy that was in effect from
19 November 2014 to May 2016?
20 A I'm not sure when they updated, but
21 it was in place during that time.
22 Q And --
23 A As a company, we have that.
24 Q And --
25 A The entire company has that, yes.
26 Q And this is an information
27 management policy that gets updated
28 regularly?

1 A I don't know. But, typically, we
2 review our policies and update them on an
3 as-needed basis.
4 Q Are there multiple revisions to
5 this policy?
6 A I don't know.
7 Q Would you keep each of the
8 revisions to the policy?
9 A Out of my scope. I don't know.
10 Q Would SoCalGas keep each of the
11 revisions to the policy?
12 A I don't know.
13 Q Okay.
14 Ms. Kitson, do you know the answer
15 to that question? Would SoCalGas keep
16 revisions to the information management
17 policy?
18 WITNESS KITSON: A I'm not aware of
19 that policy.
20 Q Okay. All right.
21 And I think you had -- I had also
22 heard you say that there were managers who
23 made sure their employees were aware of the
24 information management policy.
25 Did I follow that part correctly,
26 as well?
27 A Yes.
28 Q So how would one know if the

1 information management policy was being
2 followed?
3 A Well -- I don't -- I can't speak to
4 that time frame, because I can't remember
5 what was in place exactly. But I know as
6 employees, we have trainings that we go
7 through. And we get trained on what an
8 information management policy is about once a
9 year. So we go through a refresher of that.
10 Q Okay. And so it’s up to employees
11 to follow -- to make sure that they
12 themselves are following the information
13 management policy; is that right?
14 A I don't understand your question.
15 Sorry.
16 Q Let me ask it to you directly.
17 It’s up to you as an employees to
18 make sure your following the information
19 management policy when you're doing your
20 work?
21 A Yes.
22 Q Does anyone check to make sure
23 you're following it properly?
24 A Not that I'm aware of. I don't
25 know.
26 Q To your knowledge, is there anyone
27 else, any of the other employees who the
28 information management policy applies to, is

1 their work being checked to make sure they
2 are following the information management
3 policy?
4 A I don't know.
5 Q Okay. Regarding the check-in and
6 check-out -- so I understood in your answers
7 to Mr. Bruno that there would be a log, if
8 you will, or a card, that would show when
9 someone checked one of the well files out of
10 the main repository and when they checked it
11 back in.
12 Am I following that right?
13 A I've seen a check card, yes.
14 Q Would the check card show if
15 anything was removed from a particular well
16 file once it was checked back in?
17 A I don't know.
18 Q Okay. In your review -- I assume
19 that you've done some review and looked at
20 the well files, hard copy of your well files,
21 during your digitization efforts.
22 Am I following that correctly?
23 A I, personally, have not. I have
24 contractors that they did.
25 Q And they worked for you?
26 A Yes.
27 Q Okay. And you oversaw their work?
28 A Correct.

1 Q Okay. Let me ask you to -- I think
2 you had mentioned that either there was no
3 duplicate set of well files for Aliso at
4 Aliso. And I don't remember that you said
5 you were not aware of that or that there was
6 none.
7 Could you clarify?
8 A I'm not aware of any. I don't know
9 if there is one or not.]
10 Q Are you aware of any duplicate well
11 files for Aliso at any of the other
12 facilities?
13 A I don't know.
14 Q Okay. So you're not aware if
15 there's a set of duplicates files for the
16 Aliso wells within SoCalGas or elsewhere? Am
17 I following that right?
18 A Correct. Of any. I don't know.
19 Q Okay. But you are aware of
20 duplicate well files for the other three
21 storage facilities; is that right?
22 A Yes.
23 Q And why is that that there --
24 you're familiar with -- I guess this is to
25 your knowledge, but do you have an
26 understanding of why? I don't want to say
27 that there aren't. You're just saying you're
28 not aware. But duplicate well files at Aliso

1 have never been brought to your attention?
2 A I haven't come across them. For
3 Aliso Canyon I have not.
4 Q Did you ever wonder why you hadn't
5 come across the duplicate well files for
6 Aliso?
7 A No. I don't know the history.
8 Q But you had had occasion to come
9 across the duplicate well files for the other
10 three storage fields?
11 A Yes.
12 Q Why did you have occasion to come
13 across the duplicate well files for the other
14 three storage fields?
15 A They're actually organized in file
16 cabinets. So they're labeled as "Playa del
17 Rey or Goleta," and they're organized in such
18 a manner. That's how I've come across them.
19 Q And they're next to one another?
20 A I don't know what you mean by "next
21 to one another."
22 Q When you talk about file cabinets
23 that show Goleta, Marina del Rey, Honor
24 Rancho, those file cabinets showing the
25 duplicate files -- well files, are those next
26 to each other?
27 A They're located within the same
28 vicinity, yes.

1 Q But not Aliso?
2 A The duplicate copies are you
3 referring to?
4 Q Correct.
5 A I don't know if Aliso has duplicate
6 well records --
7 Q Okay.
8 A -- in that same area. I'm not
9 aware of any.
10 Q You haven't seen them. Okay.
11 A I haven't.
12 Q Okay. All right. You heard anyone
13 talk about duplicate well files at Aliso?
14 A For Aliso Canyon?
15 Q For Aliso Canyon, yes.
16 A I have not.
17 Q All right.
18 WITNESS KITSON: A Could I maybe help
19 explain how the file cabinets -- so at Aliso
20 Canyon we have an area where we keep all well
21 files. So that's what she's referring to.
22 So there's the Aliso Canyon file cabinets;
23 then there's the Playa del Rey file cabinets,
24 and that's how they're organized.
25 Q Okay. Yeah. Okay. Let's switch
26 timelines. Thank you, Ms. Kitson.
27 Let's switch timelines to today.
28 The hard copies of the well files. Do you

1 know where they're kept today?
2 WITNESS RAZAVI: A They're at each
3 storage facility.
4 Q Okay. And the duplicates?
5 A The duplicates are not kept up to
6 date. So I'm not aware of any duplicates
7 being put back in to Aliso Canyon location
8 where the other duplicates were kept.
9 Q So where are the other duplicates
10 kept today?
11 A For other storage facilities? The
12 only duplicates that I'm aware of are located
13 at the Aliso Canyon facility.
14 Q In the same room that you saw them
15 --
16 A Yes.
17 Q -- back in 2014 to 2016?
18 A That's all I'm aware of.
19 Q Okay. All right. Are you aware of
20 any well files from -- back to 2014 to 2016
21 of November. 2014 to May 2016. Are you
22 aware of any well files that were missing?
23 A I'm not aware of any.
24 Q Okay. Was the well history well
25 file -- you're familiar with the well
26 entitled SS-25?
27 A Yes.
28 Q And you're aware that that was the

1 well that experienced an incident beginning
2 on October 23rd, 2015; correct?
3 A Yes.
4 Q Was the well file for SS-25
5 available as of October 23rd, 2015?
6 A Yes.
7 Q Was it in the repository that you
8 discussed?
9 A Yes.
10 Q To your knowledge, was the well
11 file for SS-25 missing any information
12 required by SoCalGas's internal policies,
13 practices, procedures, or other requirements
14 as of October 23rd, 2015?
15 A Not that I'm aware of.
16 Q Okay. When you say you don't know
17 if there were missing files from 2014 to
18 2016, if there were missing files, would
19 those have been documented?
20 A I don't know.
21 Q Who would?
22 A I don't know.
23 Q Ms. Kitson, do you know the answer
24 to that question?
25 WITNESS KITSON: A I don't know.
26 Q Okay. All right.
27 MR. SHER: Darryl, may I ask a
28 question?

1 MR. GRUEN: Yeah. Absolutely.
2 MR. SHER: Q Just following up.
3 How would one know if data was
4 missing from a well file?
5 A We're speaking hard copy records?
6 Q Prior to October 23rd, 2015.
7 A I don't know.
8 MR. GRUEN: Mr. Bruno, is there
9 anything you want to ask at this point?
10 MR. BRUNO: No. Thank you.
11 MR. GRUEN: I'm going to circulate a
12 document. Let's go off the record for just a
13 moment.
14 (Off the record.)
15 MR. GRUEN: Let's go back on the
16 record.
17 This is just to confirm that the
18 subpoena for the appearance today of Ms.
19 Kitson is marked as Exhibit 1.
20 (Exhibit No. 01 was marked for
identification.)
21
22 MR. GRUEN: And the subpoena for the
23 appearance of Mr. Razavi is marked as Exhibit
24 2.
25 (Exhibit No. 02 was marked for
identification.)
26
27 MR. GRUEN: Let's go off the record.
28 (Off the record.)

SED SUR_REPLY_001933

1 (Whereupon, the following material
was placed under seal by direction of
2 CPUC counsel:)
3
4 (Sealed material) (start seal.)
5 MR. GRUEN: Let's go back on the
6 record.
7 So let's mark as Exhibit 3 a
8 document that has the Bates Stamp -- and I'll
9 use the Bate Stamp convention that I believe
10 SoCalGas used to provide us this information.
11 There are two Bate Stamp
12 conventions, but I believe I'm using the
13 second one, which I believe is the one that
14 was intended for SED. So it's marked
15 AC_CPUC_SED_KITSON_0000709.
16 And to describe this document, it
17 has on the title page, "Southern California
18 Gas Company WellView Data Integrity Project.
19 Start Date: March 4, 2015."
20 And it looks like it's by Well
21 Lifecycle Resources.
22 (Exhibit No. 03 was marked for
identification.)
23
24 MS. CLORFEINE: If I can just say that
25 it has a start date label. And it ends in
26 the same convention 71100007.
27 MR. GRUEN: Thank you. That's helpful.
28 That's referring to the Bate Stamp convention

1 indeed. And those are the three pages of the
2 document. The Bate Stamp from 709 to 711 are
3 the last three numbers. Thank you, Ms.
4 Clorfeine.
5 MR. STODDARD: Can we also clarify for
6 the record because we'll be discussing this
7 on the record presumably that this is marked
8 as confidential and protected.
9 MR. GRUEN: Indeed. And to that end,
10 why don't we seal the record for this portion
11 of the transcript. Let's be under seal for
12 this.
13 Let's go off the record.
14 (Off the record.)
15 MR. GRUEN: Back on the record.
16 Q Ms. Razavi and Ms. Kitson, do you
17 see a copy of Exhibit 3 in front of you?
18 WITNESS KITSON: A Yes.
19 WITNESS RAZAVI: A Yes.
20 Q Do you have any corrections to the
21 way I described the cover page of that
22 document?
23 WITNESS KITSON: A No.
24 WITNESS RAZAVI: A No.
25 Q Okay. Thank you. Ms. Razavi, are
26 you familiar with the WellView Data Integrity
27 Project?
28 A Yes.

1 Q Okay. And can you describe at a
2 high level what it is, please?
3 A WellView is a well data management
4 system. And one of my first projects was to
5 digitize the records and use WellView for
6 that as a central repository for the
7 digitization of the data.
8 Q Okay. And it -- I see here it
9 began March 14th, 2015? Is that an accurate
10 start date?
11 A I can't remember exactly when it
12 starts, but the timeframe is about March.
13 Q Okay. Very good. What kinds of
14 data was digitized as part of the WellView
15 Data Integrity Project?
16 A Data that would draw the
17 schematics. That was our priority to make
18 sure we have Wellbore schematics.
19 Q Okay. Any data about other data,
20 non-schematic data about the history of
21 wells?
22 A That was the priority. So our
23 priority was to first make sure the Wellbore
24 schematic was being drawn properly in the
25 database.
26 Q And point noted about the priority.
27 I understand. Was -- I'll get it to later.
28 What was the WellView Data

1 Integrity Project used for?
2 A To digitize the well data into a
3 central repository and use WellView for that.
4 Q Was it used for integrity
5 management purposes?
6 A The goal was to have the data
7 digitized and be able to pull information in
8 and out of that database to enhance our,
9 again, data on -- use the data for integrity
10 management.
11 Q Okay. Thank you. Was it also used
12 for day-to-day operations and maintenance?
13 A No.
14 Q Okay. What other things was it
15 used for other than integrity management?
16 A Well, it was used for workover
17 drilling and abandonment operations.
18 Q Okay. All the way from the
19 drilling to the abandoning of -- if that was
20 the case for a particular well then? Am I
21 following that correctly?
22 A Timeframe matters. So if WellView
23 was the software that was implemented, then
24 it would have been used for those purposes.
25 Q Okay. Okay. Was it used to
26 document compliance with the requirements of
27 the Department of Oil and Gas Geothermal
28 Resources?

1 A For what timeframe?
2 Q Well, let's start with March 4th,
3 2015 to current date.
4 A And what requirements exactly?
5 Q Let me back up and just clarify
6 because your point about timeframe is good.
7 And let me -- I think it's appropriate to
8 nail down the dates, the timing of the
9 WellView Project. The WellView Integrity
10 Project.
11 So I understand it started in March
12 of 2015. When did it end?
13 A It's actually ongoing. We're
14 continuously digitizing and enhancing our
15 databases.
16 Q Understood. Okay. So with that
17 timeframe in mind from March of 2015 to
18 present day.
19 If I used the term "DOGGR" as an
20 acronym for Department of Oil Gas and
21 Geothermal Resources, will you understand
22 that acronym?
23 A Yes.
24 Q Excuse me. I stand corrected. The
25 Division of Oil Gas and Geothermal Resources
26 is represented by the acronym "DOGGR."
27 Will you understand if I use the
28 term?

A Yes.

Q Ms. Kitson, will you also understand if I use that term?

WITNESS KITSON: A Yes.

Q Okay. Thank you. So you asked about what sorts of DOGGR requirements. Let me ask, because you're the one with the knowledge on this point. So what sorts of DOGGR requirements was the WellView Data Integrity Project used to comply with?

A We used WellView to produce well histories and well size in compliance with DOGGR requirements for workover drilling and abandonment activities.

Q So DOGGR required that Southern California Gas Company provided it with -- I am sorry summaries and what?

A Well histories.

Q Well histories?

A Those forms have a specific number. I believe they're OG-100 and OG-103.

Q Thank you. And those are for DOGGR rules, DOGGR requirements? OG-100 and OG-103?

A Yes. They're DOGGR forms.

Q DOGGR forms. Okay. So those are summaries and history -- excuse me. Let me back up.

1 Those forms are used in order for
2 SoCalGas to fill out and thereby provide
3 DOGGR with summaries and well histories?
4 A Correct.
5 Q Okay. Thank you. Was the WellView
6 Data Integrity Project used to provide
7 communications with DOGGR about other well
8 data other than what you just described?
9 A As a point of clarification, this
10 project was done to digitize the records.
11 Q Okay.
12 A The communication would be done
13 through those who conducted those activities
14 and complied with those forms.
15 Q Understood.
16 A And provided those forms.
17 Q I follow. So then the forms, the
18 OG-100 and OG-103, would then be digitized
19 and entered into WellView?
20 A It would have been already in a
21 digitized format printed out of WellView
22 provided to the Division of Oil Gas
23 Geothermal Resources.
24 Q I see. So the digitization would
25 have automatically -- not would have. The
26 digitization of OG-100 and OG-103 was put
27 into WellView when those forms were created?
28 A Okay. Sorry. Let me clarify what

1 the project was. So WellView is a well data
2 management system.
3 Q Okay.
4 A It's a software and application
5 that has over 3,000 fields. This project was
6 to enter information, and it has visuals, to
7 be able to draw Wellbore schematics.
8 That was the first thing to put the
9 basic information about a well, about a
10 casing, a tubing, so it can draw those
11 properly. And it was also used, separate
12 from this project, by the drilling group that
13 conducted workover drilling and abandonment
14 operations to record the daily activities for
15 those drilling workover and abandonment in
16 WellView.
17 Subsequently, once the job was
18 completed, the OG-100 and 103 would be
19 produced out of the database for those
20 activities. So there are two separate
21 projects if you may.
22 Q I see. Okay. To be sure I'm
23 following, the information that had been
24 input in WellView, information about workover
25 drilling and abandonment operation was then
26 used once completed in order to create or
27 produce OG-100 and OG-103 for WellView?
28 A Correct. Not a part of this

1 project.
2 Q Yes.
3 A Yes.
4 Q So WellView -- was now that there's
5 information in WellView, the information can
6 then be used as separately. Separate from
7 the WellView Project in order to create
8 OG-100 and OG-103?
9 A Correct.
10 Q For purposes of reporting to DOGGR?
11 A Correct.
12 Q Understood. Thank you. That's
13 helpful. Okay. We've talked a little bit
14 about WellView. Why don't we get into the
15 document if we can. So if you'd turn to
16 page 2, which is Exhibit 3, which has the
17 Bate Stamp the last digits are 710. And I'll
18 read the project background on page 2. An
19 excerpt at right under the project background
20 heading. And so it says starting in the
21 second paragraph:
22 "In the past 40 to 75 years some
23 wells may have been modified and historical
24 well work records are in paper format. In
25 2001 the company initiated using WellView as
26 its main repository to capture and store well
27 history data and well schematics. To date
28 the company is primarily using paper well

1 files and DOGGR records to track well data.
2 The creation of a WellView database
3 containing the desired well data will reduce
4 the effort required to locate key well
5 information and therefore improve data
6 access, data quality, performance,
7 analyzation, well integrity monitoring, and
8 decision making.
9 At the start of the project, all
10 well schematic paper documents were scanned
11 into WellView as simple attachments.
12 However, approximately 95 percent of the
13 actual critical well data remains outside of
14 the WellView database. The majority of the
15 well files within the database are either
16 entirely or partially incomplete. Therefore,
17 the integrity of the well cannot be properly
18 monitored. Nor can the well data be analyzed
19 within the powerful WellView application.
20 Well Lifecycle Resources, LLC (WLR)
21 outlines the following phases as necessary to
22 correct the well data within the company's
23 WellView database bringing the data accuracy
24 to as near 100 percent as possible using the
25 available historical data."
26 Do you see that passage I just
27 read?
28 A Yes.

1 Q Okay. Thank you. The project
2 objective just below that -- do you see the
3 heading under that that says, "Project
4 objective"? And it says the project
5 objective, at least the first one is to audit
6 the existing state of the well data within
7 each well file as detailed below within the
8 WellView database. Do you see that?
9 A Yes.
10 Q Okay. Now some questions.
11 A Sure.
12 Q So as its main repository to
13 capture and store well history data and well
14 schematics in 2001, referring to the 2001
15 date, how had the data in WellView been used
16 from 2001 until the start of the WellView
17 Data Integrity Project in March 4, 2015?
18 A I don't know. Because I wasn't
19 with the group.
20 Q Okay. Okay. Do you know who would
21 know?
22 A Potentially Todd Van De Putte.
23 Q Ms. Kitson, can you shed any light
24 on the answer to that question?
25 WITNESS KITSON: A I would agree. It
26 would be Todd Van De Putte or Dan Neville
27 (phonetic). Someone who might have been in
28 the group prior.

1 Q Okay. Thank you. And I think
2 we're -- you were talking about digitization
3 and the process of capturing well data and
4 well schematics. Is this the process that
5 we're talking about? The WellView Data
6 Integrity Project?
7 WITNESS RAZAVI: A Yes.
8 Q Very good. Between 2001 and
9 March 4th, 2015, so prior to the inception of
10 this document here, was there an index or
11 something like it to find -- help figure out
12 where a record was in WellView?
13 A What records?
14 Q Any record in WellView? Go ahead.
15 A Let me just -- maybe I can shed
16 some light on how WellView is.
17 Q Please.
18 A Every well has a name, has an API
19 number. Within each well if there's
20 information in WellView, an attachment, it's
21 fairly simple to find that out. So it's a
22 database.
23 Q Okay. So let me just ask generally
24 then, how was WellView used from 2001 until
25 March 4th of 2015?
26 A I don't know.
27 Q Okay. I'm sorry the number that
28 you had just referenced, and I forget the

1 term that you used. It slipped my mind.
2 There was an authenticating number on a well
3 file? Am I following that correctly?
4 A Each well has an API number. Think
5 of it like a unique identifier for each well.
6 That is designated to each well by the
7 Division of Oil and Gas Geothermal Resources.
8 Q Okay. And so were the API numbers
9 used for reference within WellView as well
10 between 2001 and March 4th, 2015?
11 A I can't -- I don't know about 2001.
12 I know in 2015 we were able to locate wells
13 by API number in WellView.
14 Q Understood. Do you know how far
15 back -- how far back can you tell the API
16 numbers were used in WellView?
17 A I don't know.]
18 Q Okay. And could the API number be
19 used in order to access schematics in
20 WellView for the time you were aware in 2015?
21 A Yes.
22 Q Okay. If someone needed to access
23 to see well data, well -- the data showing --
24 the historic data on a well or a schematic
25 prior to October 23, 2015, where would they
26 go to find it?
27 Would they go to WellView? Would
28 they go to the paper files? Or would they go

1 somewhere else?
2 A Depends on what type of data.
3 Q Okay. Let’s go back to the
4 workover drilling and abandonment operation
5 data. Where would they go to find that data?
6 Would they go to WellView? Prior
7 to October 23rd, 2015, would they go to
8 WellView? Would they go to the hard copy
9 well file? Or somewhere else?
10 A Potentially, a combination of both.
11 Q Where would they go first?
12 A And from when to when are you
13 referring to?
14 Q Well, I want to -- I don't want to
15 go beyond your awareness here. So I'm
16 sticking with 2015, unless you're aware of
17 WellView -- the use of WellView prior to
18 2015. But if I'm understanding right, you
19 said we weren't?
20 A Correct.
21 Q Okay. So let’s just stay with
22 2015, prior to October 23rd, 2015, with.
23 That timeline in mind, if someone
24 wanted to access the workover drilling, and
25 abandonment data for a well file, would they
26 go to WellView or to the hard copy file or
27 somewhere else?
28 A A combination of both.

1 Q Okay.
2 A The hard copy file and WellView.
3 Q So they would go to both places?
4 A Correct.
5 Q To be sure? Okay.
6 What about for a schematic? The
7 same question. Beginning of 2015 to prior to
8 October 23, 2015, if someone wanted to access
9 and see a schematic for a given well, would
10 they go to WellView or a paper file or both?
11 A Both.
12 Q Okay. Would they go anywhere else
13 to access that data?
14 A Not that I'm aware of.
15 Q Okay. Same time period, let’s say
16 January 1st 2015 to October 22nd, 2015, and
17 let’s just keep those date in mind for these
18 questions unless I specify otherwise.
19 Do you understand that?
20 A Yes.
21 Q Okay. Did someone accessing data
22 in WellView have any means of confirming that
23 the information they found in WellView was
24 accurate?
25 A I don't understand your question.
26 Q How did someone know when they were
27 looking at data in WellView that they were
28 looking at accurate data?

1 A They would have to look at the hard
2 copy well files and make sure they are
3 familiar with the history of that well.
4 Q Is that why they looked at both
5 things? They looked at the hard copy to
6 confirm that the information they were
7 accessing if in WellView was accurate?
8 A I don't want to speculate, so...
9 Q Okay. So --
10 A I don't know.
11 Q You don't know?
12 A Correct.
13 Q Understood. Okay.
14 What about completeness of
15 information? How would someone looking in
16 WellView during this time know whether the
17 information they were accessing was complete?
18 A Looking at the hard copy well
19 files.
20 Q Okay. And if they looked at the
21 hard copy well file, after looking at that
22 and WellView, how would they then know the
23 information was complete?
24 A I don't know.
25 Q Okay. How would they know looking
26 at WellView and the well file, the hard copy,
27 were there discrepancies for given well files
28 between the two sources of information during

1 that time period?
2 A I don't know.
3 Q Okay. I'm going to glean from your
4 answers that if I ask -- let me just ask it.
5 If I ask questions about well file
6 data, including schematics, workover
7 drilling, to abandonment operation, prior to
8 2001, will you be able to answer questions
9 about that time period?
10 A No.
11 Q Okay. Understood. On page 2 of
12 the document -- and this is Bates -- This is
13 Exhibit 3. And the last three digits of the
14 Bates stamp are 710.
15 Just touching on this again, the
16 sentence that says under project objective,
17 "Audit the existing state of the well data
18 within each well file as detailed below
19 within the WellView database."
20 Do you see that?
21 A Yes.
22 Q And that audit that is being
23 referenced there included well data at Aliso
24 Canyon as shown on the next point under that
25 bullet; is that right?
26 A Yes.
27 Q Okay. Continuing down under
28 project objectives, the next full bullet was

1 to "Obtain and review all available
2 historical documentation and compare to the
3 data recorded in the WellView database."
4 Do you see that?
5 A Yes.
6 Q Okay. And then the historical
7 information included all the things listed
8 below there?
9 A (Long pause.)
10 Q Why don't we cover it. I note --
11 so, the historical information included
12 review of every daily report and additional
13 reports tallies, casing cement, tubing, et
14 cetera; is that right?
15 A Yes.
16 Q Including verifying every depth OD
17 and ID of well bores, casing cement, tubing
18 and well head?
19 A Yes.
20 Q And what do OD and ID stand for?
21 A Outside diameter and inside
22 diameter.
23 Q And included verifying definitive
24 surveys?
25 A (No response.)
26 Q I won't go through every one. But
27 I want to just get it on the record so
28 someone could see, basically, these different

1 things. I think I've got an idea.
2 So I want to ask about the fourth
3 point down, "Correcting data gaps in
4 WellView," under the second project
5 objective?
6 A Yes, I see that.
7 Q Okay. What sorts of the electronic
8 and paper files were audited in order to
9 correct data gaps?
10 A Well files.
11 Q Okay.
12 A So the purpose of the project was
13 to review the hard copy well files and
14 digitize those and put them into WellView.
15 Q Okay. And I think -- did
16 correcting data gaps in this case mean adding
17 to incomplete information? Or correcting
18 inaccurate information? Or something else?
19 A Adding into the well information
20 and also looking for correctiveness of the
21 information.
22 Q Okay. So it was both?
23 A Yes.
24 Q Both adding where there was missing
25 information and correcting inaccurate
26 information.
27 Am I getting that right?
28 A Based on the hard copy paper files

1 that had accurate information, yes.
2 Q Okay.
3 A If there was a typo of depth,
4 correct those.
5 Q For example?
6 A For example, yes.
7 Q Understood.
8 Were the project objectives
9 followed that are shown here?
10 A To an extent. We started, I
11 believe, with our La Goleta storage field.
12 Q Mm-hm.
13 A I can't remember, actually, so with
14 all of the fields we started. Yeah.
15 Q Okay. So they were followed for La
16 Goleta?
17 A Yes.
18 Q And I get that they are ongoing, so
19 maybe asking you "Were they followed" is not
20 the right way to ask the question really.
21 But, to date, to your knowledge,
22 have these project objectives been followed
23 in order to do the WellView data integrity
24 project?
25 A Yes.
26 Q Okay. Was there a document that
27 was used to review the audit results and the
28 corrected data?

1 A I believe we recorded that on
2 spreadsheets.
3 Q Okay. And what did you term that
4 spreadsheet?
5 A I can't remember.
6 Q Okay. Was there a forward action
7 plan to maintain data for long-term
8 stability? I'm sorry -- long-term
9 sustainability.
10 Let’s see if I can find that in
11 here.
12 WITNESS KITSON: It's the last bullet.
13 (Crosstalk.)
14 MR. GRUEN: Thank you.
15 So where it says, "Conclude a
16 forward action plan to maintain data for
17 long-term sustainability," there was a
18 forward action plan for long-term
19 sustainability?
20 A Well, if a project is still ongoing
21 and we're providing --
22 Q Point taken. Yes.
23 Is there an ongoing forward action
24 plan to maintain data for long-term
25 sustainability?
26 A Yes.
27 Q Okay. And, I guess, it’s called
28 the forward action plan? Is there another

1 term for it?
2 A No. It's a combination of
3 processes and governance that my team does,
4 provide training and ensuring that the data
5 is collected in the fields and are collected
6 and inputted in the proper formats in the
7 proper fields within the database to ensure
8 data integrity within our database.
9 Q Okay. All right.
10 Let's turn to page 3 of Exhibit 3,
11 if you would. And that has the last three
12 digits of the Bates stamp is 711. And
13 looking at the -- under process, where it
14 says, "The WLR team improves the well data
15 integrity in the following manner." I think
16 we read it earlier.
17 If you could, what is the WLR?
18 What does that stand for? Is that well life
19 cycle resources?
20 A Yes.
21 Q Okay. So it's the consultant that
22 was responsible for this work; is that right?
23 A Yes. They were hired under my
24 supervision to conduct these activities.
25 Q Thank you. Who was on the WLR
26 team?
27 A The contractors?
28 Q Yes.

A I can't remember their names.

Q Okay. If we -- I suppose we could data request that if we needed to, and we could find out.

Were there people from SoCalGas, as well, who worked with WLR? Obviously, you did. Were there others within SoCalGas who worked with WLR in order to do the WellView data integrity project?

A I don't believe they interact -- I mean, they -- their main responsibility was to look at the well history in the well file, scan them, review them, and input the data into WellView.

Q Okay.

A And that's as of March 4th, 2015.

Q Okay. So, two things about that, so did the -- it was just you and WLR who were working on the WellView data integrity project then?

A Correct.

Q Okay. And did the scope of the work change since March 4, 2015?

A Yes.

Q How so?

A We have -- we are capturing and digitizing more of the information. So, as I mentioned before, our focus was where

1 schematics only first. So we've expanded it
2 to capture more information in the WellView
3 database historical information.
4 Q Yes. Can you elaborate on what
5 kinds of information it has been expanded to
6 include to capture?
7 A For the time frame of? Which time
8 frame are we referring to?
9 Q Well, let’s back up.
10 So we're talking -- initially,
11 we're talking March 4th, 2015, or
12 thereabouts, when the project started. And
13 it’s still in effect today.
14 A Correct.
15 Q And I understand from you that the
16 scope has changed --
17 A Mm-hm.
18 Q Since March of 2015?
19 MS. CLORFEINE: Avi, wait for him to
20 finish the question before you answer.
21 Sorry --
22 MR. GRUEN: Sorry.
23 MS. CLORFEINE: No, sorry for
24 interrupting. I just wanted a clear record.
25 Because she's saying sorry every time you're
26 saying something. So I just want to be clear
27 when you're done asking your question.
28 MR. GRUEN: I appreciate it. Thank

1 you. And this one is a bit long, just to
2 capture and be sure I'm understanding what
3 you're saying, so...
4 MS. CLORFEINE: Sorry to interrupt.
5 MR. GRUEN: Not at all. I appreciate
6 it.
7 Q So in terms of timing, how did the
8 scope of the WellView data integrity project
9 change since March of 2015?
10 WITNESS RAZAVI: A It’S expanded.
11 Q And if you -- you mentioned that.
12 And I think you mentioned it’s been expanded
13 to capture various additional types of the
14 information, in addition to workover drilling
15 and abandonment operation and schematics.
16 Am I capturing that right?
17 A Yes. Can I add some clarification
18 to that?
19 Q Please do.
20 A So part of -- two things. This
21 vendor is not working on that project at the
22 moment, since my group has expanded. So we
23 are -- we have a dedicated group that
24 provides training to those who capture
25 information in WellView. While the workover,
26 abandonment, and drilling operations, the
27 actives were captured, now, what we've done,
28 we said -- I'll give you an example.

1 Instead of typing that we drilled
2 17-inch hole, now we're using that and
3 putting it into the fields that can be
4 queried out quicker. So if one wanted to
5 have the information in a tabular format
6 quickly, you could run a report out of
7 WellView. So in those senses, the scope has
8 expanded to train those who collect
9 information in the field, corrected in
10 formats that now could be queried out quicker
11 and be fed into our integrity management
12 program and the risk model.
13 Q I follow. I think I'm hearing it's
14 not the substance or kinds of information
15 that's been changed, but how it's tabulated
16 or compiled?
17 A Correct.
18 Q Did the scope of work in any way
19 expand or change for the WellView and data
20 integrity project as a result of what
21 happened on October 23, 2015?
22 A Um -- no, we continued the effort.
23 Q Okay. Okay.
24 So in terms of -- if you'll bear
25 with me a second?
26 A Do you mind if we take a quick
27 break?
28 MR. GRUEN: I do not. In fact, maybe

1 this is a good time for a lunch break? We're
2 at noon here. So do you -- we appreciate
3 that. Shall we go off the record?
4 MS. CLORFEINE: Yes, let's go off the
5 record.
6 MR. GRUEN: Off the record.
7 (Off the record.)
8 (Whereupon, at the hour of 12:11
p.m. a recess was taken until 1:25
9 p.m.)]

1 AFTERNOON SESSION - 1:25 P.M.
2
3 * * * * *
4 AMY KITSON,
5 resumed the stand and testified further as
6 follows:
7 AVI RAZAVI,
8 resumed the stand and testified further as
9 follows:
10 MR. GRUEN: So let's go back on the
11 record if we can.
12 EXAMINATION RESUMED
13 BY MR. GRUEN:
14 And I think before we broke for lunch,
15 we were talking a little bit about paper
16 files, existing paper files, and also
17 WellView information -- information WellView.
18 And I think -- I don't know if I actually
19 used the term "well file" in the context of
20 WellView, but let me just ask you:
21 Q Are there well files in WellView
22 now?
23 WITNESS RAZAVI: A Well, "well file"
24 is a broad term; right?
25 Q Well --
26 A And what time frame, again? Sorry.
27 Just want to make sure we're --
28 Q That's okay. So starting with

1 March 4th, of 2015, or starting when the
2 WellView data integrity project began until
3 today.
4 Does WellView have well files?
5 A Yes. There are well information
6 records that are part of the well file.
7 Q Okay. And I know -- let me just
8 clarify. I'm working under the assumption
9 that your knowledge about WellView dates back
10 to the beginning of 2015.
11 Am I right in that assumption?
12 A Yes.
13 Q Okay. And so what about to the
14 beginning of 2015? WellView had well files
15 at that point as well?
16 A Yes.
17 Q Okay. All right.
18 So did you -- I think I was trying
19 to get at -- if you would, look on page 3 of
20 the Exhibit 3, page Bates 711 --
21 So you still have the document
22 entitled "WellView Data Integrity Project" in
23 front of you; right?
24 A Yes.
25 Q And you're on page 3?
26 A Yes.
27 Q And if you look under the heading
28 "process" at number five, it says there,

1 "Review and analyze every historical daily
2 drilling report and other relevant well
3 information gathered from existing paper well
4 files and DOGGR, and compare to the data that
5 is currently in the WellView database."
6 Do you see that?
7 A Yes.
8 Q Okay. So it’s comparing existing
9 well -- paper well files with data that's
10 currently in WellView; is that right? That's
11 what I'm understanding it to say in part.
12 A Yes.
13 Q And comparing DOGGR information to
14 the data that is currently in the WellView
15 database?
16 A That's what's written. I do went
17 to make a point of clarification.
18 Q Yes.
19 A That I believe this was a proposal
20 by the vendor and not a scope that I wrote.
21 Q Okay.
22 A I believe I wrote a request for
23 proposal at some point.
24 Q Okay.
25 A So --
26 Q And --
27 A But, anyways, we can move forward
28 with your question. I just wanted to say

1 that.
2 Q Well, yeah, I'm happy that you
3 mentioned that, because did the scope that
4 you wrote match this proposal?
5 A I don't remember. But I do
6 remember I specifically asked for the rates
7 to be included. And I don't see that in this
8 proposal. That's why I'm not sure if this
9 was a final version or -- it was within that
10 time frame of March 2015, I would say, but
11 I'm not sure if this is a final version,
12 so...
13 Q Do you want to take a look at it
14 and see if there's any information that isn't
15 included in the scope that you proposed for
16 the WellView data integrity project, please?
17 A I don't remember until I --
18 Q Okay. Do you want to take some
19 time off the record to see? Would it help
20 you to take a break and look at this and see
21 if there's anything that was not included in
22 the WellView data integrity project?
23 A Well, I do need to see the proposal
24 -- request for proposal that I wrote.
25 Q I see.
26 A To compare exactly word-by-word.
27 Q Okay. Maybe -- let's go off the
28 record for a second.

1 (Off the record.)
2 MR. GRUEN: Back on the record.
3 Q So while we are off the record, we
4 had asked -- I had understood from you, Ms.
5 Razavi, that you had prepared a Request For
6 Proposal that included the final scope of
7 work with regards to the WellView data
8 integrity project.
9 Did I understand that right?
10 WITNESS RAZAVI: A Yes.
11 Q Okay. Thank you.
12 And we will look to SoCalGas to
13 provide us with that document, please, and I
14 will ask for a data request and, also, to
15 identify, please, how the scope of work
16 changed in comparison to the Exhibit 3 that
17 we've been asking about today. So thank you
18 for the clarification.
19 As we move forward on this, if
20 there are any things that you recall today
21 that we ask about that are not part of the
22 final scope of work, could you please let us
23 know?
24 A Yes.
25 Q Do you know if there's anything
26 that we've asked about so far with regards to
27 Exhibit 3, this document, that were not
28 included in the final scope of work?

1 A As I stated, I don't remember until
2 I see the RFP.
3 Q Sure. I appreciate that. Okay.
4 Do you know if the final scope of
5 work in the Request For Proposal that you
6 prepared included the instruction to review
7 and analyze every historical daily drilling
8 report and other relevant well information
9 gathered from existing paper well files and
10 DOGGR and compare that to the data that is
11 currently in the WellView database?
12 A I believe that is part of the
13 scope.
14 Q Thank you. Okay.
15 So with regards to that, and that
16 instruction, if you will, why -- what was the
17 thinking behind comparing existing paper well
18 files with data that was in the WellView
19 database?
20 A In an effort to digitize the
21 records and centralize them in one location
22 -- so the purpose was to look at the well
23 files and the well histories and put them
24 into WellView.
25 Q Okay --
26 A Specifically, again, priority was
27 to be able to draw the well bore schematic.
28 Q Okay. Thank you. And as you

1 compared existing paper well files with the
2 WellView database data, did the files match?
3 A I don't remember. But the purpose
4 of it was then, again, we're enhancing the
5 database, we're populating the information
6 with it.
7 Q Okay.
8 A And we're, you know, populating the
9 data in it, so...
10 Q So one purpose -- so it was not
11 part of the purpose to check for accurate
12 population of the database based upon -- in
13 comparison to the well files, the paper well
14 files; is that right?]
15 A I don't understand your question.
16 Q When you populated the WellView
17 database, were -- was somebody looking to
18 accurately populate it with the existing
19 paper well file information?
20 A Point of clarification: The
21 contractors would read the well history, and
22 populate the information in WellView.
23 Q Thank you. And was there a quality
24 assurance/quality control process in doing
25 that population that you just described?
26 A For?
27 Q For populating a WellView database
28 using existing well files.

A Well, the well files would have been historical, and had already been sent to DOGGR; so it's historical information, the contractors reviewing the data, inputting it into WellView.

Q I understand.

A Yeah.

Q So -- so, as they're doing that --

A Yes.

Q -- as the -- as they're inputting the data from the historical well file into WellView --

A Uh-huh.

Q -- is someone checking their work to ensure that they've -- they've input the data into WellView accurately?

A Not at the time, we didn't have a process in place, because it was just me.

Q Okay. At the time that WellView data integrity project began, how many wells at Aliso Canyon were in WellView?

A I don't remember.

Q Do you have an approximate sense?

A I do not.

Q Okay. And so, I'm inferring, from your prior answer, you can't tell me how many wells at Aliso -- let me ask this differently.

1 Was any information WellView -- any
2 well file or well history information updated
3 using existing well files?
4 A I don't understand your question.
5 Q Okay. So what I'm getting at is
6 initially I had understood that the well
7 files were being used to populate --
8 A Uh-huh.
9 Q -- WellView, which suggests to me
10 that there was no existing well file
11 information in WellView. It was the first
12 time that information from that -- from a
13 given well file was input into WellView. Am
14 I following you correctly on that part?
15 A I don't know, because the database
16 was in place when I moved to that group.
17 Q Yeah. And I think this is what I'm
18 getting at, is since the database was in
19 place, were there -- here's what I'm
20 envisioning, and I'm looking to you to
21 correct me, is that there were some files
22 that had to be input completely, because they
23 did not exist in WellView, and other files
24 that maybe partially or completely did exist
25 in WellView, and so, the paper files were
26 used to update or somehow supplement that
27 information. Would that be an accurate
28 characterization?

1 A I'm not understanding what you're
2 saying. Sorry.
3 MR. SHER: Darryl, may I?
4 MR. GRUEN: Please.
5 EXAMINATION
6 BY MR. SHER:
7 Q Are you familiar with the
8 document -- sorry, with word processing
9 software called Word?
10 WITNESS RAZAVI: A Yes.
11 Q Are you familiar in Word that you
12 can track changes to a document that you're
13 working on?
14 A Yes.
15 Q Does WellView allow someone to go
16 into the WellView database and determine when
17 data was inputted?
18 A Yes.
19 EXAMINATION
20 BY MR. GRUEN:
21 Q And similarly, does WellView -- so
22 using that anology, the track changes
23 analogy --
24 A Uh-huh.
25 Q -- in Microsoft Word, what other
26 things can be tracked about changes made to
27 WellView?
28 A Date, time of when the data is

1 inputted.
2 Q Who -- who did the inputting?
3 A Yes.
4 Q Reason for the inputting?
5 A No.
6 Q Anything else?
7 A If I understand your question,
8 you're interested in understanding what it --
9 WellView can track in terms of changes made
10 to a data field?
11 Q Yeah, the nature of the changes
12 that were tracked to WellView.
13 A There's a timestamp in WellView, so
14 it does track who and what time and what
15 date --
16 Q Okay.
17 A -- the data was entered.
18 Q Okay. But, not the reasons for --
19 for the -- the changes that were tracked?
20 A Again, what type of changes are we
21 specifically --
22 Q Any changes that were made to
23 WellView.
24 A So, just so I have -- the design --
25 I -- I'd like to take some time and
26 explain --
27 Q Please.
28 A -- how the database works.

Q Please.

A So when there is a workover, drilling or abandonment operation, there's a field that is called the job, and it's -- you -- you cat -- the type of job is categorized in that field.

Q Okay.

A For example, casing repair.

Q Okay.

A So the reason for that data entry is going to be to do a repair --

Q Right.

A -- on the casing, and it's going to have daily operations associated with it and data associated with it.

Q Yeah.

A So it tracks the data on whomever is inputting the data into the database.

Q Okay. So using the casing example --

A Uh-huh.

Q -- in that case, you're talking about a change in conditions to the well. Right?

A Correct.

Q So you're documenting it as a change -- a re-casing project, essentially?

A It's a workover project.

