DRAFT

Executive Summary [§354.4(a)]

§354.4 General Information. *Each Plan shall include the following general information:*

(a) *An executive summary written in plain language that provides an overview of the Plan and description of groundwater conditions in the basin.*

Introduction

The State of California enacted the Sustainable Groundwater Management Act (SGMA), effective January 1, 2015, to mandate comprehensive sustainable groundwater resources management. SGMA provides a statewide framework for groundwater management by locally formed Groundwater Sustainability Agencies (GSAs). The Mound Basin Groundwater Sustainability Agency (MBGSA) was formed in 2017 to satisfy the requirement for a GSA to fully cover the Mound Basin (DWR Basin 4-004.03) (Basin).

MBGSA was formed pursuant to a joint exercise of powers agreement (JPA) between three local public agencies overlying the Basin: the City of San Buenaventura, the County of Ventura, and the United Water Conservation District (United) (Figure 2.1-01). The City of San Buenaventura is a local municipality that exercises water supply, water management, and land use authority within the city's boundaries. The County of Ventura exercises water management and land use authority on a portion of the land overlying the Mound Basin. See Figure 2.1-03 for land use information. United was formed in 1950 under the State of California's Water Conservation District Law of 1931 and is organized as a governmental special district. United does not produce water from the Basin but is authorized to engage in groundwater replenishment of the Basin.

MBGSA is governed by a five-member board comprising one director appointed by each member public agency (City of San Buenaventura, the County of Ventura, and United) and two stakeholder directors representing agricultural and environmental interests. Except for the two industrial well owners, all groundwater users in the Basin have direct representation in the SGMA process by virtue of a director on the MBGSA Board of Directors. MBGSA was designated as the exclusive GSA for the Basin by the State on September 30, 2017. Following submittal of an initial notification on September 17, 2018, MBGSA developed this Groundwater Sustainability Plan (GSP) to comply with SGMA's statutory and regulatory requirements and initiated planning by engaging with stakeholders and holding public meetings pursuant to an adopted Stakeholder Engagement Plan.

The goal of this GSP is to sustainably manage the groundwater resources of the Mound Basin for the benefit of current and anticipated future beneficial users of groundwater and the welfare of the general public who rely directly or indirectly on groundwater. This GSP describes the approach to achieve and maintain a sustainable groundwater resource free of undesirable results pursuant to the SGMA, while establishing long-term reliability no later than 20 years from GSP adoption through implementation.

The content of this GSP includes administrative information, description of the Basin setting, development of quantitative sustainable management criteria (SMC) that consider the interests of all beneficial uses and users of groundwater, identification of projects and management actions and monitoring networks that will ensure the Basin is demonstrably managed in a sustainable manner no later than the 20-year sustainability timeframe (2042) and for the duration of the entire 50-year planning and implementation horizon (2072).

DRAFT

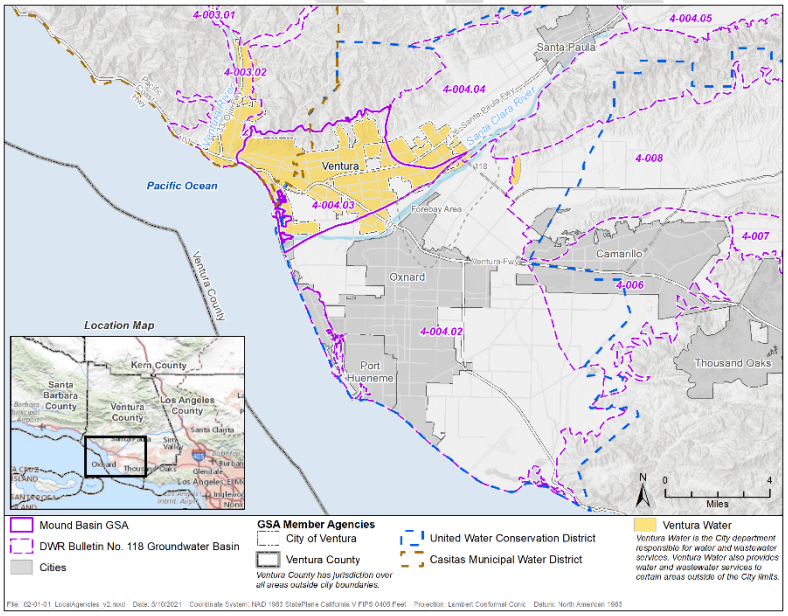
This GSP is organized following California Department of Water Resources (DWR) guidance documents (DWR, 2016a):

- Section 1 - Introduction to Plan Contents
- Section 2 - Administrative Information
- Section 3 - Basin Setting
- Section 4 - Sustainable Management Criteria
- Section 5 - Monitoring Networks
- Section 6 - Projects and Management Actions
- Section 7 - Plan Implementation
- Section 8 - References and Technical Studies

ES-1. Plan Area, Land Use, and Water Sources.

The Mound Basin is in western Ventura County along the Pacific coastline, including the City of Ventura (officially San Buenaventura). The Basin is within the Santa Clara River Valley watershed and includes the Santa Clara River estuary and floodplain at the southwestern corner, where the river discharges into the Pacific Ocean.

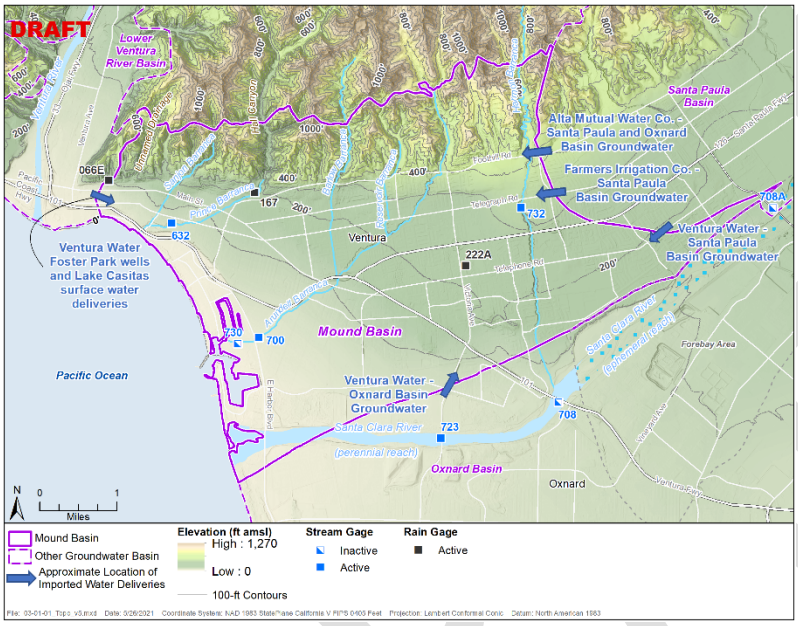
The geographic area covered by this GSP and managed by MBGSA includes the entire Mound Basin (DWR Basin No. 4-004.03), as defined by DWR Bulletin No. 118, "California's Groundwater," Update 2020 (DWR, 2021a). Adjacent basins are Oxnard Subbasin (No. 4-004.02) to the south, Santa Paula Subbasin (No. 4-004.04) to the east, and Lower Ventura River Subbasin (4-003.02) to the west.



Land use in the Basin is dominated by developed areas of the City of Ventura, including low-density residential, commercial, public/ institutional, and industrial land use designations. Agricultural land use occupies three separate areas of farmland in the eastern and southwestern portions of the Basin, and open space covers the remaining upland areas in the northern portion of the Basin. The principal land use planning agencies in the Basin include the City of Ventura (within the City limits) and County of Ventura (unincorporated areas outside of the City limits).

The beneficial uses of groundwater extracted from the principal aquifers of Mound Basin include municipal, industrial, and agricultural water supply corresponding to the land use categories above. There

are no active or recently active domestic wells in the Basin. Beneficial uses for the shallow, non-principal groundwater include the groundwater-dependent ecosystem (GDE) associated with groundwater in the Shallow Alluvial Deposits and instream flow uses in interconnected reaches of the Santa Clara River and estuary (interconnected with groundwater in the Shallow Alluvial Deposits). However, these beneficial uses are not impacted by groundwater extraction because there is no groundwater extraction from the Shallow Alluvial Deposits and groundwater extraction from principal aquifers (Mugu and Hueneme aquifers) does not materially influence shallow groundwater levels or surface water flows (see Appendix G for explanation).



The beneficial users for the principal aquifers of Mound Basin include the City of Ventura, industrial users (two as of 2021), and agricultural users (22 active wells as of 2021). There are currently no active domestic well users within the Basin or private water companies; drinking water supply within the Basin is provided exclusively by the City of Ventura.

Other sources of water supply for the Basin include groundwater extracted from City of Ventura wells located in the adjacent Santa Paula and Oxnard Basins and from the Upper Ventura River Basin (not an immediately adjacent basin), and surface water imported from the Ventura River Watershed, which is purchased from Casitas Municipal Water District (MWD). Although Mound Basin groundwater is an important source of water supply for the communities located within the Basin, the communities are not considered to be "dependent" on Mound Basin groundwater because it is only one component of the City's water supply portfolio. In contrast, agricultural beneficial users are heavily dependent on groundwater extracted from the Mound Basin as they currently do not have an alternative water supply.

ES-2. Basin Setting and Groundwater Conditions

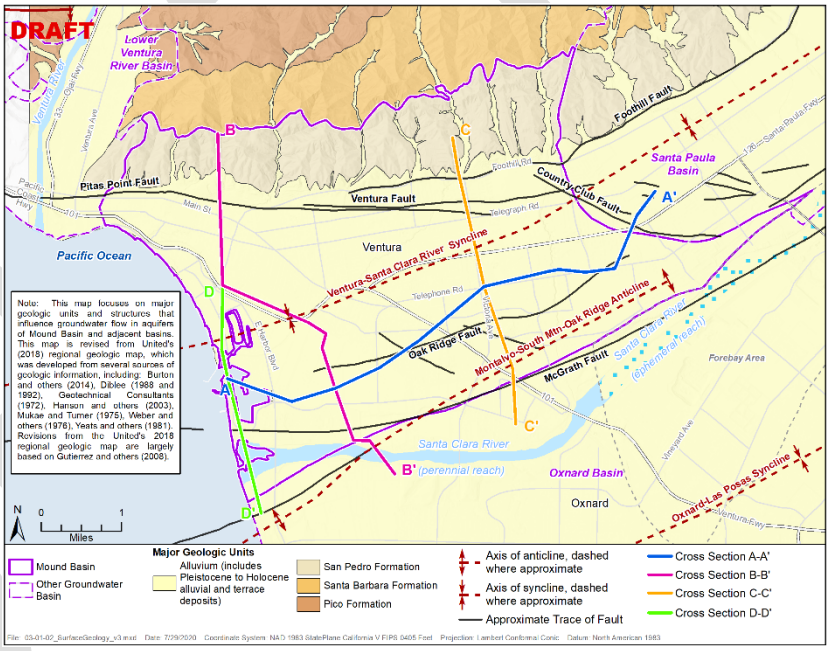
The topography of Mound Basin consists largely of gently south-sloping coastal plain, coastal and alluvial terraces, and alluvial fans. Hills rising to approximately 1,000 feet above mean sea level (ft msl) are present along the northern margin of the Basin in which one of the principal aquifers of the Basin outcrops and is recharged. Several small perennial stream channels originate in the canyons above the Basin and trend south and southwest within the Basin, either discharging into the Santa Clara River to the south or the Pacific Ocean to the west.

The Mound Basin is within the tectonically active Transverse Ranges geomorphic province of California, characterized by mountain ranges and valleys with an east-west orientation. Structurally, Mound Basin occurs within an elongate, complex syncline referred to as the Ventura structural basin, which trends east to west (Yeats et al., 1981). Near the coast, sediments were deposited on a wide delta complex that

formed at the terminus of the Santa Clara River, with a total stratigraphic thickness reportedly exceeding 55,000 ft (Sylvester and Brown, 1988).

The geologic units (strata) in the Basin, which contain groundwater, include (from youngest/shallowest to oldest/deepest):

- Recent (active) stream-channel deposits along the present course of the Santa Clara River and its tributaries;
- Holocene-age alluvial fan deposits, which cover most of the Mound Basin surface;
- Stream terrace deposits adjacent to the Santa Clara River;
- Undifferentiated older alluvium of Pleistocene age; and
- Semi-consolidated sand, gravel, and clay deposits of the San Pedro Formation of late Pleistocene age.



Structurally, the Mound Basin is generally bounded on the east by the Country Club Fault system, which offsets the aquifers and impedes groundwater flow from the Santa Paula Basin into the Mound Basin. To the northwest, the Basin boundary is the hydraulic divide between Mound Basin and Lower Ventura River Subbasin.

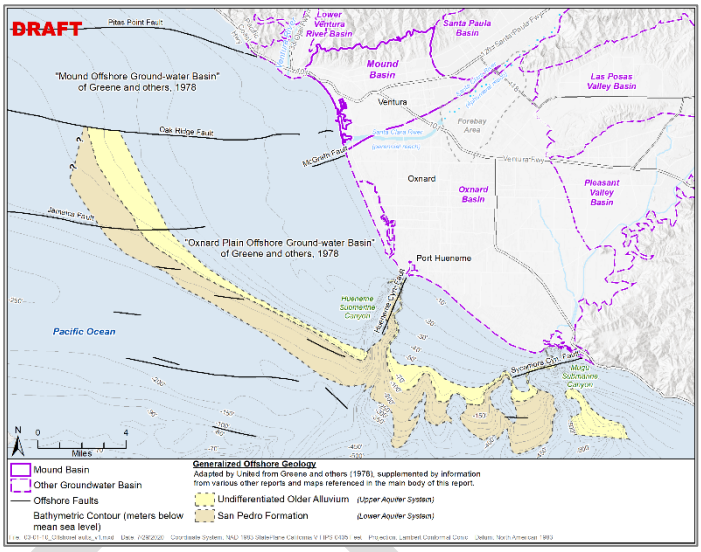
The western boundary is the Pacific Ocean shoreline; however, the primary aquifers crop out on the continental shelf approximately 10 miles offshore. The northern boundary is defined by the contact of the San Pedro Formation (the deepest freshwater-bearing formation in the Basin) with the underlying Santa Barbara Formation. The southern boundary is approximately aligned with the axis of the Montalvo-South Mountain-Oak Ridge Anticline and the McGrath Fault. The bottom of the Basin is defined by the base of fresh water, corresponding with the base of the San Pedro Formation.

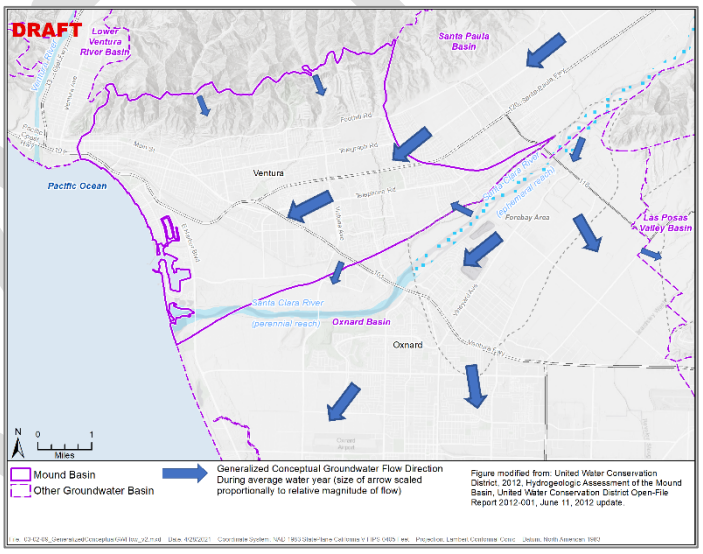
The aquifers in Mound Basin consist of layers and lenses of relatively coarse-grained, permeable sediments (primarily sand and gravel) deposited within unconsolidated alluvium and the underlying, semi-consolidated San Pedro Formation (Figure 3.1-04). Aquitards present between the aquifers in Mound Basin consist of layers of poorly permeable fine-grained sediments (primarily silt and clay, Figure 3.1-04). Distinct Hydrostratigraphic Units (HSUs) were identified using geophysical methods by United (2018), and

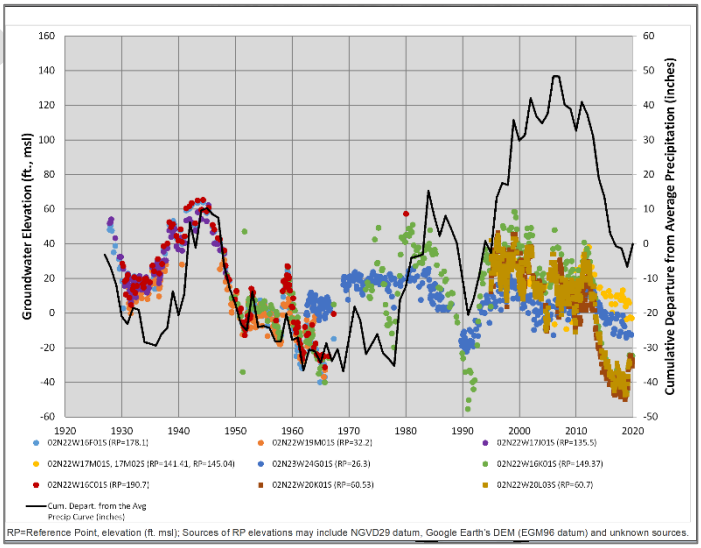
consist of the Shallow Alluvial Deposits, fine-grained Pleistocene deposits, Mugu, Hueneme, and Fox Canyon aquifers (and the aquitards between these aquifers). The Mugu and Hueneme aquifers are considered principal aquifers and are managed by this GSP. The Shallow Alluvial Deposits and fine-grained Pleistocene deposits do not meet the SGMA definition of a principal aquifer to "store, transmit, and yield significant or economic quantities of groundwater…", and the Fox Canyon Aquifer does not have material groundwater extractions; therefore, they are not considered principal aquifers in the GSP and will not be managed at this time.