1 Q A workover project.
2 A Uh-huh.
3 Q Are there instances where you were
4 tracking data not because of a change in
5 conditions in the field?
6 A I don't know.
7 MR. SHER: Let me ask.
8 MR. GRUEN: Go ahead.
9 EXAMINATION
10 BY MR. SHER:
11 Q So 2015 onwards, in your
12 experience, has -- have there been wells for
13 which there's been no data input into
14 WellView? I.e., there was just a hard copy,
15 and so, at some point, you were digitizing
16 hard copy records. Correct?
17 WITNESS RAZAVI: A Yes.
18 Q And so, were there any wells for
19 which there was no data in WellView, but you
20 were then going to input the hard copy data?
21 A Can you be more specific?
22 Q Are you aware of any well at Aliso
23 Canyon for which WellView had no data on that
24 well, but you had a hard copy file that you
25 were then going to digitize and put into
26 WellView?
27 A I don't know. I mean that's an
28 ongoing effort, that we're digitizing

1 records. It -- I don't --
2 Q Is it --
3 A I don't remember. I don't know.
4 Q Is it your understanding that all
5 of -- for Aliso Canyon, all of Aliso Canyon's
6 wells and their data, the well file, is all
7 in WellView?
8 A We are in the process of digitizing
9 the data from hard copy to electronic. And
10 to make a point of clarification, from 2015
11 and onwards, any activity done on any well,
12 the data is captured in WellView, and the
13 records are digitized and available in
14 repositories.
15 Q Do you know --
16 A The document --
17 Q I'm sorry. Do you know for how
18 long SoCalGas has used WellView?
19 A I don't.
20 Q Before you arrived, they were using
21 WellView?
22 A Yes.
23 Q And part of your remit 2015 onwards
24 was to update WellView with hard copy data?
25 A I was digitizing the data and
26 migrating the information from hard copy to
27 an electronic database, yes.
28 Q So you're using the word

1 digitizing, and I'm using the word updating
2 WellView. Are they the same thing, in your
3 mind?
4 A I don't know.
5 Q What is the difference, in your
6 mind?
7 A Between updating and digitizing?
8 Q (Nods.)
9 A Are you asking me to speculate?
10 Q Not at all. I'm just trying to
11 understand, because, in my mind, digitization
12 requires updating a digital record. Correct?
13 A Sure, unless a record doesn't
14 exist; then it needs to be created.
15 EXAMINATION
16 BY MR. GRUEN:
17 Q Is -- is there such a thing as
18 updating digital records once they are
19 entered into WellView?
20 WITNESS RAZAVI: A If there's work
21 conducted on a well, the data is constantly
22 being up -- updated, added, or data added to
23 WellView.
24 Q Same question: Is there such a
25 thing as updating information in WellView
26 without work being done on a well or without
27 a change in field conditions?
28 A What field, specifically, and

1 timeframe and --
2 Q I'm asking it generally on purpose.
3 A Uh-huh.
4 Q So I'm trying to get a sense if
5 there are reasons other than the change in
6 field conditions or workovers that would
7 prompt information in WellView to be updated.
8 Do you know the answer to that question?
9 A I don't.
10 Q Okay.
11 EXAMINATION
12 BY MR. SHER:
13 Q Do you know if -- in your
14 experience, throughout your entire career at
15 SoCalGas, have you come across any wells for
16 which there was no data in WellView?
17 WITNESS RAZAVI: A For which fields?
18 Q Aliso.
19 A I don't know.
20 Q Any of the other fields?
21 A Yes, Montebello.
22 Q And can you explain what you found?
23 A Oh, I didn't find anything.
24 Montebello wells are not in WellView.
25 Q Montebello is not in WellView?
26 A Correct.
27
28

1 EXAMINATION
2 BY MR. GRUEN:
3 Q Let me ask you to -- the -- the
4 reason -- back to track changes analogy from
5 Microsoft Word.
6 In terms of tracking the changes in
7 WellView, are there any tracked changes for
8 reasons of corrections to inaccurate data?
9 A As part of the digitization effort,
10 if, again, there was information in WellView
11 that there was a typo on a depth, that would
12 be corrected.
13 Q Any other types of corrections to
14 inaccurate data that would be shown in the
15 tracked changes?
16 A I don't know.
17 Q Okay. What about tracked changes
18 for reasons that data was incomplete in
19 WellView, and was being supplemented?
20 A The efforts that I was involved in,
21 and I'm still involved in, is to digitize the
22 hard copy records into WellView. So there
23 has been times that all the information isn't
24 in WellView because the well was drilled many
25 many years ago, potentially before the
26 company adopted WellView, that there are
27 going to be information that are in hard
28 copies that are not in WellView. We're in

SED SUR_REPLY_001977

1 the process of digitizing them.
2 Q And in those instances in -- in
3 certain of those instances, was there part of
4 a file, a well file, already in "L" -- in
5 WellView?
6 A I don't know. I need -- I mean we
7 can look at a specific case.
8 Q Sure. I -- yeah. Well, I'm asking
9 generally. We can look at that later.
10 But, I think that what I'm trying
11 to get at here is whether there is
12 information that was -- that -- that
13 needed -- whether there are information gaps
14 in a well file that had to be filled in a
15 well file in WellView. Does that make sense?
16 MR. STODDARD: Regarding -- I think
17 she's been -- I mean I just want to make sure
18 that everybody's understanding, because I
19 feel like I'm hearing that --
20 MR. GRUEN: Yeah.
21 MR. STODDARD: -- that -- she's been
22 very clear that the purpose of this was to
23 migrate data from hard copy well files to
24 WellView; and so, by design, they were
25 bringing data that already existed out of the
26 well files that had already been recorded in
27 hard copy format, and putting them into
28 WellView. So the answer to your question

1 would be "Yes."
2 MR. GRUEN: I --
3 MR. STODDARD: I just don't know if --
4 MR. GRUEN: No, I don't -- I don't
5 think that's -- respectfully, I don't think
6 that's -- that's right. I get that much.
7 Q But, I'm asking something set --
8 differently from that, and that is whether
9 there was a well file that was incomplete in
10 WellView, and needed to have gaps filled in
11 in that well file to make it complete.
12 WITNESS RAZAVI: A So, well file,
13 throughout our conversation this morning and
14 this afternoon, we've referred to most of the
15 hard copy records. Right?
16 Q Sure.
17 A So our hard copy records are
18 complete, and they've been used as a means to
19 digitize the information in WellView.
20 Q Okay.
21 A As a company, we are digitizing all
22 of our records, and --
23 Q Okay.
24 A -- moving towards putting them into
25 a document management system.
26 Q Okay.
27 A So we are going to have all
28 digitized well files. So --

1 Q Okay.
2 A -- I'm not -- yeah.
3 EXAMINATION
4 BY MR. SHER:
5 Q Sorry. I heard you say, correct me
6 if I'm wrong, that the company had only
7 complete hard copy records for all of its
8 wells, meaning that there were no hard copy
9 well files missing data?
10 WITNESS RAZAVI: A That's my
11 understanding. From my perspective, when I
12 came on board, I was under the impression
13 that the hard copy files are complete and
14 accurate, and they are the main source of the
15 data.
16 MR. GRUEN: Okay.
17 WITNESS RAZAVI: A So we used those to
18 digitize and migrate into digital format.
19 MR. SHER: Q And there's been nothing,
20 in your experience, to indicate that a hard
21 copy well file was missing data?
22 WITNESS RAZAVI: A Not that I'm aware
23 of.
24 Q You've -- no one at Edison --
25 sorry. I always do that.
26 No one at SoCalGas alerted you or
27 someone you knew that there was data missing
28 from a hard copy well file?

A Not that I remember.

Q Okay.

EXAMINATION

BY MR. GRUEN:

Q Okay. So to -- to point five again on Exhibit-3, the portion of that statement that compares DOGGR data to the data that is currently in the WellView database, do you see that?

WITNESS RAZAVI: A Yes.

Q Okay. What types of DOGGR data were reviewed?

A I don't remember. We submit all of our data to DOGGR.

Q Okay. So -- so do you recall what types of DOGGR data were compared with data that was in the WellView database?

A I believe the well history and well summaries.

Q Okay.

A OG-100 and 103s, where it existed.

Q Okay. Why did you compare DOGGR data that -- the DOGGR data you just described with data that was in the WellView database?

A In an effort to digitize the data.

Q Right.

1 EXAMINATION
2 BY MR. SHER:
3 Q Sorry. The DOGGR data is in
4 SoCalGas' possession or in DOGGR's
5 possession?
6 WITNESS RAZAVI: A Well, we have --
7 it's in our well file, but also, we submit it
8 to DOGGR, and they have it on their well --
9 website for well research.
10 Point of clarification: The vendor
11 was working remotely, so one way for them to
12 access the data was -- since they didn't
13 necessarily have all the hard copies scanned,
14 was to access through the DOGGR database.
15 MR. GRUEN: Okay.
16 MR. SHER: Q Just to make sure I -- I
17 understand that, sorry, SoCalGas' third
18 party --
19 WITNESS RAZAVI: A Uh-huh.
20 Q -- working remotely didn't have
21 access to SoCalGas' hard copy well file?
22 A No. They didn't have access when
23 they were on site; however, they would come
24 on site, they would scan certain files, they
25 would go back to their location, and they
26 would also access the DOGGR website.
27 If they finished the work on what
28 they scanned, and what they couldn't make the

1 trip to come out, they would access the DOGGR
2 website, they would get what they could from
3 the website, during their next trip, they
4 would scan a different set of files, and they
5 would continue the digitizing.
6 Q Just to be very very clear --
7 A Sure.
8 Q -- you're not describing an
9 instance where the reason they went to the
10 DOGGR website or to DOGGR to get data was
11 because the hard copy well file was missing
12 data?
13 A Correct. No, that is not the case.
14 Q Is -- is there a reason why, as
15 opposed to going to the DOGGR website when
16 they were off site --
17 A Uh-huh.
18 Q -- that SoCalGas couldn't scan the
19 hard copy well file for them, and send it on
20 to them, or FAX it to the consultant?
21 A Yes, bandwidth.
22 Q Band --
23 A There was one person managing the
24 project and other projects, and that was me.
25 Q And so, did you give direction to
26 the consultants to go to the DOGGR website,
27 as opposed to coming to you, because of
28 bandwidth concerns?

1 A They would ask me, but I had
2 instructed them to definitely check the DOGGR
3 website, and then when they would come on
4 site, they could compare, and they would scan
5 what wasn't in DOGGR's website, and digitize
6 the information in WellView.
7 Q So part of their role would be,
8 when they came back to the Aliso Canyon, they
9 would compare what they got from DOGGR, what
10 was in the well file, and whatever they
11 didn't get from DOGGR, but was still in the
12 well file, they would then digitize that
13 remaining --
14 A Correct.
15 Q -- data? Thank you.
16 EXAMINATION
17 BY MR. GRUEN:
18 Q On -- on that point, let's say that
19 they -- the third party got information from
20 DOGGR and got information from the -- the
21 hard copy well file, used both in order to
22 compare with the WellView database, but the
23 DOGGR information and the well -- hard copy
24 well file information had discrepancies with
25 one another. Do you have that in mind?
26 A I'm not aware of any instances of
27 such.
28 Q You're not aware of any instances

1 of that?
2 A (Nods.)
3 Q Okay. To your knowledge, was there
4 quality assurance/quality control to check
5 for discrepancies between DOGGR and existing
6 well files, hard copies, that were used to
7 populate the WellView database?
8 A That was expected when they're
9 looking at the DOGGR website and then the
10 hard copy wells that -- hard copies on -- on
11 the site. I'm not aware of any instances
12 that that was identified.
13 Q And it -- and it was not documented
14 in instances -- if there were instances where
15 there were discrepancies between DOGGR and
16 existing well files, hard copy, were those --
17 were those documented anywhere, to your
18 knowledge?
19 A Not that I'm aware of.
20 Q Okay.
21 MR. BRUNO: If I may, real quick.
22 MR. GRUEN: Yeah, go ahead.
23 EXAMINATION
24 BY MR. BRUNO:
25 Q Ms. Razavi, do you -- I mean do you
26 contend that everything on the DOGGR website
27 is in the hard copy form, as well?
28 WITNESS RAZAVI: A That was my

1 impression when I joined the team and when I
2 started the project, that the hard copy files
3 have the full well history and data in them.
4 Q And how about the DOGGR data, is
5 the DOGGR data complete, based on your
6 experience?
7 A I don't know.
8 Q So if there was a discrepancy,
9 based on what you've described, it would be
10 that the well file is complete, and some of
11 that information in the well file's on the
12 DOGGR website?
13 A Yes, that's my understanding.
14 Q Would the step of the DOGGR website
15 have been completed if your vendor was on
16 site a hundred percent of the time at Aliso
17 Canyon?
18 A The well file was the main source
19 that they would go to, if they were on site.
20 Q If they were on site a hundred
21 percent of the time for the --
22 A Right.
23 Q -- duration of this project, would
24 they have had a need to go to the DOGGR
25 website?
26 A I don't believe so.
27 MR. BRUNO: Thank you.
28

1 EXAMINATION
2 BY MR. GRUEN:
3 Q Okay. I want to ask you
4 specifically about Well SS-25, both "A" and
5 "B," as part of the WellView data integrity
6 project, so dating March of 2015 to prior to
7 October 23rd, 2015.
8 Did you -- did you update the Aliso
9 Well SS-25 as part of the WellView data
10 integrity project at that time?
11 A What was the time, again? Sorry.
12 Q That's okay. March of 2015 to
13 October 22nd, 2015.
14 A I don't remember.
15 Q Okay. Did you update Well SS-25-A
16 or "B" at any point as part of the WellView
17 data integrity project?
18 A I don't remember.
19 Q Okay. Let's go to point 8 of
20 page 3 of Exhibit-3, where it says,
21 "Schematic generation." Do you see that?
22 A Yes.
23 Q What is a schematic?
24 A A diagram.
25 Q Of a well?
26 A If it's a wellbore schematic, then,
27 yes, it's a down-hole wellbore diagram.
28 Q Okay. And what things are the down

1 wellbore diagrams -- those schematics used
2 for?
3 A I don't know. Someone from
4 operations should probably answer that
5 question.
6 Q At a high level, are they used for
7 integrity management?
8 A I don't know.
9 Q Okay. Ms. Kitson, do you know the
10 answer to that question? Are -- are down
11 wellbore schematics at Southern California
12 Gas Company used for integrity management
13 purposes?
14 WITNESS KITSON: A You're talking
15 about integrity management, the well
16 inspection, so our SIMP team doing the well
17 logging would use the schematic as part of
18 their job.
19 Q As part of their job to do
20 integrity management?
21 A Uh-huh.
22 Q Okay. Just for the record --
23 A Yes.
24 Q -- I think you said, "Yes."
25 A Sorry.
26 Q Okay. Thank you. Would -- are the
27 schematics used -- do you know if the
28 schematics are used to provide information to

1 the California Public Utilities Commission?
2 A I don't know.
3 Q Do you know if the schematics are
4 used to provide information to DOGGR?
5 A The team that does the well logging
6 and inspections, they put together a work
7 plan prior to performing the work, and the
8 schematic and the work plan is sent to DOGGR
9 for permitting process.
10 Q Okay. And so, the schematics in
11 WellView of those wells would be those that
12 were permitted by DOGGR, do you know?
13 A Yeah, I'd have to -- I know we have
14 different --
15 WITNESS RAZAVI: A So I'd like to take
16 a moment, and give a quick background --
17 Q Please.
18 A -- on the schematics.
19 Q That's helpful. Thank you.
20 A While this effort was focused on
21 making sure the data that draws the wellbore
22 schematic is inputted into WellView, the
23 visualization aspect of WellView was
24 challenging, so we used a third party to
25 develop the wellbore diagrams and provided
26 those to DOGGR.
27 Q The third party who developed the
28 wellbore diagrams -- if -- just as -- just

1 for shorthand, if I use the term schematic,
2 you'll understand that to mean wellbore
3 diagram in this case?
4 A Sure.
5 Q Okay. Thank you. So the third
6 party that provided the schematic to DOGGR,
7 was that part of the WellView data integrity
8 project?]
9 A What timeframe are we?
10 Q March of 2015 to let's say just
11 prior to Aliso. The incident at Aliso. So
12 prior to October 23rd, 2015?
13 A During that time, the 3rd party
14 Wellbore diagrams were not produced for
15 DOGGR.
16 Q What timeframe were they produced
17 for DOGGR?
18 A I don't know the exact time but
19 2016, 2017 as a general.
20 Q Okay. Why were they produced for
21 DOGGR?
22 A For the activities that Amy just
23 described for the Storage Integrity
24 Management Program. They would plan their
25 work, and they would have to have a proposed
26 diagram and that was for permitting.
27 Q Okay.
28 MR. BRUNO: Excuse me.

1 MR. GRUEN: Please.
2 EXAMINATION
3 BY MR. BRUNO:
4 Q Are you saying that DOGGR did work
5 on the Storage Integrity Management Program?
6 A No. I'm saying that the workover
7 program had to be permitted by DOGGR. So the
8 group, the SIMP Group, would write the
9 program. They would have to have a proposed
10 diagram available and attached to the plan.
11 And submit it to DOGGR for permitting and
12 then they would approve or reject or permit.
13 Q So it was SoCalGas's work
14 requesting the permit?
15 A Correct.
16 Q It had nothing to do with the
17 comprehensive safety review by DOGGR.
18 WITNESS KITSON: A I'll answer that.
19 So in this case, I think we're talking about
20 the same thing. So a comprehensive safety
21 review by DOGGR included many of the well
22 logging activities that we're referring to
23 here.
24 So, for example, in the
25 comprehensive safety review, order 1109,
26 there are a multitude of well logs that were
27 required. And so the engineers would write
28 up a program detailing the steps that they

1 would take to run those logs and attach the
2 Wellbore diagram to it so DOGGR could see how
3 the program versus what the well looks like.
4 Q That's helpful. Thank you.
5 EXAMINATION
6 BY MR. GRUEN:
7 Q So I think I'm struggling with just
8 one order of events here. The third party
9 provided these schematics to DOGGR in some
10 point around 2016, 2017 somewhere thereabouts
11 these included wells that had long since been
12 permitted; right? They were schematics for
13 wells that had since been -- that had been
14 already permitted by DOGGR?
15 WITNESS KITSON: A The permit we're
16 referring to here is the permit to do the
17 workover. So we cannot, as a company,
18 perform that work without getting a permit
19 from DOGGR. We can't put a rig on that well
20 and run logs without a permit from DOGGR.
21 Q I'm following. Go ahead, please.
22 Did you want to say more?
23 A No.
24 Q I think I am following. What I'm
25 trying to get at is: Was each schematic
26 provided to DOGGR? A schematic that included
27 a workover permit or a drilling permit?
28 A The workover or drilling permit was

1 a result of submitting the diagram to DOGGR.
2 So maybe the third party vendor -- it wasn't
3 -- they provided it to the company, SoCalGas.
4 Not directly to DOGGR. So we solicited the
5 work. They developed a diagram for the
6 engineer. The work plan and the permit -- or
7 the schematic were submitted to DOGGR for a
8 permit to do the work to put the rig on the
9 well.
10 Q Which would be the typical
11 permitting process; correct?
12 A Correct.
13 Q So where I'm -- that permitting
14 process has been going on for years with
15 DOGGR and SoCalGas.
16 But the wells that were -- the
17 schematics that were provided to DOGGR in
18 2016 and 2017, were those schematics -- did
19 all those schematics require some sort of
20 workover or drilling permit?
21 WITNESS RAZAVI: A I don't understand
22 your question.
23 Q Maybe it's just best to ask why
24 were the third parties -- the schematics of
25 the third party that worked on, why were
26 those provided to DOGGR?
27 A We're required to provide a diagram
28 to DOGGR as part of our planning.

SED SUR_REPLY_001993

1 Q Okay.
2 A A proposed pre-work so they can see
3 the existing condition of the Wellbore along
4 with the program and understand how the
5 program is going to reflect the Wellbore.
6 Q Okay. So we're still on the
7 permitting process.
8 A Correct.
9 Q I'm following the permitting
10 process. I'm with you both, and I get that.
11 I appreciate the description. I think what
12 I'm trying to get at is if there were any
13 others, and I'm not -- I'm hearing that there
14 weren't. I think I'm hearing that there
15 weren't any additional schematics provided to
16 DOGGR for reasons other than a permitting
17 process. Am I following that correctly?
18 A I don't know. But what I do know
19 is that we did provide diagram post workover
20 activities to DOGGR.
21 Q Okay. Okay. Which would be -- and
22 the diagrams that provided post workover
23 activities, were those different than the
24 diagrams that were provided to DOGGR for
25 permit in certain cases?
26 A So there are the as built; right?
27 So if there was a change in the process of
28 the workover, they would kind of reflect on

1 the final diagram. So the work would be
2 conducted, and we would give them the final
3 as-built diagram.
4 Q Sure. So the as-built is provided
5 to DOGGR as a matter of course. Whether the
6 project -- whether the workover changed after
7 the permit or not. The as-built was provided
8 to DOGGR as a matter of process?
9 A The final.
10 Q The final diagram?
11 A Yes.
12 Q Okay. Okay. Let me circulate --
13 MR. GRUEN: Let's go off the record for
14 a second.
15 (Off the record.)
16 MR. GRUEN: Let's go back on the
17 record.
18 Q Just with regards, Ms. Razavi, with
19 regards to the WellView Data Integrity
20 Project, when will it be done?
21 A When?
22 Q When will it be finished?
23 A Our timeline is through next year.
24 But it's kind of -- I mean, we're continually
25 updating our process and making it more
26 efficient.
27 I just want to clarify two things
28 because I think maybe this will help put it

1 in context. WellView is a Well Data
2 Management System. So we're taking the
3 well-related information and digitizing it
4 and putting it into WellView.
5 We're also digitizing the record
6 itself and moving it into a document
7 management system. That's another effort
8 that is underway and putting it in so we'll
9 have an electronic record available in one
10 repository so it will be a single repository
11 that it could access the record, and it would
12 have our data access through WellView so.
13 Q Which source, the WellView or the
14 Document Management System will be used for
15 workover, drilling, and abandonment.
16 A So the data would be entered into
17 WellView, and the record would be generated.
18 And that record would reside in the Document
19 Management System.
20 Q And which of -- so the record
21 residing in the Document Management System
22 would be used for workover drilling and
23 abandonment to inform day-to-day decisions
24 for workover drilling and abandonment. What
25 is the source of information?
26 A You need to be more specific.
27 Day-to-day activities of what?
28 Q Okay. Let's take the example you

1 gave before where you had a workover on -- I
2 think the term you used -- I think you were
3 talking about annulus. If you were talking
4 about a casing project, what source of
5 information would you use to inform? To get
6 data to inform the casing?
7 A Okay. Maybe it would be helpful if
8 I just take a moment to explain the different
9 types of information and the different
10 repositories and put it in context.
11 Q Please.
12 A Pressure information has its own
13 repository.
14 Q What's that called?
15 A It's called OSIsoft PI (phonetic.)
16 It's a process information management system.
17 Certain records for wellhead maintenance
18 that's in our repository called Maximo. It's
19 a maintenance management system. Well data,
20 is in WellView. Records, are hard copy and
21 on servers.
22 So we're digitizing the data from
23 hard copy files. Putting the data into
24 WellView, and we are consolidating the hard
25 copies and scanning them and putting them
26 into a document management system. I hope
27 that, kind of, paints the picture.
28 MR. BRUNO: I think it's helpful. I

1 have a couple questions.
2 EXAMINATION
3 BY MR. BRUNO:
4 Q The hard copy digitization work
5 that goes into WellView, isn't that static?
6 In other words, the file is the file. And at
7 some point, 100 percent of that will go into
8 WellView and it will be done? Or are you
9 putting new stuff in the file and then
10 pulling it out of the file and then
11 digitizing it?
12 A So you're right. The file is a
13 file. We're not putting 100 percent of that
14 file into WellView. We're putting -- we're
15 getting the well-related information out of
16 it.
17 So in essence -- let me explain
18 this better. If there is daily operations
19 written from the '40s and the '50s, we're not
20 going and typing all that information back
21 into WellView. Rather, we're reading that
22 well history and we're getting the certain
23 information out of that and putting it into
24 WellView so we can query the data quicker so
25 casing ID, Wellbore size, information as
26 such.
27 Q Sure. And when will that be
28 complete for all the wells at Aliso Canyon?

A Our timeline is through next year.
Q Through 2019?
A Yes.
Q And then just to make sure that I heard you correctly. Some data will remain -- well, all data will remain in the hard copy file. And then they'll be unique data in there like logs from the '50s or '60s or some time period. That's never going into WellView?
A Yes. The daily reports they will not be repopulated in WellView.
Q Are some -- there's over 100 wells at Aliso Canyon; is that correct?
A Depends. Gas storage wells?
Q Gas storage wells. Approximately, over 100?
A I don't remember the number. It all changes.
Q Are they all incomplete at this point in terms of that 2019 deadline or 2019 goal? Or are some done and some aren't? Like the current state of affairs of digitizing the information?
A I believe there's some done.
Q Okay. And then just to make sure -- I do appreciate that background you gave on the different parts of Maximo or WellView.

1 Workover activities that happen
2 today, they will go directly into the system?
3 A Correct.
4 Q They don't go into the hard copy
5 file?
6 A The data and the data activities,
7 they're all in WellView. The records that
8 are generated, they are on our servers and
9 some are attached in WellView.
10 There are also hard copies, but
11 they're all digitized, so we have these
12 electronically.
13 EXAMINATION
14 BY MR. GRUEN:
15 Q Will the updates --
16 A Can I clarify that?
17 MS. CLORFEINE: I think so. Because it
18 can't be hard copy and digitized.
19 MR. GRUEN: Q Can it be hard copy and
20 digitized? Can you have both?
21 A Yes. For example, the inspection
22 logs. The vendors provide us with a hard
23 copy and a digitized format so we have both.
24 Q And if you do a workover, I get
25 that you're updating the data in WellView.
26 Are you doing anything to the hard copies in
27 the Data Management System that you're
28 creating for them?

A We have project plans in to also consolidate all the hard copy records.

Q So not just consolidate but update them as you do workovers for example. Will you update the hard copy -- the hard copy files in the Data Management System as you continue to do workovers even after you complete WellView?

A So records is a different -- I'd like to draw a line between the records and the WellView project. WellView is for the data. Records are the Document Management System.

We do have plans to go fully digitized. However, we do understand there are going to be hard copy records that are provided through the vendors to us. So we're currently planning for consolidation of those hard copy records and updating the well files.

Q When you say "consolidation," I don't think we're using the same terms. I want to be sure. Will the data in WellView continue to match the information on the records in the Data Management System?

A Yes.

1 EXAMINATION
2 BY MR. BRUNO:
3 Q Okay. Where are the hard copies
4 going to go?
5 A In the well files. In the hard
6 copy well file.
7 Q Okay. If a well is plugged and
8 abandoned, do you still maintain the hard
9 copy of the well file?
10 A Yes.
11 Q How about in the electronic system?
12 Is that still maintained?
13 A Yes.
14 Q Indefinitely?
15 A Our retention policy is for the
16 life of the facility plus five years. And
17 that's the life of the storage facility plus
18 five.
19 Q So the Aliso Canyon Storage
20 Facility?
21 A Correct.
22 MR. GRUEN: Let me circulate if I can.
23 Off the record, please.
24 (Off the record.)
25 MR. GRUEN: Okay. Let's go back on the
26 record.
27 Wile we're off the record, I
28 circulated a document. Ms. Razavi, if I

1 could just confirm your recognition of this.
2 So this is marked
3 AC_CPUC_SED_KITSON_0000708. It has an
4 attached document that's stapled to it, which
5 unfortunately the Bates numbers didn't print
6 on this one. But we will -- just for
7 purposes of identifying the document this is
8 an e-mail that appears to be from Avi. There
9 is Avi. It's dated January 15th, 2016,
10 7:17 a.m. The subject is SIMP-WellView data
11 cleanup update. The attachments WLR-SoCal
12 WellView Database Integrity
13 Project-01.14.2016.PDF; Completed Well 2015
14 XLSX.
15 Q First of all, Ms. Kitson -- excuse
16 me. Ms. Razavi. Excuse me.
17 WITNESS KITSON: A That's all right.
18 Q As you see it, did I describe all
19 those things correctly?
20 WITNESS RAZAVI: A Yes.
21 Q And is this indeed an e-mail from
22 you dated January 15th, 2016?
23 A Yes.
24 Q You wrote this then?
25 A Yes.
26 Q Is the document -- do you recognize
27 the document attached to this hard copy
28 that's stapled as the attachment that is

1 labeled here the WLR SoCal WellView Database
2 Integrity Project?
3 A Yes.
4 Q So you are familiar with the list
5 of wells identified in the attachment then?
6 A Yes.
7 Q Okay. Turning to the e-mail itself
8 on January 15th, 2016, that you wrote, the
9 second paragraph says,
10 "Attached please see the list of
11 wells that we successfully cleaned up in
12 2015. I've also attached a summary of the
13 scope of the work cleanup criteria along with
14 process used to perform the cleanup."
15 Do you see that?
16 A Yes.
17 Q So then the list that you
18 identified in this attachment to the hard
19 copy is the list of wells that were
20 successfully cleaned up in 2015?]
21 A Yes.
22 Q And if we look at -- if you turn to
23 the document, the attachment, do you see the
24 title -- the name -- the column headings at
25 the top in blue, "Field name, well names, and
26 week completed"?
27 A Yes.
28 MS. CLORFEINE: Just for the record,

1 this is a black-and-white copy.
2 MR. GRUEN: Okay.
3 WITNESS KITSON: We have color.
4 MS. CLORFEINE: I apologize. I took my
5 glasses off.
6 (Crosstalk.)
7 MR. GRUEN: Some of them may be black
8 and white. But, fortunately, Ms. Razavi has
9 a color copy; right?
10 WITNESS RAZAVI: Yes.
11 MR. GRUEN: We're not trying to confuse
12 you with the colors, just trying to get the
13 facts down. And I'll do my best to refer to
14 the top without using colors for Counsel's
15 benefit. We did have to make some last
16 minute-copies.
17 MS. CLORFEINE: No problem. Thank you.
18 MR. GRUEN: Q So at the top then, the
19 top of the attachment, there are the words
20 "Field name, well names, and week completed."
21 Do you see those headings.
22 A Yes.
23 Q Okay. So the field name would be
24 the field where the well had its history file
25 cleaned up; is that accurate?
26 A Yes.
27 Q And the well name would represent
28 which well had its well history file cleaned

1 up; is that also accurate?
2 A Yes.
3 Q And the week completed would
4 represent the week including the dates,
5 month, and year in which the well file for
6 each well itemized on this list was cleaned
7 up?
8 A The well files were digitized into
9 WellView, yes.
10 Q Okay.
11 A During that week.
12 Q When they were digitized into
13 WellView?
14 A Yes.
15 Q Okay. So is digitizing into
16 WellView the same thing as cleaning up?
17 A In this context, that's what I
18 meant in this email, yes.
19 Q Okay. Okay. And does cleaning up
20 mean anything in addition to digitizing into
21 WellView in this context? Did you mean it to
22 -- did you intend it to mean anything else?
23 A No. I mean, digitizing well files
24 is to WellView.
25 Q Okay. All right. Continuing to
26 the back of the attachment then, do you see
27 where it lists Aliso Canyon?
28 A Yes.

1 Q Let me back up. Yeah. Just -- if
2 I can -- if you go to the email, back to the
3 email January 15th, where it says,
4 "The purpose of this project is to
5 enter missing and/or correct, pertinent well
6 data in WellView."
7 Do you see that?
8 A That's what paragraph?
9 Q The first paragraph, last sentence.
10 A Yes, I see that.
11 Q Okay. So, then, what did you mean
12 when you wrote that sentence?
13 A Well, at the time -- again, the
14 purpose of the project was to digitize the
15 records. So if there were no information in
16 WellView, we were populating that -- or the
17 contractor was populating that in WellView.
18 And if there were errors such as typos or
19 incorrect depths, we would look at the well
20 file and make those corrections into
21 WellView.
22 Q Okay. And you mentioned typos,
23 were you made aware of any other errors in
24 WellView that were corrected?
25 A I don't remember.
26 Q Okay. All right.
27
28

1 EXAMINATION
2 BY MR. SHER:
3 Q Is it clear though that if one were
4 to look at the WellView file or database, one
5 would see what was put in on a daily basis if
6 any changes were made to that particular
7 database?
8 WITNESS RAZAVI: A I need to look at
9 WellView. I do want to make a point of
10 clarification here. So this effort was done
11 by the vendor -- Well Lifecycle Resources.
12 Post this effort, we did a -- well, we're
13 still continuing to do that effort -- we went
14 back to every single well that they had
15 entered information in and we are reviewing
16 the data that they took from the well files,
17 and they populated it as a means of QCing
18 that information that was put in at that
19 time.
20 Q Okay --
21 A So if they entered the data in
22 2015, and we went and reviewed the data, and
23 we identified that there were errors in the
24 data that they entered, we have corrected it.
25 So the last date that that data was updated
26 is in WellView.
27 Q Okay. And, just to confirm, Mr.
28 Gruen was asking you about cleaning up, and

SED SUR_REPLY_002008

1 you said, "We were digitizing." And so your
2 definition of digitize would include clean up
3 and correction per the sentence in that
4 email?
5 A Yes.
6 Q Okay.
7 MR. GRUEN: Q And with regards to that
8 sentence, "Correcting pertinent well data and
9 WellView," were the corrections of the
10 pertinent well data and WellView documented?
11 A Um, there -- I mentioned this
12 earlier, too -- I believe there was a
13 spreadsheet that they captured what the
14 vendor entered.
15 Q Yes, you did. Thank you for
16 reminding me. I remember now.
17 A Yeah.
18 Q The -- okay. If we could turn to
19 the second page, and I was -- to, in fact,
20 the last part of the second page. And you
21 see the in the first column it says, "Aliso
22 Canyon."
23 Do you see that?
24 A Yes.
25 Q And under that, then, in the next
26 column over, the entries there indicate wells
27 at Aliso; is that right?
28 A Yes.

1 Q Okay. And then the entries next to
2 those wells indicate the dates when the clean
3 up happened?
4 A Yes.
5 Q Okay.
6 A I notice a few errors in those
7 dates.
8 Q Do you want to make corrections?
9 Do you want to clarify which errors you want
10 to correct?
11 A Sure. I see that there are 2017,
12 2018, 2020, 2021, and 2019 are noted. Those
13 date are inaccurate.
14 Q And what dates should they be?
15 A I don't know. I don't remember.
16 But looking at it, I know those dates are
17 inaccurate.
18 Q Okay. It looks like the beginning
19 dates are all 2015, if I'm --
20 A Yes.
21 Q -- following.
22 Okay. Do you thing the end dates
23 would all be 2015 as well?
24 A I believe so.
25 Q Okay. So turning to the entries
26 for well SS25-A and SS25-B, do you see those
27 entries?
28 A Yes.

1 Q Okay. And so it looks like the
2 data clean up for those entries occurred
3 between November 9th, 2015 and November 13th,
4 2015.
5 Am I following correctly?
6 A Based on this, yes.
7 Q Okay. So, by my math,
8 November 9th, 2015, the first entry in those
9 is 17 days after October 23rd, 2015. And if
10 you want to correct me, please do, but that's
11 a lawyer's math. So it could be corrected,
12 it could stand corrected. But,
13 approximately, I think we're at about a
14 two-and-a-half week difference though.
15 Does that sound accurate to you?
16 A Sure.
17 Q Is it a coincidence that SS25-A and
18 SS25-B were included in the SoCal WellView
19 database integrity project 17 days after the
20 incident or approximately two-and-a-half
21 weeks after the incident, rather, at well
22 SS25 at Aliso?
23 A I don't know.
24 Q Were you or someone else
25 specifically asked to include SS25-A in the
26 SoCal WellView database integrity project?
27 A I don't remember.
28 Q Do you have any written

1 communications to that effect?
2 A I don't remember.
3 Q Was there anything different about
4 the entry of SS25-A and SS25-B into WellView
5 then the other well files that were for these
6 other wells that were entered into WellView
7 as shown on this attachment?
8 A It should have followed the same
9 criteria.
10 Q Was there anything different about
11 the prompting of SS25-A and SS25-B that
12 distinguished it from the entry of these
13 other wells into WellView?
14 A I don't remember.
15 EXAMINATION
16 BY MR. BRUNO:
17 Q Ms. Razavi, in terms of the errors
18 that you identified in this exhibit with the
19 date, where does this data come from?
20 WITNESS RAZAVI: A The vendor who
21 input the data into WellView.
22 Q So you're saying the vendor made an
23 input error?
24 A Yes.
25 Q And this whole email is about
26 correcting an error that the vendor may have
27 made. But then there's yet another error in
28 the date?

1 A Yes.
2 Q And then was that looked at? Was
3 that quality verified? Or is this the first
4 time you became aware of those dates being
5 off?
6 A It’s the first time I became aware
7 of the inaccurate dates.
8 Q Do you have a quality assurance
9 concern with this vendor?
10 A Yes. That's why we changed our
11 approach.
12 Q And what do you mean by that?
13 A We are now using another vendor and
14 QCing the data that is being inputted into
15 our WellView.
16 EXAMINATION
17 BY MR. SHER:
18 Q When did that take place, the shifted
19 to the new vendor?
20 WITNESS RAZAVI: A It was earlier this
21 year.
22 Q And so this email is your email;
23 correct?
24 A Yes.
25 Q And these documents were attached
26 to your email when you sent it around?
27 A Yes.
28 Q And this is January 2016, and we're

1 now in September 2018. And so only in the
2 last few months it was discovered that the
3 original vendor had data issues?
4 A No, actually. The Well Lifecycle
5 Resources identified that the individuals who
6 were working on these wells had -- they were
7 let go. And for some time, we continued with
8 this vendor with a new team to do the data
9 input. And then, ultimately, we switched
10 vendors from Well Lifecycle Resources to
11 another vendor.
12 Q I noticed that you picked up these
13 errors right away when you looked at the
14 document. Did you not look at the document
15 before you sent it around?
16 A I don't remember.
17 Q Okay.
18 EXAMINATION
19 BY MR. GRUEN,
20 Q To your knowledge, did the well
21 file for well SS25-A look different before
22 November 9th of 2015?
23 A I don't know.
24 Q You know why I'm using that date?
25 I'm using that date as the date that was
26 shown as the dates of the week that was
27 completed -- that SS25-A was completed in
28 WellView, as shown in this attachment to your

email. So you don't -- with that context, you don't remember if well SS25-A looked different than before it was inputted into WellView?

A I don't know. I did not look over the data that was inputted into WellView at the time.

Q Did well SS25-B look -- the data in that well file?

A I don't know.

Q Okay.

MR. SHER: Do you know why these wells -- these particular wells were selected.

WITNESS RAZAVI: I don't remember.

MR. BRUNO: Do you recall the names of the vendor's employees that were let go?

WITNESS RAZAVI: Joel, I can't remember the last name, and Israel were the first names.

MR. BRUNO: Joel and Israel?

WITNESS RAZAVI: Yes.

MR. BRUNO: Thank you.

EXAMINATION

BY MR. GRUEN:

Q You -- turning back to the email that you wrote from January 2015, Exhibit 4, I believe. It states toward the middle, the one with the bullet point, the sentence with

1 the bullet point in front of it; it's the
2 first one.
3 It says, "Phase 1: Update well
4 schematics with current information and
5 production failures, if any, (casing or
6 shoe)(casing tally, directional surveys,
7 tubing, perfs, packer, gravel packs, et
8 cetera) more detail is in the summary."
9 Do you see that?
10 WITNESS RAZAVI: A Yes.
11 Q What summary are you referring to
12 there?
13 A I don't remember.
14 WITNESS KITSON: Perhaps the first
15 attachment.
16 WITNESS RAZAVI: A Yeah. I don't
17 remember.
18 MR. GRUEN: Ms. Kitson, do you --
19 WITNESS KITSON: No, I don't know.
20 Q When reviewing this, I didn't see
21 any additional attachments. But perhaps I
22 was remised. Would you be able to check
23 based on review of your emails and find the
24 summary you're referring to in this email?
25 MS. RAZAVI: A I don't know. Was it
26 attached to this email?
27 Q I'm not sure.
28 A If it exists, yes.

1 Q Okay. Was Phase 1 complete as --
2 at the time you wrote this email?
3 A Yes, I believe so.
4 Q Did it include all the wells for
5 natural gas storage in SoCalGas's possession?
6 A I believe it was completed for the
7 wells that are in the attachment.
8 Q Oh, I see. Okay. All right.
9 Did this email in any way reflect
10 any change in the scope of work identified as
11 part of the March 4th, 2015 WellView data
12 integrity project?
13 A I don't remember. We've captured
14 the information that I've listed there.
15 And I do want to make a point of
16 clarification that I -- while I was a search
17 field engineer and started the project in
18 March 2015, when the relief well operations
19 was kicked off, I was moved from my position
20 and put on the relief well. And this is
21 during that time.
22 Q Okay. Okay.
23 MR. SHER: Who handled your duties
24 while you were put on the relief well?
25 WITNESS RAZAVI: I don't remember how
26 the hand-off worked out exactly.
27 MR. GRUEN: Q Following October 23,
28 2015, were there any changes to the scope of

1 work identified as part of the March 4th,
2 2015 well data integrity project?
3 A Can you repeat that question,
4 please?
5 Q Yeah. I'm looking at the change in
6 the scope for the WellView data integrity
7 project. So it’s just a question about
8 dates.
9 Did the scope of the WellView data
10 integrity project change following
11 October 23rd, 2015?
12 A I don't remember. I don't believe
13 so.
14 Q Okay. Not -- at least not
15 immediately after. I mean, we've established
16 that there may have been some changes at some
17 point later. But I'm asking about immediate,
18 so thank you.
19 So, continuing on. The January
20 email says in the open bullet, "During this
21 phase pertinent well history files have been
22 retrieved from DOGGR website and/or well
23 history files and scanned."
24 Do you see that?
25 A Yes.
26 Q So are these -- were these files --
27 let me just ask you.
28 For what purpose were well history

1 files retrieved from the DOGGR website?
2 A We discussed this earlier, that the
3 vendors were remote.
4 Q Yeah.
5 A And I believe since I was on the
6 relief well, I don't recall them coming
7 onsite during that time.
8 Q Okay.
9 A So they accessed the DOGGR database
10 and extracted information from DOGGR database
11 to put into WellView.
12 Q Understood. So this is referencing
13 the same --
14 A Yes.
15 Q -- relationship between the
16 third-party contractors and providing them
17 the data to DOGGR that you described to us
18 earlier when we were asking about the March
19 4th, 2015 document on the WellView data
20 integrity project?
21 A Yes.
22 Q I follow.
23 MR. SHER: Can I ask a clarifying
24 question?
25 MR. GRUEN: Yeah.
26 EXAMINATION
27 BY MR. SHER:
28 Q Just -- so it’s your testimony that

1 the third-party vendor was not using the
2 DOGGR website and DOGGR information to enter
3 missing and/or correct pertinent well data in
4 WellView; is that correct?
5 WITNESS RAZAVI: A They were using.
6 Q So, again, I understood from
7 earlier?
8 A Mm-hm.
9 Q That the third party was only using
10 the DOGGR website information because they
11 weren't onsite at Aliso, and so that
12 information wasn't with them. And it was --
13 A Correct.
14 Q -- easier to get it from DOGGR.
15 A Correct.
16 Q What I'm trying the find out now,
17 was the third-party vendor using the DOGGR
18 website and DOGGR information to enter
19 missing and/or correct pertinent well data in
20 WellView, in addition to using the website
21 because it was easier?
22 A They were using the information on
23 DOGGR website because they didn't have access
24 to the onsite well information to input the
25 data into WellView.
26 Q Okay. So they were not using the
27 DOGGR website and DOGGR information to
28 correct missing information?

1 A Well, they were populating
2 information that previously could maybe have
3 not been there. I mean, that's the whole
4 exercise with this project.
5 MR. STODDARD: I have to object. She's
6 testifying as to her recollection and
7 understanding. But she can't testify as to
8 what the third-party vendor understood itself
9 to be doing when it was pulling DOGGR
10 records. This is simply her understanding of
11 what they were doing.
12 MR. SHER: Okay. I appreciate that.
13 Q The scope of the work from the
14 third-party vendor was to update well files;
15 correct?
16 WITNESS RAZAVI: A Not well files, but
17 WellView.
18 Q WellView, thank you for that
19 correction.
20 And as part of that scope, were
21 they also tasked with entering missing and/or
22 correcting pertinent data in WellView?
23 A They were -- as part of the scope,
24 they were entering information into WellView,
25 potentially, the well information was not
26 populated in WellView because the well was
27 drilled many years ago when we didn't have
28 the database. So in that context, they were

SED SUR_REPLY_002021

1 missing information in WellView, which they
2 populated the information.
3 Q Okay. So I think I'm getting this,
4 and apologize for being obtuse. It wasn't
5 that there was well data from the file
6 missing that they were going to the DOGGR
7 website to retrieve?
8 A Correct.
9 Q Okay. Thank you.
10 EXAMINATION
11 BY MR. GRUEN:
12 Q One related question -- maybe I'm
13 being equally obtuse.
14 Was the third party using DOGGR
15 information to correct pertinent well data in
16 WellView?
17 A They were using DOGGR information
18 because they weren't onsite to access the
19 well files. So they were able to get the
20 data from DOGGR remotely and populate the
21 information into WellView.
22 Q Let me just -- I've heard you say
23 that.
24 A Yes.
25 Q I'm trying to make a distinction
26 here between them -- I understood the part
27 about them being remote. Understood the part
28 about them gathering DOGGR information and

SED SUR_REPLY_002022

1 using it for purposes of populating WellView.
2 A Mm-hm.
3 Q I think Mr. Sher asked you about
4 using the DOGGR information to fill in gaps
5 in WellView where there was incomplete
6 information. Now I'm trying to supplement
7 that question and ask: In cases of
8 inaccurate information, was the third party
9 using DOGGR data to correct it where there
10 was inaccurate information in WellView?
11 A Well, they were using the available
12 information to them. Whether it was a well
13 file or well history that was on DOGGR's
14 website.
15 Q So I think the answer to that
16 question is yes, the third party was using
17 DOGGR information in order to correct
18 inaccurate information in WellView?
19 A No.
20 Q Okay. The --
21 A The information on DOGGR website
22 would be included in all hard copy well
23 files.
24 Q Okay.
25 A So they were using that information
26 to input information in WellView, so...
27 Q Okay. That suggests to me that the
28 information in the existing well file and the

SED SUR_REPLY_002023

1 information on from DOGGR was matched?
2 A Correct.
3 Q Okay. And somebody checked to be
4 sure that it was all matching?
5 A Yes. They would come on site and
6 check the well file. In this case, however,
7 I can't remember when these gentlemen were
8 let go of Well Lifecycle Resources. So while
9 they were remote and I was on the relief
10 well, during that time their only source of
11 available information was the information
12 that was on the DOGGR website.
13 Q Was there any concern given the
14 inaccuracies that were provided in the
15 attachment to the January 15th email from
16 these gentlemen, any concern that they had
17 not properly checked to see that the DOGGR
18 information had matched the well file
19 information?
20 A Yes. That's why we continued with
21 this vendor, brought a new team on, and
22 actually went through and looked at these
23 wells, I can't remember to what extent, and
24 ensured that the information that was put in
25 is correct. And, ultimately, we decided not
26 to use this vendor.
27 Q And just remind me -- you may have
28 said it, forgive me if I missed it -- at what

1 point in time did the new vendor check the
2 information on the attachment to the
3 January 15th email?
4 A So the priority is different from
5 the new vendor. They are not going by the
6 priority that this vendor had. And as a
7 point of clarification, we continued on with
8 this vendor for another, I believe
9 through 2016 -- sometime 2016, maybe 2017. I
10 can't remember the dates.
11 And then at some point we stopped
12 the effort. And we reinitiated the effort
13 earlier this year with a new vendor.
14 Q I'm not sure that answered my
15 question. And it may have, but let me just
16 be sure.
17 A Sure.
18 Q So I think -- I'm trying to
19 understand -- the vendor put some errors into
20 the attachment to your January 15th email --
21 A Mm-hm.
22 Q -- when was that vendor replaced?
23 A The -- this vendor was replaced
24 earlier this year.
25 Q Okay.
26 A But we stopped the effort with this
27 vendor, I believe -- I can't remember the
28 dates exactly, sometime last year.

1 Q Okay. And, just for the record,
2 when you say "this vendor," we're talking
3 about the vendor who did the work on the
4 attachment that's shown to your January 15th
5 exhibit?
6 A Yeah. So there were two teams with
7 this vendor that worked on WellView data
8 entry.
9 Q Okay.
10 A We had the first team that was let
11 go. And then we had the second team that
12 worked on the WellView data entry. Last year
13 sometime we stopped that effort with the
14 second team of this vendor entirely.
15 Q Okay.
16 A We restarted the new effort with
17 the new vendor this year.
18 Q Okay.
19 MR. BRUNO: Yeah. So I have a couple
20 questions.
21 EXAMINATION
22 BY MR. BRUNO:
23 Q When the new team came on with the
24 old vendor --
25 WITNESS RAZAVI: A Mm-hm.
26 Q Were they remote?
27 A They would -- same process.]
28 They would come on site, and then

1 they would scan files, and they would go off
2 site. So it was a combination of remote and
3 on site. So, yes, they were remote.
4 Q Were the errors identified -- were
5 they rampant throughout all their work or did
6 it have to do more with them being remote and
7 taking errors from the DOGGR data, or -- or
8 was it just -- was it everywhere?
9 A I don't know. I don't remember.
10 Q Why was the second team let go?
11 A We just -- the quality of the work
12 and the nature of -- of the date -- of the
13 projects that the other vendor had was closer
14 to what we were looking for. So --
15 Q And when you brought on the new
16 vendor, you said the priority changed?
17 A Yes.
18 Q Why is the vendor establishing the
19 priority?
20 A The vendor isn't. We are.
21 Q Why did the priority change?
22 A Because of the activities, we want
23 to make sure that the data that is entered
24 by -- for the workovers by our website
25 managers -- we want to make sure we don't
26 have to redo the work; so, for that reason,
27 we changed our priority. So --
28 Q And by -- I'm sorry.