Importantly, the principal aquifers extend approximately 10 miles offshore to the edge of the continental shelf, where they crop out and are exposed to seawater. The principal aquifers are believed to be protected from seawater between the shoreline and the continental shelf outcrops by the fine-grained stratigraphic units that overlie them. Modeling performed for this GSP indicates that seawater will not migrate from the aquifer outcrops to the shoreline within the 50-year SGMA period. However, there is a risk that seawater could enter the aquifers though nearshore short circuit pathways along faults or stratigraphic windows in the fine-grained stratigraphic units. This risk is considered in the GSP.

Groundwater flow directions within Mound Basin are generally from the east to west and are generally parallel with the Santa Clara River within the eastern portion of the Basin, and toward the Oxnard Basin in the southwestern portion of the Basin. A small groundwater flow component from the uplands to the north flows to the south is driven by recharge in the hills.







Measured groundwater levels in the Mound Basin have historically risen and fallen consistent with the rainfall patterns and have not exhibited evidence of chronic lowering. Groundwater storage has fluctuated similarly, with no long-term reduction and no reports of land subsidence effects or seawater intrusion historically.

The natural groundwater quality in the principal aquifers is not ideal but is beneficially used by municipal and agricultural users across the Basin. Regional Water Quality Control Board (RWQCB) Water Quality Objectives (WQOs) exist for sulfate, boron, chloride, and total dissolved solids (TDS) and are generally met, although some exceptions exist. The natural groundwater quality is generally better in the Mugu Aquifer as compared to the Hueneme Aquifer, which has more frequent exceedances of RWQCB WQOs. These constituents appear to be relatively stable at most Mound Basin wells having long-term groundwater quality records. The dissolved constituents are derived from natural sources, and groundwater extraction does not appear to be correlated with common ion chemistry concentrations; however, there is a risk that lower groundwater levels could locally induce migration of poor-quality groundwater from shallow water-bearing units into the Mugu Aquifer. Nitrate concentrations in groundwater are generally low. It is noted that several wells exhibit anomalously high nitrate concentrations that are believed to be the result of well construction or well deterioration issues that have created conduits for poor-quality water to enter the well from shallow water-bearing units. Lastly, migration of contaminant plumes is not an issue because there are none identified in the Basin at present.

Surface bodies in the Mound Basin include the Santa Clara River and its estuary and several smaller, ephemeral streams (barrancas). The Santa Clara River has perennial baseflow within its reach that spans the Mound Basin. The perennial baseflow is fed by shallow groundwater and tile drain discharges from the Mound and Oxnard Basins. The barrancas are ephemeral and flow in response to storm events and, hence, may only be transiently interconnected with shallow groundwater. Despite the interconnection with shallow groundwater occurring within the Shallow Alluvial Deposits, there is no depletion of interconnected surface water in the Basin because there are no groundwater extractions from the Shallow Alluvial Deposits and groundwater in the principal aquifers is physically separated from the surface water bodies by several hundred feet of fine-grained materials. In addition, numerical modeling simulations that varied extraction rates in the principal aquifers did not show any significant impact to shallow groundwater levels or Santa Clara River flows (Appendix G). No GDEs have been identified in the Basin that rely on groundwater from a principal aquifer.

ES-3. Water Budget

The groundwater flow model was used to quantify and evaluate the water budgets for the historical, current, and projected conditions, including the evaluation of uncertainty due to climate change (United, 2021a).

Surface water enters and leaves Mound Basin via the Santa Clara River and several smaller barrancas where they cross the Basin's boundaries primarily as storm flows. Surface water is also imported into the Basin via pipeline from Casitas MWD (Ventura Water, 2020b).

The primary sources of recharge to the Mound Basin groundwater system are underflow from the Santa Paula Basin, areal recharge (the sum of infiltration of precipitation, Municipal and Industrial (M&I) return flows, and agricultural irrigation return flows), and mountain-front recharge. Stream channel recharge is a minor component. Depending on groundwater level conditions, groundwater can flow into the Mound

Basin from the Oxnard Basin; however, there has historically been a net outflow from the Mound Basin to the Oxnard Basin. The primary groundwater outflow is groundwater extraction for beneficial use, although underflow to the Oxnard Basin can be a significant outflow at times. Discharge from the Shallow Alluvial Deposits (not a principal aquifer) along the lower, gaining reach of the Santa Clara River; via tile drains installed under farmland adjacent to the river; and via evapotranspiration are minor components. The change in storage for the Basin is a function of imbalances between inflows and outflows. In years when inflow (recharge) exceeds outflow (discharge) the volume of groundwater in storage increases, and vice versa. The average reduction in groundwater storage during the historical period (water years 1985-2015), current period (water years 2015-2019), and the baseline future projection, are 469 acre-feet per year (AF/yr), 147 AF/yr, and -84 AF/yr, respectively. The negative value for the baseline future projection indicates that the Basin is projected to have surplus inflows. Climate change and potential land use and population changes were evaluated and are not expected to materially impact the future water budget.

Modeling results for the future projection periods indicate that the projected inflow and outflows will be approximately balanced during the 20-year GSP implementation period and that the minimum thresholds for the sustainability indicators will not be exceeded. Therefore, an estimate of the sustainable yield is approximately equal to the projected extraction rates (approximately averaging 7,900 to 8,200 AF/yr), depending on climate change assumptions. It is recognized increasing extraction rates above these amounts could increase underflow from adjacent basins, thereby increasing the sustainable yield of the Mound Basin. However, this could impact sustainable management of the adjacent Santa Paula and/or Oxnard basins and is, therefore, not included in the sustainable yield estimate at this time.

Table ES-1. Summary of Average Water Budget Components (acre-feet/year).

	Mugu	Hueneme	Entire Basin
Historical (1986-2015)			
Total in	3,287	7,612	20,291
Total out	-3,462	-7,758	-20,768
Change in Storage	175	138	469
Current (2016-2019)			
Total in	4,050	7,029	12,278
Total out	-4,057	-7,252	-12,425
Change in Storage	7	224	147
Projected (Implementation Period 2022-2041)			
Total in	4,579	5,847	19,342
Total out	-4,592	-5,727	-19,355
Change in Storage	13	-120	13

ES-4. Sustainable Management Criteria

The SMC were developed using the best available science and information for the Basin. MBGSA characterized undesirable results and established minimum thresholds, measurable objectives, and interim milestones for each applicable sustainability indicator:

1. Chronic lowering of groundwater levels (Section 4.4)

2. Reduction in groundwater storage (Section 4.5)
3. Seawater intrusion (Section 4.6)
4. Degraded water quality (Section 4.7)
5. Land subsidence (Section 4.8)

The sixth sustainable management criterion, depletion of interconnected surface water, is not applicable in the Basin because surface water is not interconnected with groundwater in the principal aquifers.

The process for developing SMC for this GSP began with developing a deliberate process for SMC development that was reviewed by the MBGSA Board of Directors in June 2020, followed by adoption of a sustainability goal in September 2020. These actions were performed intentionally up front to guide SMC development. SMC development then consisted of the MBGSA Board of Directors and stakeholders reviewing SMC proposals prepared by staff. Written proposals were provided in the form of staff reports and presentations at numerous Board of Directors meetings, which included information on SGMA requirements, relevant information from the Basin Setting section, and results of additional analyses completed to support SMC development. Meeting summaries (minutes) were posted on the MBGSA website and two GSP workshops were held to address the SMC. Outreach was performed throughout the SMC development process to encourage input on the proposed SMC, including GSP newsletters, e-mails to the interested parties list, social media posts, telephone communications with stakeholders, updates at the Santa Clara River Watershed Committee, public notices, and a bilingual bill stuffer in the City of Ventura's consumer water bills.

A key part of the SMC development process is defining undesirable results (GSP Emergency Regulations §354.26(a)). The process for defining undesirable results consisted of multiple steps:

1. First, potential effects on the beneficial uses and users of groundwater, on land uses and property interests, and other effects were evaluated and described qualitatively.
2. The qualitative statement on potential effects was then translated and quantified into minimum thresholds at specific monitoring network sites (existing and proposed).
3. Lastly, a combination of minimum threshold exceedances representing undesirable results (when significant and unreasonable effects occur on any of the sustainability indicators) in the Basin was established.

For this GSP and pursuant to GSP Emergency Regulations §354.28(d), groundwater elevations are used as a proxy for the depletion of groundwater storage and land subsidence sustainability indicators.

Chronic Lowering of Groundwater Levels: Historically, measured and modeled future groundwater levels indicate no chronic lowering of groundwater levels has or will occur in the Basin. The qualitative description of undesirable results is chronic lowering of groundwater levels that causes a significant number of wells in the Basin to no longer be capable of being operated as designed for the confined aquifers of the Mound Basin. The results of analyzing groundwater levels, well data, and the groundwater model results indicate that groundwater levels could decline by a considerable amount below historical low levels in many areas of the Basin before a significant and unreasonable depletion of supply would occur. The analysis results for the groundwater supply depletion water level thresholds are supported by the lack of reported pumping problems during historical periods of lowered groundwater levels. However, the groundwater supply depletion water level thresholds can be hundreds of feet lower in elevation than

historical low groundwater levels (especially for the Hueneme Aquifer), while for others they can be similar in elevation. Groundwater levels cannot decline significantly below historical low levels without creating risk for subsidence undesirable results. For these reasons, the minimum threshold for the chronic lowering of groundwater levels is set at the historical low levels. The combination of minimum threshold exceedances that is deemed to cause significant and unreasonable effects in the Basin for chronic lowering of groundwater levels is minimum threshold exceedances in 50% of the groundwater level monitoring sites in either principal aquifer. This combination is intended to indicate significant and unreasonable effects are widespread in either principal aquifer. The measurable objective was set based on the reasonable margin of operational flexibility and was determined to be groundwater levels following wet phases that are sufficiently high to prevent groundwater levels from dropping below the minimum thresholds during a subsequent drought phase.

***Reduction in Groundwater Storage*:** The reduction in groundwater storage sustainability indicator is measured as the "total volume of groundwater that can be withdrawn from the basin without causing conditions that may lead to undesirable results." (GSP Emergency Regulations §354.28 (c)(2)). The minimum threshold is set for the extraction rate not to exceed the sustainable yield (i.e., 8,200 AF/yr) for the Basin, which is the rate that is anticipated to cause water levels to go below the historical low. The reduction of groundwater storage measurable objective is 90% of the sustainable yield (i.e., 7,400 AF/yr), based on professional judgement and to account for uncertainty in the sustainable yield estimate.

***Seawater Intrusion*:** Available data indicate that seawater has not been present in the onshore portions of the principal aquifers to date. In addition, the Mound Basin principal aquifers may only be exposed to seawater where they crop out on the continental shelf edge, approximately 10 miles offshore, greatly reducing the likelihood that seawater can find a near-shore path for intrusion into the principal aquifers. Groundwater model particle tracking results suggest that the most seawater has moved is in the Hueneme Aquifer, an average of approximately 0.5 miles from the offshore subcrop (approximately 10 miles from the shoreline) toward the shoreline during the past 100 years. The criteria used to define when and where the effects of the groundwater conditions cause undesirable results is based on the qualitative description of undesirable result, which is seawater intrusion extending east of Harbor Boulevard into areas with current or anticipated future beneficial uses. This means that the chloride concentrations should be maintained below a concentration indicative of seawater intrusion impacts at monitoring sites along Harbor Boulevard. Therefore, the minimum threshold of 150 milligrams per liter (mg/L) is used at monitoring sites along Harbor Boulevard, which is consistent with the degraded water quality sustainability indicator minimum threshold for chloride. The measurable objectives are also set consistent with the degraded water quality sustainability indicator measurable objectives for chloride.

***Degraded Water Quality*:** Groundwater quality in the Mound Basin is marginal due to natural geochemical processes, and groundwater extraction does not appear to have exacerbated these natural processes historically. Occurrences of elevated sulfate, TDS, and nitrate concentrations appear to be related to well construction/condition issues that facilitate intrusion of very poor-quality water from the shallow groundwater system into these wells, as opposed to being an indicator of regional water quality degradation in the principal aquifers. Potential future increases in Mugu Aquifer extraction rates could locally induce downward migration of very poor-quality water from the shallow groundwater system into the Mugu Aquifer, which could lead to undesirable results. The effects of groundwater conditions deemed to cause undesirable results is considered to occur when all representative monitoring wells in a principal aquifer exceed the minimum threshold concentration for a constituent for two consecutive years. The

DRAFT

minimum thresholds and measurable objectives for degraded water quality were developed by considering existing water quality standards (drinking water regulations and RWQCB Basin Plan WQOs, and historically measured concentrations). The minimum thresholds are based on RWQCB WQOs except in cases where concentrations have historically exceeded the WQO. The measurable objectives are based on preserving existing water quality consistent with upper consumer acceptance levels for drinking water (which trigger treatment requirements) or toxicity levels for crops, in cases where concentrations have historically exceeded these levels.

***Land Subsidence*:** No land subsidence due to groundwater extraction has been documented historically in the Mound Basin, which is considered to have a low estimated potential for inelastic land subsidence. Numerical modeling for the water budget suggests that future groundwater levels will remain above historical low levels, which would prevent inelastic subsidence due to groundwater extraction; however, groundwater levels could decline below historical levels and trigger inelastic land subsidence if actual future conditions differ significantly from those assumed in the projected water budget analysis. Undesirable results are any inelastic land subsidence caused by groundwater extraction in the Coastal Area of the Basin (i.e., areas located west of Harbor Boulevard). The minimum threshold is important in the Coastal Area because land subsidence here would exacerbate coastal hazards associated with sea level rise and/or impacts to the City of Ventura's sewer mains along Harbor Boulevard. Undesirable results could also occur outside of the Coastal Area if enough subsidence occurred to substantially interfere with surface land uses. Due to data coverage gaps and other factors, interferometric synthetic aperture radar (InSAR[1]) monitoring was not considered a reliable method for measuring land subsidence in the western half of the Mound Basin; therefore, groundwater levels were chosen as a proxy minimum threshold, and were set at the historical low groundwater levels to prevent measurable inelastic land subsidence due to groundwater extraction. Any combination of minimum threshold exceedances that include >50% of wells in the western half of the Basin would be considered as potentially leading to undesirable results. This combination is intended to indicate significant and unreasonable effects are widespread in the western half of the Basin. For the eastern half of the Basin, InSAR data are considered adequate to monitor for land subsidence when coupled with continuous global positioning system (GPS) data to filter out tectonic downwarping. Therefore, any exceedances of minimum thresholds in the eastern area will prompt the review of InSAR data to evaluate indications of subsidence rates (due to groundwater extraction) of ≥0.1 ft/yr that leads to cumulative subsidence of 0.6 ft or more. The less conservative minimum threshold for the eastern area was selected based on literature review of subsidence case studies. The measurable objectives for the western half of the Basin are identical to the chronic lowering of groundwater levels measurable objective, and for the eastern half they are equal to the minimum threshold.

ES-5. Monitoring Networks

The GSP Emergency Regulations require monitoring networks be developed to collect data of sufficient quality, frequency, and spatial distribution to characterize groundwater and related surface water conditions (if applicable) in the Basin; evaluate changing conditions that occur during implementation of the GSP; and for implementation of the SMC for the Basin. Monitoring networks should accomplish the following (§354.34(b)):

[1] Interferometric Synthetic Aperture Radar (InSAR) measures the spatial extent and magnitude of changes in the land surface associated with fluid extraction and natural hazards (e.g., earthquakes).

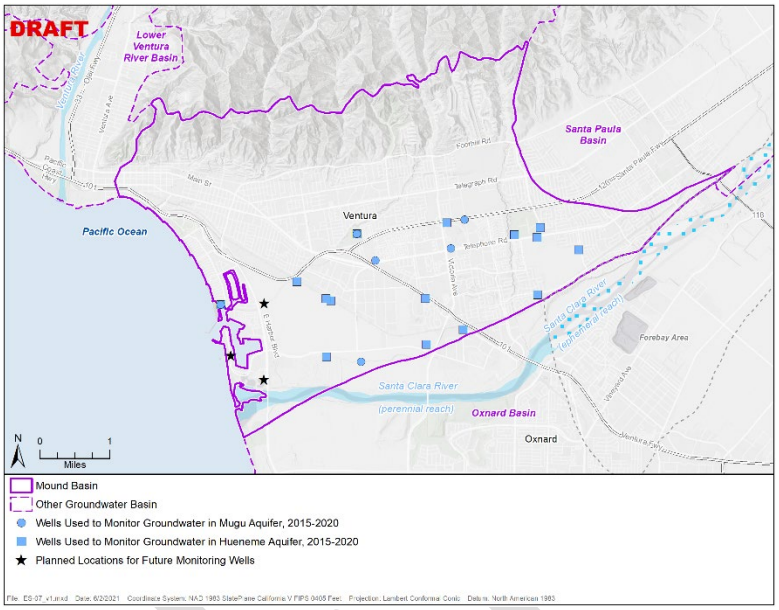
DRAFT

- **Demonstrate Progress toward Achieving Measurable Objectives Described in the GSP**: The five sustainability indicators discussed above are applicable but have already met the corresponding measurable objectives historically and are expected to meet them going forward. Therefore, the focus of this objective for the Mound Basin is to demonstrate continued compliance with the measurable objectives as opposed to progress toward meeting the measurable objectives.
- **Monitor Impacts to the Beneficial Uses and Users of Groundwater**: The uses and users described in the introduction could be impacted by degradation of water quality, seawater intrusion, and declining groundwater levels and storage (which are an important causative factor in land subsidence). Monitoring groundwater levels and quality can indicate trends that could precede land subsidence or seawater intrusion, as well as trends that could affect operation and associated costs of production wells. Under this guidance, appropriate monitoring sites in Mound Basin are in the southern portion where all the Basin's active water supply wells are located and groundwater levels are known to fluctuate. Monitoring in the northern part of the Basin is low priority due to the lack of beneficial uses.
- **Monitor Changes in Groundwater Conditions Relative to Measurable Objectives and Minimum Thresholds**: This will be accomplished using groundwater level and groundwater quality monitoring. Quarterly groundwater level monitoring and annual groundwater quality sampling frequencies are considered adequate for the Basin, due to the relatively slow rate of groundwater movement.
- **Quantify Annual Changes in Water Budget Components**: The available monitoring data for the Basin will be input to United's flow model for calculating future annual changes in subsurface water budget components and change in storage. Surface flows in the Santa Clara River are measured daily by the Ventura County Watershed Protection District (VCWPD) at flow-gaging station "723 - Santa Clara River at Victoria Ave" located outside of the Basin. Data from this station are available online and can be downloaded annually to update this surface water component of the Mound Basin water budget (VCWPD, 2021). MBGSA intends to continue using data from these existing sources as input to United's model, which will in turn be used periodically to quantify changes in water budget components. At present, this GSP does not contemplate development of a new monitoring network or modification of existing monitoring networks to obtain data regarding groundwater extraction, imported water, or recharge quantities because it is MBGSA's opinion that these water budget components are currently adequate for sustainable management of the Basin.

Groundwater levels and water quality are monitored in approximately 20 wells across the Basin by United; Ventura Water (i.e. the City of Ventura's water department) monitors two active water supply wells in the Basin, and VCWPD monitors three wells (currently or formerly used for agricultural and industrial water supply) in the Basin. VCWPD is the California Statewide Groundwater Elevation Monitoring (CASGEM) monitoring entity for the Basin.

Consistent with GSP Emergency Regulations §354.34(e), the groundwater level and quality monitoring networks that will be utilized are based primarily on existing monitoring sites that are monitored by United and VCWPD. The existing monitoring networks in the Basin have been used for several decades to collect information to demonstrate short-term, seasonal, and long-term trends in groundwater and related

DRAFT



surface water conditions. The monitoring networks include features for the collection of data to monitor the groundwater sustainability indicators applicable to the Basin. Additional monitoring sites will be added to implement the SMC for seawater intrusion (two new monitoring wells located near Harbor Boulevard). The additional monitoring sites will also help refine the hydrogeologic conceptual model (HCM) and improve the numerical model. A third monitoring site is proposed along the shoreline to provide a second site for early detection of seawater intrusion. A final decision whether to construct this third well will be made during GSP implementation, based on available funding and monitoring results from new Harbor Boulevard monitoring wells. Lastly, MBGSA will seek opportunities to enhance the monitoring networks by instrumenting and sampling additional existing wells in the Basin if and when opportunities to do so arise.

InSAR is the best available method for measuring the rate and extent of land subsidence over large areas, such as a groundwater basin. As described above, InSAR is unreliable for the western half of the Basin, so groundwater elevations will be used as a proxy to detect and monitor the potential onset of inelastic land subsidence that may result from future groundwater extractions in the Basin (i.e., if groundwater elevations decline below historical low levels). To ensure the best available data is used for monitoring land subsidence, InSAR data will be utilized when groundwater levels are below historical lows in the eastern half of the Basin. If InSAR coverage and other data issues are resolved in the future, MBGSA will update the GSP to utilize InSAR measurements for the western half of the Basin.

Pursuant to section §352.6, monitoring data will be stored in MBGSA's Data Management System (DMS). Data will be transmitted to DWR with the GSP, annual reports, and GSP updates electronically on the forms provided by DWR.

ES-6. Projects and Management Actions

The 50-year future modeling projections developed for the projected water budget suggest that the measurable objectives for the applicable sustainability indicators will be met without the need for projects or management actions. However, several management actions are included to help prevent problems from developing and to respond to potential changing conditions in the Basin. The management actions include:

- Coordinate with the County of Ventura to identify and address improperly constructed or abandoned wells that create conduits for migration of poor-quality water from shallow water-bearing units into the principal aquifers. Grant funding will be pursued to address any improperly constructed or abandoned wells that are identified.

- Coordinate with County of Ventura to review the County well permit ordinance and modify, if necessary, to ensure the future wells are properly sealed to prevent migration of poor-quality water from shallow water-bearing units into the principal aquifers.
- Develop a contingency plan to address unexpected land subsidence.
- Develop a contingency plan to address unexpected seawater intrusion.
- Partner with the City of Ventura and United to collect interim shallow groundwater data to further assess the hydraulic connection between the Santa Clara River flows and groundwater in Shallow Alluvial Deposits with groundwater extraction from the deeper principal aquifers.

ES-7. Plan Implementation

The estimated costs for the GSP implementation include annual costs for ongoing activities and estimated costs for one-time activities that are scheduled to occur within the first five-year GSP assessment period. The estimated total cost of the GSP Implementation over the 20-year planning horizon is [$7,002,188]. The total estimated cost through the first five-year assessment is [$1,937,618]. The cost is based on the best available information at the time of Plan preparation and submittal. It represents the MBGSA's current understanding of Basin conditions and the current roles and responsibilities of the MBGSA under SGMA.

Funding for GSP implementation will be obtained from groundwater extraction fees charged to groundwater users in the Basin, and grants. This funding approach has been used since the MBGSA's formation and will be reevaluated over time as the GSP implementation progresses. The Site A monitoring well planned is being funded by DWR's Technical Support Services (TSS) grant program. MBGSA will continue to pursue funding from state and federal sources to support GSP planning and implementation.

Implementation of the GSP requires robust administrative and financial structures, with adequate human resources to ensure compliance with SGMA. The activities associated with the GSP implementation are:

1. Agency administration,
2. Preparing annual reports,
3. Monitoring groundwater levels and quality and land subsidence,
4. Maintaining the Basin DMS,
5. Updating the groundwater model,
6. Constructing new monitoring wells,
7. Developing contingency plans,
8. Performing ongoing stakeholder outreach and engagement, and
9. Assessing/updating the GSP every 5 years.

MBGSA will likely continue to address its human resources needs through contracts with consultants and United.

DRAFT

GSP reporting will occur on an annual basis, with reports for the preceding water year due to DWR by April 1. Periodic evaluations (every five years) and GSP amendments (if needed) will be submitted to DWR by at least every five years (2027, 2032, 2037, and 2042). The proposed monitoring wells are scheduled for construction in 2021, 2026, and 2032, but it is noted that site identification, access agreements, and permitting will take place in the years immediately preceding construction.

Definitions of Key SGMA Terms

California Water Code

Sec. 10721

Unless the context otherwise requires, the following definitions govern the construction of this part:

(a) Adjudication action means an action filed in the superior or federal district court to determine the rights to extract groundwater from a basin or store water within a basin, including, but not limited to, actions to quiet title respecting rights to extract or store groundwater or an action brought to impose a physical solution on a basin.

(b) Basin means a groundwater basin or subbasin identified and defined in Bulletin 118 or as modified pursuant to Chapter 3 (commencing with Section 10722).

(c) Bulletin 118 means the department's report entitled California's Groundwater: Bulletin 118 updated in 2003, as it may be subsequently updated or revised in accordance with Section 12924.

(d) Coordination agreement means a legal agreement adopted between two or more groundwater sustainability agencies that provides the basis for coordinating multiple agencies or groundwater sustainability plans within a basin pursuant to this part.

(e) De minimis extractor means a person who extracts, for domestic purposes, two acrefeet or less per year.

(f) Governing body means the legislative body of a groundwater sustainability agency.

(g) Groundwater means water beneath the surface of the earth within the zone below the water table in which the soil is completely saturated with water, but does not include water that flows in known and definite channels.

(h) Groundwater extraction facility means a device or method for extracting groundwater from within a basin.

(i) Groundwater recharge or recharge means the augmentation of groundwater, by natural or artificial means.

(j) Groundwater sustainability agency means one or more local agencies that implement the provisions of this part. For purposes of imposing fees pursuant to Chapter 8 (commencing with Section 10730) or taking action to enforce a groundwater sustainability plan, groundwater sustainability agency also means each local agency comprising the groundwater sustainability agency if the plan authorizes separate agency action.

(k) Groundwater sustainability plan or plan means a plan of a groundwater sustainability agency proposed or adopted pursuant to this part.

(l) Groundwater sustainability program means a coordinated and ongoing activity undertaken to benefit a basin, pursuant to a groundwater sustainability plan.

(m) In-lieu use means the use of surface water by persons that could otherwise extract groundwater in order to leave groundwater in the basin.

DRAFT

(n) Local agency means a local public agency that has water supply, water management, or land use responsibilities within a groundwater basin.

(o) Operator means a person operating a groundwater extraction facility. The owner of a groundwater extraction facility shall be conclusively presumed to be the operator unless a satisfactory showing is made to the governing body of the groundwater sustainability agency that the groundwater extraction facility actually is operated by some other person.

(p) Owner means a person owning a groundwater extraction facility or an interest in a groundwater extraction facility other than a lien to secure the payment of a debt or other obligation.

(q) Personal information has the same meaning as defined in Section 1798.3 of the Civil Code.

(r) Planning and implementation horizon means a 50-year time period over which a groundwater sustainability agency determines that plans and measures will be implemented in a basin to ensure that the basin is operated within its sustainable yield.

(s) Public water system has the same meaning as defined in Section 116275 of the Health and Safety Code.

(t) Recharge area means the area that supplies water to an aquifer in a groundwater basin.

(u) Sustainability goal means the existence and implementation of one or more groundwater sustainability plans that achieve sustainable groundwater management by identifying and causing the implementation of measures targeted to ensure that the applicable basin is operated within its sustainable yield.

(v) Sustainable groundwater management means the management and use of groundwater in a manner that can be maintained during the planning and implementation horizon without causing undesirable results.

(w) Sustainable yield means the maximum quantity of water, calculated over a base period representative of long-term conditions in the basin and including any temporary surplus that can be withdrawn annually from a groundwater supply without causing an undesirable result.

(x) Undesirable result means one or more of the following effects caused by groundwater conditions occurring throughout the basin:

(1) Chronic lowering of groundwater levels indicating a significant and unreasonable depletion of supply if continued over the planning and implementation horizon. Overdraft during a period of drought is not sufficient to establish a chronic lowering of groundwater levels if extractions and groundwater recharge are managed as necessary to ensure that reductions in groundwater levels or storage during a period of drought are offset by increases in groundwater levels or storage during other periods.

(2) Significant and unreasonable reduction of groundwater storage.

(3) Significant and unreasonable seawater intrusion.

(4) Significant and unreasonable degraded water quality, including the migration of contaminant plumes that impair water supplies.

(5) Significant and unreasonable land subsidence that substantially interferes with surface land uses.

DRAFT

(6) Depletions of interconnected surface water that have significant and unreasonable adverse impacts on beneficial uses of the surface water.

(y) Water budget means an accounting of the total groundwater and surface water entering and leaving a basin including the changes in the amount of water stored.

(z) Watermaster means a watermaster appointed by a court or pursuant to other law.

(aa) Water year means the period from October 1 through the following September 30,

inclusive.

(ab) Wellhead protection area means the surface and subsurface area surrounding a water well or well field that supplies a public water system through which contaminants are reasonably likely to migrate toward the water well or well field.

Official California Code of Regulations

Title 23. Waters

Division 2. Department of Water Resources

Chapter 1.5. Groundwater Management

Subchapter 2. Groundwater Sustainability Plans

Article 2. Definitions

23 CCR § 351

§ 351. Definitions.

The definitions in the Sustainable Groundwater Management Act, Bulletin 118, and Subchapter 1 of this Chapter, shall apply to these regulations. In the event of conflicting definitions, the definitions in the Act govern the meanings in this Subchapter. In addition, the following terms used in this Subchapter have the following meanings:

(a) “Agency” refers to a groundwater sustainability agency as defined in the Act.

(b) “Agricultural water management plan” refers to a plan adopted pursuant to the Agricultural Water Management Planning Act as described in Part 2.8 of Division 6 of the Water Code, commencing with Section 10800 et seq.

(c) “Alternative” refers to an alternative to a Plan described in Water Code Section 10733.6.

(d) “Annual report” refers to the report required by Water Code Section 10728.

(e) “Baseline” or “baseline conditions” refer to historical information used to project future conditions for hydrology, water demand, and availability of surface water and to evaluate potential sustainable management practices of a basin.

(f) “Basin” means a groundwater basin or subbasin identified and defined in Bulletin 118 or as modified pursuant to Water Code 10722 et seq.

DRAFT

(g) “Basin setting” refers to the information about the physical setting, characteristics, and current conditions of the basin as described by the Agency in the hydrogeologic conceptual model, the groundwater conditions, and the water budget, pursuant to Subarticle 2 of Article 5.

(h) “Best available science” refers to the use of sufficient and credible information and data, specific to the decision being made and the time frame available for making that decision, that is consistent with scientific and engineering professional standards of practice.

(i) “Best management practice” refers to a practice, or combination of practices, that are designed to achieve sustainable groundwater management and have been determined to be technologically and economically effective, practicable, and based on best available science.

(j) “Board” refers to the State Water Resources Control Board.

(k) “CASGEM” refers to the California Statewide Groundwater Elevation Monitoring Program developed by the Department pursuant to Water Code Section 10920 et seq., or as amended.

(l) “Data gap” refers to a lack of information that significantly affects the understanding of the basin setting or evaluation of the efficacy of Plan implementation, and could limit the ability to assess whether a basin is being sustainably managed.

(m) “Groundwater dependent ecosystem” refers to ecological communities or species that depend on groundwater emerging from aquifers or on groundwater occurring near the ground surface.

(n) “Groundwater flow” refers to the volume and direction of groundwater movement into, out of, or throughout a basin.

(o) “Interconnected surface water” refers to surface water that is hydraulically connected at any point by a continuous saturated zone to the underlying aquifer and the overlying surface water is not completely depleted.

(p) “Interested parties” refers to persons and entities on the list of interested persons established by the Agency pursuant to Water Code Section 10723.4.

(q) “Interim milestone” refers to a target value representing measurable groundwater conditions, in increments of five years, set by an Agency as part of a Plan.

(r) “Management area” refers to an area within a basin for which the Plan may identify different minimum thresholds, measurable objectives, monitoring, or projects and management actions based on differences in water use sector, water source type, geology, aquifer characteristics, or other factors.

(s) “Measurable objectives” refer to specific, quantifiable goals for the maintenance or improvement of specified groundwater conditions that have been included in an adopted Plan to achieve the sustainability goal for the basin.

(t) “Minimum threshold” refers to a numeric value for each sustainability indicator used to define undesirable results.

(u) “NAD83” refers to the North American Datum of 1983 computed by the National Geodetic Survey, or as modified.

(v) “NAVD88” refers to the North American Vertical Datum of 1988 computed by the National Geodetic Survey, or as modified.

DRAFT

(w) “Plain language” means language that the intended audience can readily understand and use because that language is concise, well-organized, uses simple vocabulary, avoids excessive acronyms and technical language, and follows other best practices of plain language writing.

(x) “Plan” refers to a groundwater sustainability plan as defined in the Act.

(y) “Plan implementation” refers to an Agency's exercise of the powers and authorities described in the Act, which commences after an Agency adopts and submits a Plan or Alternative to the Department and begins exercising such powers and authorities.

(z) “Plan manager” is an employee or authorized representative of an Agency, or Agencies, appointed through a coordination agreement or other agreement, who has been delegated management authority for submitting the Plan and serving as the point of contact between the Agency and the Department.

(aa) “Principal aquifers” refer to aquifers or aquifer systems that store, transmit, and yield significant or economic quantities of groundwater to wells, springs, or surface water systems.

(ab) “Reference point” refers to a permanent, stationary and readily identifiable mark or point on a well, such as the top of casing, from which groundwater level measurements are taken, or other monitoring site.

(ac) “Representative monitoring” refers to a monitoring site within a broader network of sites that typifies one or more conditions within the basin or an area of the basin.

(ad) “Seasonal high” refers to the highest annual static groundwater elevation that is typically measured in the Spring and associated with stable aquifer conditions following a period of lowest annual groundwater demand.

(ae) “Seasonal low” refers to the lowest annual static groundwater elevation that is typically measured in the Summer or Fall, and associated with a period of stable aquifer conditions following a period of highest annual groundwater demand.

(af) “Seawater intrusion” refers to the advancement of seawater into a groundwater supply that results in degradation of water quality in the basin, and includes seawater from any source.

(ag) “Statutory deadline” refers to the date by which an Agency must be managing a basin pursuant to an adopted Plan, as described in Water Code Sections 10720.7 or 10722.4.