A So I'll give you an example. Maybe this brings more clarity. We have a rig schedule. Right now, we look at that rig schedule, and before a rig moves onto a well, we make sure that we go in, review the data, and make sure the data is populated with all the information in the well histories. Then, when the rig moves onto that well, and they start populating information, we don't have to go back and update the data that is being entered by the rig site managers, so it's up-to-date to that point, and there -- the rig site managers are working with an up-to-date version of the well in WellView.

Q Okay. So I -- I'm going to just state what I think I understood.

When work is occurring on a well, you want -- you want to make sure that it's good data, so that'll change the priority?

A We -- it might have been helpful for us to show how WellView operates or show the software.

If the rig moves onto a well, and we start conducting activities -- or conducting activities on that well and capturing information on that well in WellView while the historical information is not entered, it requires extra effort for us

1 to go review what's -- what was done, and
2 then populate everything prior to that
3 activity. So what we do, we look at the rig
4 schedule, we get ahead of it, we go, and we
5 make sure we review the data in WellView, we
6 enter the information before they move on, so
7 when they move onto that well and they
8 populate the information and they move off,
9 that one's complete.
10 Q I understand. Are you confident
11 that the previous vendor's errors are all
12 corrected?
13 A We have a pretty rigorous process
14 in place now. So --
15 Q Could you describe that process?
16 A The vendor who is entering the
17 information is the same vendor that has
18 developed our wellbore diagrams that we've
19 provided to DOGGR as part of the permitting
20 process, and that data has been reviewed by
21 SoCalGas and the storage field engineers. So
22 that data has been QC'd by our engineers. So
23 we use that data, and we populate WellView.
24 So, in that sense, there has been a QC
25 process in place.
26 Q Are they -- your -- your QC
27 engineers at SoCalGas, are they -- are they
28 doing that on a sample basis or a population

basis?

A No, for every -- for every well that they have to be -- they have the workover on and they have to get permitted for, they have to review the data.

Q Review the data. But, do they go back to source data to verify it's accurate?

A You mean the well file?

Q I have -- I'm -- I'm a little confused now.

I understood what you just said to mean that, if they're going to do work, they will go back and review the data.

A Uh-huh.

Q But, I'm asking about making sure that there's no errors that carry over from the old vendor to the new vendor. So I thought what you had -- I thought what you were explaining is that "Q" -- QC/QA process --

A Right.

Q -- happens by the -- SoCalGas?

A Engineers, correct.

Q So are they -- are -- so they're looking at every single well every single time they touch a well?

A Yes.

Q And what if they do it ten more

1 times in ten years, do they do it each time?
2 A Well, they have to review the well
3 history and make sure they know that well in
4 order to plan for the work. So they have to
5 review that.
6 Q But, that --
7 A That's my perspective, though. I
8 should only speak to what I understand. I
9 mean someone from operations could probably
10 answer your question better.
11 Q Okay. I guess what I'm getting at
12 is that you describe quality control by
13 SoCalGas, but is that really a process to
14 determine if all the errors are corrected
15 from the previous vendor? I mean there's
16 a -- I'm hearing a distinction between
17 understanding the --
18 A Uh-huh.
19 Q -- changes in the well versus
20 whether or not you have a level of assurance
21 that the data is accurate.
22 So I'm -- my -- my question is
23 really is SoCalGas confident that the new
24 vendor's correcting the errors of the
25 previous vendor?
26 A To the extent that the engineers
27 review the information and bless that
28 information, I can only speak to that. I

1 don't review the data myself. So --
2 Q Has the data been audited?
3 A In what sense?
4 Q Has the data been looked at by a --
5 somebody familiar with generally accepted
6 accounting principles or generally accepted
7 auditing standards, and verified that there
8 are no carryover errors?
9 A Not that I'm aware of.
10 Q As a data manager, is that --
11 A Uh-huh.
12 Q -- important to you?
13 A Very much so, yes.
14 Q Do you think it might be a good
15 idea to do an audit?
16 A Yes.
17 Q Have you -- have you mentioned that
18 to SoCalGas?
19 A We have processes in -- and plans
20 in place to conduct audits, and we have tools
21 to conduct audits, and we're currently in the
22 process of enhancing those tools so it --
23 they can be better utilized.
24 Q To your knowledge, has an audit
25 been conducted on the data that we're
26 referring to in -- in WellView?
27 A I don't remember.
28 Q Okay. I want to ask you a slightly

1 different -- well, not slightly. I want to
2 ask you a different question now.
3 A Sure.
4 Q What did you do on the relief well?
5 A I helped with logistics on that
6 well that -- I helped the drilling manager
7 with logistic -- logistical tasks and
8 activities.
9 Q And the drilling manager was?
10 A Todd Van de Putte.
11 Q Todd Van de Putte.
12 Do you know approximately when you
13 shifted over to the relief well?
14 A Before the spud date; so as soon as
15 they started the relief well, I was there.
16 Q And did you understand the purpose
17 of the relief well?
18 A Yes.
19 Q Which was?
20 A To intersect the leaking well, and
21 stop the leak by pumping cement.
22 MR. BRUNO: Okay.
23 EXAMINATION
24 BY MR. SHER:
25 Q The process that you described of
26 trying to get ahead of the rig schedule so
27 you would know -- operations would, I assume,
28 alert somebody that you need to get a rig

1 over a well at a certain time, and so your
2 team would get ahead of that schedule to make
3 sure that WellView is populated for that
4 well --
5 A That's a -- I just want to make a
6 point of clarification. My team was formed
7 recently, and that's a recent process post
8 leak. So --
9 Q Okay. So that -- that gets to
10 my -- my -- my question, which was that that
11 process, then, wasn't in place on
12 October 3rd, 2015, of getting ahead of the
13 rig overwork?
14 MR. GRUEN: October 23rd --
15 MR. SHER: Thank you.
16 MR. GRUEN: -- 2015.
17 MR. SHER: Yes.
18 WITNESS RAZAVI: A I can't remember
19 how I prioritized the data cleanup project.
20 I might have looked at the rig schedule
21 still, at that point of time, as well.
22 MR. SHER: Q Does the attachment to
23 the 20 -- the January 15, 2016 email that
24 we've been talking about -- it indicates that
25 the WellView cleanup and correction took
26 place during 11-9-15 through 11-13, and then
27 the date on the end is wrong, I'm assuming.
28 Is that correct?

1 WITNESS RAZAVI: A Sorry. Where --
2 what are you referring to, which field?
3 Q The last page --
4 A The last page.
5 Q -- Aliso Canyon, SS-25.
6 So the WellView cleanup work that
7 took place on SS-25 obviously occurred after
8 the first time a rig was put over SS-25. Is
9 that correct?
10 MS. CLORFEINE: Mr. Sher, there's --
11 MR. STODDARD: For the --
12 MS. CLORFEINE: Yeah. For the record,
13 it's 25-A and 25-B. If it says, "25," it's
14 not on this.
15 MR. SHER: Sorry.
16 Q With regards to SS-25-A and 25-B,
17 it seems that work on the WellView cleanup
18 took place after the first rig was put over
19 the well to try and stop the leak. Is that
20 correct?
21 WITNESS RAZAVI: A It -- for SS-25-A
22 and "B," the data cleanup effort started on
23 November 9th --
24 Q Uh-huh.
25 A -- which is after the SS-25 --
26 Q Leak?
27 A -- leak, yes.
28 Q So again, I'm just trying to get

1 this -- this process that you have in place
2 now --
3 A Yes.
4 Q -- you try and get ahead of the rig
5 schedule --
6 A Correct.
7 Q -- did not occur with regards to
8 the October 23rd, 2015 leak?
9 A Prior to the leak, I had not worked
10 on the Aliso Canyon wells; rather, we worked
11 on the other storage fields. And I don't
12 recall -- I don't remember if I looked at rig
13 schedules back then.
14 Q But, the dates sort of speak for
15 themselves, don't they?
16 A I don't know when the rig moved on
17 SS-25-A and "B" or if there was a rig moved
18 onto those wells.
19 MR. SHER: Great.
20 EXAMINATION
21 BY MR. GRUEN:
22 Q Just with regards to the -- the
23 wells on the -- the list attached to your
24 January 15th email of 2016, upon completion
25 of the wells on this list, what was the
26 practice of SoCalGas with regards to using
27 WellView? Was it -- did -- was WellView used
28 immediately for the files listed, once they

1 were complete?
2 A WellView was used for workover,
3 drilling and abandonment activities.
4 Q And specifically for SS-25, was
5 WellView used once it was complete, once
6 SS-25-A and SS-25-B were complete on
7 November 13th, 2015?
8 A Are you referring to SS-25 or
9 SS-25-A or "B."
10 Q Excuse me, SS-25. Was SS-25 --
11 upon completion of SS-25-A and "B" in
12 November 13, 2015, was WellView accessed in
13 order to use the completed well information?
14 A SS-25 is a separate well --
15 Q I understand.
16 A -- than SS-25-A and "B."
17 Q Thank you for the clarification.
18 Yeah.
19 A Uh-huh.
20 Q So for SS-20 -- I may not have
21 included SS-25-A and "B."
22 Upon completion of SS-25-A and "B"
23 here, was the information used as soon as it
24 was complete?
25 A I don't know.
26 MR. GRUEN: Okay. Any other questions
27 on this topic?
28 Okay. Go off the record for a

1 second.
2 (Off the record.)
3 MR. GRUEN: On the record.
4 My notes show, even though it was
5 cut off, unfortunately, that this was marked
6 with Bates stamp AC_CPUC_SED_Kitson_0000946.
7 If that is incorrect, we will clarify that at
8 a later time.
9 Q And Ms. Razavi, this is -- I see
10 here, this is an email from you to Thomas
11 Egbert, Azra Kargar and Amy Kitson dated
12 January 29, 2016, and the subject line
13 includes an initial response -- an initial
14 email and response emails regarding Aliso
15 Canyon wells. And this thread was
16 communicated in its entirety, it appears, on
17 January 29th, 2016.
18 Does that appear accurate to you?
19 WITNESS RAZAVI: A That's what the
20 document says.
21 Q Yeah, just for recognition
22 purposes --
23 A Yes.
24 Q -- for the record. Thank you.
25 And at the bottom of this page,
26 you're asking Tom Egbert and Azra Razavi
27 (sic) to review the attached report from
28 Maximo and under EQ function and fill in the

1 functionality of the well, INJ/WD/FLOOD/water
2 disposal, IDLE, etc., close paren.
3 Do you see that?
4 A Yes. Just for clarification --
5 Q Yeah.
6 A -- it was to Azra Kargar. I think
7 you mentioned my last name. I just wanted to
8 make sure.
9 Q Ah, excuse me. Thank you for the
10 clarification. I appreciate that.
11 Just -- you had explained Maximo
12 earlier, and if you wouldn't mind doing it
13 briefly once more, would you? What is
14 Maximo?
15 A It's a maintenance management
16 system.
17 Q Okay. And what is the source of
18 data for the Maximo report? I'm referring to
19 where, at the bottom, from you to Tom Egbert
20 and Azra Kargar, cc'g Amy Kitson, "Azra and
21 Tom," you say, "could you please review the
22 attached report from Maximo?"
23 A Is there an attachment to this
24 email?
25 Q I could ask you. I didn't see one.
26 A Without that, I don't know what
27 this email is regarding; but --
28 Q Yeah.

1 A -- it looks like I'm asking them to
2 fill in a spreadsheet with the functionality
3 of the wells.
4 Q Yeah. Okay. How would we ask
5 for -- for the Maximo report that's
6 referenced here?
7 A I guess however this email was
8 produced --
9 Q Okay.
10 A -- as far as an attachment.
11 MR. GRUEN: Okay. Do you know -- so
12 can we request that -- that Maximo report
13 that's referred to here? It's -- the reason
14 I'm asking for it is we just didn't see it in
15 the production. So --
16 MR. STODDARD: Yeah, it looks like,
17 based on -- we'll see -- yeah, we'll see if
18 we can locate it.
19 MR. GRUEN: Okay.
20 MR. STODDARD: It doesn't appear --
21 well, as odd as it sounds like, based on the
22 description, it looks like it might have been
23 attached to the Thomas Egbert email --
24 MR. GRUEN: Uh-huh.
25 MR. STODDARD: -- because this is my
26 first pass.
27 MR. GRUEN: Okay.
28 MR. STODDARD: But, I don't know. We

1 can check.
2 MR. GRUEN: Okay.
3 MR. STODDARD: Because there's no
4 attachment on it.
5 MS. CLORFEINE: We'll look for it.
6 MR. GRUEN: All right.
7 Q Ms. Razavi, what is the source of
8 data for the Maximo report, do you know?
9 WITNESS RAZAVI: A It has to be in
10 context. I'm not sure what exactly I'm
11 referring to --
12 Q All right.
13 A -- in here.
14 Q All right. We'll ask for it, then,
15 and move on.
16 Where you say the -- at -- at
17 that -- at the bottom of the page,
18 "Also, you are the most familiar
19 with the wells. If there are
20 wells missing please note them."
21 Do you see that?
22 A Yes.
23 Q Okay. Did Thomas Egbert, Azra
24 Kargar or anyone else add any wells to the
25 list that you provided?
26 A I -- without seeing the list, I
27 don't know.
28 Q Okay. Was -- were Thomas Egbert or

1 Azra Kargar -- did you ask them to update or
2 in any way correct the information that was
3 provided into WellView?
4 A I don't remember.
5 Q Okay. Do you remember asking
6 anyone to update or correct information that
7 was provided into WellView?
8 A What timeframe?
9 Q As part of the WellView data
10 integrity project and the timing -- the
11 timeframe -- so beginning in March of 2015.
12 A So the entire underground storage
13 staff had access to WellView, read and write
14 access; so whether they accessed WellView and
15 changed information and entered the data into
16 it, that was not under my control or
17 supervision.
18 Q Okay. At the top of the email
19 where it says, "I'm realigning this sheet
20 with what's on DOGGR website," do you see
21 that?
22 A Yes.
23 Q And where you realigned the sheet
24 with what's on DOGGR's website, which piece
25 of information changed? Did you change the
26 DOGGR website to match what was on the sheet
27 referenced here or did you change what was on
28 the sheet here to match what was on DOGGR's

1 website?
2 A Without seeing the list, I don't
3 know what I was trying to do here.
4 MR. GRUEN: I think we'll have to DR
5 it, and ask. These are questions that we
6 need to get at.
7 Okay. Any -- any follow-up
8 questions?
9 MR. BRUNO: No. I think you should
10 move on from that sheet.
11 MR. GRUEN: Okay. So the -- let's go
12 off the record, please.
13 (Off the record.)
14 MR. GRUEN: So back on the record.
15 So -- oh, gee. I think the -- the
16 email from Avi Razavi dated January 29th,
17 2016, is Exhibit 5 (sic), marked as Exhibit 5
18 (sic), please.
19 (Exhibit No. SED-04 was marked for identification.)
20
21 WITNESS RAZAVI: Sorry. What are you
22 referring to?
23 MR. GRUEN: I'm remembering to mark the
24 last email --
25 WITNESS RAZAVI: Oh.
26 MR. GRUEN: -- that I just -- excuse
27 me.
28 And -- and this email, I believe,

1 Bates stamp AC_CPUC_SED_KITSON_0000820, is an
2 email from Christian Ching, C-h-i-n-g, dated
3 January 5th, 2016. It's part of a thread
4 that extends back to January 4th, 2016,
5 emails from Mike Dozier and Azra Kargar. The
6 subject is Re: SS9 and P26C well history
7 files.
8 Q Ms. Razavi, does that look accurate
9 to you?
10 WITNESS RAZAVI: A That's what's on
11 the paper.
12 Q Very good. And -- and you are
13 included in each email as part of this email
14 thread. Is that right?
15 A Uh-huh.
16 Q Do you recall receiving these --
17 this email thread?
18 A I recall, now that I see the email.
19 Q And it refreshes your recollection?
20 A (Nods.)
21 Q Okay. So with regards to this --
22 the gist of this, as I understand it, is that
23 Mike Dozier -- I'm sorry, Azra Kargar is
24 asking about well history files SS9 and P26C
25 on January 4th. Is that right?
26 A That's what's on the email, yes.
27 Q And -- and so, this basically is an
28 email thread showing that the well history

1 files from those two wells are not available
2 in the file cabinet. Correct?
3 A That's what it says in the email.
4 Q Have the well history files for SS9
5 been -- has the well history file for SS9
6 been found?
7 A I don't know.
8 Q Has the well history file for P26C
9 been found?
10 A I don't know.
11 Q Looking back to the January 15th,
12 2016 email that you have in front of you and
13 the attached document, if you would --
14 WITNESS KITSON: Sorry.
15 MR. GRUEN: Q So, if you look at the
16 very bottom of the last sheet under "Aliso
17 Canyon," and you see that the well -- you see
18 well SS9?
19 WITNESS RAZAVI: A Yes.
20 Q And that it was completed
21 January -- excuse me, November 9th, 2015
22 through November 13th, 2015, I believe we've
23 established. Is that accurate?
24 A Yes.
25 Q So let me understand the order of
26 events here.
27 SS9 was completed in WellView in
28 November of 2015, but SS9 was not in the file

1 cabinet in January of 2016?
2 MR. STODDARD: Objection, this email is
3 neither from nor to Avi. Although she is
4 addressed on it, she can't -- all she can do
5 is confirm what the email says. She did not
6 confirm the fact that these were not actually
7 in the right -- in the -- in the well -- in
8 the file cabinet.
9 MR. GRUEN: Okay. Well, we want to ask
10 for a data request to please -- if SoCalGas
11 will please produce SS9 and the version of
12 the well -- and the version of the well file
13 that existed in January 2015, and see if --
14 if this -- if, in fact, SoCalGas has the well
15 file, please.
16 MR. SHER: Darryl, may I?
17 MR. GRUEN: Yeah.
18
19 EXAMINATION
20 BY MR. SHER:
21 Q Ms. Razavi, do you have any reason
22 to doubt the veracity of this email and the
23 contents therein, and this email being the
24 one that's dated -- there are two dates, 1-4,
25 2016 -- I believe it's been marked as
26 Exhibit 6.
27 A I'm sorry. Could you repeat your
28 question?

1 Q Do you have any reason to doubt the
2 veracity of the contents of this email?
3 A Sorry. What does veracity mean?
4 MR. GRUEN: Accuracy.
5 MR. SHER: Q Do you -- yes.
6 Do you doubt the accuracy or the
7 truth of the words in this email?
8 WITNESS RAZAVI: A I did not write it,
9 so I can't really judge that. But, that's
10 what it says, so I read what it says.
11 MR. STODDARD: To be clear on the data
12 request, just because I started to -- to
13 write it down as you were asking for it, but
14 there were a few -- you kind of rephrased it.
15 And just to be clear, what you're
16 wanting is just for SS9 the well file as it
17 existed as of the date of this email or as of
18 the date of -- it wasn't -- I missed what
19 it's as of the date of.
20 MR. GRUEN: The -- the Well SS9 -- the
21 well file, do you have it today, what the
22 state of it was -- rather, did you have it
23 on -- did SoCalGas have it on January 4th and
24 5th, 2016, and if not, when did SoCalGas find
25 the file, and where was it. Yeah.
26 EXAMINATION
27 BY MR. GRUEN:
28 Q And regarding the follow-up to

1 Mr. Sher's question, Ms. Razavi, to your
2 knowledge, did anyone follow up to find out
3 if Well SS9 had been found after this email
4 thread?
5 A I do -- I don't know.
6 Q Okay.
7 A I do want to make a point of
8 clarification. The data that was completed
9 during these -- the months of November,
10 December up until the time that I was on the
11 relief well, I don't recall the vendor being
12 on site, so I believe the vendor accessed the
13 DOGGR database; but, I can't be sure.
14 Q Understood.
15 EXAMINATION
16 BY MR. SHER:
17 Q Just following up on that, so it
18 could be possible, then, that while Mr. Azra
19 Kargar can't find the files -- I'm assuming
20 at Aliso Canyon -- in the file cabinet, that
21 this information may still have been input
22 into WellView?
23 A Well, based on this sheet, the data
24 was inputted into WellView in 2015 for SS9,
25 but I don't know if the vendor actually
26 accessed the hard copy, hard well files,
27 rather the DOGGR database.
28 Q So then, I think the answer is

1 "Yes," that the vendor didn't need the actual
2 well file, which couldn't be found based on
3 that email, in order to accurately input data
4 into WellView?
5 A That's not what I said. The vendor
6 was not on site to access the well file, so
7 the vendor remotely accessed the DOGGR
8 website.
9 MR. SHER: Okay. Thank you.
10 EXAMINATION
11 BY MR. SHER:
12 Q And Ms. Razavi, just with reference
13 to the data management system where the wells
14 files were -- had been put, entered -- and I
15 believe electronically, if I'm not mistaken.
16 Is that right?
17 WITNESS RAZAVI: A No. We were in the
18 process of --
19 Q Okay.
20 A -- scanning and moving into a
21 document management system.
22 Q I see. And is -- would -- once
23 information was put into WellView, would a --
24 would a well file have been scanned into the
25 data management system?
26 A Not necessarily.
27 Q Okay. So you don't know whether
28 SS9 was scanned into the data management

1 system as of January 4th and 5th during the
2 date of this email?
3 A I don't know.
4 EXAMINATION
5 BY MR. BRUNO:
6 Q To your knowledge, are there any
7 missing well files at Aliso Canyon at this
8 point in time?
9 WITNESS RAZAVI: A I don't know.
10 Q Why don't you know that?
11 A Because we are focused on
12 digitizing on -- as systems, and putting
13 governance around the processes that we have
14 for data collection for records management.
15 Q If there was a missing tangible
16 well file, who's the responsible manager in
17 charge?
18 A The underground storage group,
19 because they use the well files.
20 Q Is the underground storage group a
21 responsible manager? Or I -- let me rephrase
22 that.
23 Is there a responsible manager in
24 the underground storage group, or -- or is
25 the whole group in charge?
26 A The whole group, because they have
27 different -- the organization is set up that
28 pieces of information is managed through

1 different groups.
2 Q So based on your -- your -- your
3 time at SoCalGas and, you know, in data
4 management, if you will, are you familiar
5 that well files go missing at times?
6 A Not that I'm aware of.
7 Q So is this the first time you've
8 ever heard of a well file went missing?
9 A I'm not in -- at that time, this is
10 what I received. So that's the first time I
11 saw that a --
12 Q Why do you --
13 A -- well file wasn't there.
14 Q I'm sorry. Did -- I might have cut
15 you off.
16 A So that's the first time I saw that
17 a well file was missing --
18 Q Okay.
19 A -- in that email.
20 Q Do you know why they included you
21 in the email chain?
22 A No, I don't.
23 Q And Ms. Kitson, are you familiar
24 with any well files that were going missing
25 at Aliso Canyon?
26 WITNESS KITSON: A I'm not familiar
27 with any gone missing.
28 Q Do you know if these two well files

1 were ever found?
2 MR. STODDARD: Again, objection, I --
3 as to characterization that they were missing
4 as opposed to just this -- you know, maybe
5 these individuals not knowing where just to
6 specifically look for them, or any other
7 possible circumstances.
8 EXAMINATION
9 BY MR. SHER:
10 Q Just for clarification, to either
11 Ms. Kitson or Ms. Razavi, would well files at
12 Aliso Canyon, physical well files, be kept
13 anywhere other than the file cabinet for well
14 files at Aliso?
15 WITNESS KITSON: A So speculation, I
16 mean because it's not my group where I'm at,
17 but assuming, if there was work going on on a
18 well file, somebody might have it at their
19 desk or, you know, may have had it outside,
20 and then replaced it when that work is done.
21 So --
22 Q And so, based on your earlier
23 testimony, we would be able to track that
24 removal of the well file based on the log
25 sheet. Is that correct?
26 WITNESS RAZAVI: A I've seen the log
27 sheet. I don't know if it was used at the
28 time.

1 Q And in your experience as a data
2 manager, would there be anywhere else other
3 than the Aliso Canyon well file cabinets that
4 well files could be, other than at someone's
5 desk who's working on that file?
6 A Not that I'm aware of.
7 MR. GRUEN: Okay. Can we go off the
8 record for a moment?
9 (Off the record.)
10 MR. GRUEN: Back on the record, please.
11 EXAMINATION
12 BY MR. GRUEN:
13 Q Ms. Kitson, if I identify this to
14 you -- I believe this is the Bates stamps in
15 your data set with the -- your last name with
16 the Bates numbers 00006182 to 0000625. It's
17 an email from Nadia Aftab, December 8th,
18 2015, and it includes you as one of the two
19 recipients, and it is -- the subject is Re:
20 AC Integrity Program, attachments AC IMP
21 Rev 1.docx, and it has a -- it appears to
22 have an attachment in the email.
23 Upon seeing this, does this refresh
24 your recollection seeing this -- receiving
25 this document?
26 WITNESS KITSON: A Honestly, no.
27 Q Okay. That may cut the questions
28 short.

1 A Sorry.
2 Q Are you familiar with the Aliso
3 Canyon Integrity Management Program?
4 A So we never specifically -- that's
5 why I'm not familiar with this. So when we
6 developed our risk management program
7 documentation in 2016, and then following on
8 to our Storage Integrity Management Program,
9 it was called that as a program for all
10 fields. We did not have a field-specific --
11 Q Ah.
12 A -- document.
13 Q So -- so there was never an Aliso
14 Canyon Integrity Management Program that came
15 to fruition?
16 A Correct.
17 Q Okay. With regards -- nonetheless,
18 just with this document --
19 A Uh-huh.
20 Q -- on page 2 of 7, just the program
21 description, "The Aliso Canyon Integrity
22 Management Program is associated with a
23 focused safety, system integrity, and risk
24 management effort," does that sentence --
25 would you expect that to apply to the general
26 overall Storage Integrity Management Program
27 of SoCalGas?
28 A I think that's fair to say. That's

1 an integrity management statement.
2 Q Okay. And similarly, if you would
3 turn to page 5 of 7, where it says,
4 "Recordkeeping," and it says, quoting from
5 the document,
6 "The storage and access to
7 important records is an
8 essential part of the Program,
9 Depending on the type of data,
10 existing systems currently in
11 place (for example, Wellview,
12 network server) will be used to
13 store and retrieve information
14 such as well historical data,
15 maps, and operating history."
16 Would that also be an applicable
17 statement generally to the Storage Integrity
18 Management Program?
19 A Yeah, I would say recordkeeping is
20 a very important part of the Storage
21 Integrity Management Program.
22 Q Thank you. And turning -- I didn't
23 clarify this off the record, and I'll give
24 you a moment, if you want to see it and --
25 and review it, page 7 of 7, the last page,
26 which really just includes Appendix B and an
27 icon.
28 A Okay.

1 Q And if you want a chance to digest
2 that, I appreciate that. We can go off the
3 record, if you'd like.
4 A That's fine.
5 Q Okay. So again, just -- the icon
6 says, "SIMP Folder Structure - Rev1.pdf."
7 And I'm -- I need to ask some questions,
8 because I didn't recognize this document in
9 what we were provided. I didn't see it.
10 It's not to say it wasn't there.
11 But, are you familiar with the SIMP
12 folder structure?
13 A I don't -- I would have to see it.
14 Q Okay.
15 A But, I'm not familiar with this on
16 first sight.
17 Q Okay. Well, is the -- is the
18 concept of a SIMP folder structure familiar
19 to you?
20 A Yes. That's part of what Avi's
21 team was working on, as she mentioned, with
22 the records document management system, is
23 putting in a structure, a naming convention,
24 et cetera, for filing away records.
25 Q And even -- your point is noted
26 that there was never a -- a -- an integrity
27 management program for Aliso Canyon created.
28 But --

1 A They were incorporated in our --
2 the entire integrity management program for
3 all fields, and we have, you know, various
4 sections of that plan, one being
5 recordkeeping, one being data management.
6 So --
7 Q And --
8 A But, certainly, Aliso Canyon was
9 part of our full plan. We just didn't write
10 it specifically for it.
11 Q I follow. And so, there is a
12 folder structure, then, that Ms. Razavi, you
13 were working on for the Storage Integrity
14 Management Program?
15 WITNESS RAZAVI: A Not necessarily
16 just for Storage Integrity Management
17 Program, but in general for underground
18 storage and working on a -- we've worked on a
19 folder structure in 2017.
20 Q And what does the folder structure
21 entail? Is it -- is it like the -- is it the
22 same thing as the data management system for
23 hard copy well files?
24 A It's a records repository, and the
25 records would be put into this folder
26 structure --
27 Q Okay.
28 A -- as a means to migrate into a

1 document management system.
2 WITNESS KITSON: A And to ensure
3 consistency, to ensure that all fields and
4 all engineers are filing the same records the
5 same way, so that we can easily query or
6 retrieve them --
7 Q Okay.
8 A -- in the future.
9 Q Okay. Okay. So I think where I'm
10 struggling is that -- that you've got two
11 things, a data management system, and then a
12 folder structure, and the folder structure
13 feeds into the data management system. Is
14 that a fair way to characterize it?
15 WITNESS RAZAVI: A (Shakes head.)
16 Q No? I'm seeing you shake your
17 head.
18 A Yeah. No.
19 Q Okay.
20 A The folder structure is for
21 records, and the data management system is
22 for the data, the tabular data.
23 Q Okay. And so the -- the folder
24 structure is -- does -- that keeps scanned
25 versions of the hard copy well files, then?
26 A It will.
27 Q Oh, it's not in place yet?
28 A It is in place, and it's being used

1 actively. It was implemented last year.
2 Q And --
3 A And before that, there was a
4 structure, which I wasn't part of that
5 effort. So when I or my team started looking
6 at the folder structure for records, our
7 purpose was to have the structure and enhance
8 what was already in place, in order to
9 prepare for migration into a document
10 management system.
11 Q Okay. Is the folder structure
12 and -- and are the documents in the folder
13 structure used by engineers in order to -- to
14 do their work on -- on wells at Aliso?
15 A I can speak from my perspective,
16 yes; but, operations need to speak on their
17 own behalf.
18 Q How do you use them in the course
19 of your daily work?
20 A Me?
21 Q Yes.
22 A If I need to access information on
23 a well or records on a well, I use the folder
24 structure to find those records.
25 Q But, not the -- the -- do you use
26 the data management system, as well?
27 A Yes.
28 Q And WellView?

A Yes.

Q All three things.

So there's a third thing that you're using, as well?

A No, data management system is WellView.

Q Understood.

A Yes.

Q I think I see why you're lumping them together. The SIMP folder structure you are using, also, as another source of information?

A I'm not familiar with the SIMP folder structure. The folder structure I'm referring to was implemented by my team last year.

Q Oh, for --

A It is a records folder structure.

Q You did say that. I appreciate that. Thank you. Okay.

So your -- you haven't seen a SIMP folder structure document like the one that's identified at the end of page 7 of 7?

A Without seeing the documents, I'm not able to say if I've seen it or not. I don't know.

Q Have you heard of a SIMP folder structure before?

1 A I don't recall.
2 Q Okay. All right. Thank you.
3 Any other questions?
4 Let's go off the record.
5 (Off the record.)
6 MR. GRUEN: Let's go back on the
7 record.
8 Thank you for appearing today,
9 Ms. Kitson, Ms. Razavi. You are excused.
10 WITNESS KITSON: Thank you.
11 WITNESS RAZAVI: Thank you.
12 MR. GRUEN: Let's go off the record.
13 (Whereupon, at the hour of 4:03
14 p.m., the Commission then adjourned.)

SOUTHERN CALIFORNIA GAS COMPANY
CPUC-SAFETY AND ENFORCEMENT DIVISION
DATA REQUEST DATED OCTOBER 24, 2018

SOCALGAS RESPONSE DATED NOVEMBER 30, 2018

SoCalGas provides the following Responses to the CPUC-Safety and Enforcement Division's (CPUC-SED) data request dated October 24, 2018 related to the preliminary investigation regarding the Aliso Canyon Well Leak. The Responses are based upon the best available, nonprivileged information that SoCalGas was able to locate through a diligent search within the time allotted to respond to this request, and within SoCalGas' possession, custody, or control. SoCalGas reserves the right to supplement, amend or correct the Responses to the extent that it discovers additional responsive information.

SoCalGas submits these Responses, while generally objecting to any Request that fails to provide a defined time period to which SoCalGas may tailor its Response, and to the extent that any Request is overly broad, vague, ambiguous, unduly burdensome, assumes facts, or otherwise fails to describe with reasonable particularity the information sought. SoCalGas further submits these Responses without conceding the relevance of the subject matter of any Request or Response. SoCalGas reserves the right to object to use of these Responses, or information contained therein, in any dispute, matter or legal proceeding before any court, action. Finally, at the time of this Response, there are no pending oral data requests from the CPUC-SED to SoCalGas.

Question 1:

For this set of questions, please reference Attachment 1, an email data request from Maria C. Solis on 11/13/18 and the corresponding data response email from Jeff Koski question #1 (attachment 1 and 2).

a. Please complete this time and provide a timeline of events to date. Please also include and identify all well kill plans between 10/23/15 and the final well kill and well abandonment on 2/28/16.

b. Please also include all activities relating to unplanned well kill plans developed by Storage Engineering per Company Operations Standard, Well Operations – Well Kill 224.0030.[1]

c. Also, include details of all fluids used during well kill attempts per Section 4.2 of the same procedure referenced in question 1b.

d. Also, include each version of the entire well file for SS-25 that was provided

[1] For reference, Section 4.1.1 states, "This document provides guidelines for routine, planned kill jobs. Emergency kills that are performed because of unplanned conditions that may result in uncontrolled discharge of gas require special procedures for each case. Special kill plans for emergency conditions are prepared by **Storage Engineering."**

to Storage Engineering and/or others that participated in developing the plans for each well kill event.

e. Also include from Company Operations Standard, Well Operations – Well Kill 224.0030 Section 1.1 the names of all individuals, and their qualifications in compliance with Section 1.1 of the procedure below.

f. In addition, include all consultants and contactors that were used to assist with every well kill attempt in compliance with Section 1.1 of the procedure.[2] As part of this exercise, please name each individual, specify who they were managed by, and provide their applicable individual scope of work included within their consultant agreements or construction contracts. Please include this information on a spreadsheet that lists at a minimum the following: Name, Title, Company of Employment, Qualifications, Duties from 10-23-15 to 2/28/16.

g. Per Section 5.0 Records, please also provide records from the Rig Supervisor and all Daily Activity Reports related to each well kill attempt.[3]

h. Please provide all information related to Company Operations Standard, Routine Well Kills, 224.0045 and Company Operations Standard, Well Operations – Well Kill, 224.0030, including what specific sections of these procedures if any were utilized during any of the well kill attempts and how these procedures were specifically implemented.

i. Also, include the information provided in response to question 1h on the timeline provided in response to question 1 (a) above.

j. For questions 1 a-d and h above please provide at a minimum the following information in table form with accompanying records referenced.

   i. Project-specific "data"[4] information used on each well kill attempt project:
   ii. Provide the recorded sources of information and data that SCG used to

[2] "Section 1.1 The **Storage Field Engineer** is responsible for well kills. Responsibility may be delegated to certain other **Company** personnel in some circumstances. The person in charge, in accordance with pre-arranged kill plans immediately handles emergency kill jobs. The **Storage Operations Manager** and **Storage Engineering Manager** are informed of such incidents as soon as practical."

[3] As stated under Section 5.0, "Section 5.2. If the well is killed by a **Rig Supervisor**, attach these records to the Daily Activity Report. If the well is killed by someone other than a **Rig Supervisor**, retain these records in the field well file.

[4] The meaning of "data" includes, but is not limited to: kill fluid pump rate, reservoir flow rate to be overcome by pump rate, kill fluid composition, kill fluid weight, reservoir pressure and etcetera and all final calculations used for each "data" element.

control and kill well Standard SS-25.

iii. Provide records of what information data set and engineering calculations were provided to each lead decision maker and what final kill-program analysis was agreed upon for each kill attempt.

iv. Provide records of names of individuals who approved the final work plan on each kill-attempt project.

v. Reference all SoCalGas procedures followed that SoCalGas has not previously identified. Include reference to the section number and quote the passage.

vi. Reference all applicable SoCalGas procedures that SoCalGas believes it did not follow. Include reference to the section number and quote the passage.

vii. For all SoCalGas procedures that it did not follow, please explain the reasons for not following its own procedures.

Response 1:

a. SoCalGas objects to this request on the grounds that it is overly broad and unduly burdensome, and vague and ambiguous as to the phrase "timeline of events to date." Notwithstanding these objections, SoCalGas responds as follows: SoCalGas believes that CPUC-SED is requesting a daily description of operations for the SS25 incident. This information is available in the SoCalGas Daily Operations Report and Boots & Coots Daily Report. Please see the following electronic documents previously provided to CPUC-SED:

- SoCalGas SS25 and P39A Daily Operations Reports (AC_CPUC_SED_DR_16_0000361 – AC_CPUC_SED_DR_16_0001026).
- Boots & Coots SS25 and P39A Daily Reports (AC_CPUC_SED_DR_16_0025631 – AC_CPUC_SED_DR_16_0025808).

Please note, the final Boots & Coots well kill was performed on December 22, 2015. For the Boots & Coots well kill plans, please see previously provided electronic documents with Bates range AC_CPUC_SED_DR_16_0000349 – AC_CPUC_SED_DR_16_0000360.

On February 11, 2016, the relief well intercepted SS25 and temporarily controlled the flow of gas. On February 18, 2016, the California Department of Conservation, Division of Oil, Gas and Geothermal Resources (DOGGR) confirmed that the SS25 leak was permanently sealed. For Boots & Coots' P39A End of Job Report, please see previously provided electronic documents with Bates range AC_CPUC_SED_DR_16_0007930 – AC_CPUC_SED_DR_16_0008027. On September 13, 2018, SS25 was permanently plugged and abandoned.

b. SoCalGas objects to this request on the grounds that it is vague and ambiguous as to the phrase "all activities relating to unplanned well kill plans," and assumes facts that do not exist with respect to the application of Gas Standard 224.0030. Notwithstanding these objections, SoCalGas responds as follows: SoCalGas Gas Standard 224.0030 provides guidelines and direction for killing a gas storage well in routine situations. The kill of well SS25 was not a routine situation, therefore, Gas Standard 224.0030 does not apply.

Based on CPUC-SED's question relating to Gas Standard 224.0030, SoCalGas interprets this request as seeking well kill plans developed by SoCalGas. SoCalGas performed the well kill on October 24, 2015 and prepared the plan for that well kill. Between November 13, and December 22, 2015, Boots & Coots performed six well kills. The well kill plans for the Boots & Coots well kills were prepared by Boots & Coots.

The activities relating to the well kill performed by SoCalGas on October 24, 2015, are as follows: The SS25 leak was discovered on October 23, 2015 at approximately 3:15 pm. Oleksiy Garchev (Station Operations Manager), Larry Andrews (Field Maintenance Supervisor), Ed Pena (Stations Operations Specialist), and Adrian Estrella (Station Technician) arrived at SS25 to inspect the site at 3:20 pm. The operators could smell gas and after a brief search, a hole was identified in a narrow pipe that ran between the SS25 wellhead and a pressure gauge. The valve at the wellhead was activated and the pipe leak stopped, however, the operators continued to hear gas moving in the wellhead. Mr. Andrews performed a sweep of the SS25 pad using a handheld device, and it did not register any hits for natural gas. Additional SoCalGas personnel, including Thomas Egbert (Senior Storage Field Engineer), Mike Dozier (Contracts Administrator – Gas), and John Cerulle (Gas Storage Specialist) were contacted. In addition, Todd van de Putte (Drilling Manager) and Phil Baker (Director of Storage) were notified of the situation. At approximately 7:00 pm, gas was detected on the main road at the SS25 site. All crews were removed from the area and the road was closed.

Mr. van de Putte contacted Alan Fortenberry (SoCalGas contractor) and asked him to respond to the incident and mobilize equipment to kill the well. At 10:10 pm, Mr. Fortenberry arrived on site and met with Mr. Garchev, Mr. Andrews, Mr. Egbert, Mr. Cerulle, and the operations crew. Mr. van de Putte, Mr. Dozier, and Mike Volkmar (SoCalGas Contractor) participated by telephone. Mr. Fortenberry contacted Mr. van de Putte and reported on the well kill activities at each step. In addition to mobilizing equipment for the planned well kill, the team contacted Cameron (SoCalGas contractor) to check the wellhead seal. Well kill equipment began to arrive on site in the early morning hours on Saturday, October 24. From 1:00 am to 3:00 am, Onyx Oil Services (Onyx) started setting up the equipment to kill the well. The team began filling the tanks with well kill fluid at 5:00 am. At 6:00 am, Cameron arrived and injected plastic packing to reinforce the wellhead seals, but the downhole noise continued.

The well kill procedures were conducted in the early afternoon on October 24, 2015. Prior to the well kill, Mr. Fortenberry performed two calculations to determine (1) the *weight* of the kill fluid required to kill the well, and (2) the *volume* of the kill fluid required to kill the well.[5] Prior to the well kill attempt, Mr. Fortenberry stationed personnel not involved in the pumping operation on the edges of the site to monitor for fluid. The operations crew

[5] To determine the weight required, Mr. Fortenberry obtained the true vertical depth (TVD)[5] of SS25 from the wellbore schematic and surface pressure for SS25. Based on the TVD and surface pressure, Mr. Fortenberry calculated the bottom hole pressure ((TVD x 0.000025) +1) x Surface Pressure = Bottom Hole Pressure (BHP)). An Over Balance (OB) was then added to the BHP to get the kill fluid weight required to kill the well (BHP + OB/TVD/0.052 = Kill Fluid Weight (ppg)). To determine the volume required, Mr. Fortenberry used the SS25 wellbore schematic to obtain the outside and inside diameters of the tubing and casing. With that information, Mr. Fortenberry was able to calculate the tubing, annular casing, and circular volumes (((Tbg I.D. x Tbg I.D.)/1029.4) x Measure Depth[5] = Tubing Volume); (((Csg I.D.) – (Tbg O.D. x Tbg O.D.))/1029.4) x Measured Depth = Annular Casing Volume)); (Tubing Volume + Annular Casing Volume = Circular Volume).

discussed safety measures to avoid fire and location to meet in the event of a fire. With the safety briefing complete, the kill attempt began when contractors Halliburton and Onyx injected fluid down the tubing beginning at 12:27 pm. The tubing pressure quickly increased, but the casing pressure did not. The operators next attempted to kill the well by pumping fluid into the tubing-casing annulus. During the kill attempt, operators observed cracks beginning to form in the ground around the wellhead site and gas venting from the surface. The team immediately shut down the kill attempt and retreated to the kill pump truck a few hundred yards away from the wellhead. Subsequently, Mr. Fortenberry prepared a report of the well kill activities. For this report, please see previously provided electronic document with Bates range AC_CPUC_0014306.

c. SoCalGas objects to this request on the ground that the request assumes facts that do not exist with respect to the application of Gas Standard 224.0030. Notwithstanding this objection, SoCalGas responds as follows: SoCalGas Gas Standard 224.0030 provides guidelines and direction for killing a gas storage well in routine situations. The kill of well SS25 was not a routine situation, therefore, Gas Standard 224.0030 does not apply. Based on CPUC-SED's question referencing Gas Standard 224.0030, SoCalGas interprets this request as seeking information regarding SS25 well kills performed by SoCalGas. SoCalGas performed the well kill on October 24, 2015. For details of the fluids used during the SoCalGas well kill on October 24, 2015, please see previously provided electronic document with Bates range AC_CPUC_0014306.

d. SoCalGas objects to this request on the ground that the request assumes facts that do not exist with respect to the application of Gas Standard 224.0030. Notwithstanding this objection, SoCalGas responds as follows: SoCalGas Gas Standard 224.0030 provides guidelines and direction for killing a gas storage well in routine situations. The kill of well SS25 was not a routine situation, therefore, Gas Standard 224.0030 does not apply. Based on CPUC-SED's question referencing Gas Standard 224.0030, SoCalGas interprets this request as seeking information regarding SS25 well kills performed by SoCalGas. SoCalGas performed the well kill on October 24, 2015. The SS-25 well file was available to Mr. Fortenberry who conducted the well kill on October 24, 2015. SoCalGas scanned the hard copy well file for SS-25 on or around January 2016 and these files were previously provided to CPUC-SED on February 5, 2016 and June 3, 2016 (AC_CPUC_0000023-AC_CPUC_0000759; AC_CPUC_0012338 to AC_CPUC_12389). SoCalGas interprets the "well file" to mean the hard copy well files. The well file consists of the following: (1) histories (2) logs, (3) surveys, and (4) invoices. Please note, electronic versions of various well file records are available in WellView and the UGS Server. In addition, there are other electronic databases (e.g., Maximo and OSI Soft PI) with well related information. Most records in the well files are dated, and records are added, not removed, from the well file.

e. SoCalGas objects to this request on the grounds that the request assumes facts that do not exist with respect to the application of Gas Standard 224.0030, and vague and ambiguous as to the term "qualifications." SoCalGas further objects that the question assumes facts that do not exist – "qualifications" is not mentioned in Section 1.1 of the referenced Gas Standard therein. Notwithstanding these objections, SoCalGas responds as follows: SoCalGas Gas Standard 224.0030 provides guidelines and direction for killing a gas storage well in routine situations. The kill of well SS25 was not a routine situation, therefore, Gas Standard 224.0030 does not apply. Based on CPUC-SED's question referencing Gas Standard

224.0030, SoCalGas interprets this request as seeking information regarding SS25 well kills performed by SoCalGas. SoCalGas performed the well kill on October 24, 2015. Please see Response 1.b.

f. SoCalGas objects to this request on the grounds that the request is overly broad and unduly burdensome, vague and ambiguous as to the terms "qualifications" and "duties," and assumes facts that do not exist with respect to the application of Gas Standard 224.0030. SoCalGas further objects to this request on the grounds that it is unintelligible in that it assumes facts that do not exist – "qualifications" and "duties" are not mentioned in Section 1.1 of the referenced Gas Standard therein. Notwithstanding these objections, SoCalGas responds as follows: SoCalGas Gas Standard 224.0030 provides guidelines and direction for killing a gas storage well in routine situations. The kill of well SS25 was not a routine situation, therefore, Gas Standard 224.0030 does not apply. Based on CPUC-SED's question referencing Gas Standard 224.0030, SoCalGas interprets this request as seeking information regarding SS25 well kills performed by SoCalGas. SoCalGas performed the well kill on October 24, 2015. For the contractors that were used to assist with the SoCalGas well kill on October 24, 2015, please see previously provided electronic document with Bates range AC_CPUC_0014306.

g. SoCalGas objects to this request on the ground that the request assumes facts that do not exist with respect to the application of Gas Standard 224.0030. Notwithstanding this objection, SoCalGas responds as follows: SoCalGas Gas Standard 224.0030 provides guidelines and direction for killing a gas storage well in routine situations. The kill of well SS25 was not a routine situation, therefore, Gas Standard 224.0030 does not apply. Based on CPUC-SED's question referencing Gas Standard 224.0030, SoCalGas interprets this request as seeking information regarding SS25 well kills performed by SoCalGas. SoCalGas performed the well kill on October 24, 2015. For SoCalGas' Daily Operations Report for October 24, 2015, please see previously provided electronic document with Bates range AC_CPUC_0014306.

h. SoCalGas objects to this request on the grounds that the request is overly broad and unduly burdensome, vague and ambiguous as to the phrase "all information related to," and assumes facts that do not exist with respect to the application of Gas Standards 224.0030 and 224.0045. Notwithstanding these objections, SoCalGas responds as follows: SoCalGas Gas Standard 224.0045 provides guidelines and direction for killing a gas storage well in routine situations. The kill of well SS25 was not a routine situation, therefore, Gas Standard 224.0045 does not apply. Based on CPUC-CPUC-SED's question referencing Gas Standard 224.0045, SoCalGas interprets this request as seeking information regarding SS25 well kills performed by SoCalGas. SoCalGas performed the well kill on October 24, 2015. See Response 1.b.

i. See Response 1.a.

j. SoCalGas objects to the instruction to "provide at a minimum the following information in table form" on the grounds that it is overbroad and unduly burdensome. Special interrogatory instructions of this nature are expressly prohibited by California Code of Civil Procedure 2030.060(d). Notwithstanding this objection, SoCalGas responds as follows: SoCalGas Gas Standard 224.0030 provides guidelines and direction for killing a gas storage well in routine situations. The kill of well SS25 was not a routine situation, therefore, Gas Standard 224.0030 does not apply. As stated in Responses 1.a-d, based on CPUC-SED's

questions referencing Gas Standard 224.0030, SoCalGas interprets these requests as relating to well kills performed by SoCalGas. SoCalGas performed the well kill on October 24, 2015.

i. See Response 1.b. For the well kill activities on October 24, 2015, Mr. Fortenberry utilized the SS25 wellbore schematic and obtained the surface pressure for SS25. Please see previously provided electronic document with Bates range AC_CPUC_0000067.

ii. SoCalGas objects to this request as vague and ambiguous as to "recorded sources of information" and "used to control and kill Standard SS-25." Notwithstanding this objection, SoCalGas responds as follows: See Response 1.b. For the well kill activities on October 24, 2015, Mr. Fortenberry utilized the SS25 wellbore schematic and obtained the surface pressure for SS25. Please see previously provided electronic document with Bates range AC_CPUC_0014306.

iii. See Response 1.b.

iv. Todd van de Putte.

v. N/A.

vi. N/A.

vii. N/A.