(ah) “Sustainability indicator” refers to any of the effects caused by groundwater conditions occurring throughout the basin that, when significant and unreasonable, cause undesirable results, as described in Water Code Section 10721(x).

(ai) “Uncertainty” refers to a lack of understanding of the basin setting that significantly affects an Agency's ability to develop sustainable management criteria and appropriate projects and management actions in a Plan, or to evaluate the efficacy of Plan implementation, and therefore may limit the ability to assess whether a basin is being sustainably managed.

(aj) “Urban water management plan” refers to a plan adopted pursuant to the Urban Water Management Planning Act as described in Part 2.6 of Division 6 of the Water Code, commencing with Section 10610 et seq.

(ak) “Water source type” represents the source from which water is derived to meet the applied beneficial uses, including groundwater, recycled water, reused water, and surface water sources

DRAFT

identified as Central Valley Project, the State Water Project, the Colorado River Project, local supplies, and local imported supplies.

(al) “Water use sector” refers to categories of water demand based on the general land uses to which the water is applied, including urban, industrial, agricultural, managed wetlands, managed recharge, and native vegetation.

(am) “Water year” refers to the period from October 1 through the following September 30, inclusive, as defined in the Act.

(an) “Water year type” refers to the classification provided by the Department to assess the amount of annual precipitation in a basin.

1.0 Introduction to Plan Contents [Article 5 §354]

§354 Introduction to Plan Contents. *This Article describes the required contents of Plans submitted to the Department for evaluation, including administrative information, a description of the basin setting, sustainable management criteria, description of the monitoring network, and projects and management actions.*

In 2014, the State of California enacted the Sustainable Groundwater Management Act (SGMA). This law requires groundwater basins in California that are designated as medium or high priority be managed sustainably. Satisfying the requirements of SGMA generally requires five basic activities:

1. Form one or multiple Groundwater Sustainability Agency(s) (GSAs) to fully cover the basin;
2. Develop one or more Groundwater Sustainability Plan(s) (GSPs) that fully cover the basin;
3. Implement the GSP to achieve sustainable groundwater management;
4. Annual reporting to the California Department of Water Resources (DWR); and
5. Prepare and submit a written assessment of the GSP at least every five years to DWR and amend the GSP as necessary.

Mound Basin Groundwater Sustainability Agency (MBGSA) was formed in 2017 to satisfy the requirement for a GSA to fully cover the Mound Basin (DWR Basin 4-004.03) (Basin). MBGSA was designated as the exclusive GSA for the Basin by the State on September 30, 2017. MBGSA developed this document to fulfill the GSP requirements for the Basin. This GSP provides administrative information, describes the Basin setting, develops quantitative sustainable management criteria (SMC) that consider the interests of all beneficial uses and users of groundwater, and identifies projects and management actions and monitoring networks that will ensure the Basin is demonstrably managed in a sustainable manner within the 20-year sustainability timeframe (2042) and for the duration of the entire 50-year planning and implementation horizon (2072).

Following submittal of an initial notification on September 17, 2018 (Appendix A), MBGSA developed this GSP to comply with SGMA's statutory and regulatory requirements. As such, the GSP uses the terminology set forth in these requirements (see e.g. Water Code §10721 and 23 CCR §351) which is oftentimes different from the terminology utilized in other contexts (e.g. past reports or studies, past analyses, judicial rules or findings). The definitions from the relevant statutes and regulations are provided in the section titled "Definitions of Key SGMA Terms."

The GSP includes all of the required elements of the GSP Emergency Regulation organized into eight sections plus appendices as follows:

- **Section 1 - Introduction to Plan Contents** provides an overview of SGMA and the plan contents.
- **Section 2 - Administrative Information** provides information about the GSA, a description of the Plan area, and a summary of information relating to notification and communication by the Agency with other agencies and interested parties.
- **Section 3 - Basin Setting** describes the hydrogeologic conceptual model (HCM) of the Basin, current and historical groundwater conditions, the Basin water budget, and designated management areas within the Basin.

DRAFT

- **Section 4 - Sustainable Management Criteria** describes the Basin sustainability goal and the SMC developed for each of the applicable SGMA sustainability indicators. The applicable sustainability indicators for the Basin are Chronic Lowering of Groundwater Levels, Reduction of Groundwater Storage, Seawater Intrusion, Degraded Water Quality, and Land Subsidence. The Depletions of Interconnected Surface Water sustainability indicator is not applicable to the Basin.
- **Section 5 - Monitoring Networks** describes the monitoring networks that will be utilized to characterize groundwater and surface water conditions in the Basin, evaluate changing conditions that occur through implementation of the Plan, and demonstrate sustainable management.
- **Section 6 - Projects and Management Actions** describes projects and management actions included in the GSP to meet the sustainability goal for the Basin in a manner that can be maintained over the planning and implementation horizon.
- **Section 7 - Plan Implementation** describes steps to implementation, plan implementation costs, and plan funding.
- **Section 8 - References and Technical Studies**: provides a list of references and technical studies relied upon by the GSA in developing the Plan.

Appendices provide supporting information referred to in the GSP:

- MBGSA's Initial Notification to DWR for the GSP is provided in Appendix A.
- This GSP meets regulatory requirements established by the DWR as shown in Appendix B, the Elements of the Plan table.
- The formation of MBGSA Pursuant to Water Code §10723.8 is provided in Appendix C.
- The plan for MBGSA's engagement with stakeholders is provided in Appendix D.
- A list of public meetings held with MBGSA pursuant to §354.10 is provided in Appendix E.
- Comments and responses regarding the GSP pursuant to §354.10 are provided in Appendix F.
- Appendix G provides supplemental information regarding the Shallow Alluvial Deposits and the Santa Clara River in relation to the principal aquifers of the Basin.
- Areas Containing Indicators of Potential Groundwater-Dependent Ecosystems (iGDEs) are mapped in Appendix H.
- Minimum Thresholds and Measurable Objectives associated with time-series plots of modeled versus observed groundwater level are provided in Appendix I.
- Minimum Thresholds and Measurable Objectives associated with time-series plots of water quality data are provided in Appendix J.
- The approach to estimating annual change in storage for the Basin in provided in Appendix K.
- The Data Management System (DMS) documentation is provided in Appendix L.

DRAFT

2.0 Administrative Information [Article 5, SubArticle 1]

§354.2 Introduction to Administrative Information. *This Subarticle describes information in the Plan relating to administrative and other general information about the Agency that has adopted the Plan and the area covered by the Plan.*

Section 2 describes information relating to administration and other general information about MBGSA and the area covered by the GSP.

2.1 Agency Information [§354.6]

This section describes the MBGSA and its authority in relation to the SGMA. MBGSA is the exclusive GSA for Mound Basin (Department of Water Resources Basin 4-004.03), located in western Ventura County (Figures 2.1-01 and 2.1-02)

MBGSA was formed in 2017, pursuant to a joint exercise of powers agreement (JPA) between three local public agencies overlying the Basin: the City of San Buenaventura, the County of Ventura, and the United Water Conservation District (United) (Figure 2.1-01). The City of San Buenaventura is a local municipality that exercises water supply, water management, and land use authority within the city's boundaries. The County of Ventura exercises water management and land use authority on a portion of the land overlying the Mound Basin. See Figure 2.1-03 for land use information. United was formed in 1950 under the State of California's Water Conservation District Law of 1931 and is organized as a governmental special district. United does not produce water from the Basin, but is authorized to engage in groundwater replenishment of the Basin.

Per §10723.8(a) of the California Water Code, MBGSA gave notice to DWR of its decision to form a GSA for the Basin on June 28, 2017. Copies of the information required pursuant to Water Code §10723.8 for GSA Formation, updated as appropriate, is provided in Appendix C. MBGSA was designated as the exclusive GSA for the Basin by the State on September 30, 2017.

2.1.1 Name and Mailing Address [§354.6(a)]

§354.6 Agency Information. *When submitting an adopted Plan to the Department, the Agency shall include a copy of the information provided pursuant to Water Code Section 10723.8, with any updates, if necessary, along with the following information:*

(a) *The name and mailing address of the Agency.*

- GSA Name: Mound Basin Groundwater Sustainability Agency
- GSA Mailing Address: P.O. Box 3544, Ventura, CA 93006-3544

DRAFT

2.1.2 Organization and Management Structure [§354.6(b)]

§354.6 Agency Information. *When submitting an adopted Plan to the Department, the Agency shall include a copy of the information provided pursuant to Water Code Section 10723.8, with any updates, if necessary, along with the following information:*

***(b)** The organization and management structure of the Agency, identifying persons with management authority for implementation of the Plan.*

MBGSA is governed by a five-member board comprised of one director appointed by each member public agency (City of San Buenaventura, the County of Ventura, and United) and two stakeholder directors representing agricultural and environmental interests. MBGSA contracts with Bondy Groundwater Consulting, Inc. (Bryan Bondy), who serves as the Agency's Executive Director and GSP Plan Manager. MBGSA contracts with member agency United for financial and administrative support. The Executive Director manages day-to-day operations of the Agency, while Board Members vote on actions of the MBGSA. The Board of Directors is MBGSA's decision-making body. Further information about MBGSA's organization and management structure can be found in the MBGSA JPA and MBGSA Bylaws, which are included in Appendix C.

2.1.3 Plan Manager and Contact Information [§354.6(c)]

§354.6 Agency Information. *When submitting an adopted Plan to the Department, the Agency shall include a copy of the information provided pursuant to Water Code Section 10723.8, with any updates, if necessary, along with the following information:*

***(c)** The name and contact information, including the phone number, mailing address and electronic mail address, of the plan manager.*

- Mound Basin GSA Executive Director: Bryan Bondy, PG, CHG
- Phone Number: (805) 212-0484
- Email: bryan@moundbasingsa.org
- Mailing Address: P.O. Box 3544, Ventura, CA 93006-3544
- Website: www.moundbasingsa.org

2.1.4 Legal Authority [§354.6(d)]

§354.6 Agency Information. *When submitting an adopted Plan to the Department, the Agency shall include a copy of the information provided pursuant to Water Code Section 10723.8, with any updates, if necessary, along with the following information:*

***(d)** The legal authority of the Agency, with specific reference to citations setting forth the duties, powers, and responsibilities of the Agency, demonstrating that the Agency has the legal authority to implement the Plan.*

MBGSA has legal authority to perform duties, exercise powers, and accept responsibility for managing groundwater sustainably within the Mound Basin. MBGSA's legal authority comes from the SGMA, the JPA signed by MBGSA member agencies, and the MBGSA Bylaws. The JPA and bylaws are included in Appendix C. These laws and agreements, taken together, provide the necessary legal authority for the MBGSA Board to carry out the preparation and implementation of the Basin's GSP. Figures 2.1-01 and 2.1-02 show the extent of the GSP plan area, along with the jurisdictional boundary of each of the Member

Agencies of MBGSA's JPA. Figure 2.1-01 demonstrates that the entire Basin is covered by MBGSA. Therefore, MBGSA has the legal authority to implement this GSP throughout the entire plan area.

Each of the Member Agency is a local agency eligible to become a GSA (Water Code §10723(a). The Member Agencies are described below.

City of San Buenaventura

The City of San Buenaventura (usually referred to as Ventura), located on the shore of the Pacific Ocean in western Ventura County, was founded as a Spanish mission in 1782 and incorporated as a town in 1866 and is the county seat of Ventura County. The City administers land use within its municipal boundaries and is the largest land use jurisdiction within the Basin. Ventura Water (a City of Ventura department for water supply) provides retail potable water service with the City limits and portions of unincorporated Ventura County that meet the City's policy for water connections outside City limits (Municipal Code Section 22.110.055). The City's potable water supply is derived from a variety of sources, including Mound Basin groundwater. Sources located outside of Mound Basin include groundwater extracted from the adjacent Santa Paula and Oxnard Basins, subsurface water from the Ventura River (Upper Ventura River Valley Basin), and Lake Casitas (Casitas Municipal Water District [MWD]). The City also provides recycled water from the Ventura Water Reclamation Facility (VWRF). The City operates its water supply system by utilizing a conjunctive use operating procedure. The City relies more heavily on surface water sources (such as the Ventura River and Lake Casitas) during wet years while letting groundwater sources rest. During dry years, when the surface water sources are reduced, the City relies more heavily on groundwater sources to meet demands. Conjunctive use of groundwater sources is limited by the requirement to maintain long-term production from the groundwater basins within their safe or operational yield. Conjunctive use also requires treatment and blending ratios to meet water quality goals. The City also has an entitlement from the California State Water Project (SWP) of 10,000 acre-feet per year (AF/yr). To date the City has not received any of this water because there are no existing facilities to get the water directly into the City's distribution system. However, the City is currently working on the design of the State Water Interconnection Project that will enable the City to receive its State Water allocation through a connection to Calleguas MWD. Construction of the Project is expected to begin in 2022.

United Water Conservation District

In 1925, the founding organization of today's United Water Conservation District, the Santa Clara River Protection Association (Association), was formed to protect the runoff of the Santa Clara River from being exported outside the watershed. This effort was successful, and in 1927, the Association was reorganized into the Santa Clara Water Conservation District by vote of the county residents. In 1950, the voters approved the formation of the District under the State Water Conservation Act of 1931, as the United Water Conservation District, to recognize the projected population growth within the District and the need for a reliable water source. The Santa Clara Water Conservation District was then dissolved and the assets transferred to the District. This allowed the District to issue bonds in order to raise funding for construction of the Santa Felicia Dam, creating Lake Piru and other conservation facilities. The District is divided into seven divisions and is governed by an elected seven-member Board of Directors, serving four-year staggered terms.

The District covers approximately 214,000 acres in central Ventura County, California. The District's mission is to manage, protect, conserve, and enhance the water resources of the District and produce a reliable and sustainable supply of groundwater for the reasonable and beneficial use of all users. The District accomplished its mission by constructing, maintaining, and operating facilities along the Santa Clara River and its tributaries to replenishment to groundwater basins within its service area, including the Mound Basin.

Ventura County

The County of Ventura (County) was founded in 1873 and has a total area of 2,208 square miles. The County does not provide water service but does permit and regulate groundwater wells and staffs the Ventura County Watershed Protection District (VCWPD), which participates in countywide planning and management efforts on a variety of water resource programs, including water quality, storm water management, and flood control.

2.2 Description of Plan Area [§354.8]

This section provides a description of the Plan area, including a summary of jurisdictional areas and existing water-resources monitoring and management programs in Mound Basin.

2.2.1 Summary of Jurisdictional Areas and Other Features [§354.8(a)(1),(a)(2),(a)(3),(a)(4),(a)(5), and (b)]

§354.8 Description of Plan Area. *Each Plan shall include a description of the geographic areas covered, including the following information:*

(a) *One or more maps of the basin that depict the following, as applicable:*

- ***(1)*** *The area covered by the Plan, delineating areas managed by the Agency as an exclusive Agency and any areas for which the Agency is not an exclusive Agency, and the name and location of any adjacent basins.*
- ***(2)*** *Adjudicated areas, other Agencies within the basin, and areas covered by an Alternative.*
- ***(3)*** *Jurisdictional boundaries of federal or state land (including the identity of the agency with jurisdiction over that land), tribal land, cities, counties, agencies with water management responsibilities, and areas covered by relevant general plans.*
- ***(4)*** *Existing land use designations and the identification of water use sector and water source type.*
- ***(5)*** *The density of wells per square mile, by dasymetric or similar mapping techniques, showing the general distribution of agricultural, industrial, and domestic water supply wells in the basin, including de minimis extractors, and the location and extent of communities dependent upon groundwater, utilizing data provided by the Department, as specified in Section 353.2, or the best available information.*

(b) *A written description of the Plan area, including a summary of the jurisdictional areas and other features depicted on the map.*

The geographic area covered by this GSP and managed by MBGSA includes the entire Mound Basin (DWR Basin No. 4-004.03), as defined by DWR Bulletin No. 118, "California's Groundwater," Update 2020 (DWR, 2021a). The extent of Mound Basin is shown on Figures 2.1-01 and 2.1-02. The Mound Basin is bordered by the Oxnard Subbasin (DWR Basin No. 4-004.02) to the south and the Santa Paula Subbasin (DWR Basin

No. 4-004.04) to the east. The Oxnard Subbasin is managed by the Fox Canyon Groundwater Management Agency (FCGMA) pursuant to pre-SGMA legislation and SGMA. The Santa Paula Subbasin is adjudicated.

Figure 2.1-01 also delineates the jurisdictional boundaries of Ventura County, the City of San Buenaventura (Ventura), and other agencies with water management responsibilities in Mound Basin (specifically, United and Casitas MWD). Three of the four overlying agencies (Ventura County, City of Ventura, and United) are Member Agencies of the MBGSA JPA, as detailed in Section 2.1. More information about the water resource management roles of these agencies is provided in Section 2.2.2. There are no adjudicated areas located within the Mound Basin. State and Federal Land within the Mound Basin includes two State Beaches (San Buenaventura State Beach and McGrath State Beach [California Department of Parks and Recreation]) and The Channel Islands National Park Visitors Center (Department of Interior) (Figure2.1-03). The Mound Basin lies within the traditional tribal territory of the Chumash; however, there are no tribal trust lands located within the Basin.

Land use planning agencies in the Basin include the City of Ventura (within the City limits) and County of Ventura (unincorporated areas outside of the City limits) (Figure 2.1-03). The City of Oxnard overlies a very small area in the southwestern corner of the Basin and has land use planning jurisdiction there, although most of this area overlaps with McGrath State Beach (Figure 2.1-03). The Basin is covered by the general plans of the above-listed entities. Further details concerning land use are provided in Section 2.2.3.