Question 2:

For this set of questions, please reference attachment 1, an email data request from Maria C. Solis on 11/13/18 and the corresponding data response email from Jeff Koski question #5 and #14 (see email below).

From: Koskie, W. Jeff [mailto:WKoskie@semprautilities.com]
Sent: Sunday, November 15, 2015 2:46 PM
To: Solis, Maria; Epuna, Matthewson
Cc: Gonzalez, Hector O; Smith, Paul; Bauer, Troy A.
Subject: RE: Underground Storage facilities - CPUC Data Request Response - Aliso Canyon Storage Facility

Maria/Matt,

Below are responses to final group of initial data request items.

Please let me know if you have any questions, or if I can be of any further assistance.

5. What is the initial proposed future mitigation to this type of incident.

Our first priority is to stop the flow of gas using standard practices that ensure continued safety, offer the greatest likelihood of a prompt resolution and are

appropriately tailored to the individual circumstances of this leak. Once we have the current incident under control, SoCalGas will evaluate whether anything can be done to mitigate the possibility of such incidents in the future. This evaluation will likely be part of our root cause analysis of the current incident.

14. Any initial failure investigation findings to date.

We know the well has a casing leak. Until the leak is stopped and the well is inspected, we cannot determine the extent or the cause of the failure. Root cause investigation will commence at that time.

W. Jeff Koskie, ARM
Pipeline Safety and Compliance Manager
ML SC9334
Cell Phone (213) 305-8660
Office Phone (661) 775-8770 Fax: (213) 244-8155
<mailto:wkoskie@semprautilities.com>

a. Based on the data response above to questions #5 and #14 above please provide the SoCalGas Root Cause analysis/investigation. See highlighted text that specifically states a root cause investigation and a root cause analysis will be conducted and provided to completely respond to questions #5 and #14.

Response 2:

SoCalGas has not conducted its own root cause analysis. Pursuant to a letter from the CPUC and DOGGR dated December 14, 2015 (http://www.cpuc.ca.gov/uploadedFiles/CPUC_Public_Website/Content/News_Room/News_and_Updates/Letter%20dated%20December%2014%202015.pdf), SoCalGas was directed to retain an independent third party to perform the root cause analysis. In addition, pursuant to a CPUC letter dated February 11, 2016, SoCalGas was directed to turn over control of the SS-25 well site once SoCalGas had made the area safe after permanently sealing the well. SoCalGas was granted access on an as-needed basis in order to perform well pad conditioning and other work as necessary or required by DOGGR. Per CPUC investigation procedures, the CPUC released site control back to SoCalGas on September 12, 2018.

Question 3:

For this next question, please reference question #13 of attachment 1, an email data request from Maria C. Solis on 11/13/18. For convenience, the question states, "Estimate of the cost to mitigate the incident. I'll request this in the draft data request". Please provide a data response to question #13, a data response has not been provided to date specifically to respond to data request from 11/13/18.

Response 3:

SoCalGas objects to this request on the grounds that it assumes facts that do not exist with respect to the statement that "a data response has not been provided to date." Notwithstanding this objection, SoCalGas responds as follows: SoCalGas provided a response to Maria Solis' data request dated November 13, 2015 on November 15, 2015. Subsequently, pursuant to the letter from the CPUC- Executive Director dated December 23, 2015 (http://www.cpuc.ca.gov/uploadedFiles/CPUC_Public_Website/Content/News_Room/News_and_Updates/12-23-15%20Southern%20California%20Gas%20Shall%20Provide%20Information%20to%20CPUC%20Concerning%20Costs%20Associated.pdf), SoCalGas has provided monthly updates to the CPUC regarding the Aliso Incident costs. The most recent of these reports is provided in the enclosed electronic documents with Bates range AC_CPUC_SED_DR_30_0000001 - AC_CPUC_SED_DR_30_0000003 and provides the Aliso Incident costs recorded through October 31, 2018.

Question 4:

For this next set of questions, please refer to the incident reported in the following Los Angeles Daily News article https://www.dailynews.com/2015/10/29/gas-leak-near-porter- ranch-lingers-nearly-one-week-later/.

a. Please provide all records of this incident, including root cause analysis and mitigation.
b. If this is not the date of the specific incident, please provide actual date of the incident this article is referring to.

Response 4:

a. SoCalGas objects to this request as overly broad and vague and ambiguous as to "all records of this incident." Notwithstanding these objections, SoCalGas responds as follows: SoCalGas understands that CPUC-SED's inquiry is inquiring about and the article is referring to the SS25 incident at Aliso Canyon that began on October 23, 2015. See Responses 2 and 3. The root cause analysis associated with the October 23, 2015 incident is ongoing and is being performed by an independent third party.
b. See Response 4.a.

Question 5:

Please provide the resiliency plan and timeline of resiliency plan that was put in place when SoCalGas determined that the incident beginning October 23, 2015 required customer evacuations.

Response 5:

SoCalGas objects to this request as vague and ambiguous and assumes facts that do not exist regarding the use of the phrases "resiliency plan that was put in place." Notwithstanding these

objections, SoCalGas responds as follows: SoCalGas is not aware of a "resiliency plan" that relates to customer evacuations for the incident beginning October 23, 2015. Further, at no point in time did "SoCalGas determine[] that the incident beginning October 23, 2015 required customer evacuations." Additionally, no governmental agency or authority ordered an evacuation with respect to the incident. Accordingly, SoCalGas is not aware of any document or timeline relating to any "resiliency plan" requiring "customer evacuations."

SoCalGas instead interprets CPUC-SED's question to refer to the "SS-25 Incident Aliso Canyon Gas Leak Odorous Emissions Mitigation Plan and Temporary Relocation Plan" (the "Temporary Relocation Plan"). SoCalGas developed the Temporary Relocation Plan in consultation with various state and local government agencies in response to the Los Angeles County Department of Public Health's November 19, 2015 directive that SoCalGas "offer free, temporary relocation to any area residents affected by odors from the Aliso Canyon site." At no time were area residents required to relocate pursuant to the Temporary Relocation Plan; rather, residents were provided the option to relocate if they chose to do so.

For a copy of the Temporary Relocation Plan, dated December 15, 2015, that was adopted pursuant to a stipulation and Court Order dated December 24, 2015, please see electronic documents with Bates range AC_CPUC_SED_DR_30_0000004 - AC_CPUC_SED_DR_30_0000032.

Pursuant to the Department of Public Health's November 19, 2015 directive, SoCalGas offered free, temporary relocation to eligible residents from November 19, 2015 until approximately July 2016, when the last relocated residents returned home. The Temporary Relocation program ended by agreement between the County of Los Angeles and SoCalGas, and Court Order dated May 20, 2016.

Question 6:

Did SoCalGas have a resiliency plan in place immediately prior to the one provided in response to question 5? If so, please provide it.

Response 6:

As stated in Response 5, SoCalGas is not aware of a "resiliency plan" and interprets this question as referring to the Temporary Relocation Plan.

The Temporary Relocation Plan was not in place immediately prior to the incident, as it was developed in response to the incident.

Question 7:

Has SoCalGas's changed its company-wide resiliency plan since the one it created based upon the incident beginning October 23, 2015? If so, provide all such revised plans regardless of whether they are titled "resiliency" plan or something else.

Response 7:

As stated in Response 5, SoCalGas is not aware of a "resiliency plan" and interprets this question as referring to the Temporary Relocation Plan.

The Temporary Relocation Plan was developed in response to the incident and the directive from the Department of Public Health. The Plan itself has not been modified since the date it was adopted pursuant to the stipulation and Court Order dated December 24, 2015.

Question 8:

Please identify all changes made to the plans provided in response to questions 5, 6, and 7.

Response 8:

See Response 5.

SoCalGas made no changes to the Temporary Relocation Plan during the course of the incident. However, the practices for implementing the Temporary Relocation Plan were periodically revised and updated to address specific issues related to, among other things, eligibility, claims handling, and reimbursement processes.

Question 9:

Please provide all Incident Status Summary ICS forms 209 for daily operations from 10-23-15 to 2-28-16.

Response 9:

Please see electronic documents with Bates range AC_CPUC_SED_DR_30_0000033 - AC_CPUC_SED_DR_30_0000475.

Question 10:

Please submit any SoCalGas procedures, standard practices, or internal instructions that relate to cathodic protection standards for downhole well casings as applied to Aliso Canyon well casings, tubing, or other downhole equipment.

Response 10:

SoCalGas objects to this request as overbroad and vague and ambiguous as to the time period at issue and the phrase "procedures, standard practices, or internal instructions." Notwithstanding these objections, SoCalGas responds as follows: SoCalGas understands this request to be seeking written formal SoCalGas procedures related to cathodic protection for downhole well casings. Pursuant to SoCalGas' Storage Risk Management Plan, SoCalGas developed a storage-specific corrosion control manual to govern procedures, processes, and maintenance requirements

necessary to prevent and mitigate the occurrence of corrosion related wall loss on storage assets. SoCalGas previously provided its Storage Corrosion Control Manual to CPUC-SED on August 9, 2018 (see AC_CPUC_0206060 through AC_CPUC_0206113).

Question 11:

Were any of the procedures, standards, or instructions provided in response to question 10 performed on well SS-25?

a. If yes, please provide all records in relation to any cathodic protection used on well SS-25.
b. If not, please explain why not.

Response 11:

The Storage Corrosion Control Manual referenced in response to Question 10 was not performed on well SS25.

a. N/A.
b. The Storage Corrosion Control Manual was created after October 23, 2015.

Question 12:

Provide the well file for SS25 as it existed on October 23, 2015.

Response 12:

See Response 1.d.

Question 13:

Provide each iteration of the well file for SS 25 between and including October 23, 2015 and February 28, 2016. Be sure to include the date showing when each new iteration was created.

Response 13:

SoCalGas objects to "iteration of the well file" as vague and ambiguous. Notwithstanding this objection SoCalGas responds as follows: For purposes of this response, SoCalGas interprets the use of the term "well file" to mean the hard copy well files. The well file consists of the following: (1) histories (2) logs, (3) surveys, and (4) invoices. Please note, electronic versions of various well file records are available in WellView and the UGS Server. In addition, there are other electronic databases (e.g., Maximo and OSI Soft PI) with well related information. SoCalGas does not track changes to its hard copy well files or electronic well file records. However, most records in the well files are dated, and records are added, not removed, from the well file. See Response 1.d.

Question 14:

Provide the excerpt of the change log that documents all changes to the SS25 well file between October 23, 2015 and February 28, 2016.

Response 14:

See Response 13.

Question 15:

Please provide all reasons for each change made to the well SS25 well file between October 23, 2015 and February 28, 2016.

Response 15:

See Response 13.

Question 16:

As of October 23, 2015, how many versions of the well SS25 well file were there at SoCalGas (please include the master copy of the well file in answering this question)?

a. Produce all such well files.
b. As of October 23, 2015, did all versions of the SS25 well files match one another?
c. If the answer to question 16a is anything other than an unqualified "yes", please list all discrepancies between the master SS25 well file and each of the others.
d. Did any versions of the SS25 well files exist between October 23, 2015 that SoCalGas cannot produce in response to this data request?
e. If the answer to question 16c is yes, how many?
f. If the answer to question 16c is yes, what happened to each file that SoCalGas cannot produce today?

Response 16:

SoCalGas objects to this request as vague and ambiguous as to the phrase "versions of the well SS25 well file" and "master copy of the well file." Notwithstanding this objection, SoCalGas responds as follows: For purposes of this response, SoCalGas interprets the use of the term "well file" to mean the hard copy well files. The well file consists of the following: (1) histories (2) logs, (3) surveys, and (4) invoices. Please note, electronic versions of various well file records are available in WellView and the UGS Server.

As previously explained in SoCalGas' response to CPUC-SED Data Request 17, Question 19, on October 23, 2015, well files were kept at each respective storage facility. In addition, duplicate

copies of well files for all storage fields were warehoused at Aliso Canyon. These duplicate well files were not updated.

a. Please see Response 1.d. For the warehoused duplicate copy of the SS25 well file, please see electronic documents with Bates range AC_CPUC_SED_DR_30_0000476 - AC_CPUC_SED_DR_30_0001177.
b. The SS25 well file did not match the warehoused duplicate copy because the duplicate copy was not updated.
c. SoCalGas objects to this request as unduly burdensome. Notwithstanding this objection, SoCalGas responds as follows: See Response 16.a.
d. No.
e. N/A.
f. N/A.

Question 17:

Provide the change log or change logs showing changes to all SoCalGas well files. The change logs should include data entered at the date each log was created and include data that was included up through the date of this data request.

Response 17:

See Response 13.

Question 18:

Please refer to the attached email thread, dated November 4, 2015 including communications between Amy Kitson, Glenn La Fevers, Jimmie Cho and Avideh Razavi. For reference (see attached 3), the email thread states in part,

"Glenn and Jimmie-
Avi is available at noon to go through the SS 25 data with you."

a. Please explain in detail communications of this meeting.
b. Please provide all communications related to this meeting with regards to "SS 25 data".

Response 18:

a. See SoCalGas' response to CPUC-SED Data Request 32, Question 23.
b. Please see previously provided electronic documents with Bates range AC_CPUC_SED_KITSON_00010026 through AC_CPUC_SED_KITSON_00010027.

SOUTHERN CALIFORNIA GAS COMPANY
CPUC-SAFETY AND ENFORCEMENT DIVISION
DATA REQUEST DATED OCTOBER 12, 2018

SOCALGAS RESPONSE DATED NOVEMBER 7, 2018

SoCalGas provides the following responses to the California Public Utilities Commission–Safety and Enforcement Division's October 12, 2018 request for information. These responses are based upon the best available non-privileged information known at this time and are subject to change and/or supplementation as SoCalGas' investigation continues, and additional information becomes available.

SoCalGas submits these responses, while generally objecting to any request that fails to provide a defined time period to which SoCalGas may tailor its response, and to the extent that any request is overly broad, vague, ambiguous, unduly burdensome, assumes facts, or otherwise fails to describe with reasonable particularity the information sought. SoCalGas further submits these responses without conceding the relevance of the subject matter of any request or response. SoCalGas reserves the right to object to use of these responses, or information contained therein, in any dispute, matter or legal proceeding before any court, tribunal, or agency, or governmental action. Finally, at the time of this response, there are no pending oral data requests from the CPUC-SED to SoCalGas.

Please refer to the document entitled, WellView Data Integrity Project, dated March 4, 2015 and answer the following questions about it.

Question 1:

Please confirm SED's understanding that the WellView Data Integrity Project worked on a repository called WellView, which kept digitized versions of certain well files and schematics dating back to 2001. If this is incorrect, please clarify:

a. The date WellView began keeping digitized versions of SoCalGas well files.
b. That WellView is a repository to keep digitized versions of SoCalGas well files.

Response 1:

In 1997, SoCalGas purchased the WellView software application and license in an effort to create an electronic database of ongoing drilling, abandonment, workover and rig-less activity data, and to develop electronic wellbore schematics.

SoCalGas understands that where SED uses the term "WellView Data Integrity Project," which was the terminology employed by SoCalGas' third-party vendor, it is referring to what SoCalGas refers to as the "WellView Data Entry Project" that was initiated by SoCalGas on or around March 30, 2015. The WellView Data Entry Project involved electronically capturing information contained in the well file and well file records in order to "digitize" historical drilling, abandonment, and workover information into WellView with the objective of

developing an electronic wellbore schematic. SoCalGas defines "digitize" in this context to mean extraction, collection and entry of data and information from historical records into an electronic database (as distinct from duplication of hard copy records in electronic format). Please note, this digitization was an iterative process and the primary source of the data that was digitized into WellView was the hard copy well files. Data that was digitized into WellView continues to remain in the hard copy well files and electronic well file records. Please note, WellView does not contain a set of well files. WellView is a well data management system containing certain digitized data and information from the hard copy well files and electronic well file records related to well planning, completion, testing and workovers.

The WellView Data Entry Project was one of SoCalGas' initial efforts in developing its Storage Integrity Management Program (SIMP). In addition to the WellView Data Entry Project, SoCalGas initiated several other SIMP projects during this timeframe, including but not limited to: (1) Draft SIMP Plan (the initial development of the written plan for SIMP which is a proactive program to assess and enhance the safety and integrity of our underground storage system.); (2) SIMP Pilot Program (the commencement of well integrity and management work related to SIMP with a pilot program in 2014); and (3) Installation of Wireless Pressure Transmitters (the installation of wireless pressure transmitters to continuously monitor and record all surface pressures).

a. SoCalGas interprets this request as seeking the date SoCalGas began digitizing its well files under the WellView Data Entry Project. The agreement between SoCalGas and Well Life Cycle Resources for the WellView Data Entry Project was executed on March 30, 2015. The scope of work was for Well Life Cycle Resources to perform data entry into WellView and provide WellView database support services.
b. See Response 1.

Question 2:

Other than WellView, list all repositories SoCalGas has used in order to keep digitized well files since 2001.

Response 2:

See Response 1 and "digitize" definition. The only database SoCalGas digitizes well file information into is WellView. The well file consists of the following: (1) histories (2) logs, (3) surveys, and (4) invoices. Please note, there are other electronic databases (e.g., Maximo and OSI Soft PI) with digitized well related information that are not contained in the well file.

As of October 23, 2015, in addition to the hard copy well files, SoCalGas collected electronic well file records and/or well related information in the following digital repositories:

- WellView
- Rig View
- OSI Soft PI
- Maximo

- SAP
- UGS Servers
- SharePoint

WellView: A well data management system containing well file records related to well planning, drilling, completion, testing and workovers.

RigView: A rig and well project scheduling system for drilling, completions, workovers and testing.

OSI Soft PI: The repository for process information such as storage field injection and withdrawal rates, and well pressures.

Maximo: The maintenance management system for storage facilities. Inspection activities for the following well components are scheduled and recorded in Maximo:

- Wellhead valve
- Surface safety valve
- Surface-controlled subsurface safety valve

SAP: Invoice management system.

UGS Server: A storage server used to store, access, secure and manage digital data and files, including but not limited to, electronic versions of well file records and staff working files.

SharePoint: SharePoint is a web-based, collaborative platform that integrates with Microsoft Office, including but not limited to, staff working files.

Question 3:

If there is more than one repository to keep digitized well files:

a. Does each repository keep a distinct set of well files, or do some well files exist in more than one repository?
b. For what purpose is each repository (including WellView) used?
c. Has information been corrected in each of these repositories in a similar fashion to the WellView Data Integrity Project?
d. If the answer to question 3c is yes, please provide:
    i. The name of the project to correct each repository.
    ii. The date the project to correct each repository began.
    iii. The date the project to correct each repository will end.
    iv. The scope of work for each repository, including the document that shows the scope of work.

Response 3:

No, see Response 2. SoCalGas defines "digitize" in this context to mean historical data collection and entry into a database. The only repository SoCalGas digitizes well file

information into is WellView. The well file consists of the following: (1) histories (2) logs, (3) surveys, and (4) invoices. Please note, there are other electronic repositories with well related information that are not contained in the well file (e.g., Maximo and OSI Soft PI).

a. No, see Response 2.
b. See Response 1.
c. N/A.
d. N/A.

Question 4:

Specific to Aliso Canyon, provide all deliverables, products and other committed items that Wellview vendors have contracted or otherwise agreed to give to SoCalGas as part of the Wellview scope of work to date.

Response 4:

Confidential and Protected Materials Pursuant to PUC Section 583, GO 66-D, and D.17-09-023

SoCalGas interprets this request as seeking a list of deliverables and products that third-party vendors provided to SoCalGas related to the "WellView Data Entry Project." Therefore, this response does not include deliverables and products from third-party vendors related to other activities or projects (e.g., data entry into WellView for ongoing rig activities). In addition, although this request is specific to Aliso Canyon, these deliverables also applied to non-Aliso Canyon storage fields.

Well Life Cycle Resources

See Response 1 regarding SoCalGas' hiring of Well Life Cycle Resources for the WellView Data Entry Project. For Well Life Cycle Resources' scope of work, please see electronic documents with Bates range AC_CPUC_SED_DR_32_0000019 through AC_CPUC_SED_DR_32_0000031. Well Life Cycle Resources digitized well file information into WellView on or around May 2015 through May 2017. The overall deliverables of this project were WellView database population and WellView support and training services.
To meet their deliverables, Well Life Cycle Resources created the following:

- *Weekly Progress Reports*: Weekly progress reports to track vendor hours and progress on the project.
- *WellView Configuration Observations and Suggestion Summary:* As part of the database support, Well Life Cycle Resources conducted a review of existing database securities, libraries, and reports.
- *WellView Configuration Tracking Sheet*: A working document used to track the database configuration and enhancements progress.
- *Training Documents*: Customized training documents for users.
- *WellView 9 to WellView10 Data Model Mapping*: Mapping in preparation of a software upgrade to verify data fields were mapped to the appropriate tables in the upgraded software data model.

InterAct PMTI, Inc.
In May 2018, SoCalGas hired InterAct PMTI, Inc. for work related to the collection and entry of historical data into WellView. The scope of work included the "digitization" of historical drilling, abandonment, and workover information into WellView. Please see Response 1 for the "digitization" definition. InterAct PMTI, Inc. began digitizing well file information into WellView on or around May 2018. For InterAct PMTI's scope of work, please see electronic documents with Bates range AC_CPUC_SED_DR_32_0000001 through AC_CPUC_SED_DR_32_0000018. This is a continuing and evolving effort. The overall deliverable of this project is continued database population for several purposes, including but not limited to, the development of electronic wellbore schematics.

To meet their deliverable, InterAct PMTI, Inc. created the following:

- *WellView Cleanup Checklist Tracking Spreadsheet*: This is a working document used to verify the vendor is capturing data in WellView based on a set of identified data attributes.
- *Draft "How To" documents*: Outlines standardization steps on how the data should be captured in WellView.

Question 5:

Of those deliverables, products and other committed items, identify each one that Ms. Avideh Razavi reviewed and approved.

Response 5:

In March 2015, Avideh Razavi, in her capacity as Storage Field Engineer I, initiated the Well Data Entry Project and generally reviewed the Well Life Cycle Resources deliverables identified in Response 4. In addition, Ms. Razavi reviewed and approved invoices for Well Life Cycle Resources that were relevant to the Well View Data Entry Project.

Question 6:

If SoCalGas maintains that Ms. Razavi reviewed and approved a given deliverable, product or other committed item, provide the documentation that shows Ms. Razavi did so.

Response 6:

Confidential and Protected Materials Pursuant to PUC Section 583, GO 66-D, and D.17-09-023

Please see enclosed electronic documents with Bates range AC_CPUC_SED_DR_32_0000032 through AC_CPUC_SED_DR_32_0000033.

Question 7:

If another SoCalGas employee reviewed and approved a given Wellview deliverable, product or other committed item, please identify:

a. Each such employee.
b. The Wellview deliverable(s), product(s), and other committed item(s) the identified employees reviewed and approved.
c. The dates of these reviews and approvals.

Response 7:

Confidential and Protected Materials Pursuant to PUC Section 583, GO 66-D, and D.17-09-023

SoCalGas interprets this request as seeking a list of SoCalGas employees in Storage who reviewed and/or approved deliverables and products, including invoices, that Well Life Cycle Resources and InterAct PMTI, Inc. provided to SoCalGas related to the collection and entry of historical data into WellView.

a. Avideh Razavi and Carla Lynx generally reviewed the deliverables for Well Life Cycle Resources and InterAct PMTI, Inc., respectively. Avideh Razavi, Carla Lynx, Neil Navin, and Amy Kitson have reviewed and approved invoices for Well Life Cycle Resources. Carla Lynx has reviewed and approved invoices for InterAct PMTI, Inc.
b. See Response 7.a.
c. Please see enclosed electronic documents with Bates range AC_CPUC_SED_DR_32_0000032 through AC_CPUC_SED_DR_32_0000033.

Question 8:

Did Ms. Razavi or any other SoCalGas employee who reviewed and approved given Wellview deliverable(s), product(s), or other committed item(s) ever recommend any edits, changes, or comments for revising those items.

Response 8:

Yes.

Question 9:

If the answer to the prior question is yes, provide all documentation showing such edits, changes, and comments.

Response 9:

SoCalGas objects to this request as overly broad and unduly burdensome. SoCalGas provided comments to Well Life Cycle Resources and InterAct PMTI, Inc. in many different ways (e.g., in-person communications, meetings, conference calls, email, etc.). Well Life Cycle Resources and InterAct PMTI, Inc. would then incorporate SoCalGas comments directly into WellView when appropriate.

Question 10:

Who for SoCalGas reviewed invoices of the Wellview vendors and authorized payment?

Response 10:

See Response 7.

Question 11:

Confidential and Protected Materials Pursuant to PUC Section 583, GO 66-D, and D.17-09-023

Please refer to the following testimony under oath, September 25, 2018, pages 137-139 by Ms. Razavi with regards to the document marked by SoCalGas as AC_CPUC_SED_KITSON_0000708:

> Q Ms. Razavi, in terms of the errors that you identified in this exhibit with the date, where does this data come from?
>
> WITNESS RAZAVI: A The vendor who input the data into WellView.
>
> Q So you're saying the vendor made an input error?
>
> A Yes.
>
> Q And this whole email is about correcting an error that the vendor may have made. But then there's yet another error in the date?
>
> A Yes.
>
> Q And then was that looked at? Was that quality verified? Or is this the first time you became aware of those dates being off?
>
> A It's the first time I became aware of the inaccurate dates.
>
> Q Do you have a quality assurance concern with this vendor?
>
> A Yes. That's why we changed our approach.
>
> Q And what do you mean by that?
>
> A We are now using another vendor and QCing the data that is being inputted into our WellView.

Q When did that take place, the shifted to the new vendor?

WITNESS RAZAVI: A It was earlier this year.

Q And so this email is your email; correct?

A Yes.

Q And these documents were attached to your email when you sent it around?

A Yes.

Q And this is January 2016, and we're now in September 2018. And so only in the last few months it was discovered that the original vendor had data issues?

A No, actually. The Well Lifecycle Resources identified that the individuals who were working on these wells had -- they were let go. And for some time, we continued with this vendor with a new team to do the data input. And then, ultimately, we switched vendors from Well Lifecycle Resources to another vendor.

Q I noticed that you picked up these errors right away when you looked at the document. Did you not look at the document before you sent it around?

A I don't remember.

With this dialogue in mind, please answer the following follow-up questions: With regards to Ms. Razavi's statement:

> "The Well Lifecycle Resources identified that the individuals who were working on these wells had -- they were let go. And for some time, we continued with this vendor with a new team to do the data input. And then, ultimately, we switched vendors from Well Lifecycle Resources to another vendor."

a. Please confirm this is an accurate transcript of this portion of Ms. Razavi's testimony. If this is inaccurate, please correct it.
b. Please list the individuals identified by Well Lifecycle Resources who were let go.
c. Please list the start and end dates of work on the WellView Data Integrity Project of the individuals identified by Well Lifecycle Resources who were let go.
d. Please list the individuals on the new team to do the data input.
e. Please list the start and end dates of work of each individual on the new team on the WellView Data Integrity Project.
f. Were errors found in the data input by the new team?
g. If errors were found in the data input by the new team, please provide the date they were first found?
h. If errors were found in the data input by the new team, please provide documentation showing the date they were first found.

i. Please list the date SoCalGas switched vendors from Well Lifecyle Resources to another vendor.
j. Please list the reasons SoCalGas switched from WellView Data Integrity Project to another vendor.

Response 11:

Confidential and Protected Materials Pursuant to PUC Section 583, GO 66-D, and D.17-09-023

To clarify, based on Ms. Razavi's recollection and the excerpt of Ms. Razavi's transcript provided in Question 11, the error(s) identified during Ms. Razavi's testimony were on the work completion date(s) of the vendor deliverable submittals, not the actual data input into the WellView database. SoCalGas is providing this response with this clarification in mind:

SoCalGas responds to the following requests with regards to the following statement: "The Well Lifecycle Resources identified that the individuals who were working on these wells had -- they were let go. And for some time, we continued with this vendor with a new team to do the data input. And then, ultimately, we switched vendors from Well Lifecycle Resources to another vendor."

a. Notwithstanding the fact that Ms. Razavi has not reviewed the transcript of her examination under oath, and is relying on the excerpt provided above, SoCalGas responds as follows: Yes.
b. Joel Wheat and Israel Guerra.
c. Based on the review of the invoices, these employees began work on the project on or around May 2015 and ended work on the project on or around September 2016.
d. Ron Buchanan and Andy Shroble from Well Life Cycle Resources.
e. Based on the review of the invoices, these employees began work on the project on or around September 2016 and ended work on the project on or around May 2017.
f. To the best of SoCalGas' current knowledge, SoCalGas is not aware of data input errors found by the individuals on the new team (Ron Buchanan, Andy Shroble) from Well Life Cycle Resources.
g. N/A.
h. N/A.
i. SoCalGas continues to use Well Life Cycle Resources for an audit tool license and associated support services. SoCalGas signed an agreement with InterAct PMTI, Inc. for historical data entry into WellView on May 14, 2018.
j. SoCalGas assumes that "WellView Data Integrity Project" as used in this question was intended to mean "Well Life Cycle Resources." SoCalGas was looking for a local vendor that could work on-site and have continuous access to SoCalGas' hard copy well files, could meet in person with SoCalGas' employees frequently, and is familiar with California regulations. InterAct PMTI, Inc. met these needs and at the time was also helping develop updated wellbore diagrams and was already in the process of reviewing the well files. In addition, given the familiarity of InterAct PMTI, Inc. with SoCalGas' well files and wellbore diagrams, they were selected to review the data entered by Well

Life Cycle Resources into WellView for the purposes of developing an electronic wellbore diagram.

Question 12:

Prior to learning of errors, did SoCalGas use the data input from the Well Lifecycle Resources team who were let go for any purpose or purposes?

Response 12:

No, as explained in Response 11, based on Ms. Razavi's recollection, the error(s) identified during Ms. Razavi's testimony were on the work completion date(s) of the vendor deliverable submittals, not the actual data input into the database.

Question 13:

If so, what purpose or purposes?

Response 13:

N/A.

Question 14:

Confidential and Protected Materials Pursuant to PUC Section 583, GO 66-D, and D.17-09-023

With regards to Ms. Razavi's statement:

"A We are now using another vendor and QCing the data that is being inputted into our WellView."

a. Please provide the name of the vendor who is QCing the data that is being inputted into SoCalGas's WellView.
b. Please provide the contract or contracts SoCalGas has with the vendor who is QC-ing the data that is being inputted into SoCalGas's WellView.
c. Is the vendor who is QC-ing the data that is being inputted into SoCalGas's WellView checking the data input into Wellview by Well Lifecycle resources to see if it is traceable, verifiable, complete and accurate?
d. Has anyone checked the data that was input into WellView by Well Lifecycle resources to see if it is traceable, verifiable, complete and accurate?
e. Does SoCalGas have a means of telling which data was input into WellView was input by Well Lifecycle resources, and which data was input into Wellview by someone else?
f. If so, please provide the documentation showing how SoCalGas tells the difference between data entered into WellView by Well Lifecycle resources, and data entered into WellView by someone else?

Response 14:

Confidential and Protected Materials Pursuant to PUC Section 583, GO 66-D, and D.17-09-023

a. InterAct PMTI, Inc.
b. Please see enclosed electronic documents with Bates range AC_CPUC_SED_DR_32_0000001 through AC_CPUC_SED_DR_32_0000018.
c. SoCalGas objects to this request as vague and ambiguous. Absent agreed definitions, the terms 'traceable, verifiable, complete and accurate' are vague and open to interpretation. Notwithstanding this objection, SoCalGas responds as follows: Please see enclosed electronic documents with Bates range AC_CPUC_SED_DR_32_0000001 through AC_CPUC_SED_DR_32_0000018.
d. SoCalGas objects to this request as vague and ambiguous. Absent agreed definitions, the terms 'traceable, verifiable, complete and accurate' are vague and open to interpretation. Notwithstanding this objection, SoCalGas responds as follows: Please see enclosed electronic documents with Bates range AC_CPUC_SED_DR_32_0000001 through AC_CPUC_SED_DR_32_0000018.
e. When a field within a table in WellView is edited, the name of the person who last changed the information is listed.
f. SoCalGas objects to this request as overly broad and unduly burdensome. Notwithstanding that objection, SoCalGas responds as follows: Please see enclosed electronic example document with Bates range AC_CPUC_SED_DR_32_0000034.

Question 15:

Did Ms. Razavi review every product of Wellview provided to her by the vendor?

Response 15:

See Response 5.

Question 16:

Please again refer to the document marked AC_CPUC_SED_KITSON_0000708, including an email from Ms. Razavi dated January 15th.

a. It is SED's understanding from Ms. Razavi during an Examination Under Oath that "clean up" referenced in this email from her referred only to digitizing well files into WellView. Is that understanding accurate?
b. If SED's understanding in 16a is not accurate, please explain.
c. Please refer to the sentence in this email that states, "The purpose of this project is to enter missing and/or correct, pertinent well data in WellView." It is SED's understanding that she only recalls corrections to typos, but not other errors, that were corrected to well file data entered into WellView. Is this understanding accurate?
d. If SED's understanding in 16c is not accurate, please explain.

Response 16:

a. Yes.
b. N/A.
c. To clarify, no changes were made to the hard copy well files. Well Life Cycle Resources used the hard copy well files and well file records to enter historical data into WellView as explained in Response 1. Based on the excerpt of Ms. Razavi's EUO transcript in Question 11, at the time of Ms. Razavi's EUO she recalled corrections to typos, but not corrections to errors. Upon further review, additional corrections to the WellView database were made based on well file records.
d. See Response 16.c.

Question 17:

Given SED's understanding from Ms. Razavi that she only recalls corrections to typos, but not other errors, that were corrected to well file data entered into WellView, please provide the following:

a. A list showing all errors in hard copies of Well Files that were corrected before being entered into WellView.
b. A highlight or other indication of all errors that SoCalGas asserts are merely typos.
c. A different indication of errors that SoCalGas acknowledges are not typos.
d. A tally of typos prior to October 23, 2015.
e. A tally of typos on and after October 23, 2015.
f. A tally of non-typographical errors prior to October 23, 2015.
g. A tally of non-typographical errors on and after October 23, 2015.

Response 17:

SoCalGas objects to this request on the grounds that it assumes, without foundation, that there were errors in hard copy well files that were corrected in the course of the WellView Data Entry Project. This is not an accurate assumption. The purpose of the WellView Data Entry Project was to input well file information contained in the hard copy the well files into an electronic database. SoCalGas further notes that because SED has not provided the transcript from Ms. Razavi's EUO to SoCalGas, SoCalGas is unable to assess SED's basis for this question.

a.-g. For clarification, incorrect data or typos were identified and corrected in WellView. This was done by comparing the information in WellView against the original records from the hard copy well files and other sources. There were no corrections or other changes to records in the well files as part of the WellView Data Entry Project.

Question 18:

In native file format that allows columns to be sorted, please provide the log that tracks all changes made to data in WellView, including, but not limited to:

a. Date and time the change data was entered into wellview;

b. Time of when the data is inputted;
c. Who did the inputting;
d. Please add a column that identifies when a change was made in this log due to changes in field and well conditions (such as construction or maintenance), and when the change was made even when there were no changes to field and well conditions.

Response 18:

Confidential and Protected Materials Pursuant to PUC Section 583, GO 66-D, and D.17-09-023

SoCalGas objects to this request as overly broad and unduly burdensome. Notwithstanding that objection, SoCalGas responds as follows: Please see enclosed electronic example document with Bates range AC_CPUC_SED_DR_32_0000034.

Question 19:

Please explain the process by which SoCalGas checked the data inputs of Well Lifecycle Resources, and the other WellView vendors for accuracy.

a. Was this process comprehensive to ensure all data inputs were corrected?
b. Provide the documentation that shows this.

Response 19:

No, SoCalGas did not QC Well Life Cycle Resources or InterAct PMTI, Inc.'s digitization of historical data in WellView. Both vendors had their own internal QC processes. Today, SoCalGas utilizes an audit tool to ensure the database is populated with data attributes that are in the vendors' scope of work. These audits are a snapshot in time.

a. N/A
b. N/A

Question 20:

Please refer to the document entitled WellView data integrity project, dated March 4th, 2015.

a. Please identify any portions of this document that were not part of the scope of work that was implemented for the inputting of data into WellView.
b. Please correct the portions of this document to show the actual scope of work that was implemented for the inputting of data into WellView.
c. Please provide the document that shows the actual scope of work that was implemented for the inputting of data into WellView.

Response 20:

Confidential and Protected Materials Pursuant to PUC Section 583, GO 66-D, and D.17-09-023

The document entitled WellView Data Integrity Project, dated March 4th 2015 reflects a write-up description of the process that Well Life Cycle Resources used to digitize

information into WellView. This document was provided to Ms. Razavi on January 14, 2016 and is separate and distinct from the contract with Well Life Cycle Resources that provides the actual scope of work for the WellView Data Entry Project. For Well Life Cycle Resources' scope of work, please see enclosed electronic document with Bates range AC_CPUC_SED_DR_32_0000019 through AC_CPUC_SED_DR_32_0000031.

Question 21:

Provide the well file for SS-25 as it existed between October, 2015 and February, 2016.

Response 21:

For purposes of this response, SoCalGas interprets the use of the term "well file" in the questions to mean the hard copy well files explained in Response 2. Please note, electronic well file records are also collected in WellView and the UGS Server.

SoCalGas scanned the hard copy well file for SS-25 on or around January 2016 and these files were provided to SED on February 5, 2016 and June 3, 2016 (AC_CPUC_0000023 – AC_CPUC_0000759; AC_CPUC_0012338 to AC_CPUC_12389).

Question 22:

Provide the change logs that show any physical and digital copies of the SS-25 well files from March of 2015 through Feb of 2016?

Response 22:

For purposes of this response, SoCalGas interprets the use of the term "well file" in the questions to mean the hard copy well files explained in Response 2. SoCalGas keeps its well files in hard copy and does not track changes to the well files. However, most records in the well files are dated, and records are added, not removed, from the well file. Please note, electronic versions of various well file records are available in WellView and the UGS Server. Changes to electronic well file records are not tracked.

Question 23:

For this next set of questions, please refer to the document marked by SoCalGas as AC_CPUC_SED_KITSON_0002985.

a. This document appears to be an email thread, dated November 4, 2015, including Avideh Razavi, Glenn La Fevers , Amy Kitson, and Jimmie Cho to discuss holding a meeting at "the office trailer at noon" to "go through the SS 25 data." Is this an accurate depiction of the email thread? If not please correct it.
b. Did the meeting occur discussed in the email thread occur?
c. What date was the meeting held?
d. What was the purpose of the 11/4 meeting?
e. Please identify who attended the 11/4 meeting.

f. Please identify all topics discussed at the 11/4 meeting?
g. What was discussed at the 11/4 meeting relating to SS-25?
h. What was discussed at the 11/4 meeting relating to the well file for SS-25?
i. What was discussed at the 11/4 meeting relating to prior well kill attempts on SS- 25?
j. What was discussed at the 11/4 meeting relating to future well kill attempts on SS-25?
k. What was discussed at the 11/4 meeting relating to SS-25A, SS-25B, their well files, or any other wells or well files?
l. What does the phrase "the SS 25 data" mean in this email?
m. Does "the SS 25 data" relate to the SS-25 well file? If so, how?
n. Does "the SS 25 data" relate to the Wellview project? If so, how?
o. Does "the SS 25 data" relate to any other document or project relevant to well records, well safety, SIMP, or preparations for SIMP? If so, how?
p. What did SCG plan to do with "the SS 25 data" at the 11/4 meeting?
q. Had any information gaps been identified in the well file for SS-25 or any record related to SS-25 prior to the 11/4 meeting?
r. If so, for each gap: when was it identified, what was the gap, and when was it rectified?
s. Were any information gaps identified in the well file for SS-25 or any record related to SS-25 during the 11/4 meeting?
t. If so, for each gap:
    i. When was it identified?
    ii. What was the gap?
    iii. How was it rectified?
    iv. When was it rectified?
    v. Was information containing the gap provided to anyone tasked with killing SS25?
        1. If so,
            i. When was it identified?
            ii. What was the gap?
            iii. How was it rectified?
            iv. When was it rectified?
            v. Was information containing the gap provided to anyone tasked with killing SS25?
                1. If so:
                a. Which information gaps?
                b. To Whom?
                c. When?

        vi. Provide documentation showing each of these things.
u. Were any information gaps identified in the well file for SS-25 or any record related to SS-25 after the 11/4 meeting?
v. If so, for each gap:
    i. When was it identified?
    ii. What was the gap?
    iii. How was it rectified?
    iv. When was it rectified?
    v. Was the information containing the gap provided to anyone tasked with killing SS25?

i. If so:
    1. Which information gasp?
    2. To Whom?
    3. When?

vi. Provide documentation showing each of these things.

w. Had any inaccuracies been identified in the well file for SS-25 or any record related to SS-25 prior to the 11/4 meeting?

x. If so, for each inaccuracy:
    i. When was it identified?
    ii. What was the inaccuracy
    iii. How was it identified?
    iv. When was it rectified?
    v. Was the inaccurate information provided to anyone tasked with killing SS25?
    vi. If so:
        1. Which pieces of inaccurate information was provided?
        2. To whom?
        3. When?

y. Were any inaccuracies identified in the well file for SS-25 or any record related to SS-25 during the 11/4 meeting?

z. If so, for each gap:
    i. What was the inaccuracy?
    ii. When was it identified?
    iii. How was it rectified?
    iv. When was it rectified?
    v. Was the inaccurate information provided to anyone tasked with killing SS25?
    vi. If so:
        1. Which pieces of inaccurate information was provided?
        2. To Whom?
        3. When?

vii. Provide documentation showing each of these things?

aa. Were any inaccuracies identified in the well file for SS-25 or any record related to SS-25 after the 11/4 meeting?

bb. If so, for each inaccuracy:
    i. What was the inaccuracy?
    ii. When was it identified?
    iii. When was it rectified?
    iv. How was it rectified?
    v. Was the inaccurate information provided to anyone tasked with killing SS25?
    vi. If so:
        1. Which pieces of inaccurate information was provided?
        2. To Whom?
        3. When?

vii. Provide documentation showing each of these things.

viii.

cc. What did SCG plan to do with the SS-25 well file, and/or "the SS-25 data" pursuant to the 11/4 meeting?

dd. Did SCG or any of its employees or agents have any concerns related to using any SS-25 well file and/or "the SS-25 data" as it existed on Oct. 23, 2015?
   i. If so:
      1. Which employees and agents identified the concerns?
      2. Provide all communications showing these concerns.
      3. What were these concerns, and what were they based on?
      4. How and when were these concerns rectified?

ee. Did SCG or any of its employees or agents have any concerns related to using any SS-25 well file and/or "the SS-25 data" as it existed on Nov. 3, 2015?
   1. Which employees and agents identified the concerns?
   2. Provide all communications showing these concerns.
   3. What were these concerns, and what were they based on?
   4. How and when were these concerns rectified?

ff. Did SCG or any of its employees or agents make changes to any SS-25 well file, record, or data between Oct. 23, 2015 and February 11, 2016?
   i. If so, what change was made, and why?
   ii. Provide a list showing all such changes:
      1.Include dates of each change.
      2.Include those who made each change.
      3.Include reasons for each change.

gg. At any point between Oct. 23, 2015 and Feb. 18, 2016, did any Boots & Coots personnel request from any employee or agent of SCG any information related to SS-25 that the well file on SS-25 did not contain?

hh. If so, for each request:
   1. What information was requested?
   2. When was that information first requested?
   3. When was the unavailability of this information rectified?
   4. When did Boots & Coots receive this information?

ii. At any point between Oct. 23, 2015 and Feb. 18, 2016, did any Boots & Coots personnel request from any employee or agent of SCG any information related to SS-25 that the well file on SS-25 contained as inaccurate information?

jj. Was all of the information provided to Boots & Coots between October 23, 2015 and February 18, 2016 related to their well kill attempts checked for accuracy?
   i. If so:
   1. Please provide documentation showing this.
   2. Please provide the dates that such information was checked for accuracy.

kk. Provide a list showing the sources of information related to SS-25 provided to Boots & Coots between October 23, 2015 and February 18, 2016. Such information should include, but not be limited to such things as:
   i. Well history file for SS25 in hard copy.
   ii. Well history file for SS25 as shown in WellView.
   iii. Well history file for SS25 as shown in other digitized repositories.
   iv. Information gathered from DOGGR's website.
   v. Copy each of these sources of information and provide them in a folder entitled, "Information Related to SS25 Provided to Boots & Coots on SS25 October 23, 2015 to February 18, 2016".

ll. What was the purpose of the meeting later that day, referenced in the email subject as "Tonight's Meeting?"

mm. Please identify the people in attendance at the meeting referenced in the email subject as "Tonight's Meeting."

nn. Using "SS25", "SS-25", and all other possible iterations of that term, please search for all communications, including but not necessarily limited to emails related to the well file of SS-25 between October 2015 and November 2016.

   a. Please list all search terms used in the search.
   b. Please provide all communications found as a result of the search.