The City of Ventura occupies much of the land area in Mound Basin and the single largest existing land use in the Basin (in terms of area) is low-density residential, as shown on Figure 2.1-03. Inspection of Figure 2.1-03 indicates that commercial, public/institutional, industrial, and related municipal land use designations also occupy much of Mound Basin. The water use sector for these land use designations is collectively referred to in this GSP as “municipal and industrial” (M&I). Sources of water for the M&I sector in Mound Basin include local groundwater extracted from City of Ventura wells in the Basin, groundwater extracted by the City of Ventura from the adjacent Santa Paula and Oxnard basins and from the Upper Ventura River Basin (not an immediately adjacent basin), and surface water imported from the Ventura River Watershed, which is purchased from Casitas MWD. Details regarding sources and volumes of water used by the M&I and other sectors in Mound Basin is provided in Section 3.1.4.4.

Another water use sector and land use designation in Mound Basin is agricultural, which occupies three separate areas of farmland in the eastern and southwestern portions of Mound Basin (Figure 2.1-03). Sources of water for the agricultural sector in Mound Basin include local groundwater extracted from wells in the Basin and groundwater extracted from the adjacent Santa Paula and Oxnard basins.

The third major land use designation in Mound Basin is open space, consisting largely of undeveloped land in the Hillside Protection Area (Figure 2.1-03) in the foothills of the northern part of the Basin. Very little water is applied to land designated as open space in Mound Basin, although small quantities of water from the M&I sector may be applied to orchards, residential landscaping, and parks along the margins and within the open space-designated area.

Figure 2.2-04 shows the density of wells per square mile and locations of known agricultural and M&I water supply wells in the Basin. There are no known de minimis extractors in the Mound Basin. The communities within the Basin are partially dependent upon groundwater from the Mound Basin. The City of Ventura supplies water to the communities within the Basin and has a diverse water supply portfolio

DRAFT

that includes groundwater and surface water supplies from outside of the Basin. Although Mound Basin groundwater is an important source of water supply for the communities located within the Basin, the communities are not considered to be "dependent" on Mound Basin groundwater because it is only one component of the City's water supply portfolio.

2.2.2 Water Resources Monitoring and Management Programs [§354.8(c) and (d)]

2.2.2.1 Existing Water Resource Monitoring Programs [§354.8(c) and (d)]

§354.8 Description of Plan Area. *Each Plan shall include a description of the geographic areas covered, including the following information:*

(c) *Identification of existing water resource* ***monitoring*** *and management programs, and description of any such programs the Agency plans to incorporate in its monitoring network or in development of its Plan. The Agency may coordinate with existing water resource monitoring and management programs to incorporate and adopt that program as part of the Plan.*

(d) *A description of how existing water resource* ***monitoring*** *or management programs may limit operational flexibility in the basin, and how the Plan has been developed to adapt to those limits.*

Existing water resources monitoring programs are listed in Table 2.2-01.

The water resources monitoring programs that have significant relevance to this GSP are the United, Ventura Water, and VCWPD groundwater resource monitoring programs. Details regarding groundwater monitoring locations (i.e., wells) and parameters monitored by these agencies/programs are provided in Section 5. In summary, United monitors groundwater quality and/or elevations in 20 wells across Mound Basin, while Ventura Water monitors their two active M&I water supply wells in the Basin, and VCWPD variably monitors two to four wells (currently or formerly used for agricultural and industrial water supply) in the Basin. VCWPD is the California Statewide Groundwater Elevation Monitoring (CASGEM) monitoring entity for the Basin. VCWPD compiles the groundwater level data gathered by Ventura County staff with that gathered by other agencies and uploads the data to the CASGEM website in accordance with CASGEM program requirements. VCWPD will continue in this role and provide data consistent with the CASGEM program. The MBGSA plans to continue coordinating with these other programs/agencies to obtain groundwater elevation and quality data to support GSP development, monitoring, and annual reporting, as detailed in Section 5.

As described in more detail in Sections 3.1 and 3.3, surface water is not diverted for beneficial uses from surface water bodies located within the Mound Basin. VCWPD monitors rainfall and surface water flow in selected streams (barrancas) in Mound Basin, as described in more detail in Sections 3.1, 3.2, and 3.3. VCWPD also monitors surface water flow in the Santa Clara River in the Oxnard Basin approximately 1.5 miles upstream from Mound Basin, as described in Sections 3.2 and 3.3. The City of Ventura monitors surface water quality in the Santa Clara River Estuary, pursuant to the discharge permit for the VWRF.

The existing water resource monitoring programs do not limit operational flexibility in the Basin.

2.2.2.2 Existing Water Resource Management Programs [§354.8(c) and (d)]

> ***§354.8 Description of Plan Area.*** *Each Plan shall include a description of the geographic areas covered, including the following information:*
>
> ***(c)*** *Identification of existing water resource monitoring and* ***management programs****, and description of any such programs the Agency plans to incorporate in its monitoring network or in development of its Plan. The Agency may coordinate with existing water resource monitoring and management programs to incorporate and adopt that program as part of the Plan.*
>
> ***(d)*** *A description of how existing water resource monitoring or* ***management programs*** *may limit operational flexibility in the basin, and how the Plan has been developed to adapt to those limits.*

Existing water resources management programs within the Basin are listed in Table 2.2-02. The key existing water resource management programs are described below.

City of Ventura Urban Water Management Plan and Related Planning Programs

The City's Urban Water Management Plan (Kennedy/Jenks Consultants, 2021a) describes their existing and planned sources of water supply and demand, as well as their water management programs. The City's 2020 Comprehensive Water Resources Report (Ventura Water, 2020b) provides updated information and projections on impacts of the City's water resources management program. Another related planning document is the City's Water Shortage Event Contingency Plan (Kennedy/Jenks Consultants, 2021b), which identifies actions to be taken during the various stages of a water shortage. The City's Urban Water Management Plan and related documents contain certain elements that reduce the likelihood of exceedances of the City's Mound Basin groundwater extraction projections used in the development of this GSP:

- **Demand Management Measures**: Existing and planned water conservation measures within the City of Ventura have resulted in reductions in M&I water use in Mound Basin, as described in Section 3.3. This reduced demand has been incorporated into the projections for future water use in Mound Basin in this GSP.
- **Recycled Water Reuse**: The City currently distributes approximately 564 AF/yr of treated recycled water for landscape and golf course irrigation (Kennedy/Jenks Consultants, 2021a). The City is currently in the planning phases for the proposed VenturaWaterPure Project, which includes additional diversion of tertiary treated effluent to a new Advanced Water Purification Facility for potable reuse. The future water supply that will be provided by the VenturaWaterPure Project is projected to be 2,800 AF/yr after 2025 and 4,000 AF/yr after 2030 (Ventura Water, 2020b; Kennedy/Jenks Consultants 2021a).
- **State Water Interconnection Project**: The City has a 10,000 AF/yr allocation from the California SWP. To date, the City has not constructed the improvements necessary to receive direct delivery of its allocation. Ventura Water is pursuing the State Water Interconnection Project with Calleguas MWD, Casitas MWD, and United. The projected available water supply for SWP water delivered by the State Water Interconnection Project is estimated to be 2,075-10,000 AF in 2025 and 0-10,000 AF in 2030 (Ventura Water, 2020b).
- **Water Shortage Event Contingency Plan (Kennedy/Jenks Consultants, 2021b)**: This plan provides criteria for when and how voluntary and mandatory water use restrictions are implemented during droughts or other emergency occurred that limited availability of water

supply within the City's service area. The project will reduce the potential for increased City demand for Mound Basin groundwater.

The City of Ventura's Urban Water Management Plan (Kennedy/Jenks, 2021b) and related planning programs do not limit operational flexibility in the Basin.

Casitas MWD Urban Water Management and Agricultural Water Management Plan

Casitas MWD's 2020 update to its Urban Water Management and Agricultural Water Management Plan (Casitas MWD, 2021) describes their existing and planned sources of water supply and demand, as well as their water management programs. Casitas MWD provides surface water to the City of Ventura, some of which is imported to Mound Basin. Similar to the City of Ventura's Urban Water Management Plan, the Casitas MWD plan includes descriptions of their water-resource management programs, including:

- Water shortage contingency planning.
- Demand management measures.
- Planned expansion of their portfolio of water supplies (including imports from the California SWP).

Elements of Casitas MWD's Urban Water Management and Agricultural Water Management Plan were used to inform development of the City of Ventura's 2020 Comprehensive Water Resources Report (Ventura Water, 2020b), which in turn was used to project future water use in Mound Basin in this GSP.

Watersheds Coalition of Ventura County Integrated Regional Water Management Plan

The Integrated Regional Water Management Plan (IRWMP) prepared by the Watersheds Coalition of Ventura County (2019) includes several "resource management strategies" that have the potential to directly or indirectly affect water resources management in Ventura County, including the Santa Clara River Watershed and Mound Basin. Some of the management strategies listed in the IRWMP that could potentially affect water-resources management by the MBGSA include the following:

- **Reduce Water Demand**: Includes a list of agricultural water efficiency best-management practices (BMPs) for agriculture and notes that urban water use efficiency practices and standards are implemented by urban water suppliers in Urban Water Management Plans.
- **Improve Operational Efficiency and Transfers**: Summarizes the effects of conveyance projects (for importing water from other areas or within Mound Basin), system reoperation, and water transfers.
- **Increase Water Supply**: Describes the benefits of conjunctive-use projects, desalination of seawater or brackish water, precipitation enhancement, municipal recycled water use, surface storage.
- **Increase Water Supply**: Describes several actions or policies that can improve water quality, including drinking water treatment and distribution, groundwater and aquifer remediation, matching water quality to use, pollution prevention, salt and salinity management, and urban storm water runoff management.

- **Practice Resources Stewardship**: Provides definitions for, and summarizes benefits of, the following activities: agricultural lands stewardship, ecosystem restoration, forest management, land use planning and management, sediment management, and watershed management.
- **People and Water**: Describes approaches for engaging the public in water-resources management, including economic incentives, outreach and engagement, "water and culture," and water-dependent recreation.
- **Other Strategies**: Summarizes potential future sources of supply or strategies for improving water-resources management, including crop idling for water transfers, "dewvaporation" for atmospheric pressure desalination, fog collection, irrigated land retirement, "rainfed agriculture," snow fences (at higher elevations in the Santa Clara River watershed), and "waterbag" transport/storage technology (towing water by ship from other coastal regions in inflatable bladders).

These IRWMP management strategies are not anticipated to limit operational flexibility.

2.2.2.3 Conjunctive-Use Programs [§354.8(e)]

§354.8 Description of Plan Area. *Each Plan shall include a description of the geographic areas covered, including the following information:*
(e) *A description of conjunctive use programs in the basin.*

The City of Ventura's surface water imports to Mound Basin from Casitas MWD comprise a conjunctive-use program, as described in the Ventura Water (2020b) Comprehensive Water Resources Report:

> *"The City (of Ventura) operates its water supply system by utilizing a conjunctive use operating procedure. The City relies more heavily on surface water sources (such as the Ventura River and Lake Casitas) during wet years while letting groundwater sources rest. During dry years, when the surface water sources are reduced, the City relies more heavily on groundwater sources to meet demands. Conjunctive use of groundwater sources is limited by the requirement to maintain long-term production from the groundwater basins within their safe or operational yield. Conjunctive use also requires treatment and blending ratios to meet water quality goals."*

More detail regarding quantities and sources of Ventura Water's surface water use in Mound Basin is provided in Section 3.1 and 3.3. According to the Ventura Water (2020b) Comprehensive Water Resources Report, the City intends to continue their conjunctive use of surface water and groundwater into the foreseeable future. This conjunctive-use program has been incorporated into the projections for future water supply and demand in Mound Basin in this GSP.

United operates a conjunctive-use program in the Forebay area of the Oxnard Basin, adjacent to Mound Basin (Figure 2.1-02) consisting of artificial recharge of 60,000 to 70,000 AF/yr of surface water diverted from the Santa Clara River, followed by groundwater extraction by United and other groundwater users (United, 2018). As described in Section 3.3, artificial recharge by United during high-rainfall years raises groundwater levels in Oxnard Basin sufficiently to induce substantial volumes of groundwater underflow

from Oxnard Basin to Mound Basin. This conjunctive-use program has been incorporated into the projected water budget for Mound Basin in this GSP (Section 3.3).

2.2.3 Land Use/General Plans

The Basin is dominated by residential, commercial, and industrial land uses located within incorporated areas of the City of Ventura and collectively accounts for approximately 58% of Basin land acreage (Figure 2.1-03). Residential uses vary between large rural parcels with few impervious surfaces to suburban and urban residential parcels associated with higher development densities and surrounded by more impervious surfaces, wider roads, and more sidewalks. Open space accounts for approximately 13% of Basin land acreage. The key area open space that is relevant to this GSP is the hillsides along the northern part of the Basin where the principal aquifers receive recharge (Figure 3.1-11). Agricultural land accounts for approximately 1,972 acres of the Basin (approximately 14% of the Basin land area) (Figure 2.1-03). Agricultural land is not located in any key Basin recharge areas.

2.2.3.1 Land Use and General Plans Summary [§354.8(f)(1),(f)(2), and (f)(3)]

§354.8 Description of Plan Area. *Each Plan shall include a description of the geographic areas covered, including the following information:*

(f) *A plain language description of the land use elements or topic categories of applicable general plans that includes the following:*

(1) *A summary of general plans and other land use plans governing the basin.*

(2) *A general description of how implementation of existing land use plans may change water demands within the basin or affect the ability of the Agency to achieve sustainable groundwater management over the planning and implementation horizon, and how the Plan addresses those potential effects.*

(3) *A general description of how implementation of the Plan may affect the water supply assumptions of relevant land use plans over the planning and implementation horizon.*

California state law requires that cities and counties prepare and adopt a "comprehensive long-term general plan for the physical development of the county or city" and that "elements and parts [of the plan] comprise an integrated, internally consistent and compatible statement of policies for the adopting agency" (California Government Code, §65300 and §65300.5). Among the required elements of the plan is the conservation, development, and utilization of water developed in coordination with groundwater agencies such as MBGSA (California Government Code, §65302[d][1]).

All existing general plans and future updates undergo an analysis of environmental impacts under the California Environmental Quality Act (CEQA). In addition, all discretionary projects proposed within the Oxnard Subbasin under municipal, County, and/or state jurisdiction are required to comply with CEQA. In 2019, the Governor's Office of Planning and Research released an update to the CEQA Guidelines that included a new requirement to analyze projects for their compliance with adopted GSPs. Specifically, the applicable significance criteria include the following:

- Would the program or project substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin?
- Would the program or project conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?

Therefore, to the extent general plans allow growth that could have an impact on groundwater supply, such projects would be evaluated for their consistency with adopted GSPs and for whether they adversely impact the sustainable management of the Basin. Under CEQA, potentially significant impacts identified must be avoided or substantially minimized unless significant impacts are unavoidable, in which case the lead agency must adopt a statement of overriding considerations.

The following sections contain a description of the land use plans that are applicable to sustainable groundwater management planning within the Mound Basin, a discussion of the consideration given to the land use plans, and an assessment of how the GSP may affect those plans. The plans included were selected as the plans with the most salient information relating to sustainable management. General plans are considered applicable to the GSP to the extent that they may change water demands within the Mound Basin or affect the ability of the GSA to achieve sustainable groundwater management over the planning and implementation horizon.

General Plans applicable to the Mound Basin are the City of Ventura General Plan (City of Ventura, 2005) and the Ventura County General Plan (County of Ventura, 2020). Most of the Basin falls within incorporated areas of the City of Ventura (Figure 2.1-01). The unincorporated areas within the Basin include mostly agricultural land use and open space that fall under the County of Ventura's General Plan, although the agricultural areas also fall within the planning area addressed in the City of Ventura's General Plan. A small area (0.5 square miles) of the Basin falls within the City of Oxnard's planning area, but implementation of this general plan (City of Oxnard, 2014) is expected to have a negligible effect on GSP implementation in the Mound Basin.

In addition to the General Plans, it is important to understand that the agricultural land and open space in the Basin lies is subject to the City of Ventura and County of Ventura Save Open Space and Agricultural Resources (SOAR) voter initiatives currently approved through 2050 (SOAR, 2015). The SOAR initiatives require a majority vote of the people to rezone unincorporated open space, agricultural, or rural land for development. In addition to the SOAR initiatives, the City of Ventura Hillside Voter Participation Area Act (HVPAA), also approved through 2050, requires voter approvals for development or the extension of City urban services into the hillsides. The existence of the SOAR and HVPPA make it very unlikely that a material change in land use will occur during the foreseeable future. Because agricultural land and open space is not expected to convert to other uses, it is assumed that there is little potential for new development that could impact basin recharge or water demands. These assumptions will be revisited during each five-year GSP assessment.

2005 Ventura General Plan

The current version of the City of Ventura's General Plan was adopted in 2005 (City of Ventura, 2005), which has a planning horizon of 2025. The City of Ventura launched the first phase to update its General Plan in November 2020.