Response 23:

Based on a review of available documents and discussions with the individuals on the November 4, 2015 email, SoCalGas responds as follows:

a. AC_CPUC_SED_KITSON_0002985 is an email on November 4, 2015, between Amy Kitson, Glenn La Fevers, Jimmie Cho, and Avideh Razavi, regarding Ms. Razavi's availability to go through SS25 data with Mr. La Fevers and Mr. Cho.
b. Yes.
c. November 4, 2015.
d. To review SS25 data.
e. Avideh Razavi, Jimmie Cho, and Glenn La Fevers.
f. Based on a review of available documents and discussions with individuals on the November 4, 2015 email, it is SoCalGas' understanding that the topic that was discussed at the November 4, 2015 meeting was the development of talking points related to Aliso Canyon and SS25 well information.
g. Historical well information.
h. The meeting was not to discuss the well file, but rather to discuss SS25 historical well information, which includes information contained in the SS25 well file.
i. Based on a review of available documents and discussions with individuals on the November 4, 2015 email, it is SoCalGas' understanding that prior well kill attempts on SS25 were not discussed at the November 4, 2015 meeting.
j. Based on a review of available documents and discussions with individuals on the November 4, 2015 email, it is SoCalGas' understanding that prior well kill attempts on SS25 were not discussed at the November 4, 2015 meeting.
k. Aliso Canyon and SS25 well information. See Response 23.f. and 23.h.
l. Historical information about the well SS25. See Response 23.h.
m. The historical well information is contained in the SS25 well file.
n. No.
o. No.
p. The purpose of discussing the SS25 historical well information was to create talking points in order to prepare for external meetings scheduled for November 4, 2015.
q. SoCalGas objects to this request as overly broad and unduly burdensome with respect to "any record related to SS-25" and vague and ambiguous with respect to "information gap." Notwithstanding these objections, SoCalGas responds as follows: The November 4, 2015

meeting did not involve discussion of potential gaps in the well file. Based on the recollection of the individuals that attended the meeting, they were not aware of any gaps in the well file prior to that meeting.

r. SoCalGas objects to this request as overly broad and unduly burdensome with respect to "any record related to SS-25" and vague and ambiguous with respect to "information gap." Notwithstanding these objections, SoCalGas responds as follows: N/A.

s. SoCalGas objects to this request as overly broad and unduly burdensome with respect to "any record related to SS-25" and vague and ambiguous with respect to "information gap." Notwithstanding these objections, SoCalGas responds as follows: No.

t. SoCalGas objects to this request as overly broad and unduly burdensome with respect to "any record related to SS-25" and vague and ambiguous with respect to "information gap." Notwithstanding these objections, SoCalGas responds as follows: N/A

u. SoCalGas objects to this request as overly broad and unduly burdensome with respect to "any record related to SS-25" and vague and ambiguous with respect to "information gap." Notwithstanding these objections, SoCalGas responds as follows: No.

v. SoCalGas objects to this request as overly broad and unduly burdensome with respect to "any record related to SS-25" and vague and ambiguous with respect to "information gap." Notwithstanding these objections, SoCalGas responds as follows: N/A.

w. SoCalGas objects to this request as overly broad and unduly burdensome with respect to "any record related to SS-25" and vague and ambiguous with respect to "information gap." Notwithstanding these objections, SoCalGas responds as follows: No.

x. SoCalGas objects to this request as overly broad and unduly burdensome with respect to "any record related to SS-25" and vague and ambiguous with respect to "information gap." Notwithstanding these objections, SoCalGas responds as follows: N/A.

y. SoCalGas objects to this request as overly broad and unduly burdensome with respect to "any record related to SS-25" and vague and ambiguous with respect to "information gap." Notwithstanding these objections, SoCalGas responds as follows: No.

z. SoCalGas objects to this request as overly broad and unduly burdensome with respect to "any record related to SS-25" and vague and ambiguous with respect to "information gap." Notwithstanding these objections, SoCalGas responds as follows: N/A.

aa. SoCalGas objects to this request as overly broad and unduly burdensome with respect to "any record related to SS-25" and vague and ambiguous with respect to "information gap." Notwithstanding these objections, SoCalGas responds as follows: No.

bb. SoCalGas objects to this request as overly broad and unduly burdensome with respect to "any record related to SS-25" and vague and ambiguous with respect to "information gap." Notwithstanding these objections, SoCalGas responds as follows: N/A.

cc. See Response 23.p.

dd. SoCalGas objects to this request as vague and ambiguous with respect to "any concerns." Notwithstanding this objection, SoCalGas responds as follows: SoCalGas is not aware of any of its employees or agents having concerns related to using the SS-25 well file and/or "the SS-25 data" as it existed on October 23, 2015.

ee. SoCalGas objects to this request as vague and ambiguous with respect to "any concerns." Notwithstanding this objection, SoCalGas responds as follows: SoCalGas is not aware of any of its employees or agents having concerns related to using the SS-25 well file and/or "the SS-25 data" as it existed on November 3, 2015.

ff. SoCalGas keeps its well files in hard copy and does not track changes to the well files. However, most records in the well files are dated, and records are added, not removed, from the well file. Please note, electronic well file records are contained in WellView and the UGS Server.

gg. SoCalGas objects to this request as vague and ambiguous and overbroad with respect to "any information related to SS-25 that the well file on SS-25 did not contain." Notwithstanding this objection, SoCalGas responds as follows: SoCalGas provided the well file and additional well related information for SS25 requested by Boots and Coots. See also Response 23.hh below.

hh. SoCalGas has provided communications between Boots and Coots and SoCalGas that include requests related to the SS25 incident. Please see previously provided Bates range AC_CPUC_SED_DR_16_0001037 – AC_CPUC_SED_DR_16_0019407.

ii. SoCalGas objects to this request as vague and ambiguous. Notwithstanding this objection, SoCalGas responds as follows: SoCalGas is not aware of any Boots & Coots personnel request for information related to SS-25 that the well file on SS-25 contained as inaccurate.

jj. SoCalGas objects to this request as vague with respect to the phrase "all of the information provided" and time period at issue, and as overly broad. Notwithstanding this objection, SoCalGas responds as follows: SoCalGas did not verify whether the information provided to Boots and Coots between October 23, 2015 and February 18, 2016 was accurate after it was provided to Boots & Coots. SoCalGas has no reason to believe that any information provided to Boots & Coots during that period was not accurate.

kk. SoCalGas has provided communications between Boots and Coots and SoCalGas that include data requests related to the SS25 incident. Please see previously provided Boots & Coots communications with Bates range AC_CPUC_SED_DR_16_0001037 – AC_CPUC_SED_DR_16_0019407. Please note Boots and Coots was provided the hard copy well file for SS-25. SoCalGas scanned the hard copy well file for SS-25 on or around January 2016 and these files were provided to SED on February 5, 2016 and June 3, 2016 (AC_CPUC_0000023-AC_CPUC_0000759; AC_CPUC_0012338 to AC_CPUC_12389).

ll. Based on a review of available documents and discussions with individuals on the November 4, 2015 email, it is SoCalGas' understanding that it participated in two meetings on the evening of November 4, 2015. SoCalGas held a briefing with various governmental agencies and also attended a meeting of the Porter Ranch Neighborhood Council.

mm. Based on a review of available documents and discussions with individuals on the November 4, 2015 email, it is SoCalGas' understanding that its briefing with governmental agencies was attended by representatives of various agencies, including the Los Angeles City and County Fire Departments, the South Coast Air Quality Management District, the Division of Oil Gas and Geothermal Resources, the Los Angeles County Department of Health and elected officials. SoCalGas does not have a list of attendees at the Porter Ranch Neighborhood Council meeting.

nn. SoCalGas objects to this request as overly broad and unduly burdensome.

Question 24:

As stated in the instructions, please provide the name of the person responsible for answering each question in this data request.

Response 24:

SoCalGas objects to the instructions submitted by SED on the grounds that they are overbroad and unduly burdensome. Special interrogatory instructions of this nature are expressly prohibited by California Code of Civil Procedure Section 2030.060(d). Notwithstanding this objection, responses to Q1 through Q23 were generally prepared and reviewed by Avideh Razavi and Gregory Healy.

Question 25:

For every question in this data request, please clarify whether SoCalGas asserts that the information in the answer and in the question be kept confidential. If SoCalGas asserts the information in the question be kept confidential, please provide each legal basis for doing so.

Response 25:

Please see the Confidentiality Declaration which has been provided in association with SoCalGas' responses to this data request.

SOUTHERN CALIFORNIA GAS COMPANY

CPUC-SAFETY AND ENFORCEMENT DIVISION AND DEPARTMENT OF CONSERVATION- DIVISION OF OIL, GAS, AND GEOTHERMAL RESOURCES DATED JANUARY 26, 2016

Supplemental Response Dated March 11, 2019

General Response:

The information provided herein and in the enclosed electronic document production is provided in response to the January 26, 2016 data requests of the CPUC-SED and DOGGR. The information provided is based upon the best available information known at this time. SoCalGas reserves the right to supplement, amend, or correct the responses to the extent it discovers additional responsive information. Please note that this is a partial production, which supplements the initial productions in response to Questions A.1 and C.1 on February 5, 2016 and June 3, 2016.

The supplemental responses provided herein are denoted in red.

A. Detailed Well Data – "Standard Sesnon" 25 (SS-25) (API 037-00776)

Question 1:

All well records.

Response 1 (February 5, 2019):

Please see enclosed electronic document production set for copies of documents comprising the active SS-25 well file, documents Bates range AC_CPUC_0000023 - AC_CPUC_0000759.

Supplemental Response 1 (June 3, 2016):

SoCalGas has identified additional documents related to Standard Sesnon 25 and supplements its responses to Question A(1) of SED and DOGGR's data request dated January 26, 2016, and to Question 1 of SED's data request dated March 10, 2106, to include these documents. This supplemental production is bates stamped AC_CPUC_0012338 to AC_CPUC_12389 and is a copy of a file labeled Standard Sesnon Well #1-25 as it was kept in the usual course of business. For purposes of clarity, we identify below the documents that have not been previously produced to SED:

AC_CPUC_0012338

AC_CPUC_0012351

AC_CPUC_0012352

AC_CPUC_0012353

AC_CPUC_0012354

AC_CPUC_0012355

AC_CPUC_0012357

AC_CPUC_0012358

AC_CPUC_0012361

AC_CPUC_0012386

AC_CPUC_0012388

AC_CPUC_0012389

Supplemental Response 1 (March 11, 2019):

Please see enclosed electronic document production with the Bates range AC_CPUC_0206158 - AC_CPUC_0208846.

The enclosed documents supplement the complete hard copy version of the well file for SS-25, originally produced on February 5, 2016, and include electronic well file documents and/or well-related information to further assist the CPUC and DOGGR's investigation with a comprehensive, broad set of well-related information. While SoCalGas continues to keep its well files in hard copy, electronic versions of well file records are available in various digital repositories (e.g., WellView, UGS Servers). The hard copy well file consists of the following: (1) histories (2) logs, (3) surveys, and (4) invoices. The only repository SoCalGas digitizes well file information is WellView.

Please note that SoCalGas had previously supplemented its production of the well file for SS-25 on June 3, 2016. The June 3, 2016 supplemental production was Bates stamped AC_CPUC_0012338 – AC_BLD_0012389.

C. Construction - SS-25, S-25A, SS-25B

Question 1:

For well sites SS-25, S-25A, SS-25B, provide any and all design and construction records for since well inception.

Response 1 (February 5, 2016):

As to well SS-25, see response to A1.

As to well SS-25A, please see enclosed electronic document production set for the active well file associated with well SS-25A, Bates range AC_CPUC_0000001 - AC_CPUC_00000011 and AC_CPUC_0000760 - AC_CPUC_0001198.

As to well SS-25B, please see enclosed electronic document production set for the active well file associated with well SS-25B, Bates range AC_CPUC_0000012 - AC_CPUC_0000022 and AC_CPUC_0001199 - AC_CPUC_0001587.

Supplemental Response (March 11, 2019):

Please see enclosed electronic documents with the Bates range AC_CPUC_0208847 - AC_CPUC_0212127 for SS-25A and AC_CPUC_0212128 - AC_CPUC_0213917 for SS-25B.

The enclosed documents supplement the complete hard copy version of the well file for SS-25A and SS-25B, originally produced on February 5, 2016, and include electronic well file documents and/or well-related information to further assist the CPUC and DOGGR's investigation with a comprehensive, broad set of well-related information. While SoCalGas continues to keep its well files in hard copy, electronic versions of well file records are available in various digital repositories (e.g., WellView, UGS Servers). The hard copy well file consists of the following: (1) histories (2) logs, (3) surveys, and (4) invoices. The only repository SoCalGas digitizes well file information is WellView.

SOUTHERN CALIFORNIA GAS COMPANY
CPUC-SAFETY AND ENFORCEMENT DIVISION
UPDATED DATA REQUEST DATED OCTOBER 17, 2016

RESPONSE DATED NOVEMBER 7, 2016

SoCalGas provides the following response to the California Public Utilities Commission–Safety and Enforcement Division's October 10, 2016 request for supplemental information. This response is based upon the best available non-privileged information known at this time, and is subject to change and/or supplementation as SoCalGas' investigation continues, and additional information becomes available.

Question 1:

(Active) Well List (injection/withdrawal list, deliverability list) - **provide records for all Aliso Field, years 1990 - 2016**

Response 1:

For withdrawal schedules from 1995 through 2016, please see enclosed the electronic documents with Bates Range AC_CPUC_0013630-AC_CPUC_0014120.

For injection schedules from 1990 through 2016, please see enclosed the electronic documents with Bates Range AC_CPUC_00 – AC_CPUC_0014121-AC_CPUC_0014298.

Question 3:

Daily Drilling (Workover) Reports(typically provided by well contractors for SoCalGas field engineers to summarize in DOG "History of Oil or Gas Well") – **provide records for SS-25, SS-25A. SS-25B, years 1968-2016**

Response 3:

SoCalGas previously provided the well files for SS-25, SS-25A, and SS-25B on February 5, 2016 and June 3, 2016. These well files include daily operations summaries for SS-25, SS-25A, and SS-25B.

- For the SS-25 well file, please see the documents with Bates Range AC_CPUC_0000023 – AC_CPUC_0000759 and AC_CPUC_0012338-AC_CPUC_0012389.
- For the SS-25A well file, please see the documents with Bates Range AC_CPUC_0000001 – AC_CPUC_00000011 and AC_CPUC_0000760 – AC_CPUC_0001198.
- For the SS-25B well file, please see the documents with Bates Range AC_CPUC_0000012 – AC_CPUC_0000022 and AC_CPUC_0001199-AC_CPUC_0001587 – AC_CPUC_0001198.

For additional SS-25, SS-25A, and SS-25B daily operations summaries, please see the enclosed documents with Bates Range AC_CPUC_
0014299-AC_CPUC_0014562.

Question 8:

Data Base of all Aliso Storage Wells requiring noise logs– what wells had FU noise logs - **provided records for all Aliso Field, 2000 – 2016**

a. This data may be provided in a easily sortable spreadsheet form. A duplicate *.pdf of the same information may be sent in conjunction for records control purposes.

Response 8:

For a list of noise logs from 2010 through 2015, please see enclosed the document Bates stamped AC_CPUC_0014711.

Question 9:

Annual SoCalGas - Storage Field Reports **– provide records for years 2000 – 2016**

Response 9:

For Annual Field Reports from 2007-2014, please see enclosed the documents with Bates Range AC_CPUC_0014563- AC_CPUC_14668.

Question 11:

(Pre-SIMP/SIMP)Well list and Verner USIT logs run on each **– provide records for years 2010 – 2016**

Response 11:

For SIMP well lists, please see enclosed the documents with Bates Range AC_CPUC_0014669-AC_CPUC_0014710.

SOUTHERN CALIFORNIA GAS COMPANY

CPUC-SAFETY AND ENFORCEMENT DIVISION
DATA REQUEST 17
DATED MARCH 30, 2018

RESPONSE DATED APRIL 27, 2018

SoCalGas provides the following response to the California Public Utilities Commission–Safety and Enforcement Division's March 30, 2018 request for information. This response is based upon the best available non-privileged information known at this time, and is subject to change and/or supplementation as SoCalGas' investigation continues, and additional information becomes available.

Question 17:

As of October 23, 2015, please identify all other terms SoCalGas used to describe the repository of information SoCalGas collects with regards to each of their wells at their natural gas storage facilities. If any of these terms identify well related documentation that is not kept in the well file, please provide the working definition of each such term, and include what information is kept that is not kept in the well file.

Response 17:

SoCalGas objects to this request as vague and ambiguous. Notwithstanding this objection, SoCalGas responds as follows: SoCalGas interprets this request as seeking information regarding digital repositories of well related information other than the well file.

On October 23, 2015, in addition to the well files, SoCalGas collected electronic well file records and well related information in the following digital repositories:

- WellView
- Rig View
- OSI Soft PI
- Maximo
- SAP
- UGS Servers
- SharePoint

WellView: A well information management system containing well file records related to well planning, drilling, completion, testing and workovers.

RigView: A rig and well project scheduling system for drilling, completions, workovers and testing.

OSI Soft PI: The repository for process information such as storage field injection and withdrawal rates, and well pressures.

Maximo: The maintenance management system for storage facilities. Inspection activities for the following well components are scheduled and recorded in Maximo:

- Wellhead valve
- Surface safety valve
- Surface-controlled subsurface safety valve

SAP: Invoice management system.

UGS Server: A storage server used to store, access, secure and manage digital data and files, including but not limited to, electronic versions of well file records and staff working files.

SharePoint: SharePoint is a web-based, collaborative platform that integrates with Microsoft Office, including but not limited to, staff working files.

Question 18:

As of the date of this data request, please identify all other terms SoCalGas uses to describe the repository of information SoCalGas collects with regards to each of their wells at their natural gas storage facilities. If any of these terms identify well related documentation that is not kept in the well file, please provide the working definition of each such term, and include what information is kept that is not kept in the well file.

Response 18:

SoCalGas objects to this request as vague and ambiguous. Notwithstanding this objection, SoCalGas responds as follows: SoCalGas interprets this request as seeking information regarding digital repositories of well related information other than the well file.

As of the date of this request, in addition to the well files, SoCalGas collects electronic well file records and well related information in the following digital repositories described in Response 17:

- WellView
- Rig View
- OSI Soft PI
- Maximo
- SAP
- UGS Servers
- SharePoint

Question 19:

Please list all locations where SoCalGas kept its well files for the following storage facilities on October 23, 2015:
Aliso Canyon?
Honor Rancho?
Goleta?

Response 19:

On October 23, 2015, well files were kept at each respective storage facility. In addition, duplicate copies of well files for the above referenced storage fields were warehoused at Aliso Canyon. These duplicate well files were not updated.

Question 20:

Please list all locations where SoCalGas keeps its well files for the following storage facilities as of the date of this data request:
-Aliso Canyon?
-Honor Rancho?
-Goleta?

Response 20:

As of the date of this data request, well files are kept at each respective storage facility. In addition, duplicate copies of well files for the above referenced storage fields are warehoused at Aliso Canyon. These duplicate well files are not updated.

Question 21:

On October 23, 2015, did SoCalGas keep its well files in hard copy, electronically, or both?

Response 21:

On October 23, 2015, SoCalGas kept well files in hard copy. Electronic versions of various well file records were available in the digital repositories listed in Response 17.

Question 22:

Today, does SoCalGas keep its well files in hard copy, electronically, or both?

Response 22:

Today, SoCalGas keeps well files in hard copy. Electronic versions of various well file records are available in the digital repositories listed in Response 18.

Question 23:

If SoCalGas keeps any well files electronically, please describe the process SoCalGas used to ensure that the information in the electronic well file is a complete and accurate match of any well file related hard copy information.

Response 23:

See Response 22.

Question 24:

Does SoCalGas track changes to its well files? If so, describe the method SoCalGas uses to track such changes?

Response 24:

No, SoCalGas does not track changes to its well files. However, most well file records are dated, and records are added not removed from the well files. SoCalGas is currently working on transitioning UGS Records to an electronic Records Document Management System that will be able to track well file changes.

Question 25:

Does SoCalGas have an index or other such documentation that shows its well files? If so, please provide it.

Response 25:

SoCalGas objects to this request as vague and ambiguous. Notwithstanding this objection, SoCalGas responds as follows: No, SoCalGas does not have an index of the contents of each well file.

Question 26:

If the answer to question 25 is yes, did SoCalGas have such an index or documentation on October 23, 2015? If so, please provide that documentation as it existed on October 23, 2015?

Response 26:

N/A.

Question 27:

With regards to the well file or well files for SS-25 on October 23, 2015?

a. Was there more than one well file?
b. If so, how many were there?
c. Were there multiple copies of the well file for SS-25? If so, how many copies of the well file for SS-25 were there?
d. Was control kept over each copy? In other words, if there were more than one copy of the SS- 25 well file prior to October 23, 2015, when information was added to or changed in one copy, was it added to or changed in the same way in all of the other copies?
e. Describe the organizational structure, if any, in which the SS-25 well file(s) were arranged. For example, were the grouped with other well files in any fashion? If so, for what purpose were they organized the way they were?
f. Please identify all of the repositories in which the well file(s) for SS-25 was kept.

Response 27:

a. No, wells have one well file with multiple parts.
b. N/A.
c. See Response 19.
d. See Response 19.
e. The SS-25 well file was kept with the other well files.
f. See Response 21.

Question 28:

Please answer the same questions as in question 24, but do so for the well file(s) and copies of such well file(s) related to SS-25A.

Response 28:

a. No, wells have one well file with multiple parts.
b. N/A.
c. See Response 19.
d. See Response 19.
e. The SS-25A well file was kept with the other well files.
f. See Response 21.

Question 34:

How does SoCalGas document work at Aliso Canyon in general?

Response 34:

In general, SoCalGas documents well work electronically. Documentation of work performed on a well is also retained in well files, as appropriate.

Question 35:

Where does SoCalGas keep documentation about work done at Aliso Canyon?

Response 35:

SoCalGas documents valve maintenance and inspection activities in Maximo and wellwork activities in WellView. Documentation of work performed on a well is also retained in well files, as appropriate.

Question 36:

In what form does SoCalGas keep documentation about work done at Aliso Canyon?

Response 36:

The documentation stored for work done at our storage fields is stored in digital format. Documentation of work performed on a well is also retained in well files, as appropriate.

Question 37:

List all types of historical documents does SoCalGas keep at Aliso Canyon?

Response 37:

SoCalGas stores and maintains the following well-related historical types of documents at Aliso Canyon:

- Well design, drilling, maintenance, and abandonment records
- Inspection records (logs, surveys, tests)
- Operational data and reports
- Maps
- Diagrams
- Geological and reservoir studies and reports
- New drilling, maintenance/remediation, and abandonment

SOUTHERN CALIFORNIA GAS COMPANY

CPUC-SAFETY AND ENFORCEMENT DIVISION
DATA REQUEST 17
DATED MARCH 30, 2018

RESPONSE DATED MAY 11, 2018

SoCalGas provides the following response to the California Public Utilities Commission–Safety and Enforcement Division's March 30, 2018 request for information. This response is based upon the best available non-privileged information known at this time, and is subject to change and/or supplementation as SoCalGas' investigation continues, and additional information becomes available.

SoCalGas submits these Responses, while generally objecting to any Request that fails to provide a defined time period to which SoCalGas may tailor its Response, and to the extent that any Request is overly broad, vague, ambiguous, unduly burdensome, assumes facts, or otherwise fails to describe with reasonable particularity the information sought. SoCalGas further submits these Responses without conceding the relevance of the subject matter of any Request or Response. SoCalGas reserves the right to object to use of these Responses, or information contained therein, in any dispute, matter or legal proceeding before any court, tribunal, agency or governmental action. Finally, at the time of this Response, there are no pending oral data requests from the CPUC-SED to SoCalGas.

Question 15:

Please provide SoCalGas's working definition of the term "well file" used on October 23, 2015.

Response 15:

On October 23, 2015 SoCalGas' working definition of the "well file" included records relating to well design, historical testing, workover, and other information pertinent to the operation of an underground storage well.

Question 16:

Please provide SoCalGas's working definition of the term "well file" used as of the date of this data request.

Response 16:

Today, SoCalGas' working definition of the "well file" includes records relating to well design, historical testing, workover, and other information pertinent to the operation of an underground storage well.

Question 32:

Please define casing failure.

Response 32:

SoCalGas defines "casing failure" as casing leaks or breaches in the casing.

Question 33:

Please provide all documents from Aliso Canyon related to casing failures. This request applies to Aliso Canyon well work. The information is as of October 23, 2015.

Response 33:

Based on a meet and confer discussion regarding this data request, SoCalGas provided a table previously produced on January 17, 2017 identifying past casing leaks. SoCalGas understands that the prior production on January 17, 2017 satisfies this request. SoCalGas can provide additional documentation if further information is required and requested by SED.

For the previously produced table and associated workover histories identifying casing leaks at the Aliso Canyon Storage Field, the type of leak, the well depth location, and the method of mitigation and repair, please see enclosed electronic documents with Bates range: AC_CPUC_SED_DR_17_0001077 through AC_CPUC_SED_DR_17_0001449.

SOUTHERN CALIFORNIA GAS COMPANY
CPUC-SAFETY AND ENFORCEMENT DIVISION
DATA REQUEST DATED AUGUST 21, 2018

SOCALGAS RESPONSE DATED OCTOBER 5, 2018

SoCalGas provides the following responses to the California Public Utilities Commission–Safety and Enforcement Division's August 21, 2018 request for information. These responses are based upon the best available non-privileged information known at this time and are subject to change and/or supplementation as SoCalGas' investigation continues, and additional information becomes available.

SoCalGas submits these responses, while generally objecting to any request that fails to provide a defined time period to which SoCalGas may tailor its response, and to the extent that any request is overly broad, vague, ambiguous, unduly burdensome, assumes facts, or otherwise fails to describe with reasonable particularity the information sought. SoCalGas further submits these responses without conceding the relevance of the subject matter of any request or response. SoCalGas reserves the right to object to use of these responses, or information contained therein, in any dispute, matter or legal proceeding before any court, action. Finally, at the time of this response, there are no pending oral data requests from the CPUC-SED to SoCalGas.

Question 1:

Please identify all of the various maximum pressures that apply to Southern California Gas Company natural gas storage facilities and/or wells. This should include, but not be limited to:

a. Design pressure
b. Maximum shut in tubing pressure
c. Reservoir pressure

Response 1:

SoCalGas interprets this request as seeking the following maximum pressures that apply to belowground gas storage infrastructure and/or wells at SoCalGas' current natural gas storage fields – Aliso Canyon, Honor Rancho, Playa del Rey, and La Goleta. Please note, other than wellhead pressure information, the response does not include pressure information for the above-ground facilities at SoCalGas' natural gas storage fields.

a. Design Pressure: Gas storage wells are connected to the gas storage reservoir. As a result, each well operates under the same "maximum reservoir pressure." SoCalGas designs new casing and tubing strings for wells in accordance with American Petroleum Institute (API) Technical Report 5C3 and utilizes a minimum safety factor of 1.15 for internal yield pressure for new casing and tubing. Gas storage wellheads are designed with pressure ratings based on the maximum operating pressure of a well.
b. Maximum Shut-In Tubing Pressure: The maximum shut-in tubing pressure for the SoCalGas storage fields, are as follow:
    i. Aliso Canyon – 3050 psi. Please note, this maximum surface pressure is based on the original maximum reservoir pressure of 3600 psi. The current maximum

reservoir pressure of 2,926 psi corresponds to a maximum surface pressure of 2,476 psi.

ii. Honor Rancho – 3600 psi.
iii. Playa del Rey –1491 psi.
iv. La Goleta – 1861 psi.

c. Reservoir Pressure: The maximum reservoir pressure for the SoCalGas storage fields are as follows:
   i. Aliso Canyon – 3600 psi. Please note, this maximum reservoir pressure is the original maximum reservoir pressure for the Aliso Canyon storage field. The current maximum reservoir pressure per DOGGR is 2,926 psi.
   ii. Honor Rancho – 4400 psi.
   iii. Playa del Rey – 1700 psi.
   iv. La Goleta – 2050 psi.

Question 2:

Please provide the formulas SoCalGas uses to determine each of the pressures provided in response to question 1.

Response 2:

a. Please see electronic documents with Bates range AC_CPUC_SED_DR_27_0000001 - AC_CPUC_SED_DR_27_0000022.
b. Please see electronic documents with Bates range AC_CPUC_SED_DR_27_0000023 - AC_CPUC_SED_DR_27_0000045.
c. Please see electronic documents with Bates range AC_CPUC_SED_DR_27_0000046 - AC_CPUC_SED_DR_27_0000064.

Question 3:

Please list all SoCalGas Company documents that talk about or reference the pressures referenced in question 1, and the formulas provided in response to question 2 with regards to SoCalGas natural gas storage facility wells. These documents should include, but not be limited to, requirements, standards, practices, programs, and anything else that sets for instructions or requirements for determining these maximum pressures on SoCalGas natural gas storage facility wells.

Response 3:

SoCalGas interprets this request as seeking SoCalGas' current written requirements, standards, programs, and procedures that set forth the instructions or requirements for determining the maximum pressures provided in Response 1 and the formulas provided in Response 2. Please see electronic documents with Bates range AC_CPUC_SED_DR_27_0000001 - AC_CPUC_SED_DR_27_0000064.

Question 4:

Please provide the terms Southern California Gas Company uses that relate to:

a. The limits on reservoir pressure at a Southern California Gas Company natural gas storage facility?
b. The reservoir pressure beyond which a Southern California Gas Company natural gas storage facility reservoir should not operate?
c. The design pressure at a Southern California natural gas storage facility well.
d. The Maximum shut in tubing pressure at a Southern California natural gas storage facility well.

Response 4:

a. Minimum Reservoir Pressure and Maximum Reservoir Pressure.
b. Maximum Reservoir Pressure.
c. Please see Response 1.a.
d. Maximum Surface Pressure.

Question 5:

Please provide all Southern California Gas Company documents that talk about or reference to the terms SoCalGas has provided in response to question 4. These documents should include, but not be limited to requirements, standards, practices, programs, and anything else that sets forth instructions or requirements for determining the pressure limits on Southern California Gas Company's natural gas storage field reservoirs.

Response 5:

SoCalGas objects to this request as overly broad and unduly burdensome. SoCalGas interprets this request as seeking SoCalGas' current written requirements, standards, programs, and procedures that set forth the instructions or requirements for the pressures listed in Response 4. Please see electronic documents with Bates range AC_CPUC_SED_DR_27_0000001 - AC_CPUC_SED_DR_27_0000064.

Question 6:

Of those documents provided in response to question 5, please list all documents that apply or applied Southern California Gas Company's Aliso Canyon natural gas storage facility.

Response 6:

The following documents provided in response to question 5 apply to SoCalGas' Aliso Canyon storage field: Bates range AC_CPUC_SED_DR_27_0000065 - AC_CPUC_SED_DR_27_0000115.

Question 7:

Of those documents provided in response to question 5, please list all documents that applied as of October 23, 2015.

Response 7:

The following documents applied as of October 23, 2015: Bates range AC_CPUC_SED_DR_27_0000117 -AC_CPUC_SED_DR_27_0000131. On October 23, 2015, there was a prior version of Gas Standard 224.070. For the version of Gas Standard 224.070 that existed on October 23, 2015 please see the electronic document with Bates Range AC_CPUC_SED_DR_27_0000116.

Question 8:

Of those documents provided in response to question 5, please list all documents that applied prior to October 23, 2015.

Response 8:

The following documents applied prior to October 23, 2015: Bates range AC_CPUC_SED_DR_27_0000153 -AC_CPUC_SED_DR_27_0000168. Prior to October 23, 2015, there were earlier versions of Gas Standard 224.070. For the earlier versions of Gas Standard 224.070 that existed prior to October 23, 2015, please see electronic document with Bates range AC_CPUC_SED_DR_27_0000132 -AC_CPUC_SED_DR_27_0000151.

Question 9:

Of those documents requested in questions 3 and 5, are there any that were in existence, but that Southern California Gas Company no longer has?

Response 9:

No.

Question 10:

If the answer to question 9 is yes, please list all such documents.

Response 10:

N/A.

Question 11:

Based upon the documents provided in response to question 5, did SoCalGas use a formula or formulas to calculate the maximum pressures identified in response to question 2 for the reservoirs at Aliso Canyon on October 23, 2015?

Response 11:

Yes.

Question 12:

If the answer to question 11 is yes, please provide the formula or formulas.

a. Please be sure to identify each variable in the formula;
b. Provide a definition of each variable in the formula;
c. Refer to the document and page of the document provided in response to question 4 that is the basis for each formula provided.

Response 12:

Please see electronic documents with Bates range AC_CPUC_SED_DR_27_0000001 - AC_CPUC_SED_DR_27_0000064.

Question 13:

As of October 23, 2015, please identify each reservoir in Aliso that had its reservoir pressure (or concept identified in response to question 4) kept below the results of the required formula or formulas identified in response to question 12.

Response 13:

There is only one gas storage reservoir at Aliso Canyon – the Sesnon-Frew Gas Storage Zone. On October 23, 2015, the reservoir pressure of the Sesnon-Frew Gas Storage Zone was below the maximum reservoir pressure of 3600 psi.

Question 14:

For the Standard Sesnon reservoir at Aliso Canyon as of October 22, 2015, please identify each variable in the formulas used to calculate the concepts identified in response to question 2, and provide the definition of each variable.

Response 14:

There is no "Standard Sesnon" reservoir at Aliso Canyon. There is only one gas storage reservoir at Aliso Canyon – the Sesnon-Frew Gas Storage Zone.

Question 15:

Please identify the impact of the most recently installed compressors at Aliso Canyon on the overall reservoir pressure (or term SoCalGas uses to refer to reservoir pressure). Please include the minimum and maximum reservoir pressures for each reservoir at Aliso since the installation of those compressors, as well as the date of each such reservoir pressure.

Response 15:

The recently installed compressors do not affect the maximum and minimum reservoir pressures of the Sesnon-Frew Zone storage reservoir at Aliso Canyon.

Question 16:

What is the impact of the overall storage volume of each Aliso Canyon reservoir on the reservoir pressure of that reservoir? If this impact can be expressed in a formula, please include that formula, the reference and page number for that formula, and an explanation for how that formula was derived.

Response 16:

Please see electronic documents with Bates range AC_CPUC_SED_DR_27_0000023 - AC_CPUC_SED_DR_27_0000045.

Question 17:

Has SoCalGas used reservoir pressure (or term SoCalGas uses to refer to reservoir pressure) in order to determine which wellhead to place on each well at its storage facilities? If so, please provide all such wells that have received wellheads that account for reservoir pressure.

Response 17:

Yes, the maximum reservoir pressure is used to determine which wellhead to place on each well. All wells have received wellheads with a pressure rating above the maximum reservoir pressure.

Question 18:

Are wellheads components of well facilities?

Response 18:

The wellhead is a component of a gas storage well. Components of a gas storage well include, but are not limited to, the wellhead, tubing, casing, packers and valves.

Question 19:

Do wellheads have restrictions with regards to pressure they can withstand from injection and withdrawal?

Response 19:

Wellheads are designed for pressure that exceeds reservoir pressure, thus wellheads are able to withstand withdrawal and injection pressure.

Question 20:

With regards to wellheads discussed in response to questions 19-21, did the wellhead on SS25 in any way impair the ability to kill SS25? Please explain.

Response 20:

No, the wellhead did not impair the ability to kill SS25. SoCalGas had access to all the wellhead valves and connected to the wellhead in the first attempt to kill the well. The wellhead functioned as expected.

Prior to pumping any kill fluid, SoCalGas had Cameron West Coast service the primary seals in the wellhead by injecting plastic sealant to re-energize the primary and secondary seals around the 7" casing inside the wellhead.

Question 21:

It is SED's understanding that SoCalGas used the tubing and the casing on SS25 to inject and withdraw gas prior to October 23, 2015. Is this understanding correct? If so:

a. When did SoCalGas start this practice of injecting and withdrawing gas through the casing on SS25?
b. Why did SoCalGas decide to inject and withdraw gas through the casing on SS25?
c. When SoCalGas started the practice of injecting and withdrawing gas through the casing on SS25, did SoCalGas do any safety related studies or analyses with regards to withdrawing or injecting gas into the casing?
d. Specifically, when SoCalGas started the practice of injecting and withdrawing gas through the casing on SS25, did SoCalGas study the conditions under which the casing would leak?
    i. If so, please provide all such studies.
    ii. If not, why not?

Response 21:

For SS25, SoCalGas withdrew gas through both the tubing and the tubing-casing annulus, and injected gas through the tubing-casing annulus.

a. Gas was moved through the casing in SS25 since SoCalGas first began operating the well. SoCalGas previously provided CPUC-SED with a data response listing the month/time range of initial withdrawal/injection for all wells. Please see electronic documents with Bates range Please see electronic documents with Bates range AC_CPUC_SED_DR_27_0000169 -AC_CPUC_SED_DR_27_0000174.
b. Prior to October 23, 2015, withdrawal and injection through the casing was industry practice. Please see electronic documents with Bates range AC_CPUC_SED_DR_27_0000175 -AC_CPUC_SED_DR_27_0000350.
c. At Aliso Canyon prior to the conversion of wells to tubing flow only, in general, high structure wells were operated as casing flow and lower structure wells were operated as tubing flow. For more information, please see the electronic document with Bates range AC_CPUC_SED_DR_27_0000351-AC_CPUC_SED_DR_27_0000411.
d. See Response 21.c.

Question 22:

Please provide a list of all wells within SoCalGas storage facilities for which SoCalGas has injected and/or withdrawn gas through well casing.

Response 22:

SoCalGas interprets this request as seeking information about SoCalGas' Aliso Canyon storage field. SoCalGas previously provided CPUC-SED with a data response that lists the month/time range of initial withdrawal/injection for all wells. Please see electronic documents with Bates range AC_CPUC_SED_DR_27_0000412 -AC_CPUC_SED_DR_27_0000417.

Question 23:

Please answer questions 21 a-d again, but this time for the entire list of wells provided in response to question 22.

Response 23:

For the Aliso Canyon wells within SoCalGas for which SoCalGas has injected and/or withdrawn gas through the well casing:

a. Gas was moved through the casing in these wells since SoCalGas first began operating the well. SoCalGas previously provided CPUC-SED with a data response listing the month or time range of initial withdrawal/injection for all wells. Please see

electronic documents with Bates range AC_CPUC_SED_DR_27_0000169 - AC_CPUC_SED_DR_27_0000174.

b. Prior to October 23, 2015, withdrawal and injection through the casing was industry practice. Please see electronic documents with Bates range AC_CPUC_SED_DR_27_0000175 -AC_CPUC_SED_DR_27_0000350.
c. At Aliso Canyon, prior to the conversion of wells to tubing flow only, in general, high structure wells were operated as casing flow and lower structure wells were operated as tubing flow. For more information, please see the electronic document with Bates range AC_CPUC_SED_DR_27_0000351 -AC_CPUC_SED_DR_27_0000411.
d. See Response 21.c.

Question 24:

Did SoCalGas provide notice to any agencies when it decided to move gas through the casing on well SS25? If so:

a. Which agencies?
b. Please provide all documentation showing such notice for each well.

Response 24:

a. SoCalGas moved gas through the casing in SS25 since the initiation of gas storage operations in the 1970s. There was no requirement to provide formal notice. However, SoCalGas understands that the Division of Oil, Gas and Geothermal Resources (DOGGR) was aware that gas was moved through the casing in SS25.
b. N/A.

Question 25:

If the answer to question 24 is no, please explain.

Response 25:

N/A.

Question 26:

Please list the titles of, and provide, all industry practices and standards that support and/or allow injecting and withdrawing gas through well casings.

Response 26:

A representative listing of industry practices and standards that support and/or allow injecting and withdrawing gas through well casings include:

- American Petroleum Institute, American Gas Association, Interstate Natural Gas Association of America, *Underground Natural Gas Storage Integrity & Safe Operations,* July 6, 2016, pp. 55-56.
- Final Report of the Interagency Task Force on Natural Gas Storage Safety, *Ensuring Safe and Reliable Underground Natural Gas Storage*, October 2016, p. 54.

Question 27:

Please list the titles of, and provide, all SoCalGas requirements, standards, practices, memoranda, internal reports, and other documentation that supports and/or allows injecting and withdrawing gas through well casings.

Response 27:

N/A.

Question 28:

How many active wells did SoCalGas have in its existing natural gas storage facilities prior to October 23, 2015?

Response 28:

For a list of SoCalGas wells at SoCalGas' natural gas storage facilities on or around 10/23/15, please see electronic document with Bates range AC_CPUC_SED_DR_27_0000418.

Question 29:

Of the number of wells provided in response to question 28, how many injected and/or withdrew gas through casing?

Response 29:

Please see electronic document with Bates range AC_CPUC_SED_DR_27_0000419.

Question 30:

How many active wells does SoCalGas have in its existing natural storage facilities as of the date of this data request?

Response 30:

For a list of active wells at the Aliso Canyon storage field please see electronic documents with Bates range AC_CPUC_SED_DR_27_0000421 -AC_CPUC_SED_DR_27_0000423. For a list of active wells at the non-Aliso storage fields (Playa del Rey, Honor Rancho, and La Goleta), please see electronic document with Bates range AC_CPUC_SED_DR_27_0000420.

Question 31:

Of the number of wells provided in response to question 30, how many inject and/or withdraw gas through casing?

Response 31:

None.

Question 32:

How many of the number of wells provided in response to question 31 are at SoCalGas's Aliso Canyon natural gas storage facility?

Response 32:

N/A.

Question 33:

What was the maximum pressure for each of the pressures identified in response to question 1 for wells at SoCalGas natural gas storage facilities as of October 23, 2015?

a. Please provide the supporting document, including reference to page number, for the maximum pressure provided in response to question 34.

Response 33:

Please see Response 1.

Question 34:

What is maximum pressure for each of the pressures identified in response to question 1 for wells at SoCalGas natural gas storage facilities based upon as of the date of this data request?

Response 34:

Please see Response 1.

Question 35:

How has the basis for calculating the maximum pressures identified in response to question 1 for wells at SoCalGas natural gas storage facilities changed from October 23, 2015 to the date of this data request?

Response 35:

Please see Response 1.

Question 36:

Provide a spreadsheet showing:

a. All SoCalGas storage facility wells that currently have subsurface safety valves.
b. All SoCalGas storage facility wells that no longer have subsurface safety valves.
c. The date of installation of each subsurface safety valve.
d. The date of removal of each subsurface safety valve that was removed.
e. Whether the subsurface safety valve isolates/isolated tubing?
f. Whether the subsurface safety valve isolates/isolated casing?
g. Depth of the subsurface safety valve.
h. If the subsurface safety valve was removed, reason for removal.

Response 36:

a. For a list of current active wells with shallow set SSSVs, please see electronic document with Bates range AC_CPUC_SED_DR_27_0000424.

b. – h.:
SoCalGas objects to requests 36 b-h as overly broad and unduly burdensome. Notwithstanding this objection, SoCalGas responds as follows: SoCalGas previously prepared and provided this information to CPUC-SED for the Aliso Canyon storage field. Please see electronic documents with Bates range AC_CPUC_SED_DR_27_0000426 - AC_CPUC_SED_DR_27_0000430. In addition, SoCalGas previously provided the CPUC with a copy of a data request response to DOGGR. That data request response included a narrative regarding SoCalGas' experience with deep-set SSSVs at SoCalGas' storage fields, and correspondence that SoCalGas had in its records regarding SSSVs. Please see electronic documents with Bates range AC_CPUC_SED_DR_27_0000431 - AC_CPUC_SED_DR_27_0003343.

Questions 37-40 – On September 6, 2018, counsel for SED provided clarification on Questions 37-40 as follows: "items 37-40 of DR 27 should reference both "job history file" and "well history file"."

Question 37:

Please provide SoCalGas's definition of job history and well history files as of October 23, 2015.

Response 37:

As of October 23, 2015, SoCalGas' well file had four components – (1) well history file, (2) log file, (3) survey file, and (4) invoice file. There was no "job history file." However, the "well history

file" included DOGGR Form OG-103 (History of Oil and Gas) which details the rig work performed on a well during drilling, abandonment, and workover operations.

Question 38:

Please identify all records that must be kept in SoCalGas's job history and well history files as of October 23, 2015.

Response 38:

Please see Response 37. SoCalGas' practice is to include the following types of documents in the "well history file": DOGGR Form OG-103 (Well History Report), DOGGR Form OG-100 (Well Summary), Notices of Intent (NOI), Permits to Drill/Rework, and Workover Programs. Operators are required to submit OG-103 and OG-100 to DOGGR within 60 days after the drilling completion, suspension, or abandonment of a well.

Question 39:

Please provide all SoCalGas requirements, standards, practices, memoranda, internal reports, and other documentation that show the types of records that were required to be kept in SoCalGas's job history files as of October 23, 2015.

Response 39:

SoCalGas interprets this request as seeking SoCalGas' formal written requirements, standards, practices, memoranda, internal reports, and other formal written documents that show the types of records required to be kept for a well. For SoCalGas Records Management and Retention Schedule as of and prior to October 23, 2015, please see electronic documents with Bates range AC_CPUC_SED_DR_27_0003344 -AC_CPUC_SED_DR_27_0004205.

Question 40:

Please provide the job history file for SS25 as it looked on October 23, 2015.

Response 40:

Please see Response 37. For the "well history file" for SS25, please see electronic documents with Bates range AC_CPUC_SED_DR_27_0004206 -AC_CPUC_SED_DR_27_0004430.

Question 41:

Please list the titles of, and provide, all SoCalGas requirements, standards, practices, memoranda, internal reports, and other documentation that relate to creating, maintaining, keeping, retaining, modifying and deleting job history files between the point in time at which SoCalGas acquired Aliso Canyon natural gas storage facility and October 23, 2015.

Response 41:

SoCalGas interprets this request as seeking SoCalGas' formal written requirements, standards, practices, memoranda, internal reports, and other formal written documents that relate to creating, maintaining, modifying and deleting well file information from the point in time at which SoCalGas acquired the Aliso Canyon storage field and October 23, 2015. SoCalGas objects to this request as overly broad and unduly burdensome. Notwithstanding this objection, SoCalGas responds as follows: For SoCalGas' Records Management and Retention Schedules as of and prior to October 23, 2015, please see electronic documents with Bates range AC_CPUC_SED_DR_27_0003344 -AC_CPUC_SED_DR_27_0004205.

SOUTHERN CALIFORNIA GAS COMPANY
CPUC-SAFETY AND ENFORCEMENT DIVISION
DATA REQUEST DATED AUGUST 14, 2018

SOCALGAS RESPONSE DATED SEPTEMBER 14, 2018

SoCalGas provides the following Responses to the CPUC-Safety and Enforcement Division's (CPUC-SED) data request dated August 14, 2018 related to the preliminary investigation regarding the Aliso Canyon Well Leak. The Responses are based upon the best available, nonprivileged information that SoCalGas was able to locate through a diligent search within the time allotted to respond to this request, and within SoCalGas' possession, custody, or control. SoCalGas reserves the right to supplement, amend or correct the Responses to the extent that it discovers additional responsive information.

SoCalGas submits these Responses, while generally objecting to any Request that fails to provide a defined time period to which SoCalGas may tailor its Response, and to the extent that any Request is overly broad, vague, ambiguous, unduly burdensome, assumes facts, or otherwise fails to describe with reasonable particularity the information sought. SoCalGas further submits these Responses without conceding the relevance of the subject matter of any Request or Response. SoCalGas reserves the right to object to use of these Responses, or information contained therein, in any dispute, matter or legal proceeding before any court, action. Finally, at the time of this Response, there are no pending oral data requests from the CPUC-SED to SoCalGas.

In response to SED's request that SoCalGas' date all documents and authenticate those dates, SoCalGas responds that all documents that represent email communications provide the sender's name, the recipient(s), and reflect the date on which the communication was made; for all other documents, information regarding the creator, and the date on which the document was created, may be ascertained by reviewing the document's meta-data.

Question 1:

For this set of questions, please refer to Application (A.) 10-12-006, also called the "Application of Southern California Gas Company for authority to update its gas revenue requirement and base rates effective on January 1, 2012." Please specifically refer to Exhibit (Exh.) No. SCG-04-CWP, entitled "Capital Workpapers to Prepared Direct Testimony of James D. Mansdorfer on Behalf of Southern California Gas Company, Before the Public Utilities Commission of the State of California, December 2010". The page numbers of this document are shown as "JDM-CWP" followed by the page number. This document will be provided for convenience as Attachment A.

In this document, SCG provided recorded and forecasted costs for years 2009 – 2012 for various gas storage budget categories, as listed in 1(a) – (f) below. Each question below (Questions 1(a) – (f)) references a page number of Exh. No. SCG-04-SWP. For each question, please provide a spreadsheet (six spreadsheets in total) that itemizes all wells that were identified as part of these forecasted costs. Within each of the six spreadsheets, please provide the following columns:

1. the name of each well that SoCalGas used to justify its forecast expenditures in Exh. No. SCG-04-CWP;
2. the name of each well that received actual expenditures for the work noted in the identified workpaper page from 2009 to 2012.
3. the field in which each listed well is located;
4. the date(s) at which each well in column 1 was identified as requiring the type of work noted in the workpaper;
5. the date(s) at which each well in column 2 was identified as requiring the type of work noted in the workpaper;
6. what steps, if any, were taken to remediate or repair the well between the date of the filing of the 2012 GRC (Dec. 15, 2010) and the date of the filing of the 2016 GRC (Nov. 14, 2014);
7. the total amount spent on each well listed in column 1 in 2009;
8. the total amount spent on each well listed in column 1in 2010;
9. the total amount spent on each well listed in column 1 in 2011;
10. the total amount spent on each well listed in column 1 in 2012;
11. the total amount spent on each well listed in column 2 in 2009;
12. the total amount spent on each well listed in column 2 in 2010;
13. the total amount spent on each well listed in column 2 in 2011;
14. the total amount spent on each well listed in column 2 in 2012;
15. provide the title of each document that existed as of December 2010 (the date listed on Exh. No. SCG-04-CWP) showing the forecasted expenditure for each well listed in column 1;
16. provide the title of each document created to show the actual expenditures for each well listed in column 2;
17. provide the title of each document that verified the scope of work that existed as of December 2010 (the date listed on Exh. No. SCG-04-CWP) for each well listed in column 1.
18. provide the title of each document that verified the actual work completed for each well listed in column 2.
19. Separately from the spreadsheet, provide separate folders containing the documents requested in columns 13, 14, 15, and 16. Please ensure that each of these folders contain one seamless document with pages in order of Bates stamp, and that each document is searchable, and printable in the same fashion shown electronically.

The spreadsheets with the 16 columns listed above should be created for the following pages in Exh. No. SCG-04-CWP of A.10-12-006.

a. Exh. No. SCG-04-CWP, pp. JDM-CWP-1 and JDM-CWP-2, with Project Title, "Gas Transmission – Storage – Compressor Stations – Blanket"
b. Exh. No. SCG-04-CWP, p. JDM-CWP-5, "Project Title, Gas Storage – Wells –Blanket"
c. Exh. No. SCG-04-CWP, p. JDM-CWP-6, "Project Title, Storage Wells – Leaking Wellhead Replacements/Upgrades",
d. Exh. No. SCG 04-CWP, p. JDM-CWP-7, "Project Title, Storage Wells – Two Well Replacements".

e. Exh. No. SCG 04-CWP, p. JDM-CWP-8, "Project Title, Storage Wells –Expended Tubing Replacements"
f. Exh. No. SCG 04-CWP, p. JDM-CWP-10, "Project Title, Aliso Canyon – Valve Replacement Program".

Response 1:

Based on SoCalGas' review of existing information readily available, SoCalGas responds as follows: Please see the electronic document with Bates range AC_CPUC_SED_DR_24_0000001. Please note, the document contains a summary of total capital expenditures recorded by field for the budget codes identified in the data request. Data was not available by well, and some data was not available by field and is summarized for multiple fields. In addition, the document contains forecasts for 2010-2012.

Question 2:

For this set of questions, please refer to Application (A.) 14-11-004, also called the "General Rate Case Application of Southern California Gas Company, dated November 14, 2014." Please specifically refer to Exhibit (Exh.) No. SCG-06-CWP, entitled "Capital Workpapers to Prepared Direct Testimony of Phillip E. Baker on Behalf of Southern California Gas Company, Before the Public Utilities Commission of the State of California, November 2014". This document will be provided for convenience as Attachment B.

In this document, SCG provided recorded and forecasted costs for years 2009 – 2012 for various gas storage budget categories, as listed in question 2(a) – (f) below. Each question below (Questions 2(a) – (f))references a page number in Exh. No. SCG-06-CWP. For each question, please provide a spreadsheet (six spreadsheets in total) that itemizes all wells that were identified as part of these forecasted costs. Within each of the six spreadsheets, please provide the following columns:

1. the name of each well that SoCalGas used to justify its forecast expenditures in Exh. No. SCG-06-CWP;
2. the name of each well that received actual expenditures for the work noted in the identified workpaper page from 2009 to 2015.
3. the field in which each listed well is located;
4. the date(s) at which each well in column 1 was identified as requiring the type of work noted in the workpaper;
5. the date(s) at which each well in column 2 was identified as requiring the type of work noted in the workpaper;
6. what steps, if any, were taken to remediate or repair each well shown in column 1 between the date of the filing of the A.14-11-004 (Nov. 14, 2014), and October 22, 2015;
7. the total amount spent on each well listed in column 1 in 2009;
8. the total amount spent on each well listed in column 1in 2010;
9. the total amount spent on each well listed in column 1 in 2011;
10. the total amount spent on each well listed in column 1 in 2012;
11. the total amount spent on each well listed in column 1 in 2013;

12. the total amount spent on each well listed in column 1 in 2014;
13. the total amount spent on each well listed in column 1 in 2015 (through October 22);
14. the total amount spent on each well listed in column 2 in 2009;
15. the total amount spent on each well listed in column 2 in 2010;
16. the total amount spent on each well listed in column 2 in 2011;
17. the total amount spent on each well listed in column 2 in 2012;
18. the total amount spent on each well listed in column 2 in 2013;
19. the total amount spent on each well listed in column 2 in 2014;
20. the total amount spent on each well listed in column 2 in 2015 (through October 22);
21. provide the title of each document that existed as of November 2014 (the date listed on Exh. No. SCG-06-CWP) showing the forecasted expenditure for each well listed in column 1;
22. provide the title of each document created to show the actual expenditures for each well listed in column 2;
23. provide the title of each document that verified the scope of work that existed as of November 2014 (the date listed on Exh. No. SCG-04-CWP) for each well listed in column 1.
24. provide the title of each document that verified the actual work completed for each well listed in column 2.
25. Separately from the spreadsheet, provide separate folders containing the documents requested in columns 19, 20, 21, and 22. Please ensure that each of these folders contain one seamless document with pages in order of Bates stamp, and that each document is searchable, and printable in the same fashion shown electronically.

The spreadsheets with the 22 columns listed above should be created for the following pages in Exh. No. SCG-04-CWP of A.14-11-003.

a. Gas Storage – Compressor Stations – Blanket projects: see p. 9 of 156, A.14- 11-003, Exh. No. SCG-06-CWP
b. Gas Storage – Wells – Blanket Projects: see pp. 67-68 of 156, A.14-11-003, Exh. No. SCG-06-CWP
c. Wellhead Leak Repairs: see pp. 27-28 of 156, A.14-11-003, Exh. SCG-06-CWP
d. Replacement Wells: see pp. 57-58 of 156, A.14-11-003, Exh. SCG-06-CWP
e. Well Tubing Replacements: see pp. 22-23 of 156, A.14-11-003, Exh. SCG-06-CWP
f. Wellhead Valve Replacements: see pp. 17-18 of 156, A.14-11-003, Exh. SCG- 06-CWP
g. Well Inner-string installations: see pp. 32-33 of 156, A.14-11-003, Exh. SCG- 06-CWP.
h. Plug and Abandon Wells: see pp. 62-63 of 156, A.14-11-003, Exh. SCG-06-CWP.

Response 2:

Based on SoCalGas' review of existing information readily available, SoCalGas responds as follows: Please see the electronic document with Bates range AC_CPUC_SED_DR_24_0000001. Please note, the document contains a summary of total capital expenditures recorded by field for the budget codes identified in the data request. Data was not available by well, and some data was not available by field and is summarized for multiple fields. In addition, the document contains forecasts for 2010-2012.

Question 3:

In Phillip Baker's (A.14-11-003 testimony, Exh. SCG-06, attached as exhibit C), several references, shown under the heading "References in Mr. Baker's testimony" below, were made to work required on specific wells and classes of well. For each reference listed below, please provide in a spreadsheet a list of all wells that were identified by SCG as requiring the type of work described in that part of Mr. Baker's testimony, as of the date of the 2016 GRC filing (Nov. 14, 2014).

For each well identified for each reference, please also provide in separate columns of the spreadsheet including:

1. the name of the well(s) that are included as part of the reference;
2. the field in which the well is located;
3. the date at which the well was identified as requiring the type of work described in the category;
4. all steps, if any, were taken to remediate or repair the well between the date of the filing of A.14-11-003 (Nov. 14, 2014) and the October 22, 2015.
5. What steps, if any, were taken to remediate or repair the well between October 23, 2015 and the date of this data request.
6. Provide the titles of the documents that existed as of November 14, 2014 which shows that the well identified in column a had been identified as requiring the type of remediation/repair work described in Mr. Baker's testimony. Please ensure there is authentication of those dates. Please ensure that each document is clearly labeled as referring to one of the listed wells.
7. Provide the titles of the documents that existed as of November 14, 2014 which shows that the well identified in column a had been shown as experiencing the kind of problem(s) described in Mr. Baker's testimony. Please ensure there is authentication of those dates. Please ensure that each document is clearly labeled as referring to one of the listed wells.

References in Mr. Baker's Testimony:

a. "For example in 2013, again at Aliso Canyon, two wells were found to have leaks in the production casing at depths adjacent to the shallower oil production sands." see: p. PEB-19, lns. 5 – 7, A.14-11-003, Exh. SCG-06.
b. "The increasing number of safety and integrity conditions summarized in Table PEB-8 below is attributed primarily to the frequency of use, exposure to the environment, and length of time the wells have been in service." For this question, please ensure to include in the spreadsheet each well identified in Table PEB-8. [Table PEB-8, Number of Major Well Integrity Workovers by Year]" see: p. PEB- 19, lns. 11 – 17, 2016 GRC Exh. SCG-06.
c. "Ultrasonic surveys conducted in storage wells as part of well repair work from 2008 to 2013 identified internal/external casing corrosion, or mechanical damage in 15 wells." See: PEB-19, lns. 17 – 18, 2016 GRC Exh. SCG-06
d. "External casing corrosion has been observed at relatively shallow depths in the production casing, and at deeper intervals near the Aliso Canyon shallow oil production zone at which [sic] is being water-flooded." See: PEB-19, lns. 18 – 21, 2016 GRC Exh. SCG-06
e. "Internal mechanical wear has been observed in production casings, likely as a result of drilling operations that took place when the well was originally drilled." See: PEB-19, lns. 21 – 22, 2016 GRC Exh. SCG-06
f. "…external tubing corrosion has been observed on tubing in the joint above the packer most likely as a result of stagnant fluid." See: PEB-19 – PEB-20, lns. 22 – 2, 2016 GRC Exh. SCG-06
g. "…SoCalGas has 52 storage wells in service that are more than 70 years old." See: PEB-20, lns. 4 – 5, 2016 GRC Exh. SCG-06
h. "Half of the 229 storage wells are more than 57 years old as of July 2014." See: PEB-20, lns. 5 – 6, 2016 GRC Exh. SCG-06
i. "In summary, it is expected that the oldest wells in closest proximity to the public, located in environmentally or safety-sensitive areas that have not had recent downhole inspections or work would likely be prioritized for inspection." See: PEB-22, lns. 14 – 17, 2016 GRC Exh. SCG-06
j. Table PEB-10, Southern California Gas Company Capital Expenditures Summary of Capital Expenditures Summary of Costs (Thousands of $2013). Please include all storage compressors included in the $8,991,000 number in the column entitled "2013 Recorded".
k. Table PEB-10, Southern California Gas Company Capital Expenditures Summary of Capital Expenditures Summary of Costs. Please include all storage wells included in the $10,976,000 number in the column entitled "2013 Recorded".

Response 3:

The references in (g) and (h) do not relate to work required on specific wells, but instead are references regarding the age of the wells. Therefore, given that no specific work was described, columns (c) through (g) are not applicable.

g. Based on SoCalGas' review of relevant documents, SoCalGas responds as follows:

Please see the electronic document with Bates range AC_CPUC_SED_DR_24_0000002.

h. Based on SoCalGas' review of relevant documents, SoCalGas responds as follows:

   Please see the electronic document with Bates range AC_CPUC_SED_DR_24_0000002.

Please note, SoCalGas is compiling the remaining information requested in Question 3 and will supplement this response as soon as possible.

Question 4:

In A.14-11-006, Exh. SCG-06, p. 77 of 156 states, "Safety and/or integrity conditions that are presently unknown may exist within the high pressure (up to 3,600 psig) above ground pipe laterals and below ground facilities that comprise of 229 aging gas storage field wells that can exceed 13,000 feet in depth."

1. Please list the "229 aging storage field wells that can exceed 13,000 feet in depth", which were noted in that statement.
2. Please provide the document that was available in November 2014, the date shown on Exh. SCG-06, that shows these "229 aging storage field wells that can exceed 13,000 feet in depth".

Response 4:

The testimony refers to 229 aging storage fields and some can exceed 13,000 feet in depth. The three storage field wells that exceed 13,000 feet in depth are the WEZU 13A, WEZU 23, and WEZU 25C wells at the Honor Rancho storage field. In November 2014, this information was contained in the well file.

SEMPRA: ****OPEN MCR*** Per Incident commander Glenn La Fever. During the repair process to mitigate the Leak at the well head in Aliso Canyon, oil was extracted and was vented into the atmosphere. There is an oily mist that may potentially be moving into the Porter Ranch area. Customer Service Field, Distribution and Meter Reading employees who are or may be headed to work in the area have been given instructions to avoid the Porter Ranch area until further notice. The Customer Contact Center has been notified. If an A-1 is issued in the area, CSF employees are to take extreme caution when working the order. FROM:sstrong 818-701-2505 SENT: @15:00

Well Summary

Standard Senson 25 has broached to surface with several fissures on pad site.
11-3/4" casing to 990 ft. 7" casing to 8,585 ft. 5-1/2" slotted liner to 8,745 ft. 2-7/8" tubing to 8,510 ft. Packer depth 8,468 ft.

Hour	Hour	Activity on Site
5:45	6:00	Traveled from hotel to location.
6:00	6:30	Performed site assessment. Took LEL readings. Cleared location to begin work. 2-7/8" - 1,202 psi. 7" - 229 psi.
		11-3/4" - 89 psi.
6:30	7:00	Attended morning safety/operations meeting. Discussed perforating tubing and pumping kill.
7:00	9:00	Installed targeted 90 on wellhead flowline. Stabbed lubricator. Tested to 300/4,000 psi. Test good. Equalized swab valve with
		1,200 psi. Opened swab valve. Tubing pressure 1,201 psi. Pumped 6 bbls of 10.8 ppg CaCl2. 2-7/8" - 908 psi. 7" - 229 psi.
		11-3/4" - 90 psi.
9:00	11:15	RIH with tubing punch. Tagged EZSV at 8,402 ft. Perforated tubing 8,387 ft to 8,391 ft. Pulled out of hole. Laid down lubricator.
11:15	14:00	2-7/8" - 1,526 psi. 7" - 253 psi. 11-3/4" - 89 psi. Held PJSM. Pumped 10 9.4 ppg polymer pill. Began displacing with 9.4 ppg
		CaCl2. After displacing tubing volume opened choke on 7" casing. Pump rate 6 bpm. PP - 166 psi. After 80 bbls displaced
		observed increased gas flow and liquid from fissures. Pump rate 8.0 bpm. PP - 1,500 psi. Continued pumping at 8.0
		bpm. After 185 bbls pumped. Pump pressure - 1,400 psi. Pony motor went down. 7" - 45 psi. 11-3/4" - 45 psi. Pumps offline.
		Brought pumps online at 7 bpm. Pump pressure 0 psi. After 210 bbs pumped. Pump pressure 203 psi. After 320 bbls pumped
		PP - 634 psi. Brine, oil, and gas flowing from fissures on pad. After 693 bbls pumped 10 bbls 9.4 ppg polymer pill.
		Displaced into tubing with 3 bbls. Shut down. Tubing pressure 0 psi. 7" - 192 psi. 11-3/4" - 92 psi.
14:00	17:00	Lined up to pump down 2-7/8" x 7" annulus. Pumped junk shot. After 5 bbls pumped observed brine from fissures. Continued
		pumping junk shots. Shut down. 2-7/8" - 278 psi. 7" - 293 psi. 11-3/4" - 42 psi.
17:00	17:45	Attended end of the day meeting. Discussed pumping junk shot to plug hole in 7" casing and pumping barite pill
		out of perfs in tubing.
17:45	18:00	Traveled to hotel.

Projected Operations

Pump barite pill.

Subject: So Cal Gas - Aliso Canyon - Standard Sesnon 25 (API#03700776) - Preliminary DRAFT Shallow Gas Recovery Outline

Hi John,

Per the meeting with Bruce and your folks at the Standard Sesnon 25 well site today (11-13-15) the following is the requested preliminary draft outline of the plan to recover the residual shallow gas as a result of the Standard Sesnon 25 well leak at the Aliso Canyon Field, after the Standard Sesnon 25 well has been secured. The general work plan outline will likely consist of the following activities:

- Assess the Standard Sesnon 25 well site for equipment stability and make improvements to the well site as deemed necessary, so that a workover rig may work on the wellsite to completely cement/abandon or utilize the well for shallow gas recovery per the DOGGR permitting requirements.
- Collect and review the local Aliso Canyon Field and nearby Standard Sesnon-25 site geologic data, and other well survey data to assess the possible areal extent of the shallow gas impacted area in the Standard Sesnon-25 area of the Aliso Canyon field.
- Review and assess the existing Gas Company wells near the Standard Sesnon 25 wellsite to determine which wells may be viable candidates for shallow gas recovery in the vicinity of the Standard Sesnon-25 well site.
- Select approximately 3-4 of the wells determined to be viable for gas recovery, acquire the DOGGR Notice of Intent to Rework permits and convert the existing wells in preparation to recover the shallow gas.
- Design and install a temporary shallow gas collection system for the shallow gas recovery to the Gas Company system.
- Produce and meter the wells designated as shallow gas recovery wells to the Gas Company system.
- Perform ongoing monitoring and sampling to verify the composition of the recovered shallow gas.

This general outline is a preliminary draft and evolving work product and will be modified as more information about the SS-25 well, wellsite and other onsite data are collected.

Elaine got this as a text at 3:00 but seems strange neither Todd or I got it. Just want to make sure this isn't something fishy especially since it isn't even accurate. Brine is not oil.

"Standard Sesnon" 25 Chronology - Summary

- **October 23, 2015** At ±1600 a SCG representative called the DOGGR Ventura office (formally District 2). SCG stated that the Standard Sesnon 25 well had suffered a well head leak on the surface, and that mitigation procedures would begin the next day at daybreak. The well gave no indication of a serious problem.
- **October 24, 2015:** SCG called the DOGGR Ventura office and updated the on-call engineer about the status of the leaking well head after the first well control attempt.
- **October 26, 2015:** SCG contacted The DOGGR Ventura office to inform them that Boots and Coots (international well control experts) had been called out to Aliso Canyon, since normal well control operations were not effective. SCG believed that the well had formed methane ices in the tubing string. B&C performed an assessment of the situation. The DOGGR scheduled a field meeting with SCG for the next morning.
- **October 27, 2015:** The DOGGR inspected the leaking well, noting surface cracks leaking gas. Gas was also escaping out the west side of the hill just next to the well. DOGGR management was informed that the situation was more complicated and serious than was previously reported. The DOGGR recommended daily visits to Aliso Canyon and updates from the operator until the situation was resolved.
- **October 28, 2015:** The well head was resealed and the well was produced to try to reduce gas leaking at surface. Special well equipment was assembled to determine where ice was plugging the tubing and perhaps causing a leak. The cause of the leak was still not known.
- **October 29, 2015**: SCG confirmed the well tubing was blocked, perhaps by ices.
- **October 30, 2015**: The well gave no indication that a more serious issue was present. SCG made plans for special equipment to be brought from Louisiana, should it be required.
- **October 31-November 1, 2015:** SCG prepared the site for operations and began moving in equipment. A special low temperature mud was formulated for a second well control attempt, because of ices in the well tubing.
- **November 2, 2015:** More equipment arrived at the site for the second well control attempt. **November 3 - 4, 2015, 2015:** The special well control equipment was setup. The DOGGR was onsite during operations. SCG sent the DOGGR a "Notice of Intent" for the second well control attempt and was issued a permit.
- **November 5, 2015:** Well control equipment was tested and approved.
- **November 6, 2015:** The second well control attempt was made, during which the ices were cleared from the tubing. The injected heavy, low temperature mud was supposed to over-balance the gas at the bottom of the well, and stop the leak. The attempt failed.
- **November 7 - 12, 2015:** Wireline logs were run to gather additional information. The logs indicated extreme cold and gas flow noise from about 350 to 990 feet below the surface. This is the suspected location of the leak. Field wide withdrawal of gas began on 11/11/2015, to reduce the pressure in the gas storage reservoir.
- **November 13, 2015:** The third well control attempt was made, but with much more heavy mud. During the attempt, a ground surface vent opened up about 20 feet to the north of the well, emitting a high volume of gas. All other gas leaks around the well ceased.

- **November 14 – 17, 2015:** More wireline logs were run for diagnostics. The process for the first relief well was begun. The DOGGR now had a representative onsite every day, all day. Daily reports were sent to the DOGGR HQ and the governor's office.
- **November 18, 2015:** A fourth well control attempt was made with a large amount of heavy mud and barite. It was not successful.
- **November 19 – 23, 2015:** Some equipment was removed from the site. Several days of work were lost due to weather conditions. The fifth well control attempt was designed. On November 23 work began on the first relief well, as permitted by the DOGGR.
- **November 24, 2015:** The fifth well control attempt was made and failed. For weather and safety reasons, the pumping equipment for this attempt had been moved to a site about 400 feet uphill and to the north. During this attempt, the ground to the north of the well suffered significant erosion, forming a deep vent.
- **November 25, 2015:** A sixth well control attempt was made and failed. Surface ground erosion increased.
- **November 26 - December 11, 2015:** The well site was monitored and cleaned up. The main focus was now drilling the first relief well and operations are running 24 hours a day. SCG put the leaking well on production starting December 7, to reduce the gas reservoir pressure and try to reduce the gas leak.
- **December 11, 2015**: AECom and Flour both made on site visits to create proposals for design, fabrication, and installation of systems to capture leaking gas. An attempt to install a special pipe for gas capture in the vent was not successful.
- **December 12, 2015:** SCG planed to start air sampling at the SS25 site shortly, to record gas emission variations over time.
- **December 13, 2015:** A seventh well control attempt is discussed. The first relief well work continues.
- **December 14, 2015:** Due to the dangerous wind conditions, Site 25 was shut down in the morning. AECom is working with B&C to build a bridge over the SS-25 wellhead, to span the surface erosion vent, allowing access to the well. SCG is rebuilding and strengthening the catch basins and culverts surrounding the Site 25 location in anticipation of heavier El Nino rains.
- **December 15, 2105:** The fabrication of the bridge continues. The first relief well drilling continues.
- **December 16, 2015:** Continue to clean up the SS25 site for the wellhead bridge installation. The bridge is 100 feet long, with a safety cage in the middle.
- **December 17, 2015:** SCG is finishing the bridge that will be installed across and over the SS25 wellhead and vent opening. Relief well drilling is at 2439 feet MD.
- **December 18, 2015:** The well access bridge construction continues.
- **December 19, 2015:** The well access bridge construction was completed and installed this afternoon on the SS 25 well.
- **December 20, 2015:** A wireline unit set into place on the SS 25 site for the relief well ranging run.
- **December 21, 2015:** Ranging is successful at about 4000 feet underground and the relief well is on track to intercept the leaking well.
- **December 22, 2015:** A seventh well control attempt was made and failed. Surface ground erosion increased.

- **December 23, 2015:** The SS25 site was assessed and cleanup began after the last well control attempt. SCG and B&C provided well control modeling data to the national labs supporting the well control efforts. The first relief well drilling continues.
- **December 24, 2015:** SCG is looking at possible incineration of captured leaking gas, if possible. SS25 site continues to be cleaned up. The first relief well drilling continues.
- **December 25, 2015:** Stainless steel meshes were installed over the vent, to reduce oil misting. AECom is re-working a preliminary design for a second bridge structure that would be used for oil mist capture, gas leak re-direction, and gas leak capture.
- **December 26, 2015:** The morning weather was clear, but with very strong winds from the north, which prevented safe operations at the SS25. The first relief well drilling continues.
- **December 27, 2015:** The morning weather was clear, but with very strong winds from the north, which prevented safe operations at the SS25. The whole gas field has been and continues to be on maximum withdraw, to reduce the gas reservoir pressure.
- **December 28, 2015:** An updated plug and abandonment program for the leaking well is discussed between SCG and the DOGGR. The first relief well drilling continues. Site preparation at the second relief well continues.
- **December 29, 2015:** The current mesh covering portions of the existing bridge appear to be working. Oil misting is noticeably reduced.
- **December 30, 2015: I**n preparation of future rain, one thousand sandbags are brought on location. Construction continues on the new mist abatement structures.
- **December 31, 2015:** The weather is not favorable today with winds gusting to 50-70 mph today. The two relief well efforts continue.
- **January 1, 2016:** The two relief well efforts continue.
- **January 2, 2016:** The two relief well efforts continue.
- **January 3, 2016:** A 60 foot section bridge with mist abatement mesh was installed by crane.
- **January 4, 2016:** Construction continues on two additional mist abatement structures. The governor visits the Aliso Canyon site.
- **January 5, 2016:** The two relief well efforts continue.
- **January 6, 2015:** The next oil mist abatement structure has been completed and is awaiting better weather conditions for installation. The two relief well efforts continue.

SOUTHERN CALIFORNIA GAS COMPANY
CPUC-SAFETY AND ENFORCEMENT DIVISION
DATA REQUEST DATED OCTOBER 23, 2018

SOCALGAS AMENDED RESPONSE 12(f) DATED DECEMBER 7, 2018

SoCalGas provides the following Amended Response to Question 12(f) of the CPUC-Safety and Enforcement Division's (CPUC-SED) data request dated October 23, 2018 related to the preliminary investigation regarding the Aliso Canyon Well Leak. The Response is based upon the best available, non-privileged information that SoCalGas was able to locate through a diligent search within the time allotted to respond to this request, and within SoCalGas' possession, custody, or control. SoCalGas reserves the right to supplement, amend or correct the Response to the extent that it discovers additional responsive information.

SoCalGas submits this Response, while generally objecting to the extent the Request fails to provide a defined time period to which SoCalGas may tailor its Response, and to the extent that the Request is overly broad, vague, ambiguous, unduly burdensome, assumes facts, or otherwise fails to describe with reasonable particularity the information sought. SoCalGas further submits this Response without conceding the relevance of the subject matter of the Request or Response. SoCalGas reserves the right to object to use of the Response, or information contained therein, in any dispute, matter or legal proceeding before any court, action. Finally, at the time of this Response, there are no pending oral data requests from the CPUC-SED to SoCalGas.

For this set of questions, please refer to the following timeline, which is a verbatim copy of what SED received from Southern California Gas Company (SoCalGas) in response to a question 1 of an SED Data Request to SoCalGas, dated November 13, 2015. For reference, a copy of the SED Data Request dated November 13, 2015 is Appendix A at the bottom of this data request. Questions are shown below this timeline stated from SoCalGas.

Aliso Canyon Natural Gas Leak November 15, 2015

DRAFT Timeline of Events*

- Friday, October 23 – Leak discovered, area made safe for well procedures, personnel and equipment mobilized; standard procedures began, internal notifications made.
- Saturday, October 24 – Standard procedures to stop leak not effective. SoCalGas brings in additional external expertise (Onyx & Halliburton). Regulatory notifications begin.
- Sunday, October 25 –Boots and Coots experts arrive, mobilize and begin evaluation. SoCalGas Media & Employee Communications team participating. Initial information regarding situation distributed to Customer Contact Center and others that night. Regulatory notifications expanded.
- Monday, October 26 – SoCalGas' Emergency Operations Center (EOC) activated in monitor mode to provide support to Aliso Canyon Incident Command team. Evaluations continue on the well. Customer message posted on socalgas.com. SoCalGas holds community meeting on Aliso Canyon Turbine Replacement Project. Provided information and answers about leak. Some customers expressed anger/frustration about the leak.
- Tuesday, October 27 – Crews conduct more diagnostics and tests. Letter sent to customers, posted, emailed to elected officials, HOAs. SoCalGas sets up dedicated email and phone hotline

for customer inquiries. Daily operational briefing set up for fire dept., emergency management and elected official Public Information Officers (PIO). Daily briefings with SCAQMD begin.

- Wednesday, October 28 – Crews use wireline rig for diagnostics. KTLA-TV Channel 5 and KABC-TV Channel 7 cover story. Customer letter hand delivered to 1,400 homes. Public information booth set up at Aliso Canyon facility and staffed from 10 a.m. and 5 p.m. daily.
- Thursday, October 29 – Multiple diagnostics, including initial "wireline" completed. Determined need for coiled tubing rig to be brought in. SoCalGas mails 8,100 letters to Porter Ranch area. SoCalGas creates Frequently Asked Questions fact sheet to help respond to customer questions.
- Friday, October 30 – Wireline equipment removed. Update letter, fact sheet emailed with message that odor will last. SoCalGas begins daily air sampling of multiple random sites on site and in community which is available on socalgas.com. KTLA-TV Channel 5 and KABC-TV Channel 7 cover protest at Aliso Canyon gates by local activists. Less than 20 attend rally. L.A. Daily News runs story and photos: "Natural Gas Leak Near Porter Ranch Lingers Nearly One Week Later."
- Saturday, October 31--Crews at SoCalGas work to prepare site for coiled tubing rig. SoCalGas delivers an update via letter to 1,400 homes closest to the facility.
- Sunday, November 1—Coiled tubing rig arrives in late afternoon. Adjacent wells killed (one Saturday & one Sunday) in preparation for work on SS-25.
- Monday, November 2 – Equipment unloaded, set up. SoCalGas mails letter to 8,100 customers. SoCalGas.com begins daily posting of updates; Posted air sampling results on socalgas.com.
- Tuesday, November 3 – Coiled tubing ready set up and connected, started pressure testing.
- Wednesday, November 4 – Coiled tubing pressure testing continues. SoCalGas briefs representatives from L.A. City and County Fire Departments, Hazmat, SCAQMD, DOGGR, L.A. County Department of Health and elected officials prior to the Porter Ranch Neighborhood Council meeting. SoCalGas speaks at the Porter Ranch Neighborhood Council. KTLA-TV Channel 5 and KCBS-TV Channel 2, KNX 1070 radio cover. Ken Bruno from CPUC SED visits with Jimmie Cho, SoCalGas Senior Vice President - Gas Operations and System Integrity, for tour of site. L.A. Daily News runs story: "Leaking Natural Gas Well Concerns Porter Ranch Residents."
- Thursday, Nov 5. – Coiled tubing pressure testing completed. L.A. Daily News reports on community meeting. Reporter Greg Wilcox visits Aliso Canyon main office area and interviews Jimmie Cho and Glenn La Fevers, SoCalGas' Storage Operations Manager. SoCalGas supplies photos to press. L.A. Daily News updates story: "Porter Ranch Residents Confront Officials Over Gas Leak."
- Friday, Nov. 6 – Coiled tubing rig begins breaking through the blockage and introducing fluid into the well. SoCalGas adds daily p.m. email briefing to local PIOs and elected officials.
- Saturday, Nov 7 - Second day of multi-day coiled tubing operation focuses on additional evaluation to guide the next step efforts to stop the flow of gas. Wireline rig set up. SoCalGas continues air monitoring. CARB/CEC fly plane over site to monitor methane. L.A. Daily News online article "New Attempt Made to Stop Gas Leak" featured on home page, reports on situation and includes photos coiled tubing rig and of SoCalGas execs meeting with LAFD officials on site. Posted on front page of weekend edition.
- Sunday Nov. 8 – Well-management experts continue multi-day evaluation. The focus was on continued evaluation of the well pipe conditions. Information from multiple diagnostic tests will

guide next steps to safely stop the flow of gas. L.A. Daily News runs column: "Leaking Well a Vexing Problem."

- Monday November 9 – Well-management experts continue multi-day evaluation. L.A. Daily News runs column: "Crews Make Progress in Repairing Gas Leak."
- November 10 - Additional well testing work performed. Hosted a site visit by representatives from state and local agencies and elected offices. Visitors were provided an overview of Aliso Canyon and Storage operations, and briefed on the current status of efforts to mitigate the leaking well.
- November 11 - Conducted data analysis, finalized strategy to stop the leak, and began preparing the site with the appropriate well-control equipment.
- November 12 - Successfully installed the "bridge plug" in the well tubing and continued to prepare the well site.
- November 13 - Tubing perforation activities performed and attempted stop the flow of gas by putting fluids down the well. During this operation, there was a release of a mist into the air. Based on the information at this time, it is not believed that these materials pose a threat to public health. Out of an abundance of caution, residents were notified to stay inside. Once determined that the mist was contained to our facility, residents were again notified that there was no reason to remain inside. Office of Emergency Services and National Response Center were notified of the release. They were updated at 3:14 pm that flow was reduced.
- November 14 – Evaluating the well conditions, preparing the site and determining the best strategy for our continued efforts to stop the flow of gas. Representatives from the L.A. County Health & Hazmat have inspected the site today and yesterday and observed our containment procedures. Collected samples of the mud and liquid from yesterday's release and having it analyzed and expect results tonight. At 1:05 pm OES and NRC were notified of release containment and minor additional release of crude oil at 4:30 am.

* Based on best available information at this time.

Question 12(f):

Regarding the statement "November 14-25, 2015 – Four top-well kill attempts were made by Boots and Coots by attempting to pump various types of fluid down the well."

With regards to the top well-kill attempts, what options, if any, were no longer feasible after the installation of the bridge plug in the tubing?

Response 12(f):

SoCalGas is unaware of all the options that may have been no longer feasible as a result of the installation of the bridge plug. However, SoCalGas understands that the installation of the bridge plug removed access to the tubing below where the bridge plug was set. In order to have performed a bullhead kill, the bridge plug would have had to be milled out.

2 **Questions and Responses** **5**

2.1 Question 1 5

2.2 Question 2 6

2.3 Question 3 6

1 Background

The Legal Division of the California Public Utilities Commission issued a Data Request to Blade Energy Partners (Blade) on June 19, 2020. Data Request No: SED 107 is related the Preliminary Investigation of Southern California Gas Company's Aliso Canyon Storage Facility.

The CPUC questions (from file: "I1906016 SED Data Request 107 Final.pdf") are included verbatim followed by the Blade responses to the questions.

The questions are related to the document titled: *Chapter IX, Prepared Reply Testimony of Greg Healy on behalf of Southern California Gas Company (U 904 G)* (file name: "9_Ch. IX - Healy (A Final).pdf").

2 Questions and Responses

Please refer to the following passage in the testimony of Mr. Greg Healy, which is provided as an attachment to this Data Request for reference.

SoCalGas' February and March 2019 supplemental responses to Blade's data requests were provided at Blade's specific request, so that Blade had the most complete records and to allow it to complete its commissioned root cause analysis. In about January 2019, Blade and SoCalGas had ongoing discussions (including at an in-person meeting) regarding whether Blade had been provided with the entire universe of documents that could inform its RCA investigation, including documents and data that had not specifically been asked for in a written data request.

As noted in the written supplemental responses themselves, the process chosen for production does not indicate that SoCalGas' prior responses to these four data requests were incomplete; rather, tying the documents to formal data requests was simply a means to keep track of the documents provided to Blade, which, over the course of Blade's 3+ year investigation, were significant. The prior responses provided to the data requests were already complete.

SOCALGAS' SUPPLEMENTAL RESPONSES 1 DID NOT SUBSTANTIALLY IMPACT BLADE'S RCA REPORT.

With these passages in mind, please answer:

2.1 Question 1

1. Did SoCalGas' February or March 2019 supplemental responses to Blade's data requests provide information that was responsive to a data request that Blade issued on January 31, 2016 as part of its Root Cause Analysis?

   For each answer of yes, please also answer:

   a. Did Blade use the information in the February or March 2019 supplemental responses to:

      i. Confirm any facts or conclusions in its Root Cause Analysis or Supporting Reports?

      ii. Change any facts or conclusions in its Root Cause Analysis or Supporting Reports?

2.1.1 Blade Response

The data request from January 31, 2016 was fulfilled over time in 2016 and 2017. The data request was also fulfilled during the meetings with SoCalGas personnel on February 8, 2016 and August 24, 2018.

The data provided in February/March 2019 was related to wells SS-25, SS-25A and SS-25B. The bulk of the data had already been provided previously in 2016 and 2017. There was minimal new data provided during February/March 2019. Blade did conduct a detailed review of the supplemental responses for information to confirm existing data and to check for new data that may further inform or change the RCA conclusions.

The supplemental responses were consistent with the data already provided and consequently confirmed our interpretation.

The supplemental responses did not change any of the RCA conclusions.

SED SUR_REPLY_002204

2.2 Question 2

2. Did SoCalGas' February or March 2019 supplemental responses to Blade's data requests provide information that was responsive to a data request that Blade issued on February 19, 2016 as part of its Root Cause Analysis?

   For each answer of yes, please also answer:

   a. Did Blade use the information in the February or March 2019 supplemental responses to:

      i. Confirm any facts or conclusions in its Root Cause Analysis or Supporting Reports?

      ii. Change any facts or conclusions in its Root Cause Analysis or Supporting Reports?

2.2.1 Blade Response

The data request from February 19, 2016 was fulfilled over time in 2016 and 2017. The data request was also fulfilled during the meetings with SoCalGas personnel on February 8, 2016 and August 24, 2018.

The data provided in February/March 2019 was related to wells SS-25, SS-25A and SS-25B. The bulk of the data had already been provided previously in 2016 and 2017. There was minimal new data provided during February/March 2019. Blade did conduct a detailed review of the supplemental responses for information to confirm existing data and to check for new data that may further inform or change the RCA conclusions.

The supplemental responses were consistent with the data already provided and consequently confirmed our interpretation.

The supplemental responses did not change any of the RCA conclusions.

2.3 Question 3

3. Did SoCalGas' February or March 2019 supplemental responses to Blade's data requests provide information that was responsive to a data request that Blade issued on April 7, 2016 as part of its Root Cause Analysis?

   For each answer of yes, please also answer:

   a. Did Blade use the information in the February or March 2019 supplemental responses to:

      i. Confirm any facts or conclusions in its Root Cause Analysis or Supporting Reports?

      ii. Change any facts or conclusions in its Root Cause Analysis or Supporting Reports?

2.3.1 Blade Response

The data request from April 7, 2016 was fulfilled over time in 2016 and 2017. The data request was also fulfilled during the meetings with SoCalGas personnel on February 8, 2016 and August 24, 2018.

The data provided in February/March 2019 was related to wells SS-25, SS-25A and SS-25B. The bulk of the data had already been provided previously in 2016 and 2017. There was minimal new data provided during February/March 2019. Blade did conduct a detailed review of the supplemental

responses for information to confirm existing data and to check for new data that may further inform or change the RCA conclusions.

The supplemental responses were consistent with the data already provided and consequently confirmed our interpretation.

The supplemental responses did not change any of the RCA conclusions.

ORDER INSTITUTING INVESTIGATION ON THE COMMISSION'S OWN MOTION INTO THE OPERATIONS AND PRACTICES OF SOUTHERN CALIFORNIA GAS COMPANY WITH RESPECT TO THE ALISO CANYON STORAGE FACILITY AND THE RELEASE OF NATURAL GAS, AND ORDER TO SHOW CAUSE WHY SOUTHERN CALIFORNIA GAS COMPANY SHOULD NOT BE SANCTIONED FOR ALLOWING THE UNCONTROLLED RELEASE OF NATURAL GAS FROM ITS ALISO CANYON STORAGE FACILITY (I.19-06-016)

SOUTHERN CALIFORNIA GAS COMPANY

(DATA REQUEST SED-SCG-64 DATED APRIL 6, 2020)

SOCALGAS SUPPLEMENTAL RESPONSE DATED MAY 15, 2020

SoCalGas provides the following Responses to the Safety and Enforcement Division (SED) data request dated April 6, 2020 in I.19-06-016. The Responses are based upon the best available, nonprivileged information that SoCalGas was able to locate through a diligent search within the time allotted to respond to this request, and within SoCalGas' possession, custody, or control. SoCalGas' responses do not include information collected or modeled by Blade Energy Partners' during its Root Cause Analysis Investigation. SoCalGas reserves the right to supplement, amend or correct the Responses to the extent that it discovers additional responsive information.