Most of the Basin falls within the incorporated limits of the City of Ventura, which consists of predominantly residential, commercial, and industrial land uses (Figure 2.1-03). Present City policy does not include specific growth targets and instead promotes a "Smart Growth" approach that emphasizes creating a "well-planned and designed community" and preserving open space and farmland. The plan calls for measured and appropriate growth in Ventura by prioritizing areas appropriate for additional development based on community values and infrastructure potential. Importantly, the plan emphasizes

an "Infill First" strategy to help avoid sacrificing farmland and sensitive areas in hillsides, which lie predominantly at the edges of the City. Most growth is anticipated to occur within the existing City limits in the "Infill" areas. The development potential within the remainder of the City is very limited. Growth in open space and agricultural areas is unlikely to occur given the City's General Plan policies and the involvement of groups such as SOAR and HVPPA.

As of December 2019, there are 47 infill development projects that are either approved or under construction. The estimated water demand for these projects is 921 AF/yr, and these demands are included into City's forecasts cited elsewhere in this GSP. Going forward, development is not expected to impact water demand for groundwater in the Mound Basin because the City's Water Rights Dedication and Water Resource Net Zero Fee Ordinance and Resolution ("Net Zero Policy") adopted June 6, 2016, requires all new and intensified development to offset the demand associated with its impact on the City's potable water system.

Offsets can take the form of water rights dedication (i.e. transfer existing rights to extract groundwater from the Mound Basin or the adjacent Oxnard or Santa Paula basins) or payment of a fee that funds development of new City water supplies. Future water supplies include VenturaWaterPure (potable reuse of advanced treated tertiary treated effluent from the VWRF and an interconnection with Calleguas MWD that will allow the City to access its 10,000 AF/yr Table A entitlement from the California SWP. Infill development is expected to have a very small impact on groundwater because the total area with infill potential is small, infill areas are not located in the principal recharge area of the Basin, and because the General Plan includes a policy to helps maintain groundwater recharge:

- Action 5.16: Require new developments to incorporate storm water treatment practices that allow percolation to the underlying aquifer and minimize offsite surface runoff utilizing methods such as pervious paving material for parking and other paved areas to facilitate rainwater percolation and retention/detention basins that limit runoff to pre-development levels.

Approximately 556 acres of agricultural lands within the Basin is located within the City's sphere of influence in the eastern part of the Basin (approximately 4% of the Basin land area) (Figure 2.1-01). Another 1,267 acres of agricultural land within the Basin is located outside of the City's sphere of influence in the western part of the Basin (approximately 9% of the Basin land area) (Figure 2.1-01).

The City of Ventura's General Plan (City of Ventura, 2005) includes numerous elements that discourage development of agricultural land:

- **Policy 3C**: Maximize use of land in the city before considering expansion
- **Action 3.14**: Utilize infill, to the extent possible
- **Policy 3D**: Continue to preserve agricultural and other open space lands within the City's Planning Area
- **Action 3.20**: Pursuant to SOAR, adopt development code provisions to "preserve agricultural and open space lands as a desirable means of shaping the City's internal and external form and size, and of serving the needs of the residents.

The key area open space that is relevant to this GSP is the hillsides along the northern part of the Basin where the principal aquifers receive recharge (Figure 3.1-11). The hillsides open space lies predominantly

outside of the incorporated limits of the City and the City's sphere of influence (Figure 2.1-01). Nonetheless, the City's General Plan includes numerous elements that discourage development in this area:

- **Policy 1B**: Increase the area of open space protected from development impacts.
- **Action 1.12**: Update the provisions of the Hillside Management Program as necessary to ensure protection of open space lands.
- **Action 1.13**: Recommend that the City's Sphere of Influence boundary be coterminous with the existing City limits in the hillsides in order to preserve the hillsides as open space.
- **Action 1.14**: Work with established land conservation organizations toward establishing a Ventura hillsides preserve.
- **Action 1.15**: Actively seek local, State, and federal funding sources to achieve preservation of the hillsides.

As mentioned earlier, the existence of the SOAR and HVPPA make it very unlikely that a material amount of open space or agricultural land will be developed during the foreseeable future. Because agricultural land and open space is not expected to convert to other uses, it is assumed that there is little potential for new development in these areas that could impact basin recharge or water demands. These assumptions will be revisited during each five-year GSP assessment.

County of Ventura 2040 General Plan

The Ventura County 2040 General Plan (County of Ventura, 2020) applies to the County as a whole and includes area-specific plans for distinct unincorporated areas.

The key recharge area that is relevant to this GSP is the open space on the hillsides along the northern part of the Basin where the principal aquifers receive recharge (Figure 3.1-11). The hillsides open space lies predominantly outside of the incorporated limits of the City and the City's sphere of influence and is included in the Ventura County 2040 General Plan (Figure 2.1-01). The Ventura County 2040 General Plan also applies to the approximate 1,267 acres of agricultural land located outside of the City and its sphere of influence in the western part of the Basin (Figure 2.1-01). Although these open space and agricultural areas are located outside of the City's sphere of includes, any future development would very likely involve annexation to the City. The County's General Plan includes numerous elements that discourage development in the open space and agricultural areas and/or continued viability of agricultural activities on agricultural land.

Guiding Principle - Land Use and Community Character: Direct urban growth away from agricultural, rural, and open space lands, in favor of locating it in cities and unincorporated communities where public facilities, services, and infrastructure are available or can be provided.

Guiding Principle - Conservation and Open Space: Conserve and manage the County's open spaces and natural resources, including soils, water, air quality, minerals, biological resources, scenic resources, as well as historic and cultural resources.

Guiding Principle - Agriculture: Promote the economic vitality and environmental sustainability of Ventura County's agricultural economy by conserving soils/land while supporting a diverse and globally competitive agricultural industry that depends on the availability of water, land, and farmworker housing.

DRAFT

WR-6: To sustain the agricultural sector by ensuring an adequate water supply through water efficiency and conservation.

WR-6.1 - Water for Agricultural Uses: The County should support the appropriate agencies in their efforts to effectively manage and enhance water quantity and quality to ensure long-term, adequate availability of high quality and economically viable water for agricultural uses, consistent with water use efficiency programs.

WR-6.2 Agricultural Water Efficiency: The County should support programs designed to increase agricultural water use efficiency and secure long-term water supplies for agriculture.

WR-6.3 Reclaimed Water Use: The County should encourage the use of reclaimed irrigation water and treated urban wastewater for agricultural irrigation in accordance with federal and state requirements in order to conserve untreated groundwater and potable water supplies.

from the Ventura County 2040 General Plan

The Ventura County 2040 General Plan includes a Saticoy Area Plan for the unincorporated community of Saticoy located at the southeastern "tip" of the Basin (Figure 2.1-03). Saticoy is already largely developed (residential and industrial); thus, the Saticoy Area Plan focuses on redevelopment aspects. Saticoy's water service is provided by the City of Ventura. Thus, City of Ventura water supply policies apply in Saticoy, meaning that any new or intensified development would be required to be water neutral. The Saticoy Area overlaps with a very small area of the Basin and is not located in a key recharge area. Based on the foregoing, land use planning in the Saticoy Area will not have a significant impact in this GSP.

The Ventura County 2040 General Plan (County of Ventura, 2020) includes numerous elements designed to facilitate coordinated planning with MBGSA, maintain groundwater recharge, protect groundwater quality, and conserve groundwater resources.

WR-1: To effectively manage water supply by adequately planning for the development, conservation, and protection of water resources for present and future generations.

WR-1.1 - Sustainable Water Supply: The County should encourage water suppliers, groundwater management agencies, and groundwater sustainability agencies to inventory and monitor the quantity and quality of the county's water resources, and to identify and implement measures to ensure a sustainable water supply to serve all existing and future residents, businesses, agriculture, government, and the environment.

WR-1.2 - Watershed Planning: The County shall consider the location of a discretionary project within a watershed to determine whether or not it could negatively impact a water source. As part of discretionary project review, the County shall also consider local watershed management plans when considering land use development.

WR-1.3 - Portfolio of Water Sources: The County shall support the use of, conveyance of, and seek to secure water from varied sources that contribute to a diverse water supply portfolio. The water supply portfolio may include, but is not limited to, imported water, surface water, groundwater, treated brackish groundwater, desalinated seawater, recycled water, and storm water where economically feasible and protective of the environmental and public health.

WR-1.4 - State Water Sources: The County shall continue to support the conveyance of, and seek to secure water from, state sources.

WR-1.5 - Agency Collaboration: The County shall participate in regional committees to coordinate planning efforts for water and land use that is consistent with the Urban Water Management Planning Act, Sustainable Groundwater Management Act, the local Integrated Regional Water Management Plan, and the Countywide National Pollutant Discharge Elimination System Permit (storm water and runoff management and reuse).

WR-1.6 - Water Supplier Cooperation: The County shall encourage the continued cooperation among water suppliers in the county, through entities such as the Association of Water Agencies of Ventura County and the Watersheds Coalition of Ventura County, to ensure immediate and long-term water needs are met efficiently.

WR-1.7 - Water Supply Inter-Ties: The County shall encourage the continued cooperation among water suppliers in the county, through entities such as Association of Water Agencies of Ventura County and the Watersheds Coalition of Ventura County, to establish and maintain emergency inter-tie projects among water suppliers.

WR-1.9 - Groundwater Basin Use for Water Storage: Where technically feasible, the County shall support the use of groundwater basins for water storage.

WR-1.10 - Integrated Regional Water Management Plan: The County shall continue to support and participate with the Watersheds Coalition of Ventura County in implementing and regularly updating the Integrated Regional Water Management Plan.

WR-1.11 - Adequate Water for Discretionary Development: The County shall require all discretionary development to demonstrate an adequate long-term supply of water.

WR-1.12 - Water Quality Protection for Discretionary Development: The County shall evaluate the potential for discretionary development to cause deposition and discharge of sediment, debris, waste and other pollutants into surface runoff, drainage systems, surface water bodies, and groundwater. The County shall require discretionary development to minimize potential deposition and discharge through point source controls, storm water treatment, runoff reduction measures, best management practices, and low impact development.

WR-1.14 - Discretionary Development and Conditions of Approval: Golf Course Irrigation: The County shall require that discretionary development for new golf courses shall be subject to conditions of approval that prohibit landscape irrigation with water from groundwater basins or inland surface waters identified as Municipal and Domestic Supply or Agricultural Supply in the California Regional Water Quality Control Board's Water Quality Control Plan unless:

1. The existing and planned water supplies for a Hydrologic Area, including interrelated Hydrologic Areas and Subareas, are shown to be adequate to meet the projected demands for existing uses as well as reasonably foreseeable probable future uses within the area; and
2. It is demonstrated that the total groundwater extraction/recharge for the golf course will be equal to or less than the historic groundwater extraction/recharge for the site as defined in the County Initial Study Assessment Guidelines.

Further, where feasible, reclaimed water shall be utilized for new golf courses.

WR-2: To implement practices and designs that improve and protect water resources.

WR-2.1 - Identify and Eliminate of Sources of Water Pollution: The County shall cooperate with Federal, State and local agencies in identifying and eliminating or minimizing all sources of existing and potential point and non-point sources of pollution to ground and surface waters, including leaking fuel tanks, discharges from storm drains, dump sites, sanitary waste systems, parking lots, roadways, and mining operations.

WR-2.2 - Water Quality Protection for Discretionary Development: The County shall evaluate the potential for discretionary development to cause deposition and discharge of sediment, debris, waste, and other contaminants into surface runoff, drainage systems, surface water bodies, and groundwater. In addition, the County shall evaluate the potential for discretionary development to limit or otherwise impair later reuse or reclamation of wastewater or storm water. The County shall require discretionary development to minimize potential deposition and discharge through point source controls, storm water treatment, runoff reduction measures, best management practices, and low impact development.

WR-2.3 - Discretionary Development Subject to CEQA Statement of Overriding Considerations – Water Quality and Quantity: The County shall require that discretionary development not significantly impact the quality or quantity of water resources within watersheds, groundwater recharge areas or groundwater basins.

WR-3: To promote efficient use of water resources through water conservation, protection, and restoration.

WR-3.1 - Non-Potable Water Use: The County shall encourage the use of non-potable water, such as tertiary treated wastewater and household graywater, for industrial, agricultural, environmental, and landscaping needs consistent with appropriate regulations.

WR-3.2 - Water Use Efficiency for Discretionary Development: The County shall require the use of water conservation techniques for discretionary development, as appropriate. Such techniques include low-flow plumbing fixtures in new construction that meet or exceed the California Plumbing Code, use of graywater or

reclaimed water for landscaping, retention of storm water runoff for direct use and/or groundwater recharge, and landscape water efficiency standards that meet or exceed the standards in the California Model Water Efficiency Landscape Ordinance.

WR-3.3 - Low-Impact Development: The County shall require discretionary development to incorporate low impact development design features and best management practices, including integration of storm water capture facilities, consistent with County's Storm water Permit.

WR-3.4 - Reduce Potable Water Use: The County shall strive for efficient use of potable water in County buildings and facilities through conservation measures, and technological advancements.

WR-4: To maintain and restore the chemical, physical, and biological integrity and quantity of groundwater resources.

WR-4.1 - Groundwater Management: The County shall work with water suppliers, water users, groundwater management agencies, and groundwater sustainability agencies to implement the Sustainable Groundwater Management Act (SGMA) and manage groundwater resources within the sustainable yield of each basin to ensure that county residents, businesses, agriculture, government, and the environment have reliable, high-quality groundwater to serve existing and planned land uses during prolonged drought years.

WR-4.2 - Important Groundwater Recharge Area Protection: In areas identified as important recharge areas by the County or the applicable Groundwater Sustainability Agency, the County shall condition discretionary development to limit impervious surfaces where feasible and shall require mitigation in cases where there is the potential for discharge of harmful pollutants within important groundwater recharge areas.

WR-4.3 - Groundwater Recharge Projects: The County shall support groundwater recharge and multi-benefit projects consistent with the Sustainable Groundwater Management Act and the Integrated Regional Water Management Plan to ensure the long-term sustainability of groundwater.

WR-4.4 - In-Stream and Recycled Water Use for Groundwater Recharge: The County shall encourage the use of in-stream water flow and recycled water for groundwater recharge while balancing the needs of urban and agricultural uses, and healthy ecosystems, including in-stream waterflows needed for endangered species protection.

WR-4.5 - Discretionary Development Subject to CEQA Statement of Overriding Considerations – Water Quantity and Quality: The County shall require that discretionary development shall not significantly impact the quantity or quality of water resources within watersheds, groundwater recharge areas or groundwater basins.

WR-4.7 - Discretionary Development and Conditions of Approval – Oil, Gas, and Water Wells: The County shall require that discretionary development be subject to conditions of approval requiring proper drilling and construction of new oil, gas, and water wells and removal and plugging of all abandoned wells on-site.

WR-4.8 - New Water Wells: The County shall require all new water wells located within Groundwater Sustainability Agency (GSA) boundaries to be compliant with GSAs and adopted Groundwater Sustainability Plans (GSPs).

WR-5: To protect and, where feasible, enhance watersheds and aquifer recharge areas through integration of multiple facets of watershed-based approaches.

WR-5.1 - Integrated Watershed Management: The County shall work with water suppliers, Groundwater Sustainability Agencies (GSAs), wastewater utilities, and storm water management entities to manage and enhance the shift toward integrated management of surface and groundwater, storm water treatment and use, recycled water and conservation, and desalination.

WR-5.2 - Watershed Management Funding: The County shall continue to seek funding and support coordination of watershed planning and watershed-level project implementation to protect and enhance local watersheds.

WR-7.1 - Water for the Environment: The County shall encourage the appropriate agencies to effectively manage water quantity and quality to address long-term adequate availability of water for environmental purposes, including maintenance of existing groundwater-dependent habitats and in-stream flows needed for riparian habitats and species protection.

from the Ventura County 2040 General Plan

City of Oxnard 2030 General Plan

A small area (0.5 square miles) in the southwestern corner the Basin lies within the City of Oxnard's planning boundary (Figure 2.1-01) (City of Oxnard, 2014). This area consists of the last approximately 1 mile of the Santa Clara River, including its estuary. This area is designated "Resource Protection" and "Recreation" (a small area lies within the McGrath State Beach). Due to the very small area and the land use designations, it is very unlikely that the land use in this area will change or that groundwater wells would be drilled. Based on the foregoing, it appears this area will not have a material impact on this GSP; and, for this reason, the City of Oxnard's General Plan is not discussed further in this GSP.

2.2.3.1.1 How Land Use Plans May Impact Water Demands and Sustainable Groundwater Management

This GSP is not anticipated to be impacted by the City of Ventura or County of Ventura land use plans. The general plans already include policies that protect the key recharge area in the Basin (open space in the hillsides along the northern part of the Basin). Open space in the key recharge area is further protected from development by SOAR and HVPPA. Development allowed pursuant to the general plans will not create new demands for Mound Basin groundwater because growth will likely occur within the City of Ventura (within incorporated area or through annexation), making it subject to the City's Net Zero Policy. The Net Zero Policy requires that new water demands for development projects be met by a dedication of an existing water right (i.e. transfer existing rights to extract groundwater from the Mound Basin or the adjacent Oxnard or Santa Clara basins) or payment of a fee that funds development of new City water supplies. Future City of Ventura water supplies under development include VenturaWaterPure (potable reuse of advanced treated tertiary treated effluent from the VWRF) and an interconnection with Calleguas MWD that will allow the City to access its 10,000 AF/yr Table A entitlement from the California SWP.