SoCalGas objects to the instructions submitted by SED and to the continuing and indefinite nature of this request on the grounds that they are overbroad and unduly burdensome. Special interrogatory instructions of this nature and continuing interrogatories are expressly prohibited by California Code of Civil Procedure Section 2030.060(d) and 030.060(g), respectively. SoCalGas will provide responsive documents in existence at the time of its response. Should SED seek to update its request, SoCalGas will respond to such a request as a new data request in the future.

SoCalGas submits these Responses, while generally objecting to any Request that fails to provide a defined time period to which SoCalGas may tailor its Response, and to the extent that any Request is overly broad, vague, ambiguous, unduly burdensome, assumes facts, or otherwise fails to describe with reasonable particularity the information sought. SoCalGas further submits these Responses without conceding the relevance of the subject matter of any Request or Response. SoCalGas reserves the right to object to use of these Responses, or information contained therein, in any dispute, matter or legal proceeding. Finally, at the time of this Response, there are no pending oral data requests from SED to SoCalGas.

Please refer to the following passages in the testimony of Mr. Gregory Healy for this next set of questions.

QUESTION 2:

On page 7, it states, "SED's Opening Testimony alleges that SoCalGas committed 226 violations [footnote omitted) by initially withholding documents from and later supplementing its response to SED's Data Request No. 16 (SED DR 16). . .SoCalGas initially withheld these referenced documents on the basis of the attorney-client communication privilege and/or attorney work product doctrine, but later de-designated and produced the documents.

SED claims that this initial withholding and subsequent release constitute violations of Section 451 because "[the withholding] delayed SED's ability to get this information as part of its preformal investigation". [Footnote omitted.]. SED further claims this conduct constitutes a Rule 1.1 violation because "SoCalGas represented to SED that these items were protected by attorneyclient or attorney work product privilege, when they were not. [Footnote omitted]. SED alleges these violations began the day SoCalGas initially asserted the privilege and continued until SoCalGas released the documents. [Footnote omitted.]

However, SED's assertions ignore several significant considerations: (a) the complexity and volume of records reviewed in the process of responding to SED's data request, (b) that SoCalGas was transparent in its discovery responses and appropriately qualified that they were subject to change, and (c) SED has also withdrawn assertions of privilege.

A. SoCalGas' Initial Review of Documents Was Long and Complex.

SoCalGas reviewed over 8,000 documents in the course of responding to SED DR 16, which broadly sought "any and all communications . . . between SoCalGas and Boots and Coots" over a period of two years. This iterative review was conducted by several attorneys over the course of several weeks and culminated in the production of over 5,000 documents, totaling nearly 20,000 pages, and the preparation of iterative privilege logs, the first of which was over 180 pages and listed over 900 documents."

B. SoCalGas Expressly Qualified Its Responses and Appropriately Supplemented Its Production to SED

SoCalGas' initial and supplemental responses to SED expressly informed SED that SoCalGas' responses were based on the best available information and potentially subject to further supplementation. For example, SoCalGas' March 5, 2018 response to SED DR 16 made clear that its responses were "based upon the best available, nonprivileged information that SoCalGas was able to locate through a diligent search within the time allotted to respond to this request, and within SoCalGas' possession, custody, or control." [Footnote omitted.] SoCalGas further stated that its responses were subject to supplementation, amendment and correction. [Footnote omitted.] . . .

ORDER INSTITUTING INVESTIGATION ON THE COMMISSION'S OWN MOTION INTO THE OPERATIONS AND PRACTICES OF SOUTHERN CALIFORNIA GAS COMPANY WITH RESPECT TO THE ALISO CANYON STORAGE FACILITY AND THE RELEASE OF NATURAL GAS, AND ORDER TO SHOW CAUSE WHY SOUTHERN CALIFORNIA GAS COMPANY SHOULD NOT BE SANCTIONED FOR ALLOWING THE UNCONTROLLED RELEASE OF NATURAL GAS FROM ITS ALISO CANYON STORAGE FACILITY (I.19-06-016)

SOUTHERN CALIFORNIA GAS COMPANY

(DATA REQUEST SED-SCG-64 DATED APRIL 6, 2020)

SOCALGAS SUPPLEMENTAL RESPONSE DATED MAY 15, 2020

SoCalGas revisited the documents listed on its privilege log and determined that it could de-designate certain of the documents. Based on this additional review, SoCalGas produced additional documents, with the latest production submitted on March 15, 2019, over eight (8) months before SED served its Opening Testimony. [Footnote omitted.]. SED has not alleged that any of the documents contained in the de-designated sets were in any way material to its investigation or were relied upon for any purpose other than to allege 226 violations against SoCalGas. [Footnotes omitted.]

With the above passages in mind, with regards to the privilege log in response to Data Request 16, please answer:

> a. Does SoCalGas continue to assert attorney client privilege over all of the communications on the most up to date privilege log in response to SED Data Request 16?
> b. If not, please turn over the communications over which SoCalGas no longer asserts attorney-client privilege.
> c. For those communications over which SoCalGas continues to assert attorney-client privilege, will SoCalGas stipulate to the following:
>
> > a. A declaration that there is a valid legal basis under current statutory and case law to assert attorney-client privilege over each of these communications?
> > b. An in-camera review by the Administrative Law Judges of the instant proceeding to determine whether the communications are validly protected by attorney-client privilege?

<u>RESPONSE 2 (Dated April 27, 2020):</u>

a. No. SoCalGas will be de-designating additional communications from the privilege log most recently produced to SED on March 15, 2019, in response to SED Data Request 16.
b. SoCalGas is preparing the documents and will provide them in a supplemental response the week of May 4, 2020.
c. SoCalGas objects to this request to the extent it does not seek information of a factual nature that is appropriate for discovery.

ORDER INSTITUTING INVESTIGATION ON THE COMMISSION'S OWN MOTION INTO THE OPERATIONS AND PRACTICES OF SOUTHERN CALIFORNIA GAS COMPANY WITH RESPECT TO THE ALISO CANYON STORAGE FACILITY AND THE RELEASE OF NATURAL GAS, AND ORDER TO SHOW CAUSE WHY SOUTHERN CALIFORNIA GAS COMPANY SHOULD NOT BE SANCTIONED FOR ALLOWING THE UNCONTROLLED RELEASE OF NATURAL GAS FROM ITS ALISO CANYON STORAGE FACILITY (I.19-06-016)

SOUTHERN CALIFORNIA GAS COMPANY

(DATA REQUEST SED-SCG-64 DATED APRIL 6, 2020)

SOCALGAS SUPPLEMENTAL RESPONSE DATED MAY 15, 2020

SUPPLEMENTAL RESPONSE 2.b (Dated May 15, 2020):

Please see electronic documents with Bates range:
I1906016_SCG_SED_DR_64_0000001 – I1906016_SCG_SED_DR_64_0001208.

An updated privilege log is also included in this response.

ORDER INSTITUTING INVESTIGATION ON THE COMMISSION'S OWN MOTION INTO THE OPERATIONS AND PRACTICES OF SOUTHERN CALIFORNIA GAS COMPANY WITH RESPECT TO THE ALISO CANYON STORAGE FACILITY AND THE RELEASE OF NATURAL GAS, AND ORDER TO SHOW CAUSE WHY SOUTHERN CALIFORNIA GAS COMPANY SHOULD NOT BE SANCTIONED FOR ALLOWING THE UNCONTROLLED RELEASE OF NATURAL GAS FROM ITS ALISO CANYON STORAGE FACILITY (I.19-06-016)

SOUTHERN CALIFORNIA GAS COMPANY

(DATA REQUEST SED-SCG-64 DATED APRIL 6, 2020)

SOCALGAS RESPONSE DATED APRIL 27, 2020

SoCalGas provides the following Responses to the Safety and Enforcement Division (SED) data request dated April 6, 2020 in I.19-06-016. The Responses are based upon the best available, nonprivileged information that SoCalGas was able to locate through a diligent search within the time allotted to respond to this request, and within SoCalGas' possession, custody, or control. SoCalGas' responses do not include information collected or modeled by Blade Energy Partners' during its Root Cause Analysis Investigation. SoCalGas reserves the right to supplement, amend or correct the Responses to the extent that it discovers additional responsive information.

SoCalGas objects to the instructions submitted by SED and to the continuing and indefinite nature of this request on the grounds that they are overbroad and unduly burdensome. Special interrogatory instructions of this nature and continuing interrogatories are expressly prohibited by California Code of Civil Procedure Section 2030.060(d) and 030.060(g), respectively. SoCalGas will provide responsive documents in existence at the time of its response. Should SED seek to update its request, SoCalGas will respond to such a request as a new data request in the future.

SoCalGas submits these Responses, while generally objecting to any Request that fails to provide a defined time period to which SoCalGas may tailor its Response, and to the extent that any Request is overly broad, vague, ambiguous, unduly burdensome, assumes facts, or otherwise fails to describe with reasonable particularity the information sought. SoCalGas further submits these Responses without conceding the relevance of the subject matter of any Request or Response. SoCalGas reserves the right to object to use of these Responses, or information contained therein, in any dispute, matter or legal proceeding. Finally, at the time of this Response, there are no pending oral data requests from SED to SoCalGas.

Please refer to the following passages in the testimony of Mr. Gregory Healy for this next set of questions.

QUESTION 2:

On page 7, it states, "SED's Opening Testimony alleges that SoCalGas committed 226 violations [footnote omitted) by initially withholding documents from and later supplementing its response to SED's Data Request No. 16 (SED DR 16). . .SoCalGas initially withheld these referenced documents on the basis of the attorney-client communication privilege and/or attorney work product doctrine, but later de-designated and produced the documents.

SED claims that this initial withholding and subsequent release constitute violations of Section 451 because "[the withholding] delayed SED's ability to get this information as part of its preformal investigation". [Footnote omitted.]. SED further claims this conduct constitutes a Rule 1.1 violation because "SoCalGas represented to SED that these items were protected by attorneyclient or attorney work product privilege, when they were not. [Footnote omitted]. SED alleges these violations began the day SoCalGas initially asserted the privilege and continued until SoCalGas released the documents. [Footnote omitted.]

However, SED's assertions ignore several significant considerations: (a) the complexity and volume of records reviewed in the process of responding to SED's data request, (b) that SoCalGas was transparent in its discovery responses and appropriately qualified that they were subject to change, and (c) SED has also withdrawn assertions of privilege.

A. SoCalGas' Initial Review of Documents Was Long and Complex.

SoCalGas reviewed over 8,000 documents in the course of responding to SED DR 16, which broadly sought "any and all communications . . . between SoCalGas and Boots and Coots" over a period of two years. This iterative review was conducted by several attorneys over the course of several weeks and culminated in the production of over 5,000 documents, totaling nearly 20,000 pages, and the preparation of iterative privilege logs, the first of which was over 180 pages and listed over 900 documents."

B. SoCalGas Expressly Qualified Its Responses and Appropriately Supplemented Its Production to SED

SoCalGas' initial and supplemental responses to SED expressly informed SED that SoCalGas' responses were based on the best available information and potentially subject to further supplementation. For example, SoCalGas' March 5, 2018 response to SED DR 16 made clear that its responses were "based upon the best available, nonprivileged information that SoCalGas was able to locate through a diligent search within the time allotted to respond to this request, and within SoCalGas' possession, custody, or control." [Footnote omitted.] SoCalGas further stated that its responses were subject to supplementation, amendment and correction. [Footnote omitted.] . . .

ORDER INSTITUTING INVESTIGATION ON THE COMMISSION'S OWN MOTION INTO THE OPERATIONS AND PRACTICES OF SOUTHERN CALIFORNIA GAS COMPANY WITH RESPECT TO THE ALISO CANYON STORAGE FACILITY AND THE RELEASE OF NATURAL GAS, AND ORDER TO SHOW CAUSE WHY SOUTHERN CALIFORNIA GAS COMPANY SHOULD NOT BE SANCTIONED FOR ALLOWING THE UNCONTROLLED RELEASE OF NATURAL GAS FROM ITS ALISO CANYON STORAGE FACILITY (I.19-06-016)

SOUTHERN CALIFORNIA GAS COMPANY

(DATA REQUEST SED-SCG-64 DATED APRIL 6, 2020)

SOCALGAS RESPONSE DATED APRIL 27, 2020

SoCalGas revisited the documents listed on its privilege log and determined that it could de-designate certain of the documents. Based on this additional review, SoCalGas produced additional documents, with the latest production submitted on March 15, 2019, over eight (8) months before SED served its Opening Testimony. [Footnote omitted.]. SED has not alleged that any of the documents contained in the de-designated sets were in any way material to its investigation or were relied upon for any purpose other than to allege 226 violations against SoCalGas. [Footnotes omitted.]

With the above passages in mind, with regards to the privilege log in response to Data Request 16, please answer:

> a. Does SoCalGas continue to assert attorney client privilege over all of the communications on the most up to date privilege log in response to SED Data Request 16?
> b. If not, please turn over the communications over which SoCalGas no longer asserts attorney-client privilege.
> c. For those communications over which SoCalGas continues to assert attorney-client privilege, will SoCalGas stipulate to the following:
>
> > a. A declaration that there is a valid legal basis under current statutory and case law to assert attorney-client privilege over each of these communications?
> > b. An in-camera review by the Administrative Law Judges of the instant proceeding to determine whether the communications are validly protected by attorney-client privilege?

<u>RESPONSE 2:</u>

a. No. SoCalGas will be de-designating additional communications from the privilege log most recently produced to SED on March 15, 2019, in response to SED Data Request 16.
b. SoCalGas is preparing the documents and will provide them in a supplemental response the week of May 4, 2020.
c. SoCalGas objects to this request to the extent it does not seek information of a factual nature that is appropriate for discovery.

COLUMNS PROVIDED IN SOCALGAS ATTORNEY-CLIENT PRIVILEGE LOGS RELATED TO SED DATA R
QUESTION 10, Data Request 21, and Data Request 64, Question 2

Doc #	Prod Beg CPUC SED DR 16	Email From	Email To	Email CC	Email BCC	Parent Date

REQUEST 16

ADDITIONAL SAFETY AND ENFORCEMENT DIVISION QUESTIONS IN DATA

Description	Was document released to Safety and Enforcement Division?	If document has been released to SED, date of release.	Bates Number(s) of document(s) Released to SED.

REQUEST 93 (COLUMNS J THROUGH AK)

Did the released document contain a related document(s)?	"Was the related document(s) released also?"	If the related document was released, Bates Number(s) of Released Document	If the related document was not released, why not?

Has the released document been duplicated to SED?	If the released document has been duplicated to SED, identify Bates Number(s) of all duplicates.	Did the released document contain any redacted information?	Reason for continued redaction in released document.	Bates number(s) where redacted information appears.	Basis for alleged privilege shown in "Description" column (Column I).

Where Legal Advice Was Shown as Provided in Column I, Name of Attorney Who Provided Legal Advice	Where Legal Advice Was Shown as Provided in Column I, Date that Attorney in Column W Provided Legal Advice	Where Legal Advice Was Shown as Provided in Column I, Form of Communication in Which Attorney Dispensed Legal Advice

Where Legal Advice Was Shown as Provided in Column I, and the Individual Making the Communication Was Not an Attorney, Was the Individual Making the Communication Doing So As Part of Her or His Pre-Existing Formal Job Description?	Where an attorney name is provided in column W, was that attorney representing SoCalGas, Boots & Coots or someone else?	Where the attorney name provided in column W worked for a law	Was the entry released outside of SoCalGas?	If the answer to column "AC" is yes, to which person(s) and/or entity (entities) was the entry released?

Chain of Communication from attorney (column W) to the indivic

Date of release to each person(s) or entity (entities) identified in column AD.	Date and Time of Communication from Attorney Who Provided Legal Advice (Column W)	Recipients of Communication from Attorney who Provided Legal Advice	Name(s) of Recipient(s) Who Passed on Legal Advice from Attorney Listed in Column W to Individual on the Privilege Log Who Made the Allegedly Privileged Communication

dual uttering the communication shown on the SoCalGas logs (Columns AF through AK).

Date and time of Communication from Recipients Who Passed on Legal Advice from Attorney Listed in Column W to Individual on the Privilege Log Who Made the Allegedly Privileged Communication	Method of Communication from Recipients Who Passed on Legal Advice from Attorney Listed in Column W to the Individual Who Made the Allegedly Privileged Communication	Recipients of Communication from Recipients (Column AH) Who Passed on Legal Advice from Attorney Listed in Column W

INSTRUCTIONS

You are instructed to answer the following Data Requests in the above-captioned proceeding, with written, verified responses per Public Utilities Code §§ 309.5, 314, 314.5, 581 and 582, and Rules 1.1 and 10.1 of the California Public Utilities Commission's Rules of Practice and Procedure. Restate the text of each request prior to providing the response. For any questions, email the SED contact(s) above with a copy to the SED attorney. These data requests should be considered continuing so that if any information provided changes, or new information becomes available that is responsive to a request, respondent is requested to supplement its response to SED.

If the respondent objects to any of these data requests, please submit specific objections within five business days. If respondent asserts any privilege, please provide within ten business days a privilege log listing all documents the respondent claims are privileged and the following information for each document: the basis for the privilege claimed, a summary of the purpose and subject of the document withheld, the date of the document, the author(s), and all recipients of the document.

In responding to each request please restate the text of the request prior to providing the response, and provide the name of the person(s) answering the request, the title of such person(s), and the name and title of the person they work for. With respect to each document produced, identify the number of the data request and question number that the document is responding to.

These data requests do not-supersede or excuse any pending oral data requests to the respondent unless that is expressly stated in the written data request.

Identify the person providing the answer to each data request and his/her contact information. Responses should be provided both in the original electronic format, if available, and in hard copy. (If available in Word format, send the Word document and do not send the information as a PDF file.) All electronic documents submitted in response to this data request should be in readable, downloadable, printable, and searchable formats, unless use of such formats is infeasible. Each page should be numbered. If any of your answers refer to or reflect calculations, provide a copy of the supporting electronic files that were used to derive such calculations, such as Excel-compatible spreadsheets or computer programs, with data and formulas intact and functioning. Documents produced in response to the data requests should be Bates-numbered, and indexed if voluminous. Responses to data requests that refer to or incorporate documents should identify the particular documents referenced by Bates-numbers or Bates-range.

If a request, definition, or an instruction, is unclear, notify SED as soon as possible. In any event, answer the request to the fullest extent possible, specifying the reason for your inability to answer the remaining portion of the Data Request.

In answering these data requests, the respondent should adhere to the Commission's Rules of Practice and Procedure (Rules), with particular attention to Rule 1.1 of those Rules, which requires the respondent to "never mislead the Commission or its staff by an

artifice or false statement of law of fact." The respondent should keep in mind that "Violations of Rule 1.1 can occur by a failure to correctly cite a proposition of law, *a lack of candor*, withholding information, providing incorrect information, or a failure to correct mistaken information."[1] SED expects the respondent to respond to these data requests with the highest level of candor.

<u>If SoCalGas does not intend to provide a complete substantive answer to a question, objections to each such question are due May 22, 2020. Otherwise, objections may accompany the answer to a question on the due date for the data response. As this Data Request also has a certain level of complexity, SED invites and encourages SoCalGas to promptly request a meet and confer with SED regarding the questions in this data request to the extent SoCalGas does not understand the questions asked, so that SoCalGas can precisely identify any points of confusion and requests for clarification.</u>

DEFINITIONS

Unless the request indicates otherwise, the following definitions are applicable in providing the requested information.

1. The terms "document," "documents,", "documentary material", or "documentation" include, without limitation, the following items, whether in electronic form, printed, recorded, or written or reproduced by hand: reports, studies, statistics, projections, forecasts, decisions, and orders, intra-office and interoffice communications, correspondence, memoranda, financial data, summaries or records of conversations or interviews, statements, returns, diaries, calendars, work papers, graphs, notebooks, notes, charts, computations, plans, drawings, sketches, computer printouts, summaries of records of meetings or conferences, summaries or reports of investigations or negotiations, opinions or reports of consultants, photographs, bulletins, records or representations or publications of any kind (including microfilm, videotape, and records however produced or reproduced), electronic or mechanical or electrical records of any kind (including, without limitation, tapes, tape cassettes, discs, emails, and records) other data compilations (including without limitation, input/output files, source codes, object codes, program documentation, computer programs, computer printouts, cards, tapes, discs and recordings used in automated data processing, together with the programming instructions and other material necessary to translate, understand, or use the same), and other documents or tangible things of whatever description which constitute or contain information within the scope of these data requests.

2. "Relating to" or "related to" means concerning, addressing, referring, discussing, commenting

   upon, analyzing, mentioning or involving in any way.

3. "Identify":

[1] Administrative Law Judge's Ruling Denying Southern California Edison Company's Motion For Summary Adjudication Of Alleged Rule 1.1 Violations Related To Data Request Responses Dated December 10, 2010, I.09-01-018, January 10, 2012, p. 6.

a. When used in reference to a person includes stating his or her full name, his or her most recent known business address and telephone number, and his or her present title or position;

b. When used in reference to documents includes stating the nature of the document (e.g., letter, memorandum), the date (if any), the title of the document, the identity of the author and/or the document, the location of the document, the identity of the person having possession, control or custody of the document, and the general subject matter of the document.

4. "CPUC" as used herein refers to the California Public Utilities Commission.

5. "SED" as used herein refers to the Safety and Enforcement Division.

6. "SCG" or "SoCalGas" as used herein refers to the Southern California Gas Company and/or its affiliates.

Questions

Please note that this Data Request applies to each entry for which SoCalGas asserted privilege in response to SED Data Request 16, Question 10, including each SoCalGas' update to that Data Request question.[1] The questions in this data request accompany the spreadsheet entitled, "Document for SoCalGas to Fill in as Part of Data Request 93". Unless shown otherwise, each question in this document explains the information that SoCalGas is requested to fill in under each column heading in the spreadsheet. Unless specific instructions are otherwise provided in a question, SED requests that the entry in each column of the attached spreadsheet be filled out for each entry shown in the SoCalGas privilege logs that are responsive to SED Data Request 16, Question 10, and Data Request 21. SED also requests that the spreadsheet be populated with information from SoCalGas response to SED Data Request 64, Question 2, where applicable.

1. Compile all of the privilege logs that SoCalGas has provided SED which are responsive to SED Data Request 16, Question 10.
2. Provide the information from SoCalGas' privilege logs in columns B through H, which match the column headings that SoCalGas provided from its privilege logs.
3. Column J-"Was Document Released to Safety and Enforcement Division? " Entries in this column should be a yes or no answer. Namely, if the entry on the privilege log has since been provided to SED, a yes answer is requested in the corresponding row with the entry under this column. If the entry on the privilege log has not been provided to SED, a no answer is requested in the corresponding row with the entry under this column.
4. Column K-"If document has been released to SED, date of release." Entries in this column are limited to those documents identified on the log that have been released to SED. For such entries, provide the date the document in the entry was released.
5. Column L-"Bates Number(s) of document(s) released to SED." Entries in this column should identify the Bates Number or Bates Numbers that have been released that are associated with the entry.
6. Column M-"Did the released document contain a related document?" Entries in this column apply to released documents only. For each released document, identify whether it had a related document. Examples of related documents include the following: For released email attachments, related documents would include emails to which the attachment was attached. For released emails, related documents would include the attachments that were attached to the email. If the released document in the corresponding row had a related document, answer yes. If not, answer no. If there is more than one document related to the one that was released, provide a separate entry for each related document. For example, if a released email had two email attachments, each email attachment will need an entry.
7. Column N-"Was the related document(s) released also?" Entries in this column apply to released documents that contained related documents, and therefore received an answer of "yes" in column N. If a document was released, and its related document was also released, answer "yes". If a document was released, and any its related document were not released, answer "no".
8. Column O-"If the related document was released, Bates Number(s) of Released Document." Entries in this column apply to related documents identified in column M that were also released. For example, if an email was released, and its attachment was also released, provide the Bates number of the released email

[1] In addition, this Data Request applies to SoCalGas' response to SED Data Request 21, which requested that SoCalGas highlight attorney names on the privilege log provided in response to Data Request 16 Question 10. This Data Request also applies to SoCalGas response to SED Data Request 64, Question 2, in which SoCalGas allegedly de-designated responses that were part of the log that SoCalGas provided in response to Data Request 16, Question 10.

attachment. Similarly, if an attachment was released, and its related email was released, provide the Bates number of the released email.

9. Column P-"If the related document was not released, why not?" Entries in this column apply to related documents identified in column M that were not released. This column is requesting an explanation as to the reason why even though an allegedly privileged document has been released, a related document still has a valid privilege.
10. Column Q-"Has the released document been duplicated?" Entries in this column apply to documents that have been provided by SoCalGas to SED in duplicate. For example, an email thread that was provided more than one time, but with one additional email added to it would fall into this category. All of the portions of the email thread that are duplicated by another released document provided by SoCalGas would fall into this category.
11. Column R-"If the released document has been duplicated, to SED, identify Bates Number(s) of all duplicates." Entries in this column should include the Bates number or Bates numbers on all documents that duplicated the Bates number document entered in column L. Note: A duplicate is defined as an email page that was duplicated, and not by the exact image of on the Bates numbered document. For example, if an email thread was provided across two separate Bates numbers or sets of Bates numbers, that email thread is a duplicate, regardless if the exact same part of the email thread happened to fall on the same Bates stamped document or not. If a portion of a Bates number has not been duplicated (such as a unique addition to an email thread, do not include that Bates number as a duplicate).
12. Column S-"Did the released document contain any redacted information? " Entries in this column apply to released documents that still contain redacted information. Such entries should receive a "yes" response.
13. Column T-"Reason for continued redaction in released document". Entries in this column apply to the entries in column S that received a "yes" response. Such entries should receive a renewed description for the reason that the alleged privilege continues to apply to such a redaction.
14. Column U-"Bates number(s) where redacted information appears." Entries in this column apply to the entries in column S that received a "yes" response. Such entries should include the Bates number or Bates numbers in this column that show the redacted information.
15. Column V-"Basis for alleged privilege shown in "Description" column (Column I). For all privilege logs entries that SoCalGas provided in response to SED Data Request 16, Question 10, and that SoCalGas has now released to SED, provide the valid basis as to why SoCalGas initially asserted the privilege. For such entries, please be sure to include the document itself and how it complied with the explanation of the privilege in the "description" column. For example, most of the entries in the description column included the words "reflecting legal advice" about a subject area. For such entries, please explain how the released document "reflected legal advice" in the subject area provided in the description column.
16. Column W-"Where Legal Advice Was Provided in Column I, Name of Attorney Who Provided Legal Advice". Entries in this column should name the attorney who provided the legal advice where legal advice was shown in the description column (column I). This entry is needed, as many of the entries in the initial attorney-client privilege log entries do not show the name of the attorney who dispensed the advice in the communications, so it is not apparent whether the communication is validly protected under the alleged privilege.
17. Column X-"Where Legal Advice Was Shown As Provided in Column I, Date and Time that Attorney in Column W Provided Legal Advice". Entries in this column should show the date and time that the attorney who is named in column W provided the legal advice under the "Description" provided in the log under column I.
18. Column Y-"Where Legal Advice Was Shown as Provided in Column I, Form of Communication in Which Attorney Dispensed Legal Advice." Entries in this column should show the form (method) of communication in which the attorney identified in column W dispensed the advice identified in column I. For example, if the advice was dispensed via email, then email should be included in the entry. If the advice was dispensed via email and verbally, then both entries should be included in this column. If the advice was dispensed only verbally, then SED reserves the right to request an affidavit or similar declaration under penalty of perjury from the attorney identified under column W who is shown as having provided the advice.

19. Column Z-"Where Legal Advice Was Shown as Provided in Column I, and the Individual Making the Communication Was Not an Attorney, Was the Individual Making the Communication Doing So As Part of Her or His Pre-Existing Formal Job Description?" Entries in this column should be "Yes" or "No". If the "description" column shows legal advice was dispensed, and the individual making the allegedly privileged communication was not an attorney, and that individual was making the communication as part of his or her job description, then an entry of "yes" is requested. If the individual making the allegedly privileged communication was not an attorney, but the individual was making a communication that was not part of her or his pre-existing formal job description, then an entry of "no" is requested.
20. Provide the pre-existing job description for each individual asked about in response to question 17.
21. Column AA-"Where an attorney name is provided in column W, was that attorney representing SoCalGas, Boots & Coots or someone else?" Entries in this column should show the entity that the attorney represented.
22. Column AB-"Where the attorney name provided in column W worked for a law firm, provide the name of the firm." Entries in this column refer to outside counsel who worked for a law firm. Provide the name of the law firm for which that attorney worked at the time she or he dispensed the advice.
23. Column AC-"Was the entry released outside of SoCalGas?" Entries in this column should have a "yes" answer if the entry on the privilege log consisted of a communication (including documents that were part of that communication) that were released outside of SoCalGas.
24. Column AD-"If the answer to column "AC" is yes, to which person(s) and/or entity (entities) was the entry released?" This column should identify all entities that received the released communication. This includes, but is not limited to, Sempra Utilities, Boots & Coots, and plaintiffs in the civil litigation related SoCalGas Aliso Canyon natural gas storage facility incident that began October 23, 2015.
25. Column AE-"Date of release to each person(s) or entity (entities) identified in column AD." This entry is requested to identify the date that each entry was released to each person(s) or entity or entities identified in column AD.
26. Columns AF through AK-"Chain of Communication from attorney (column W) to the individual uttering the communication shown on the SoCalGas logs." These columns are requested to show that there was a clear chain of communication from the attorney who communicated the legal advice to the individual listed on the SoCalGas log who uttered the legal advice. As one example, multiple entries under the "Description" column of SoCalGas' privilege log uses the words "reflecting legal advice". In such instances, it is unclear from this the exact chain of communication from the attorney who gave the legal advice to the individual who is shown on the log who made the communication. With this general instruction, the instruction for each specific column from AF through AJ is shown below.

    These columns are premised on the assumption that the attorney listed in column W did not directly communicate her or his legal advice to the person who made the allegedly privileged statement shown on the SoCalGas privilege log. Ultimately, these columns are requested to be filled in to show the exact line of individuals through which the attorney's advice in Column W was received by the person shown on the privilege log to have made the allegedly privileged communication. Additional necessary columns should be added to show the entire line of communication from the attorney in column W to the individual shown making the allegedly privileged communication in the privilege log. Such columns are requested to include the names of each group of recipients of the attorney's legal advice (for example, see column AH), the date and time those recipients made communications to pass on the attorney's advice from column W (for example, see column AI), the method of communication from those recipients toward the individual shown on the privilege log (for example, see column AJ), and the next group of recipients of the attorney's advice (for example, see column AK).

    a. Column AF- "Date and Time of Communication from Attorney Who Provided Legal Advice (Column W)"-This is a request to show the exact date and time that the attorney who dispensed the

legal advice that was followed for each privilege log entry. For example, where the privilege log uses the words "reflecting legal advice" under the "description" column, column AF is requested to provide the date and time the attorney in column W communicated the legal advice that was reflected in the description column of the privilege log.

b. Column AG-"Recipients of Communication from Attorney who Provided Legal Advice"-This is a request to show all recipients who received the legal advice at from the attorney (column W) who dispensed the legal advice that was followed for each entry in the privilege log. For example, where the privilege log uses the words "reflecting legal advice" under the "description" column, column AG is requested to provide all recipients who received the communication from the attorney listed in column W, and at the date and time that attorney communicated that legal advice (column AF).

c. Column AH-"Name(s) of Recipients Who Passed on Legal Advice from Attorney Listed in Column W to Individual on the Privilege Log Who Made the Allegedly Privileged Communication." This column requests the name of the recipient(s) who passed on the attorney's advice that ultimately was received by the individual who made the allegedly privileged communication on the privilege log.

d. Column AI-"Date and Time of Communication from Recipients Who Passed on Legal Advice from Attorney Listed in Column W to Individual on the Privilege Log Who Made the Allegedly Privileged Communication." This column requests the date and time in which the recipients (listed in Column AH) passed on the advice from the attorney (Column W) that ultimately was received by the individual who made the allegedly privileged communication on the privilege log.

e. Column AJ-"Method of Communication from Recipients Who Passed on Legal Advice from Attorney Listed in Column W to the Individual Who Made the Allegedly Privileged Communication." This column requests the method of communication in which the recipients (listed in Column AH) passed on the advice from the attorney (Column W) that ultimately was received by the individual who made the allegedly privileged communication on the privilege log.

f. Column AK-"Recipients of Communication from Recipients (Column AH) Who Passed on Legal Advice from the Attorney Listed in Column W". This column requests the names of the recipients who received the communication from the recipients listed in column AH and who then passed on that advice from the attorney listed in column W that ultimately was received by the individual who made the allegedly privileged communication on the privilege log.

27. Provide the date in which SoCalGas initially provided the allegedly privileged log entry to SED.
28. Replicate on the spreadsheet that is part of this data request all of the highlighted entries showing the attorney names provided in response to SED Data Request 21.
29. Provide the requested spreadsheet in native file format so that SED can do sorting and see a complete document.

Please send your response to the Originator, and a copy of your response to Project Coordinator and e-copies to the following SED representatives:

Nicholas.sher@cpuc.ca.gov
Darryl.gruen@cpuc.ca.gov

Please provide the above information as it becomes available but no later than the due date identified above. If you are unable to provide the information by this date, please notify the Originator **at least** 3 days before the data request is due and provide your best estimate of when the information can be provided. Please identify the person who provides the response and his/her phone number and email address.

ORDER INSTITUTING INVESTIGATION ON THE COMMISSION'S OWN MOTION INTO THE OPERATIONS AND PRACTICES OF SOUTHERN CALIFORNIA GAS COMPANY WITH RESPECT TO THE ALISO CANYON STORAGE FACILITY AND THE RELEASE OF NATURAL GAS, AND ORDER TO SHOW CAUSE WHY SOUTHERN CALIFORNIA GAS COMPANY SHOULD NOT BE SANCTIONED FOR ALLOWING THE UNCONTROLLED RELEASE OF NATURAL GAS FROM ITS ALISO CANYON STORAGE FACILITY (I.19-06-016)

SOUTHERN CALIFORNIA GAS COMPANY

(DATA REQUEST SED-SCG-93 DATED MAY 19, 2020)

SOCALGAS RESPONSE DATED JUNE 8, 2020

SoCalGas provides the following Responses to tbhe Safety and Enforcement Division (SED) data request dated May 19, 2020 in I.19-06-016. The Responses are based upon the best available, nonprivileged information that SoCalGas was able to locate through a diligent search within the time allotted to respond to this request, and within SoCalGas' possession, custody, or control. SoCalGas' responses do not include information collected or modeled by Blade Energy Partners' during its Root Cause Analysis Investigation. SoCalGas reserves the right to supplement, amend or correct the Responses to the extent that it discovers additional responsive information.

SoCalGas objects to the instructions submitted by SED and to the continuing and indefinite nature of this request on the grounds that they are overbroad and unduly burdensome. Special interrogatory instructions of this nature and continuing interrogatories are expressly prohibited by California Code of Civil Procedure Section 2030.060(d) and 2030.060(g), respectively. SoCalGas will provide responsive documents in existence at the time of its response. Should SED seek to update its request, SoCalGas will respond to such a request as a new data request in the future.

SoCalGas submits these Responses, while generally objecting to any Request that fails to provide a defined time period to which SoCalGas may tailor its Response, and to the extent that any Request is overly broad, vague, ambiguous, unduly burdensome, assumes facts, or otherwise fails to describe with reasonable particularity the information sought. SoCalGas further submits these Responses without conceding the relevance of the subject matter of any Request or Response. SoCalGas reserves the right to object to use of these Responses, or information contained therein, in any dispute, matter or legal proceeding. Finally, at the time of this Response, there are no pending oral data requests from SED to SoCalGas.

Questions:

Please note that this Data Request applies to each entry for which SoCalGas asserted privilege in response to SED Data Request 16, Question 10, including each SoCalGas' update to that Data Request question.1 The questions in this data request accompany the spreadsheet entitled, "Document for SoCalGas to Fill in as Part of Data Request 93". Unless shown otherwise, each question in this document explains the information that SoCalGas is requested to fill in under each column heading in the spreadsheet. Unless specific instructions are otherwise provided in a question, SED requests that the entry in each column of the attached spreadsheet be filled out for each entry shown in

the SoCalGas privilege logs that are responsive to SED Data Request 16, Question 10, and Data Request 21. SED also requests that the spreadsheet be populated with information from SoCalGas response to SED Data Request 64, Question 2, where applicable.

QUESTION 1:

Compile all of the privilege logs that SoCalGas has provided SED which are responsive to SED Data Request 16, Question 10.

RESPONSE 1:

SoCalGas objects to this request to the extent that it fails to ask a question. SoCalGas further objects to this request on the grounds it is unduly burdensome and seeks information that has already been provided to SED.

QUESTION 2:

Provide the information from SoCalGas' privilege logs in columns B through H, which match the column headings that SoCalGas provided from its privilege logs.

RESPONSE 2:

SoCalGas objects to this request on the ground it is unduly burdensome and seeks information that has already been provided to SED.

QUESTION 3:

Column J-"Was Document Released to Safety and Enforcement Division? " Entries in this column should be a yes or no answer. Namely, if the entry on the privilege log has since been provided to SED, a yes answer is requested in the corresponding row with the entry under this column. If the entry on the privilege log has not been provided to SED, a no answer is requested in the corresponding row with the entry under this column.

RESPONSE 3:

SoCalGas objects to this request on the grounds it is unduly burdensome; seeks information that has already been provided to SED to the extent the documents have been provided along with a revised privilege log to reflect updates, as explained to SED during a meet-and-confer call on May 28, 2020.

QUESTION 4:

Column K-"If document has been released to SED, date of release." Entries in this column are limited to those documents identified on the log that have been released to SED. For such entries, provide the date the document in the entry was released.

RESPONSE 4:

SoCalGas objects to this request on the grounds it is unduly burdensome and seeks information that has already been provided to SED to the extent the documents have been provided along with a revised privilege log to reflect updates.

QUESTION 5:

Column L-"Bates Number(s) of document(s) released to SED." Entries in this column should identify the Bates Number or Bates Numbers that have been released that are associated with the entry.

RESPONSE 5:

SoCalGas objects to this request on the grounds it is unduly burdensome and seeks information that has already been provided to SED to the extent the documents have been provided along with a revised privilege log to reflect updates, as explained to SED during a meet-and-confer on May 28, 2020.

QUESTION 6:

Column M-"Did the released document contain a related document?" Entries in this column apply to released documents only. For each released document, identify

whether it had a related document. Examples of related documents include the following: For released email attachments, related documents would include emails to which the attachment was attached. For released emails, related documents would include the attachments that were attached to the email. If the released document in the corresponding row had a related document, answer yes. If not, answer no. If there is more than one document related to the one that was released, provide a separate entry for each related document. For example, if a released email had two email attachments, each email attachment will need an entry.

RESPONSE 6:

SoCalGas objects to this request on the grounds it is unduly burdensome and seeks information that has already been provided to SED to the extent the documents have been provided along with a revised privilege log to reflect updates, as explained to SED during a meet-and-confer on May 28, 2020.

QUESTION 7:

Column N-"Was the related document(s) released also?" Entries in this column apply to released documents that contained related documents, and therefore received an answer of "yes" in column N. If a document was released, and its related document was also released, answer "yes". If a document was released, and any its related document were not released, answer "no".

RESPONSE 7:

SoCalGas objects to this request on the grounds it is unduly burdensome; seeks information that has already been provided to SED to the extent the documents have been provided along with a revised privilege log to reflect updates, as explained to SED during a meet-and-confer call on May 28, 2020.

QUESTION 8:

Column O-"If the related document was released, Bates Number(s) of Released Document." Entries in this column apply to related documents identified in column M that were also released. For example, if an email was released, and its attachment was

also released, provide the Bates number of the released email attachment. Similarly, if an attachment was released, and its related email was released, provide the Bates number of the released email.

RESPONSE 8:

SoCalGas objects to this request on the grounds it is unduly burdensome; and seeks information that has already been provided to SED to the extent the documents have been provided along with a revised privilege log to reflect updates, as explained to SED during a meet-and-confer call on May 28, 2020.

QUESTION 9:

Column P-"If the related document was not released, why not?" Entries in this column apply to related documents identified in column M that were not released. This column is requesting an explanation as to the reason why even though an allegedly privileged document has been released, a related document still has a valid privilege.

RESPONSE 9:

SoCalGas objects to this request on the grounds it is unduly burdensome; seeks information that has already been provided to SED to the extent the documents have been provided along with a revised privilege log to reflect updates, as explained to SED during a meet-and-confer call on May 28, 2020.

QUESTION 10:

Column Q-"Has the released document been duplicated?" Entries in this column apply to documents that have been provided by SoCalGas to SED in duplicate. For example, an email thread that was provided more than one time, but with one additional email added to it would fall into this category. All of the portions of the email thread that are duplicated by another released document provided by SoCalGas would fall into this category.

RESPONSE 10:

SoCalGas objects to this request on the grounds it is unduly burdensome; seeks information that has already been provided to SED to the extent the documents have been provided along with a revised privilege log to reflect updates, as explained to SED during a meet-and-confer call on May 28, 2020; and is vague and ambiguous with respect to the term "duplicated." Moreover, SoCalGas objects to this request to the extent it fails to acknowledge that documents were provided in duplicate to SED at SED's request.

QUESTION 11:

Column R-"If the released document has been duplicated, to SED, identify Bates Number(s) of all duplicates." Entries in this column should include the Bates number or Bates numbers on all documents that duplicated the Bates number document entered in column L. Note: A duplicate is defined as an email page that was duplicated, and not by the exact image of on the Bates numbered document. For example, if an email thread was provided across two separate Bates numbers or sets of Bates numbers, that email thread is a duplicate, regardless if the exact same part of the email thread happened to fall on the same Bates stamped document or not. If a portion of a Bates number has not been duplicated (such as a unique addition to an email thread, do not include that Bates number as a duplicate).

RESPONSE 11:

SoCalGas objects to this request on the grounds it is unduly burdensome; seeks information that has already been provided to SED to the extent the documents have been provided to SED; and is vague and ambiguous with respect to the term "duplicated." Moreover, SoCalGas objects to this request to the extent it fails to acknowledge that documents were provided in duplicate to SED at SED's request.

QUESTION 12:

Column S-"Did the released document contain any redacted information? " Entries in this column apply to released documents that still contain redacted information. Such entries should receive a "yes" response.

RESPONSE 12:

SoCalGas objects to this request on the grounds it is unduly burdensome; and seeks information that has already been provided to SED to the extent the documents have been provided along with a revised privilege log to reflect updates, as explained to SED during a meet-and-confer call on May 28, 2020.

QUESTION 13:

Column T-"Reason for continued redaction in released document". Entries in this column apply to the entries in column S that received a "yes" response. Such entries should receive a renewed description for the reason that the alleged privilege continues to apply to such a redaction.

RESPONSE 13:

SoCalGas objects to this request on the grounds it is unduly burdensome and seeks information that has already been provided to SED to the extent SED has been provided with a current privilege log.

QUESTION 14:

Column U-"Bates number(s) where redacted information appears." Entries in this column apply to the entries in column S that received a "yes" response. Such entries should include the Bates number or Bates numbers in this column that show the redacted information.

RESPONSE 14:

SoCalGas objects to this request on the grounds it is unduly burdensome and seeks information that has already been provided to SED to the extent SED has been provided with a current privilege log.

ORDER INSTITUTING INVESTIGATION ON THE COMMISSION'S OWN MOTION INTO THE OPERATIONS AND PRACTICES OF SOUTHERN CALIFORNIA GAS COMPANY WITH RESPECT TO THE ALISO CANYON STORAGE FACILITY AND THE RELEASE OF NATURAL GAS, AND ORDER TO SHOW CAUSE WHY SOUTHERN CALIFORNIA GAS COMPANY SHOULD NOT BE SANCTIONED FOR ALLOWING THE UNCONTROLLED RELEASE OF NATURAL GAS FROM ITS ALISO CANYON STORAGE FACILITY (I.19-06-016)

SOUTHERN CALIFORNIA GAS COMPANY

(DATA REQUEST SED-SCG-93 DATED MAY 19, 2020)

SOCALGAS RESPONSE DATED JUNE 8, 2020

QUESTION 15:

Column V-"Basis for alleged privilege shown in "Description" column (Column I). For all privilege logs entries that SoCalGas provided in response to SED Data Request 16, Question 10, and that SoCalGas has now released to SED, provide the valid basis as to why SoCalGas initially asserted the privilege. For such entries, please be sure to include the document itself and how it complied with the explanation of the privilege in the "description" column. For example, most of the entries in the description column included the words "reflecting legal advice" about a subject area. For such entries, please explain how the released document "reflected legal advice" in the subject area provided in the description column.

RESPONSE 15:

SoCalGas objects to this request on the grounds it is unduly burdensome and seeks information that has already been provided to SED, and moreover calls for a legal conclusion.

QUESTION 16:

Column W-"Where Legal Advice Was Provided in Column I, Name of Attorney Who Provided Legal Advice". Entries in this column should name the attorney who provided the legal advice where legal advice was shown in the description column (column I). This entry is needed, as many of the entries in the initial attorney-client privilege log entries do not show the name of the attorney who dispensed the advice in the communications, so it is not apparent whether the communication is validly protected under the alleged privilege.

RESPONSE 16:

SoCalGas objects to this request on the grounds it is unduly burdensome and seeks information that has already been provided to SED to the extent SED has been provided with a current privilege log, as explained to SED during a meet-and-confer call on May 28, 2020.

ORDER INSTITUTING INVESTIGATION ON THE COMMISSION'S OWN MOTION INTO THE OPERATIONS AND PRACTICES OF SOUTHERN CALIFORNIA GAS COMPANY WITH RESPECT TO THE ALISO CANYON STORAGE FACILITY AND THE RELEASE OF NATURAL GAS, AND ORDER TO SHOW CAUSE WHY SOUTHERN CALIFORNIA GAS COMPANY SHOULD NOT BE SANCTIONED FOR ALLOWING THE UNCONTROLLED RELEASE OF NATURAL GAS FROM ITS ALISO CANYON STORAGE FACILITY (I.19-06-016)

SOUTHERN CALIFORNIA GAS COMPANY

(DATA REQUEST SED-SCG-93 DATED MAY 19, 2020)

SOCALGAS RESPONSE DATED JUNE 8, 2020

QUESTION 17:

Column X-"Where Legal Advice Was Shown As Provided in Column I, Date and Time that Attorney in Column W Provided Legal Advice". Entries in this column should show the date and time that the attorney who is named in column W provided the legal advice under the "Description" provided in the log under column I.