2.2.3.1.2 How Sustainable Groundwater Management May Affect Water Supply Assumptions of Land Use Plans

This GSP is not anticipated to impact land use plans by the City or County of Ventura because the estimated sustainable yield of the Basin is sufficient to supply planned groundwater extraction in the Basin, and any new water demands resulting from development will be offset pursuant to the City of Ventura's Net Zero Policy by dedication of an existing water right (i.e. transfer existing rights to extract groundwater from the Mound Basin or the adjacent Oxnard or Santa Clara basins) or payment of a fee that funds development of new City water supplies. In short, land use planning for the Mound Basin is not constrained by the Mound Basin sustainable yield.

The GSP will not impact land use plans elements that address recharge areas because the key recharge area is open space in the hillsides along the northern part of the Basin that is already protected from development by City of Ventura and County of Ventura General Plan policies, SOAR, and HVPPA.

DRAFT

2.2.3.1.3 *Impact of Land Use Plans Outside of Basin on Sustainable Groundwater Management [§354.8(f)(5)]*

> **§354.8 Description of Plan Area.** *Each Plan shall include a description of the geographic areas covered, including the following information:*
> ***(f)*** *A plain language description of the land use elements or topic categories of applicable general plans that includes the following:*
> ***(5)*** *To the extent known, the Agency may include information regarding the implementation of land use plans outside the basin that could affect the ability of the Agency to achieve sustainable groundwater management.*

Land use planning for the areas immediately surrounding Mound Basin is addressed in the Ventura County 2040 General Plan (County of Ventura, 2020), described in Section 2.2.3.1. This GSP is not anticipated to be impacted by the County of Ventura 2040 General Plan for the same reasons described in Section 2.2.3.1.1.

2.2.3.2 Well Permitting [§354.8(f)(4)]

> **§354.8 Description of Plan Area.** *Each Plan shall include a description of the geographic areas covered, including the following information:*
> ***(f)*** *A plain language description of the land use elements or topic categories of applicable general plans that includes the following:*
> ***(4)*** *A summary of the process for permitting new or replacement wells in the basin, including adopted standards in local well ordinances, zoning codes, and policies contained in adopted land use plans.*

Water well permits are obtained from the Ventura County Groundwater Section, a division of Ventura County Public Works Department. Water well permits are issued pursuant to the requirements of Ventura County Water Well Ordinance No. 4468. The Ventura County Groundwater Section oversees compliance with County Water Well Ordinance No. 4468 which is inclusive of California's Water Well Standards Bulletins 74-9, 74-81, and 74-90. The Ventura County Groundwater Section monitors and enforces these standards by requiring drilling contractors with a valid C-57 license to submit permit applications for the construction, modification, reconstruction (i.e., deepening), or destruction of any well within their jurisdiction and through inspections. Pursuant to the County of Ventura 2040 General Plan (County of Ventura, 2020), Ventura County Groundwater Section will review the MBGSA's GSP and related resolutions and ordinances to ensure the compliance with MBSGA requirements prior to issuing a water well permit within the boundary of the Mound Basin.

In addition to County Water Well Ordinance 4468, the County of Ventura 2040 General Plan includes the following policies on well permitting:

- **WR-4.7 - Discretionary Development and Conditions of Approval – Oil, Gas, and Water Wells**: The County shall require that discretionary development be subject to conditions of approval requiring proper drilling and construction of new oil, gas, and water wells and removal and plugging of all abandoned wells on-site.
- **WR-4.8 - New Water Wells**: The County shall require all new water wells located within Groundwater Sustainability Agency (GSA) boundaries to be compliant with GSAs and adopted Groundwater Sustainability Plans (GSPs).

2.2.4 Additional Plan Elements [§354.8(g)]

§354.8 Description of Plan Area. *Each Plan shall include a description of the geographic areas covered, including the following information:*

(g) *A description of any of the additional Plan elements included in Water Code Section 10727.4 that the Agency determines to be appropriate.*

GSP Emergency Regulations [§354.8(g) allows GSAs to include certain "additional plan elements" in the GSP, including:

(a) Control of saline water intrusion.

(b) Wellhead protection areas and recharge areas

(c) Migration of contaminated groundwater.

(d) A well abandonment and well destruction program.

(e) Replenishment of groundwater extractions.

(f) Activities implementing, opportunities for, and removing impediments to, conjunctive use or underground storage.

(g) Well construction policies.

(h) Measures addressing groundwater contamination cleanup, groundwater recharge, in-lieu use, diversions to storage, conservation, water recycling, conveyance, and extraction projects.

(i) Efficient water management practices, as defined in §10902 , for the delivery of water and water conservation methods to improve the efficiency of water use.

(j) Efforts to develop relationships with state and federal regulatory agencies.

(k) Processes to review land use plans and efforts to coordinate with land use planning agencies to assess activities that potentially create risks to groundwater quality or quantity.

(l) Impacts on groundwater-dependent ecosystems (GDEs).

MBGSA determined that the following additional plan elements are appropriate to include in this GSP:

- (d) Well Destruction Program: MBGSA will seek to destroy improperly abandoned or constructed wells that act as conduits for migration of poor-quality water from shallow water-bearing units into the principal aquifers. This additional plan element is included in the groundwater quality protection measures management action, which is described in Section 6.5.
- (g) Well Construction Policies: MBGSA will coordinate with the County of Ventura to ensure new wells are properly constructed to prevent migration of poor-quality water from shallow water-bearing units into the principal aquifers. This additional plan element is included in the groundwater quality protection measures management action, which is described in Section 6.5.
- (j) Efficient water management practices, as defined in §10902 , for the delivery of water and water conservation methods to improve the efficiency of water use: MBGSA will seek

DRAFT

opportunities to encourage, promote, and support efforts to increase agricultural water use efficiency.

- (k) Processes to review land use plans and efforts to coordinate with land use planning agencies to assess activities that potentially create risks to groundwater quality or quantity: MBGSA will coordinate with the City of Ventura concerning its General Plan update initiated in November 2020. MBGSA will participate in future general plan updates by the County of Ventura and City of Ventura.

2.3 Notice and Communication [§354.10]

Mound Basin is a relatively small basin with only 26 active wells extracting an average of approximately 6,300 AF/yr. Twenty-two wells supply agricultural beneficial users who formed the Mound Basin Agricultural Water Group (MBAWG) to provide organized input on the GSP. MBAWG selects the Agricultural Stakeholder Director on the MBGSA Board of Directors and the Agency's Stakeholder Engagement Plan (SEP) (Appendix D) specifically charges the Agricultural Stakeholder Director with engaging the Basin's agricultural users of groundwater and representing their interests before the Agency. The remaining wells supply municipal and industrial uses, chiefly the City of Ventura, which has a Director seat on the MBGSA Board of Directors. Thus, all the groundwater users in the Basin except the two industrial well owners have direct representation in the SGMA process by virtue of a director on the MBGSA Board of Directors. There are no active or recently active domestic wells in the Basin. All potable water in the Basin, including that used by disadvantaged communities (DACs) is supplied by the City of Ventura.

In addition to the high degree of direct stakeholder representation on the MBGSA Board of Directors, the MBGSA found it important to develop and implement a SEP to seek, encourage, and consider as much public input on the GSP as possible and to ensure compliance with SGMA requirements (Appendix D). The SEP is tailored to the specific stakeholder landscape of the Basin. The SEP encourages the active involvement of individual stakeholders and stakeholder organizations and other interested parties in the development and implementation of the GSP for the Mound Basin (Appendix D). The SEP was designed and developed to ensure compliance with Water Code §10723.2, which requires GSA to "consider the interests of all beneficial uses and users of groundwater, as well as those responsible for implementing groundwater sustainability plans." The SEP identifies stakeholders, stakeholder outreach and engagement methodologies, opportunities for integration with other overlapping local programs and planning processes, and the public meeting process used by the GSA. The SEP guides notice and communication activities during GSP development and will continue to serve as a guide during GSP implementation. The following subsections provide a summary of information relating to notification and communication by MBGSA with other agencies and interested parties, as required by the GSP Emergency Regulations.

2.3.1 Beneficial Uses and Users [§354.10(a)]

§354.10 Notice and Communication. *Each Plan shall include a summary of information relating to notification and communication by the Agency with other agencies and interested parties including the following:*

(a) *A description of the beneficial uses and users of groundwater in the basin, including the land uses and property interests potentially affected by the use of groundwater in the basin, the types of parties representing those interests, and the nature of consultation with those parties.*

Water Code §10723.2 requires MBGSA to consider the interests of all beneficial uses and users of groundwater within the Basin. These interests are listed below with a description of the nature of MBGSA's consultation with them.

- **Holders of Overlying Groundwater Rights:**
  - **Agricultural Users**: There are agricultural users of groundwater operating on land overlying the Basin. To account for these users' interests, the Agency designated a seat on its five-member governing board to be filled by an Agricultural Stakeholder Director. The Agricultural Stakeholder Director is appointed from nominations received by MBAWG or the Ventura County Farm Bureau. The Agricultural Stakeholder Director is responsible for engaging the Basin's agricultural users of groundwater and representing their interests before the Agency.
  - **Domestic Well Owners**: No domestic wells were identified during development of the GSP, as confirmed by the County of Ventura, the local well permitting agency. The lack of domestic wells is likely due to the availability of potable water from Ventura Water (City of Ventura) and the significant expense required to drill a domestic water supply well to the depth required to reach a principal aquifer in Mound Basin. Available data suggest that shallow groundwater above the principal aquifers is not suitable for potable use (Figures 3.1-21 and -22). For these reasons, it is not anticipated that domestic wells will be drilled in the future.
  - **Industrial Users**: Two industrial wells have been identified in the Basin: Saticoy Lemon Association (lemon-packing facility cooperative) and Ivy Lawn Cemetery Association. Given Saticoy Lemon Association's ties to agriculture, the Agricultural Stakeholder Director is responsible for engaging this stakeholder. The Executive Director is responsible for engaging Ivy Lawn Memorial Park and met with its Board on February 19, 2020.
  - **Other Users**: The County of Ventura operates a well for landscape irrigation at the County Government Center. The County is represented on the Agency's Board of Directors.
- **Municipal Well Operators:** The Agency is a JPA created by three local public agencies. One of the Agency's signatory members, the City of San Buenaventura, operates municipal wells within the Basin and is represented on the Agency's Board of Directors.
- **Public Water Systems:**
  - Ventura Water (City of San Ventura) operates a public water system serving residents and business within and surrounding the City. The City of San Buenaventura is a signatory member to the JPA Agreement forming the Agency and is represented on the Agency's Board of Directors.
  - Casitas MWD is a wholesale water agency that provides a portion of the potable water supplied by Ventura Water within the Basin. Casitas MWD's service area overlaps with a western portion of the Basin. However, Casitas MWD does not operate any facilities in the Basin because Ventura Water's connection to Casitas MWD is located several miles north of the Basin.

DRAFT

- **Local Land Use Planning Agencies:**
  - The County of Ventura has land use planning authority on unincorporated land overlying the Basin (Figure 2.1-01). The County is a signatory member to the MBGSA JPA Agreement and is represented on the Agency's Board of Directors.
  - The City of Ventura has land use planning authority on incorporated land overlying the Basin (Figure 2.1-01). The City is a signatory member to the MBGSA JPA Agreement and is represented on the Agency's Board of Directors.
  - The City of Oxnard has land use planning authority over a small (0.5 square miles) area in the southwestern corner the Basin (Figure 2.1-01). This area consists of the last approximately 1 mile of the Santa Clara River, including its estuary. This area is designated "Resource Protection" and "Recreation" (a small area lies within the McGrath State Beach). Due to the very small area and the land use designations, it is very unlikely that the land use in this area will change or that groundwater wells would be drilled. Thus, MBGSA concluded that the land use planning by the City of Oxnard will not have a material impact on this GSP.

- **Environmental Users of Groundwater:** There are several environmental organizations dedicated to preserving and maintaining environmental values operating within the boundaries of the Basin. To account for these users' interests, the Agency designated a seat on its five-member governing board to be filled by an Environmental Stakeholder Director. The Environmental Stakeholder Director is appointed from nominations received from local environmental nonprofit organizations supportive of the Basin's groundwater sustainability. The Environmental Stakeholder Director is responsible for engaging stakeholders within the Basin and representing environmental interests before the Agency.
  - Environmental beneficial uses in the Basin include instream flow uses in interconnected reaches of the lower Santa Clara River and its Estuary and the associated GDE identified as GDE Area 11. However, these beneficial uses are not impacted by groundwater extraction because there is no groundwater extraction from the shallow groundwater units (a.k.a. Shallow Alluvial Deposits) and groundwater extraction from principal aquifers (Mugu and Hueneme aquifers) does not materially influence shallow groundwater levels or surface water flows (see Appendix G for explanation).
- **Surface Water Users:** There are no permitted or licensed surface water diversions in the Basin. Instream beneficial uses are described in the preceding bullet.
- **The Federal Government:** Not applicable because there is no federal land within the Basin.
- **California Native American Tribes:** The Mound Basin lies within the traditional tribal territory of the Chumash; however, there are no tribal trust lands located within the Basin. The Agency ensured that a representative of overlying California Native American tribes was on the Agency's interested parties list, in order to receive notices of all Agency meetings and other stakeholder involvement opportunities.
- **Disadvantaged Communities:** There are no domestic wells, community water supply wells, or mutual water companies serving water to DACs or Severely Disadvantaged Communities (SDACs) in the Basin. The City of Ventura (Ventura Water) serves the areas indicated by DWR as

DRAFT

DACs and SDACs. As the water supplier for DACs/SDACs in the Basin, the City represented DAC/SDAC interests through its participate on the MBGSA Board of Directors. In addition, direct outreach to DACs/SDACs was accomplished via Ventura Water bill stuffers and newsletters, including materials provided in Spanish.

- **Entities listed in §10927 that Monitor and Report Groundwater Elevations:**
  - The County of Ventura is the designated CASGEM entity for the Basin. The County is a signatory member to the JPA Agreement forming the Agency and represented on the Agency's Board of Directors.
  - United performs monitoring in the Basin and shares the data it collects with the County and MBGSA. United is a signatory member to the JPA Agreement forming the Agency and is represented on the Agency's Board of Directors.

2.3.2 Public Meetings [§354.10(b)]

§354.10 Notice and Communication. *Each Plan shall include a summary of information relating to notification and communication by the Agency with other agencies and interested parties including the following:*
(b) *A list of public meetings at which the Plan was discussed or considered by the Agency.*

A list of public meetings is included as Appendix E.

2.3.3 Public Comments [§354.10(c)]

§354.10 Notice and Communication. *Each Plan shall include a summary of information relating to notification and communication by the Agency with other agencies and interested parties including the following:*
(c) *Comments regarding the Plan received by the Agency and a summary of any responses by the Agency.*

Public comments and responses are included as Appendix F.

2.3.4 Communication [§354.10(d)]

2.3.4.1 Decision-Making Process [§354.10(d)(1)]

§354.10 Notice and Communication. *Each Plan shall include a summary of information relating to notification and communication by the Agency with other agencies and interested parties including the following:*
(d) *A communication section of the Plan that includes the following:*
(1) *An explanation of the Agency's decision-making process.*

The JPA that created MBGSA requires the GSA to hold public meetings at least quarterly that are noticed and meet all of the requirements of the Ralph M. Brown Act for transparency in California government. To hold a valid meeting the MBGSA must have a quorum of the Board of Directors, which consists of an absolute majority of directors plus one director. With these requirements in mind, the MBGSA:

- Holds board meetings on a regular schedule (no less frequently that quarterly);

- Provides written notice of meetings with meeting agenda and meeting material available at least 72 hours prior to regular meetings;
- Sends email meeting reminders to MBGSA's interested parties list; and
- Posts meeting agendas on https://www.moundbasingsa.org/ and at the meeting location prior to the meeting, as required by law.

MBGSA agendas include general public comments at the beginning of each board meeting. General comments allow community members to raise any groundwater-related issue that is not on the agenda. Public comment time is also given prior to a vote on all agenda items to ensure public opinion can be incorporated into MBGSA Board of Director decisions.

The MBGSA Board directs the Executive Director to fulfill the various requirements of SGMA. To do this, the Executive Director, with support from consultants and United staff, provides the Board with research and recommendation memos, work plans, technical summaries, budgets, and other work products as required to carry out board decisions. Most MBGSA decisions require an affirmative vote of a minimum of three Directors. There are certain matters that come before the MBGSA Board of Directors that require a unanimous vote of all Directors on first reading. If unanimity is not obtained on the first reading of the matter, the Board shall continue a final vote on the matter during a second reading approved by an affirmative vote of a minimum of three (3) Directors, and only if at least one (1) of the affirmative votes is by the City of San Buenaventura's Director or the Agricultural Stakeholder Director. Matters requiring the special voting provisions include of any of the following:

- Annual budget and amendments thereto;
- GSP for the Basin or any amendments thereto;
- Adoption of groundwater extraction fees or charges;
- Adoption of any taxes, fees, or assessments subject to Proposition 218; or
- Any stipulation to resolve litigation concerning groundwater rights within, or groundwater management for, the Basin.