RESPONSE 17:

SoCalGas objects to this request on the grounds it is unduly burdensome, seeks information that has already been provided to SED, seeks information outside the scope of the Assigned Commissioner's Scoping Memo and Ruling dated September 26, 2019, and is not reasonably calculated to lead to the discovery of admissible information pursuant to Rule 10.1 of the Commission's Rules of Practice and Procedure.

QUESTION 18:

Column Y-"Where Legal Advice Was Shown as Provided in Column I, Form of Communication in Which Attorney Dispensed Legal Advice." Entries in this column should show the form (method) of communication in which the attorney identified in column W dispensed the advice identified in column I. For example, if the advice was dispensed via email, then email should be included in the entry. If the advice was dispensed via email and verbally, then both entries should be included in this column. If the advice was dispensed only verbally, then SED reserves the right to request an affidavit or similar declaration under penalty of perjury from the attorney identified under column W who is shown as having provided the advice.

RESPONSE 18:

SoCalGas objects to this request on the grounds it is unduly burdensome, seeks information outside the scope of the Assigned Commissioner's Scoping Memo and Ruling dated September 26, 2019, is not reasonably calculated to lead to the discovery of admissible information pursuant to Rule 10.1 of the Commission's Rules of Practice and Procedure, and is unintelligible to the extent it seeks information regarding "verbal" advice given in documents identified on a privilege log.

ORDER INSTITUTING INVESTIGATION ON THE COMMISSION'S OWN MOTION INTO THE OPERATIONS AND PRACTICES OF SOUTHERN CALIFORNIA GAS COMPANY WITH RESPECT TO THE ALISO CANYON STORAGE FACILITY AND THE RELEASE OF NATURAL GAS, AND ORDER TO SHOW CAUSE WHY SOUTHERN CALIFORNIA GAS COMPANY SHOULD NOT BE SANCTIONED FOR ALLOWING THE UNCONTROLLED RELEASE OF NATURAL GAS FROM ITS ALISO CANYON STORAGE FACILITY (I.19-06-016)

SOUTHERN CALIFORNIA GAS COMPANY

(DATA REQUEST SED-SCG-93 DATED MAY 19, 2020)

SOCALGAS RESPONSE DATED JUNE 8, 2020

QUESTION 19:

Column Z-"Where Legal Advice Was Shown as Provided in Column I, and the Individual Making the Communication Was Not an Attorney, Was the Individual Making the Communication Doing So As Part of Her or His Pre-Existing Formal Job Description?" Entries in this column should be "Yes" or "No". If the "description" column shows legal advice was dispensed, and the individual making the allegedly privileged communication was not an attorney, and that individual was making the communication as part of his or her job description, then an entry of "yes" is requested. If the individual making the allegedly privileged communication was not an attorney, but the individual was making a communication that was not part of her or his pre-existing formal job description, then an entry of "no" is requested.

RESPONSE 19:

SoCalGas objects to this request on the ground it is unintelligible and vague and ambiguous with reference to the phrase, "Pre-Existing Formal Job Description." SoCalGas further objects to this request to the extent that information that has already been provided to SED, as explained to SED during a meet-and-confer call on May 28, 2020.

QUESTION 20:

Provide the pre-existing job description for each individual asked about in response to question 17.

RESPONSE 20:

SoCalGas objects to this request on the ground it is unintelligible and vague and ambiguous with reference to the phrase, "Pre-Existing Formal Job Description." SoCalGas further objects to this request on the grounds it is unduly burdensome, seeks information outside the scope of the Assigned Commissioner's Scoping Memo and Ruling dated September 26, 2019, and is not reasonably calculated to lead to the discovery of admissible information pursuant to Rule 10.1 of the Commission's Rules of Practice and Procedure.

QUESTION 21:

Column AA-"Where an attorney name is provided in column W, was that attorney representing SoCalGas, Boots & Coots or someone else?" Entries in this column should show the entity that the attorney represented.

RESPONSE 21:

SoCalGas objects to this request to the extent it is unduly burdensome and seeks information that has already been provided to SED.

QUESTION 22:

Column AB-"Where the attorney name provided in column W worked for a law firm, provide the name of the firm." Entries in this column refer to outside counsel who worked for a law firm. Provide the name of the law firm for which that attorney worked at the time she or he dispensed the advice.

RESPONSE 22:

SoCalGas objects to this request to the extent it is unduly burdensome and seeks information that has already been provided to SED.

QUESTION 23:

Column AC-"Was the entry released outside of SoCalGas?" Entries in this column should have a "yes" answer if the entry on the privilege log consisted of a communication (including documents that were part of that communication) that were released outside of SoCalGas.

RESPONSE 23:

SoCalGas objects to this request to the extent it is unduly burdensome and is vague and ambiguous and unintelligible with respect to the phrase, "released outside of SoCalGas." SoCalGas further objects to the extent that the request fails to identify a timeframe for which SoCalGas can tailor its response. SoCalGas further objects to this

request to the extent it is outside the scope of this proceeding as determined by the Assigned Commissioner's Scoping Memo and Ruling dated September 26, 2019 and is not reasonably calculated to lead to the discovery of admissible evidence pursuant to Rule 10.1 of the Commission's Rules of Practice and Procedure.

QUESTION 24:

Column AD-"If the answer to column "AC" is yes, to which person(s) and/or entity (entities) was the entry released?" This column should identify all entities that received the released communication. This includes, but is not limited to, Sempra Utilities, Boots & Coots, and plaintiffs in the civil litigation related SoCalGas Aliso Canyon natural gas storage facility incident that began October 23, 2015.

RESPONSE 24:

SoCalGas objects to this request to the extent it is unduly burdensome and is vague and ambiguous and unintelligible with respect to the phrase, "released outside of SoCalGas." SoCalGas further objects to this request to the extent it is outside the scope of this proceeding as determined by the Assigned Commissioner's Scoping Memo and Ruling dated September 26, 2019 and is not reasonably calculated to lead to the discovery of admissible evidence pursuant to Rule 10.1 of the Commission's Rules of Practice and Procedure.

QUESTION 25:

Column AE-"Date of release to each person(s) or entity (entities) identified in column AD." This entry is requested to identify the date that each entry was released to each person(s) or entity or entities identified in column AD.

RESPONSE 25:

SoCalGas objects to this request to the extent it is unduly burdensome and is vague and ambiguous and unintelligible with respect to the phrase, "released outside of SoCalGas." SoCalGas further objects to this request to the extent it is outside the scope of this proceeding as determined by the Assigned Commissioner's Scoping Memo and Ruling dated September 26, 2019 and is not reasonably calculated to lead to

the discovery of admissible evidence pursuant to Rule 10.1 of the Commission's Rules of Practice and Procedure.

QUESTION 26.a:

Columns AF through AK-"Chain of Communication from attorney (column W) to the individual uttering the communication shown on the SoCalGas logs." These columns are requested to show that there was a clear chain of communication from the attorney who communicated the legal advice to the individual listed on the SoCalGas log who uttered the legal advice. As one example, multiple entries under the "Description" column of SoCalGas' privilege log uses the words "reflecting legal advice". In such instances, it is unclear from this the exact chain of communication from the attorney who gave the legal advice to the individual who is shown on the log who made the communication. With this general instruction, the instruction for each specific column from AF through AJ is shown below.

These columns are premised on the assumption that the attorney listed in column W did not directly communicate her or his legal advice to the person who made the allegedly privileged statement shown on the SoCalGas privilege log. Ultimately, these columns are requested to be filled in to show the exact line of individuals through which the attorney's advice in Column W was received by the person shown on the privilege log to have made the allegedly privileged communication. Additional necessary columns should be added to show the entire line of communication from the attorney in column W to the individual shown making the allegedly privileged communication in the privilege log. Such columns are requested to include the names of each group of recipients of the attorney's legal advice (for example, see column AH), the date and time those recipients made communications to pass on the attorney's advice from column W (for example, see column AI), the method of communication from those recipients toward the individual shown on the privilege log (for example, see column AJ), and the next group of recipients of the attorney's advice (for example, see column AK).

a. Column AF- "Date and Time of Communication from Attorney Who Provided Legal Advice (Column W)"-This is a request to show the exact date and time that the attorney who dispensed the legal advice that was followed for each privilege log entry. For example, where the privilege log uses the words "reflecting legal

advice" under the "description" column, column AF is requested to provide the date and time the attorney in column W communicated the legal advice that was reflected in the description column of the privilege log.

RESPONSE 26.a:

SoCalGas objects to this request to the extent it is outside the scope of this proceeding as determined by the Assigned Commissioner's Scoping Memo and Ruling dated September 26, 2019 and is overly burdensome and not reasonably calculated to lead to the discovery of admissible evidence pursuant to Rule 10.1 of the Commission's Rules of Practice and Procedure. SoCalGas further objects to the extent this question duplicates other questions in this Data Request 93.

QUESTION 26.b:

b. Column AG-"Recipients of Communication from Attorney who Provided Legal Advice"-This is a request to show all recipients who received the legal advice at from the attorney (column W) who dispensed the legal advice that was followed for each entry in the privilege log. For example, where the privilege log uses the words "reflecting legal advice" under the "description" column, column AG is requested to provide all recipients who received the communication from the attorney listed in column W, and at the date and time that attorney communicated that legal advice (column AF).

RESPONSE 26.b:

SoCalGas objects to this request to the extent it is unduly burdensome, is vague and ambiguous, and seeks information already provided to SED.

QUESTION 26.c:

c. Column AH-"Name(s) of Recipients Who Passed on Legal Advice from Attorney Listed in Column W to Individual on the Privilege Log Who Made the Allegedly Privileged Communication." This column requests the name of the recipient(s) who passed on the attorney's advice that ultimately was received by the individual who made the allegedly privileged communication on the privilege log.

RESPONSE 26.c:

SoCalGas objects to this request to the extent it is unduly burdensome, is vague and ambiguous, and seeks information already provided to SED.

QUESTION 26.d:

d. Column AI-"Date and Time of Communication from Recipients Who Passed on Legal Advice from Attorney Listed in Column W to Individual on the Privilege Log Who Made the Allegedly Privileged Communication." This column requests the date and time in which the recipients (listed in Column AH) passed on the advice from the attorney (Column W) that ultimately was received by the individual who made the allegedly privileged communication on the privilege log.

RESPONSE 26.d:

SoCalGas objects to this request to the extent it is unduly burdensome, is vague and ambiguous, seeks information already provided to SED, and is not reasonably calculated to lead to the discovery of admissible evidence.

QUESTION 26.e:

e. Column AJ-"Method of Communication from Recipients Who Passed on Legal Advice from Attorney Listed in Column W to the Individual Who Made the Allegedly Privileged Communication." This column requests the method of communication in which the recipients (listed in Column AH) passed on the advice from the attorney (Column W) that ultimately was received by the individual who made the allegedly privileged communication on the privilege log.

RESPONSE 26.e:

SoCalGas objects to this request on the grounds it is unduly burdensome, seeks information outside the scope of the Assigned Commissioner's Scoping Memo and Ruling dated September 26, 2019, is not reasonably calculated to lead to the discovery of admissible information pursuant to Rule 10.1 of the Commission's Rules of Practice

and Procedure, and is unintelligible to the extent it seeks information regarding the method of communication in documents identified on a privilege log.

QUESTION 26.f:

f. Column AK-"Recipients of Communication from Recipients (Column AH) Who Passed on Legal Advice from the Attorney Listed in Column W". This column requests the names of the recipients who received the communication from the recipients listed in column AH and who then passed on that advice from the attorney listed in column W that ultimately was received by the individual who made the allegedly privileged communication on the privilege log.

RESPONSE 26.f:

SoCalGas objects to this request to the extent it is unduly burdensome, is vague and ambiguous, seeks information already provided to SED, and is not reasonably calculated to lead to the discovery of admissible evidence.

QUESTION 27:

Provide the date in which SoCalGas initially provided the allegedly privileged log entry to SED.

RESPONSE 27:

SoCalGas objects to this request on the grounds the request is vague and ambiguous with respect to the phrase "the alleged privileged log entry," and thus unintelligible. SoCalGas also objects to this request on the ground it is argumentative. SoCalGas further objects to this request to the extent that it seeks information that is equally available to SED.

QUESTION 28:

Replicate on the spreadsheet that is part of this data request all of the highlighted entries showing the attorney names provided in response to SED Data Request 21.

ORDER INSTITUTING INVESTIGATION ON THE COMMISSION'S OWN MOTION INTO THE OPERATIONS AND PRACTICES OF SOUTHERN CALIFORNIA GAS COMPANY WITH RESPECT TO THE ALISO CANYON STORAGE FACILITY AND THE RELEASE OF NATURAL GAS, AND ORDER TO SHOW CAUSE WHY SOUTHERN CALIFORNIA GAS COMPANY SHOULD NOT BE SANCTIONED FOR ALLOWING THE UNCONTROLLED RELEASE OF NATURAL GAS FROM ITS ALISO CANYON STORAGE FACILITY (I.19-06-016)

SOUTHERN CALIFORNIA GAS COMPANY

(DATA REQUEST SED-SCG-93 DATED MAY 19, 2020)

SOCALGAS RESPONSE DATED JUNE 8, 2020

RESPONSE 28:

SoCalGas objects to this request on the ground it is unintelligible. SoCalGas further objects to this request to the extent that the information sought has already been provided to SED, or is equally available to SED.

QUESTION 29:

Provide the requested spreadsheet in native file format so that SED can do sorting and see a complete document.

RESPONSE 29:

SoCalGas objects to this request on the grounds it is vague and ambiguous with respect to the phrase "complete document."

DATA REQUEST for Safety and Enforcement Division Preliminary Investigation of Southern California Gas Company in the Matter of the Aliso Canyon Well Leak

Data Request No: SED-Aliso-SoCalGas – 12FEB18

Date of this Request: February 12, 2018

Date Responses Due: **On or before February 26, 2018**

To: Sabina Clorfeine

Originated by: Randy Holter
Email: rh3@cpuc.ca.gov
Phone: (213) 576-7153

Cc: Mr. Kenneth Bruno
Mr. Nicholas Sher
Mr. Darryl Gruen

INSTRUCTIONS

You are instructed to answer the following Data Requests in the above-captioned proceeding, with written, verified responses per Public Utilities Code §§ 314, 314.5, 581 and 582, and Rules 1.1 and 10.1 of the California Public Utilities Commission's Rules of Practice and Procedure. Restate the text of each request prior to providing the response. For any questions, email the SEF contact(s) above with a copy to the SED program manager and attorneys.

These data requests should be considered continuing so that if any information provided changes, or new information becomes available that is responsive to a request, respondent is requested to supplement its response to SED.

If the respondent objects to any of these data requests, please submit specific objections within five business days. If respondent asserts any privilege, please provide within ten business days a privilege log listing all documents the respondent claims are privileged and the following information for each document: the basis for the privilege claimed, a summary of the purpose and subject of the document withheld, the date of the document, the author(s), and all recipients of the document.

In responding to each request please restate the text of the request prior to providing the response, and provide the name of the person(s) answering the request, the title of such person(s), and the name and title of the person they work for. With respect to each document produced, identify the number of the data request and question number that the document is responding to.

These data requests do not-supersede or excuse any pending oral data requests to the respondent unless that is expressly stated in the written data request.

Identify the person providing the answer to each data request and his/her contact information. Responses should be provided both in the original electronic format, if available, and in hard copy. (If available in Word format, send the Word document and do not send the information as a PDF file.) All electronic documents submitted in response to this data request should be in readable, downloadable, printable, and searchable formats, unless use of such formats is infeasible. Each page should be numbered. If any of your answers refer to or reflect calculations, provide a copy of the supporting electronic files that were used to derive such calculations, such as Excel-compatible spreadsheets or computer programs, with data and formulas intact and functioning. Documents produced in response to the data requests should be Bates-numbered, and indexed if voluminous. Responses to data requests that refer to or incorporate documents should identify the particular documents referenced by Bates-numbers or Bates-range.

If a request, definition, or an instruction, is unclear, notify SED as soon as possible. In any event, answer the request to the fullest extent possible, specifying the reason for your inability to answer the remaining portion of the Data Request.

In answering these data requests, the respondent should adhere to the Commission's Rules of Practice and Procedure (Rules), with particular attention to Rule 1.1 of those Rules, which requires the respondent to "never mislead the Commission or its staff by an artifice or false statement of law of fact." The respondent should keep in mind that "Violations of Rule 1.1 can occur by a failure to correctly cite a proposition of law, *a lack of candor*, withholding information, providing incorrect information, or a failure to correct mistaken information."[1] SED expects the respondent to respond to these data requests with the highest level of candor.

DEFINITIONS

Unless the request indicates otherwise, the following definitions are applicable in providing the requested information.

1. The terms "document," "documents," or "documentary material" include, without limitation, the following items, whether in electronic form, printed, recorded, or written or reproduced by hand: reports, studies, statistics, projections, forecasts, decisions, and orders, intra-office and interoffice communications, correspondence, memoranda, financial data, summaries or records of conversations or interviews, statements, returns, diaries, calendars, work papers, graphs, notebooks, notes, charts, computations, plans, drawings, sketches, computer printouts, summaries of records of meetings or conferences, summaries or reports of investigations or negotiations, opinions or reports of consultants, photographs, bulletins, records or representations or publications of any kind (including microfilm, videotape, and records however produced or reproduced), electronic or mechanical or electrical records of any kind (including, without limitation, tapes, tape cassettes, discs, emails, and records) other data compilations (including without limitation, input/output files, source codes, object codes, program documentation, computer programs, computer printouts, cards, tapes, discs and recordings used in automated data processing, together with the programming instructions and other material necessary to translate, understand, or use the same), and other documents or tangible things of whatever description which constitute or contain information within the scope of these data requests.

2. "Relating to" means concerning, addressing, referring, discussing, commenting upon, analyzing, mentioning or involving in any way.

3. "Identify":

[1] Administrative Law Judge's Ruling Denying Southern California Edison Company's Motion For Summary Adjudication Of Alleged Rule 1.1 Violations Related To Data Request Responses Dated December 10, 2010, I.09-01-018, January 10, 2012, p. 6.

a. When used in reference to a person includes stating his or her full name, his or her most recent known business address and telephone number, and his or her present title or position;

b. When used in reference to documents includes stating the nature of the document (e.g., letter, memorandum), the date (if any), the title of the document, the identity of the author and/or the document, the location of the document, the identity of the person having possession, control or custody of the document, and the general subject matter of the document.

4. "CPUC" as used herein refers to the California Public Utilities Commission.

5. "SED" as used herein refers to the Safety and Enforcement Division.

6. "SCG" or "SoCalGas" as used herein refers to the Southern California Gas Company and/or its affiliates.

7. SS25 refers to the Aliso Canyon Well that leaked on October 23rd, 2015.

8. Well kill plan number 1 means a written document from Boots and Coots describing the steps that Boots and Coots took in order to do their first well kill attempt on SS25.

9. Well kill plan number 2 means a written document from Boots and Coots describing the steps that Boots and Coots took in order to do their second well kill attempt on SS25.

10. Well kill plan number 3 means a written document from Boots and Coots describing the steps that Boots and Coots took in order to do their third well kill attempt on SS25.

11. Well kill plan number 4 means a written document from Boots and Coots describing the steps that Boots and Coots took in order to do their fourth well kill attempt on SS25.

12. Well kill plan number 5 means a written document from Boots and Coots describing the steps that Boots and Coots took in order to do their fifth well kill attempt on SS25.

13. Well kill plan number 6 means a written document from Boots and Coots describing the steps that Boots and Coots took in order to do their sixth well kill attempt on SS25.

14. Well kill attempt refers to the action to carry out each well kill plan, as well as any other actions that were part of an attempt to seal well SS25 after October 23rd, 2015 .

15. Communications includes, but is not limited to, emails, texts, letters, memorandums, plans, calculations, etc.

Data Requests:

1. Please provide resumes/c.v. for the following individuals
   Brett Lane
   Todd Van De Putte
   Tom Egbert
   Roger Schweke
   Jimmy Cho

2. Of those individuals identified in response to question 1, please explain their roles related to the SS25 well leak on October 23rd, 2015.

3. Please provide any and all contracts between Southern California Gas Company ("SoCalGas") and Boots and Coots for the years 2010-2018.

4. Of those contracts between SoCalGas and Boots and Coots provided in response to question 2, please specify which contracts with Boots and Coots were related to the leak on Aliso Canyon well SS 25.

5. Of those contracts between SoCalGas and Boots and Coots provided in response to question 2, please specify which contracts are related to:
   a. The first well kill attempt of Aliso well SS25 with Boots and Coots;
   b. The second well kill attempt of Aliso well SS25 with Boots and Coots;
   c. The third well kill attempt of Aliso well SS25 with Boots and Coots;
   d. The fourth well kill attempt of Aliso well SS25 with Boots and Coots;
   e. The fifth well kill attempt of Aliso well SS25 with Boots and Coots;
   f. The sixth well kill attempt of Aliso well SS25 with Boots and Coots;

6. Please provide any employees that were involved from Boots and Coots in the following:
   a. First well kill attempt;
   b. Second well kill attempt;
   c. Third well kill attempt;
   d. Fourth well kill attempt;
   e. Fifth well kill attempt;
   f. Sixth well kill attempt.

7. Please provide Well kill plans, 1, 2, 3, 4, 5, and 6.

8. It is SED's understanding that these well kill plans referenced in question 7 are also referred to as "sheets". Please confirm SED's understanding is accurate.

9. Please provide any deviations that occurred from the well kill plans provided in response to Question 7.

10. Please provide any and all communications relating to Aliso Canyon between SoCalGas and Boots and Coots for the time period October 1, 2015 – January 31, 2018.

11. Please provide any and all contracts between SoCalGas and Don Shackleford for the years 2010-2018.

    Of those contracts between SoCalGas and Don Shackleford provided in response, were any of those related to, or used for Mr. Shackleford's services on the leak on Aliso Canyon well SS 25. If so, please specify which ones.

12. Please provide any and all communications relating to Aliso Canyon between SoCalGas and Don Shackleford for the time period October 1, 2015 – January 31, 2018.

13. When did SCG implement STIMP?

14. Why did SCG implement STIMP?

15. Who was the driver of STIMP (SME and responsible manager in charge)

16. With regards to the well-kill attempts, what data did SCG (or its agents) provide to the National Labs? Did SCG provide the Labs with any other data relating to the Aliso leak? Was any information received back? If so, please provide copies.

17. What was Halliburton's role at Aliso Canyon (during the well-kill attempts)?

18. Provide a list of all Boots and Coots personnel who were present for any amount of time at Aliso between October 2015 and January 2018; please include job descriptions, titles, and the dates when each individual was present.

19. Provide any contractors, subcontractors, or other personnel hired by SoCalGas who were involved in the operations of the leak response and subsequent kill operations, and also present at Aliso for the dates mentioned in question 18; please include job descriptions, titles, and the dates when each individual was present.

20. Provide a list of all Haliburton personnel who were present for any amount of time at Aliso between October 2015 and January 2018; please include job descriptions, titles, and the dates when each individual was present.

SED SUR_REPLY_002729

1 Background

Southern California Gas Company (SoCalGas) issued a data request to Blade Energy Partners (Blade) on January 23, 2020.

Blade reviewed the data request and prepared responses to each part of the data requests. The SoCalGas questions are included verbatim followed by the Blade responses in Section 2.

SED SUR_REPLY_002730

2 Questions and Responses

2.1 Question 1.

With regards to YOUR statement in the BLADE REPORT, at p. 5-6, that "the root causes for the uncontrolled release of hydrocarbons for 111 days from SS-25 were … [t]he lack of internal policy and regulation that required production casing wall thickness inspections … methodologies such as periodic wall thickness measurements were necessary," please respond to the following questions:

2.2 Question 1.a.

Identify and describe any and all INDUSTRY STANDARD(S) that YOU considered, evaluated, or assessed in connection with internal policies requiring production casing wall thickness inspections.

2.2.1 Response 1.a.

Blade did not identify any INDUSTRY STANDARD(S) "in connection with internal policies requiring production casing wall thickness inspections".

2.3 Question 1.b.

Produce any and all DOCUMENTS related to any INDUSTRY STANDARDS identified in response to Request 1(a) above.

2.3.1 Response 1.b.

No INDUSTRY STANDARD(S) were identified with "in connection with internal policies requiring production casing wall thickness inspections".

2.4 Question 1.c.

For each of the INDUSTRY STANDARD(S) identified in response to Request 1(a) above, describe the reason(s) why BLADE evaluated the INDUSTRY STANDARD(S)

2.4.1 Response 1.c.

No INDUSTRY STANDARD(S) were identified with "in connection with internal policies requiring production casing wall thickness inspections".

2.5 Question 1.d.

Identify any and all LAW(S) that YOU considered, evaluated, or assessed in connection with the above statement.

2.5.1 Response 1.d.

Blade reviewed the October 2015 version of the *California Statutes and Regulations for Conservation of Oil, Gas, and Geothermal Resources* [1] as described in the Blade Report on pages 197 – 199—Section 4.6.1.

2.6 Question 1.e.

For each LAW(S) that YOU evaluated in preparing the BLADE REPORT identified in response to Request 1(d) above, state YOUR understanding as to whether SoCalGas complied with the LAW(S).

2.6.1 Response 1.e.

Based on Blade's technical review, no requirements were identified in the October 2015 version of the *California Statutes and Regulations for Conservation of Oil, Gas, and Geothermal Resources* [1] requiring operators to conduct wall thickness inspections in gas storage wells. This is discussed on page 202—Section 4.7 of the Blade Report.

2.7 Question 1.f.

For each LAW(S) identified in response to Request 1(d) above, describe the reason(s) why BLADE evaluated the LAW(S).

2.7.1 Response 1.f.

An outcome of the RCA process was that the leak could have been prevented if a SoCalGas internal policy and regulations had been in place requiring periodic inspections to determine casing wall thickness as discussed on page 231—Section 5.3.1 and pages 237 – 238—Section 5.3.2 in the Blade Report. Periodic inspections would have allowed tracking wall thickness vs. time and provided data for assessing the pressure capacity of the production casing.

Therefore, Blade evaluated the regulations to determine if regulations were in place prior to the SS-25 leak that required production casing wall thickness inspections. Blade's assessment of the 2015 regulations is included in the Blade Report on pages 197 – 199—Section 4.6.

2.8 Question 2.

With regards to YOUR statement in the BLADE REPORT, at p. 5-6, that "the root causes for the uncontrolled release of hydrocarbons for 111 days from SS-25 were … [t]he lack of a real-time, continuous pressure monitoring system for well surveillance," please respond to the following questions:

2.9 Question 2.a.

Identify and describe any and all INDUSTRY STANDARD(S) that YOU considered, evaluated, or assessed related to real-time, continuous pressure monitoring systems for well surveillance.

2.9.1 Response 2.a.

Blade did not identify any INDUSTRY STANDARD(S) "related to real-time, continuous pressure monitoring systems for well surveillance."

SED SUR_REPLY_002732

2.10 Question 2.b.

Produce any and all DOCUMENTS related to any INDUSTRY STANDARDS identified in response to Request 2(a) above.

2.10.1 Response 2.b.

No INDUSTRY STANDARD(S) were identified "related to real-time, continuous pressure monitoring systems for well surveillance."

2.11 Question 2.c.

For each of the INDUSTRY STANDARD(S) identified in response to Request 2(a) above, describe the reason(s) why BLADE evaluated the INDUSTRY STANDARD(S)

2.11.1 Response 2.c.

No INDUSTRY STANDARD(S) were identified "related to real-time, continuous pressure monitoring systems for well surveillance."

2.12 Question 2.d.

Identify any and all LAW(S) that YOU considered, evaluated, or assessed in connection with the above statement.

2.12.1 Response 2.d.

Blade reviewed the October 2015 version of the *California Statutes and Regulations for Conservation of Oil, Gas, and Geothermal Resources* [1] as described in the Blade Report on pages 197 – 199—Section 4.6.1.

2.13 Question 2.e.

For each LAW(S) that YOU evaluated in preparing the BLADE REPORT identified in response to Request 2(d) above, state YOUR understanding as to whether SoCalGas complied with the LAW(S).

2.13.1 Response 2.e.

Based on Blade's technical review, no requirements were identified in the October 2015 version of the *California Statutes and Regulations for Conservation of Oil, Gas, and Geothermal Resources* [1] requiring "a real-time, continuous pressure monitoring system for well surveillance."

2.14 Question 2.f.

For each LAW(S) identified in response to Request 2(d) above, describe the reason(s) why BLADE evaluated the LAW(S).

2.14.1 Response 2.f.

An outcome of the RCA process was that the lack of a real-time, continuous pressure monitoring system for well surveillance prevented an immediate identification of the SS-25 leak and accurate estimation of the gas flow rate. The SS-25 gas injection could have been stopped earlier preventing additional cooling at the leak and may have prevented the brittle failure that caused the production casing to circumferentially part resulting in the large breach in the casing. This is discussed in the Blade Report on page 230—Section 5.2.3, page 233—Section 5.3.1, and page 239—Section 5.4.

Therefore, Blade evaluated the regulations to determine if regulations were in place prior to the SS-25 leak that required "real-time, continuous pressure monitoring system for well surveillance."

2.15 Question 3.

With regards to YOUR statement in the BLADE REPORT, at p. 5-6, that "the root causes for the uncontrolled release of hydrocarbons for 111 days from SS-25 were … "[t]he lack of systemic practices of external corrosion protection for surface casing strings," please respond to the following questions:

2.16 Question 3.a.

Identify and describe any and all INDUSTRY STANDARD(S) that YOU considered, evaluated, or assessed in connection with external corrosion protection for surface casing strings.

2.16.1 Response 3.a.

Blade considered the NACE Standard Practice SP0186-2007 titled "Application of Cathodic Protection of External Surfaces of Well Casings" [2] (formerly RP0186-2001).

The foreword from SP0186-2007 describes the standard as follows:

> This NACE International standard practice identifies procedures to determine the need for cathodic protection (CP) and the current requirements to achieve CP of well casings associated with oil and gas production and gas storage. It also outlines practices for the design and installation of CP systems and for their operation and maintenance.

2.17 Question 3.b.

Produce any and all DOCUMENTS related to any INDUSTRY STANDARDS identified in response to Request 3(a) above.

2.17.1 Response 3.b.

NACE Standard SP0186-2007 can be purchased from the NACE website.

2.18 Question 3.c.

For any INDUSTRY STANDARD(S) identified in response to Request 3(a) above, describe the reason(s) why BLADE evaluated the INDUSTRY STANDARD(S).

SED SUR_REPLY_002734

2.18.1 Response 3.c.

An outcome of the RCA process was that the lack of systematic practices of external corrosion protection for surface casing strings was one of the root causes for the release of hydrocarbons. This is discussed several places in the Blade Report including, page 99—Section 2.7.4; page 124—Section 2.10.2, page 193—Section 4.5, page 205—Section 4.7, page 233—Section 5.3.1, and page 239—Section 5.4.

Therefore, Blade considered the NACE Standard Practice SP0186-2007 and RP0186-2001 to determine whether the SP/RP criteria, applied to SS-25 conditions, would have identified a need for cathodic protection of the surface casing.

2.19 Question 3.d.

For any INDUSTRY STANDARD(S) identified in response to Request 3(a) above, describe how long before the October 23, 2015 leak they were published or otherwise made available.

2.19.1 Response 3.d.

The NACE standard RP0186 was published in 2001, and SP0186, which superseded RP0186, was published in 2007.

2.20 Question 3.e.

Identify any and all LAW(S) that YOU considered, evaluated, or assessed in connection with the above statement.

2.20.1 Response 3.e.

Blade reviewed the October 2015 version of the *California Statutes and Regulations for Conservation of Oil, Gas, and Geothermal Resources* [1] as described in the Blade Report on pages 197 – 199—Section 4.6.1.

2.21 Question 3.f.

For each LAW(S) that YOU evaluated in preparing the BLADE REPORT identified in response to Request 3(e) above, state YOUR understanding as to whether SoCalGas complied with the LAW(S).

2.21.1 Response 3.f.

Based on Blade's technical review, no requirements were identified for cathodic protection of surface casings in the October 2015 version of the *California Statutes and Regulations for Conservation of Oil, Gas, and Geothermal Resources* [1].

2.22 Question 3.g.

For each LAW(S) identified in response to Request 3(e) above, describe the reason(s) why BLADE evaluated the LAW(S).

2.22.1 Response 3.g.

An outcome of the RCA process was that the lack of systematic practices of external corrosion protection for surface casing strings was one of the root causes for the release of hydrocarbons. This is discussed several places in the Blade Report including, page 99—Section 2.7.4, page 124—Section 2.10.2, page 193—Section 4.5, page 205—Section 4.7, page 233—Section 5.3.1, and page 239—Section 5.4.

Therefore, Blade considered the October 2015 version of the *California Statutes and Regulations for Conservation of Oil, Gas, and Geothermal Resources* [1] to determine any requirements "in connection with external corrosion protection for surface casing strings".

2.23 Question 4.

With regards to YOUR statement in the BLADE REPORT, at p. 5-6, that "the root causes for the uncontrolled release of hydrocarbons for 111 days from SS-25 were … "[t]here was no quantitative understanding of well deliverability, although data were available, and well-established industry practices existed for such analysis," please respond to the following questions:

2.24 Question 4.a.

Identify and describe any and all INDUSTRY STANDARD(S) that YOU considered, evaluated, or assessed in connection with the above statement.

2.24.1 Response 4.a.

Well deliverability analysis is a long-established and widely used practice by the petroleum industry.

Blade used the following handbooks and textbooks in conducting well deliverability analysis:

- *Production Optimization Using Nodal Analysis*, H. Dale Beggs, OGCI Publications, 1991
- *Petroleum Production Systems*, First Edition, M.J. Economides, A.D. Hill, C. Ehlig-Economides, Prentice Hall, 1994
- *Petroleum Production Systems*, Second Edition, M.J. Economides, A.D. Hill, C. Ehlig-Economides, D. Zhu, Prentice Hall, 2013

Blade used PROSPER, a commercially available software, which is widely used in the petroleum industry.

2.25 Question 4.b.

Produce any and all DOCUMENTS related to any INDUSTRY STANDARDS identified in response to Request 4(a) above.

2.25.1 Response 4.b.

These documents are available for purchase online.

2.26 Question 4.c.

For each of the INDUSTRY STANDARD(S) identified in response to Request 4(a) above, describe the reason(s) why BLADE evaluated the INDUSTRY STANDARD(S)

2.26.1 Response 4.c.

An outcome of the RCA process was that the lack of understanding of the well deliverability was a root cause and affected the well-control planning as discussed in the Blade Report on pages 132 – 133—Section 3.2.1. Well gas flow rate is a key parameter used in dynamic kill modeling and in estimating the total gas leak volume.

Therefore, Blade used industry practices to establish well deliverability following the leak event.

2.27 Question 4.d.

Identify any and all LAW(S) that YOU considered, evaluated, or assessed in connection with the above statement.

2.27.1 Response 4.d.

Blade reviewed the October 2015 version of the *California Statutes and Regulations for Conservation of Oil, Gas, and Geothermal Resources* [1] as described in the Blade Report on pages 197 – 199—Section 4.6.1.

2.28 Question 4.e.

For each LAW(S) that YOU evaluated in preparing the BLADE REPORT identified in response to Request 4(d) above, state YOUR understanding as to whether SoCalGas complied with the LAW(S).

2.28.1 Response 4.e.

Based on Blade's technical review, no requirements were identified for well deliverability estimation in the October 2015 version of the *California Statutes and Regulations for Conservation of Oil, Gas, and Geothermal Resources* [1].

2.29 Question 4.f.

For each LAW(S) identified in response to Request 4(d) above, describe the reason(s) why BLADE evaluated the LAW(S).

2.29.1 Response 4.f.

An outcome of the RCA process was that the lack of understanding of the well delivery was a root cause and affected the well-control planning as discussed in the Blade Report on pages 132 – 133—Section 3.2.1. Well gas flow rate is a key parameter used in dynamic kill modeling and in estimating the total gas leak volume.

Therefore, Blade reviewed the October 2015 version of the *California Statutes and Regulations for Conservation of Oil, Gas, and Geothermal Resources* [1] to identify any requirements for estimating well deliverability.

2.30 Question 5.

With regards to YOUR statement in the BLADE REPORT, at p. 217, that "no failure analysis or subsequent risk assessment was done that may have led to an awareness that corrosion was a potential problem," please respond to the following questions:

2.31 Question 5.a.

Identify and describe any and all INDUSTRY STANDARD(S) that YOU considered, evaluated, or assessed related to "failure analysis or subsequent risk assessment" related to gas storage well casings.

2.31.1 Response 5.a.

There are no specific standards or practices related to "failure analysis or subsequent risk assessment" related to gas storage well casings. However, Blade considered and evaluated API RP 585, *Pressure Equipment Integrity Incident Investigation* [3].

Blade considered API RP 1171 *Functional Integrity of Natural Gas Storage in Depleted Hydrocarbon Reservoirs and Aquifer Reservoirs* [4] published in September 2015 that does address risk assessments for gas storage wells.

2.32 Question 5.b.

Produce any and all DOCUMENTS related to any INDUSTRY STANDARDS identified in response to Request 5(a) above.

2.32.1 Response 5.b.

API RP 585 and API RP 1171 can be obtained from the API website.

2.33 Question 5.c.

For each of the INDUSTRY STANDARD(S) identified in response to Request 5(a) above, describe the reason(s) why BLADE evaluated the INDUSTRY STANDARD(S)

2.33.1 Response 5.c.

An outcome of the RCA process was that a direct cause of the release of hydrocarbons was an axial rupture due to external microbial corrosion on the 7 in. casing outside diameter caused by ground water. A root cause was the lack of a detailed follow-up investigation failure analyses, or RCA of casing leaks, parted casings, or other failure events as discussed in the Blade Report on page 237—Section 5.3.2. The lack of failure analyses and risk assessments related to corrosion are discussed on page 232—Section 5.3.1.

Therefore, Blade reviewed industry standards to establish industry practices regarding failure analysis and subsequent risk assessments.

2.34 Question 5.d.

Identify any and all LAW(S) that YOU considered, evaluated, or assessed in connection with the above statement.

2.34.1 Response 5.d.

Blade reviewed the October 2015 version of the *California Statutes and Regulations for Conservation of Oil, Gas, and Geothermal Resources* [1] as described in the Blade Report on pages 197 – 199—Section 4.6.1.

2.35 Question 5.e.

For each LAW(S) that YOU evaluated in preparing the BLADE REPORT identified in response to Request 5(d) above, state YOUR understanding as to whether SoCalGas complied with the LAW(S).

2.35.1 Response 5.e.

Based on Blade's technical review, no requirements were identified for failure analysis or subsequent risk assessments in the October 2015 version of the *California Statutes and Regulations for Conservation of Oil, Gas, and Geothermal Resources* [1].

2.36 Question 5.f.

For each LAW(S) identified in response to Request 5(d) above, describe the reason(s) why BLADE evaluated the LAW(S).

2.36.1 Response 5.f.

An outcome of the RCA process was that a direct cause of the release of hydrocarbons was an axial rupture due to external microbial corrosion on the 7 in. casing outside diameter caused by ground water. A root cause was the lack of a detailed follow-up investigation failure analyses, or RCA of casing leaks, parted casings, or other failure events as discussed in the Blade Report on page 237—Section 5.3.2. The lack of failure analyses and risk assessments related to corrosion are discussed on page 232—Section 5.3.1.

Therefore, Blade reviewed the October 2015 version of the *California Statutes and Regulations for Conservation of Oil, Gas, and Geothermal Resources* [1] to identify requirements regarding failure analysis and subsequent risk assessments.

2.37 Question 6.

With regards to YOUR statement in the BLADE REPORT, at p. 237, that "[t]he root causes for the uncontrolled release of hydrocarbons for 111 days from SS-25 were . . . The lack of a dual mechanical barrier system in the wellbore," please respond to the following questions:

2.38 Question 6.a.

Identify and describe any and all INDUSTRY STANDARD(S) that YOU considered, evaluated, or assessed regarding use of dual mechanical barrier systems in gas storage wells.

2.38.1 Response 6.a.

Blade considered API RP 1171 titled "*Functional Integrity of Natural Gas Storage in Depleted Hydrocarbon Reservoirs and Aquifer Reservoirs*" [4] that was published in September 2015. However, API RP 1171 does not require dual mechanical barrier in gas storage wells.

Blade also considered ISO Technical Specification 16530-1, *Petroleum and Natural Gas Industries-Well Integrity Life Cycle Governance* [5] that does discuss the need for multiple barriers and redundancy to achieve a high level of reliability. However, ISO 16530-1 was published in 2017.

2.39 Question 6.b.

Produce any and all DOCUMENTS related to any INDUSTRY STANDARDS identified in response to Request 6(a) above.

2.39.1 Response 6.b.

API RP 1171 is available on the API website. ISO 16530-1 is available on the ISO website.

2.40 Question 6.c.

For each of the INDUSTRY STANDARD(S) identified in response to Request 6(a) above, describe the reason(s) why BLADE evaluated the INDUSTRY STANDARD(S)

2.40.1 Response 6.c.

An outcome of the RCA process was that a root cause of the release of hydrocarbons was the lack of a dual mechanical barrier system, as discussed in the Blade Report on page 233—Section 5.3.1.

Therefore, Blade considered and assessed API RP 1171 and ISO 16530-1 to determine industry practices for dual barrier requirements.

2.41 Question 6.d.

Identify any and all LAW(S) that YOU considered, evaluated, or assessed in connection with the above statement.

2.41.1 Response 6.d.

Blade reviewed the October 2015 version of the *California Statutes and Regulations for Conservation of Oil, Gas, and Geothermal Resources* [1] as described in the Blade Report on pages 197 – 199—Section 4.6.1.

2.42 Question 6.e.

For each LAW(S) that YOU evaluated in preparing the BLADE REPORT identified in response to Request 6(d) above, state YOUR understanding as to whether SoCalGas complied with the LAW(S).

2.42.1 Response 6.e.

Based on Blade's technical review, no requirements were identified for dual mechanical barriers for gas storage wells in the October 2015 version of the *California Statutes and Regulations for Conservation of Oil, Gas, and Geothermal Resources* [1].

2.43 Question 6.f.

For each LAW(S) identified in response to Request 6(d) above, describe the reason(s) why BLADE evaluated the LAW(S).

2.43.1 Response 6.f.

An outcome of the RCA process was that a root cause of the release of hydrocarbons was the lack of a dual mechanical barrier system in the wellbore, as discussed in the Blade Report on page 233—Section 5.3.1.

Therefore, Blade evaluated the regulations to determine if regulations were in place prior to the SS-25 leak that required a dual mechanical barrier system for gas storage wells.

2.44 Question 7.

With regards to YOUR statement in the BLADE REPORT, at p. 238, that "[t]he root causes for the uncontrolled release of hydrocarbons for 111 days from SS-25 were . . . The lack of a well-specific well-control plan that considered transient kill modeling or well deliverability," please respond to the following questions:

2.45 Question 7.a.

Identify and describe any and all INDUSTRY STANDARD(S) that YOU considered, evaluated, or assessed related to well-specific well-control plans that consider transient kill modeling or well deliverability.

2.45.1 Response 7.a.

Although there are many references in the open literature, Blade considered the following as part of the RCA:

- API RP 1171, *Functional Integrity of Natural Gas Storage in Depleted Hydrocarbon Reservoirs and Aquifer Reservoirs* [4] (published in September 2015)
- *Advanced Blowout and Well Control* [6] reference book
- *NORSOK Standard D-010 Rev 4, June 2013, Well Integrity in Drilling and Well Operations* [7]

2.46 Question 7.b.

Produce any and all DOCUMENTS related to any INDUSTRY STANDARDS identified in response to Request 7(a) above.

2.46.1 Response 7.b.

These documents are available for purchase online.

SED SUR_REPLY_002741

2.47 Question 7.c.

For any INDUSTRY STANDARD(S) identified in response to Request 7(a) above, describe the reason(s) why BLADE evaluated the INDUSTRY STANDARD(S).

2.47.1 Response 7.c.

An outcome of the RCA process was that a root cause of the release of hydrocarbons was the lack of a well-specific well-control plan that considered transient kill modeling or well deliverability, as discussed in the Blade Report on page 233—Section 5.3.1.

Therefore, Blade considered API 1171, NORSOK Standard D010 and *Advanced Blowout and Well Control* book. API RP 1171 discusses industry practices for a blowout contingency plan. NORSOK Standard D010 discusses kill rate simulation. The *Advanced Blowout and Well Control* book includes a discussion on dynamic kill operations and using friction to control the bottom hole pressure to kill the well.

2.48 Question 7.d.

For any INDUSTRY STANDARD(S) identified in response to Request 7(a) above, describe how long before the October 23, 2015 leak they were published or otherwise made available.

2.48.1 Response 7.d.

API RP 1171 was issued in September 2015.

The book *Advanced Blowout and Well Control* was published in 1994.

NORSOK Standard D-010 Rev 4 was updated in June 2013.

2.49 Question 7.e.

Identify any and all LAW(S) that YOU considered, evaluated, or assessed in connection with the above statement.

2.49.1 Response 7.e.

Blade reviewed the October 2015 version of the *California Statutes and Regulations for Conservation of Oil, Gas, and Geothermal Resources* [1] as described in the Blade Report on pages 197 – 199—Section 4.6.1.

2.50 Question 7.f.

For each LAW(S) that YOU evaluated in preparing the BLADE REPORT identified in response to Request 7(e) above, state YOUR understanding as to whether SoCalGas complied with the LAW(S).

2.50.1 Response 7.f.

Based on Blade's technical review, no requirements were identified for well-specific well-control plans that considered transient kill modeling or well deliverability in the October 2015 version of the *California Statutes and Regulations for Conservation of Oil, Gas, and Geothermal Resources* [1].