2.3.4.2 Public Engagement [§354.10(d)(2) and (d)(3)]

§354.10 Notice and Communication. *Each Plan shall include a summary of information relating to notification and communication by the Agency with other agencies and interested parties including the following:*

(d) *A communication section of the Plan that includes the following:*

(2) *Identification of opportunities for public engagement and a discussion of how public input and response will be used.*

(3) *A description of how the Agency encourages the active involvement of diverse social, cultural, and economic elements of the population within the basin.*

MBGSA uses a variety of methods create opportunities for public engagement and obtain public input for consideration in GSP development and implementation. These methods are presented in the MBGSA SEP (Appendix D) and include:

- **Stakeholder Directors:** The MBGSA Board of Directors includes two stakeholder directors, one each for environmental and agricultural interests. Pursuant to the SEP, the stakeholder directors are responsible for actively obtaining input from their respective stakeholder constituencies and communicating that input to the MBGSA Board and Executive Director for consideration.
- **Direct Engagement by MBGSA Staff:** The Executive Director met or spoke directly with stakeholders during the GSP process, including Ivy Lawn Memorial Park (industrial well operator), City of Ventura, United, and members of MBAWG.
- **MBGSA Board Meetings:** Regular and Special meetings of the MBGSA Board of Directors provided opportunities for the public to engage with the Board, Executive Director, and consultants and provide direct input. The public is welcomed to comment at each meeting and the MBGSA Board regularly incorporates public suggestions into its deliberations and the decisions it makes during Board meetings. Meeting notes are kept by the Clerk of the Board and submitted to the MBGSA Board for approval. All meeting minutes and notes are collected on the MBGSA Website along with supporting agendas, packets, and presentation materials.
- **GSP Workshops:** MBGSA has held several public workshops to provide in depth discussion of the GSP and obtain stakeholder feedback. The workshops include polls to help facilitate public input on key issues and identify which outreach methods are most effective. Public input received during the GSP Workshops is reviewed with MBGSA Board of Directors during subsequent Board meetings prior to making decisions.
- **Online Comment Form:** MBGSA's website includes a comment submission form. The on-line form provides a convenient method for anyone to provide input on the GSP. All comments received via the website were compiled into a table and considered prior to GSP adoption. All comments submitted on-line were responded to in writing (Appendix F).
- **Contact with Staff:** The public is welcomed to contact MBGSA Executive Director or Clerk of the Boards and may do so via telephone, e-mail, or website inquiry (https://www.moundbasingsa.org/contact-us/).

MBGSA uses a variety of methods to inform stakeholders and encourage the active involvement of diverse social, cultural, and economic elements of the population within the groundwater pursuant to Water Code §10727.8(a). These methods are presented in the MBGSA SEP (Appendix D) and include:

- **Statement Describing the Manner in which Interested Parties May Participate in the Development and Implementation of the Groundwater Sustainability Plan (Water Code §10727.8(a)):** The statement was prepared and posted to DWW's SGMA Portal as part of filing a notice of intent to DWR of the MBGSA decision to develop a GSP for the Basin on September 17, 2018. The statement is included, provided in Appendix A, and was developed into the MBGSA SEP (Appendix D).
- **Development and Maintenance of an Interest Parties List:** MBGA developed an interest parties list prior to electing to become a GSA pursuant to Water Code §10723.8(a)(4) and maintained that list after becoming as GSA pursuant after to Water Code §10723.4. The interested parties list is used it to send e-mail meeting notices, agendas, newsletters, and updates.

- **Public Notices:** In accordance with Water Code §10723(b), §10730(b)(1), and §10728.4, MBGSA published public notices in accordance with Government Code §6066 prior to electing to be a GSA, before imposing or increasing groundwater extraction fees, and before adopting the GSP.
- **MBGSA Website:** The MBGSA website provides SGMA and agency information, includes meeting information, meeting materials, and links to meeting agendas and packets. The website provides links to agency resource materials, maps, newsletters, presentation materials, and meeting recordings.
- **Facebook:** The MBGSA Facebook page is used to push meeting notices and other information.
- **Periodic Newsletters:** MBGSA issues periodic newsletters concerning MBGSA status and activities.
- **Existing Outreach Venues:** MBGSA uses the Member Agencies existing outreach networks to provide regular updates about the GSP Development and, going forward, GSP implementation. This includes information via email newsletters, websites, bill inserts, and social media.
- **Santa Clara River Watershed Committee:** The Executive Director provides MBGSA updates during Santa Clara River Watershed Committee meetings and requests publication of MBGSA workshop notices via the Committee's email network.
- **Direct outreach to Public, including DACs/SDACs**: Ventura Water bill stuffers and newsletters about the MBGSA and GSP process were sent to every potable water user in the Basin, including materials provided in Spanish.

Public input was used to help shape the GSP development. The input was also used to develop content for MBGSA meetings, newsletters, and website content. MBGSA public meetings were designed to encourage input, discussion, and questions. Because the Basin and number of stakeholders is small, the meetings provided ample opportunity for everyone to provide comments and ask questions.

Examples of how public input helped shape the GSP include:

- During the development of the GSP water budget, outreach to the City of Ventura was performed to learn about the City's planned well replacements and planned future groundwater extraction rates. The City's planning estimated were incorporated into the planning process.
- During the development of the GSP water budget, outreach to MBAWG was performed to develop estimates of anticipated future agricultural cropping and groundwater extraction rates. MBAWG's estimates were incorporated into the planning process.
- During the analysis of potential land use change, outreach to MBAWG was performed to obtain input about the potential for development of agricultural land in the Basin. MBAWG's input on this topic was incorporated into the planning process.
- During development of SMC for the land subsidence sustainability indicator, outreach to the City of Ventura was performed to obtain input on critical infrastructure that could be potential impacted by land subsidence. The City provided information about the susceptibility of its sewer main that became a key factor in establishing the SMC for the land subsidence sustainability indicator.

- In addition to the above-described examples, input received from MBAWG and Ivy Lawn Memorial Park about costs helped focus the agency on ensuring the GSP is fit-for-purpose for the Basin and only includes aspects absolutely necessary to maintain sustainable conditions in the Basin.

2.3.4.3 Progress Updates [§354.10(d)(4)]

§354.10 Notice and Communication. *Each Plan shall include a summary of information relating to notification and communication by the Agency with other agencies and interested parties including the following:*
(d) *A communication section of the Plan that includes the following:*
(4) *The method the Agency shall follow to inform the public about progress implementing the Plan, including the status of projects and actions.*

MBGSA will continue to follow its adopted SEP to inform the public about progress implementing the GSP, including the status of projects and actions.

DRAFT

3.0 Basin Setting [Article 5, SubArticle 2]

§354.12 Introduction to Basin Setting. *This Subarticle describes the information about the physical setting and characteristics of the basin and current conditions of the basin that shall be part of each Plan, including the identification of data gaps and levels of uncertainty, which comprise the basin setting that serves as the basis for defining and assessing reasonable sustainable management criteria and projects and management actions. Information provided pursuant to this Subarticle shall be prepared by or under the direction of a professional geologist or professional engineer.*

This section describes the information about the characteristics and current conditions of Mound Basin that provide the basis for defining and assessing reasonable SMC, projects, and management actions. As required under §10733.2 of the California Water Code, this section was prepared by a professional geologist and includes subsections that describe the HCM, current and historical groundwater conditions, a water balance, and management areas within Mound Basin based on best available data and information available for Mound Basin at the time of preparation of this GSP.

Most of the information presented in this section is derived from the following sources, which synthesize and summarize and add to historical scientific studies and information:

- "Hydrogeologic Assessment of Mound Basin—United Water Conservation District Open-File Report 2012-01" (United, 2012);
- "Ventura Regional Groundwater Flow Model and Updated Hydrogeologic Conceptual Model: Oxnard Plain, Oxnard Forebay, Pleasant Valley, West Las Posas, and Mound Groundwater Basins—Open-File Report 2018-02" (United, 2018); and
- "Preliminary Hydrogeological Study—Mound Basin Groundwater Conditions and Perennial Yield Study" (Hopkins, 2020).

In addition to the above-listed studies, well construction, groundwater elevation, and groundwater quality data collected by United, VCWPD, and others were relied upon and have been compiled into the MBGSA DMS.

3.1 Hydrogeologic Conceptual Model [§354.14]

§354.14 Hydrogeological Conceptual Model.
(a) Each Plan shall include a descriptive hydrogeologic conceptual model of the basin based on technical studies and qualified maps that characterize the physical components and interaction of the surface water and groundwater systems in the basin.

This section provides a descriptive HCM of the Basin based on technical studies and qualified maps that characterize the physical components and interaction of the surface water and groundwater systems in Mound Basin, to the extent such characterization is possible based on existing best available data and information.

3.1.1 Regional Hydrology

Topography, surface water bodies, and imported water sources and points of delivery in Mound Basin are described below.

3.1.1.1 Topography [§354.14(d)(1)]

§354.14 Hydrogeological Conceptual Model.
(d) Physical characteristics of the basin shall be represented on one or more maps that depict the following:
(1) Topographic information derived from the U.S. Geological Survey or another reliable source.

Topography of Mound Basin is shown on Figure 3.1-01. The topography of Mound Basin consists largely of gently south-sloping coastal plain, coastal and alluvial terraces, and alluvial fans. The Santa Clara River floodplain and estuary occupies the southwest corner of the Basin, and moderately sloping hills rising to 1,000 feet above mean sea level (ft msl) are present along the northern margin of the Basin. Several small stream channels originate in the canyons above the Basin and trend south and southwest within the Basin, forming incised drainage features labeled "barrancas" (Spanish for "gullies") on United States Geological Survey (USGS) topographic maps of the region. The barrancas typically have a vertical relief in the range of 10 to 30 ft.

3.1.1.2 Surface Water Bodies [§354.14(d)(5)]

§354.14 Hydrogeological Conceptual Model.
(d) Physical characteristics of the basin shall be represented on one or more maps that depict the following:
(5) Surface water bodies that are significant to the management of the basin.

Surface water bodies within the Mound Basin include the Santa Clara River, its estuary, and the Pacific Ocean (Figure 3.1-01). In addition, three barrancas (Sanjon, Arundell, and Harmon) tributary to the Santa Clara River in Mound Basin are shown on Figure 3.1-01. The barrancas typically only flow in response to precipitation events. No springs or seeps are shown on USGS topographic maps within or adjacent to the boundaries of Mound Basin.

3.1.1.3 Imported Water [§354.14(d)(6)]

§354.14 Hydrogeological Conceptual Model.
(d) Physical characteristics of the basin shall be represented on one or more maps that depict the following:
(6) The source and point of delivery for imported water supplies.

Sources and approximate points of delivery of imported water supplies used in Mound Basin are shown on Figure 3.1-01. Three water purveyors import water into Mound Basin: Alta Mutual Water Company (Alta MWC), Farmers Irrigation Company (FICO), and the City of Ventura (Ventura Water), as follows:

- Alta MWC conveys approximately 200 AF/yr on average of groundwater extracted from its wells located in the Santa Paula and Oxnard Basins to farms in the eastern Mound Basin (B. Bondy of Alta MWC, personal communication, April 2020).

- FICO conveys approximately 1,000 AF/yr on average of groundwater extracted from its Santa Paula Basin wells to farms in the eastern Mound Basin (United, 2017a).
- Ventura Water imports water for municipal supply from several sources outside of Mound Basin, as follows (quantities of water reported below are averages for the period from 2015 to 2020 [Ventura Water, 2020a]):
  - Ventura Water extracts approximately 2,700 AF/yr of groundwater from its Saticoy wells in the Santa Paula Basin and supplies that water to portions of the City overlying both the Mound and Santa Paula Basins. Ventura Water has stated that the specific quantity of imported water from this source distributed to each basin is variable and cannot be precisely determined. However, estimating based on the area occupied by the City of Ventura in Santa Paula Basin and typical water use per acre for developed land in the region, it appears that most of the groundwater extracted from Santa Paula Basin by Ventura Water may be used within Santa Paula Basin, and the quantity of groundwater imported by the City of Ventura to Mound Basin is a relatively small portion of the 2,700 AF/yr total extracted.
  - Ventura Water extracts approximately 3,500 AF/yr of groundwater from its "Golf Course" well field in the Oxnard Basin for blending and distribution throughout its service area.
  - Ventura Water obtains approximately 5,000 AF/yr of water from the Ventura River watershed (sources include water from Casitas MWD and Ventura Water's facilities at Foster Park) for blending and distribution throughout its service area.
- Jam Mutual Water Company (agricultural) and several ranches straddle the basin boundary shared with the Oxnard Basin. It is assumed that small quantities of groundwater move across the basin boundary within these entities/parcels. The details of water movement across the basin boundary within these entities/parcels is not known.

3.1.2 Regional Geology [§354.14(b)(1) and (d)(2)]

§354.14 Hydrogeological Conceptual Model.
(b) *The hydrogeologic conceptual model shall be summarized in a written description that includes the following:*
(1) The regional geologic and structural setting of the basin including the immediate surrounding area, as necessary for geologic consistency.
(d) *Physical characteristics of the basin shall be represented on one or more maps that depict the following:*
(2) Surficial geology derived from a qualified map including the locations of cross-sections required by this Section.

This subsection describes the regional geologic and structural setting of Mound Basin. The groundwater basins of the Santa Clara River Valley, including Mound Basin, are within the Transverse Ranges geomorphic province of California, characterized by mountain ranges and valleys (basins) that are oriented east-west rather than the typical northwest-southeast trend common in the adjacent Peninsular and Coastal Ranges geomorphic provinces. Structurally, Mound Basin occurs within an elongate, complex syncline referred to as the Ventura structural basin, which trends east to west (Yeats et al., 1981). The province is tectonically active today as a result of transpressional stress related to right-lateral movement

along the San Andreas Fault, where the North American tectonic plate contacts the Pacific plate. This transpressional stress occurring in the Transverse Ranges results in ongoing uplift of the adjacent mountains while the basins continue to flex downward (deepen).

The Ventura structural basin is filled with sediments that were deposited in both marine and terrestrial settings (Yeats et al., 1981). Near the coast, sediments were deposited on a wide delta complex that formed at the terminus of the Santa Clara River. The total stratigraphic thickness of these marine and terrestrial deposits in the Ventura structural basin reportedly exceeds 55,000 ft (Sylvester and Brown, 1988). Surface exposures of the major rock units and structural features in the vicinity of Mound Basin are shown in a simplified manner on Figure 3.1-02 and are discussed below. A geologic map that shows more details of the shallow surficial sediments (including landslides, stream terraces, alluvium in active stream channels, artificial fill, alluvial fans, and other near-surface deposits) prepared by the California Geological Survey (Gutierrez et al., 2008) is provided on Figure 3.1-03.

Geologic units (strata) in Mound Basin that may contain freshwater aquifers or aquitards are classified from youngest (top) to oldest (bottom as follows):

- Recent (active) stream-channel deposits along the present course of the Santa Clara River and its tributaries;
- Holocene -age alluvial fan deposits, which cover most of the Mound Basin;
- Stream terrace deposits adjacent to the Santa Clara River;
- Undifferentiated older alluvium of Pleistocene age; and
- Semi-consolidated sand, gravel, and clay deposits of the San Pedro Formation (also referred to as the Saugus Formation and/or Las Posas Formation by some researchers, most recently by Gutierrez et al., 2008), of late Pleistocene age.

Stratigraphic relationships are shown conceptually on Figure 3.1-04. The classification approach shown on Figure 3.1-04 is based largely on hydrogeologic characteristics (United, 2018). Other researchers have divided these deposits in other, equally valid ways, based on geomorphological or other characteristics (e.g., Mukae and Turner, 1975; Dibblee, 1992; USGS, 2003a; Hopkins, 2020). For example, Hopkins Groundwater Consultants, Inc. (Hopkins), mapped the subsurface geologic formations through Mound Basin based upon 10 cross-sections. Cross-sections showing the subsurface geometry of these units are shown on Figures 3.1-05 through 3.1-08.

Older (and typically deeper) strata than those listed above typically are poorly permeable or contain water that is too brackish or saline for municipal or agricultural uses. These strata include (following the descriptions of Burton et al., 2011):

- Sandstone, siltstone, and shale of the Santa Barbara Formation (Yerkes, 1987), of early Pleistocene age. This unit was mapped as the “Mudpit Claystone Member of the Pico formation” by Dibblee (1988, 1992), but several more recent investigations, including those by Burton et al. (2011), the USGS (2003a), and United (2012, 2018), refer to this unit as the Santa Barbara Formation.
- Marine siltstones, sandstones, and conglomerates of the Pico Formation, of Pliocene or early Pleistocene age.

DRAFT

- Marine shales of the Sisquoc and the Monterey Formation, both of Miocene age, which underlie the Pico Formation at depth.

Within the Ventura structural basin, the trend of many (but not all) geologic structures is east-northeast to west-southwest, consistent with regional structural trends (Figure 3.1-02). The Country Club, Oak Ridge, and McGrath (sometimes referred to as Montalvo) faults have previously been identified as significantly limiting or diverting groundwater flow (John F. Mann Jr. & Associates, 1959; Mukae and Turner, 1975; Weber et al., 1976). In general, the older (deeper) geologic units show greater displacement across these faults than the younger (shallower) units. Therefore, groundwater flow in the deeper aquifers can typically be expected to be more disrupted across faults than groundwater flow in shallow aquifers.

Similar to faults in the Ventura structural basin, the axes of major folds (anticlines and synclines) in the sedimentary strata tend to be oriented approximately east-northeast to west-southwest (Figure 3.1-02). The axis of the Ventura-Santa Clara River syncline trends through Mound Basin in an east-west direction, plunging gradually to the west. The Montalvo-South Mountain-Oak Ridge Anticline is approximately parallel to the Ventura-Santa Clara River Syncline and is located near the southern boundary of Mound Basin (Geotechnical Consultants, 1972). Some workers also place a parallel fault at the location of the Montalvo-South Mountain-Oak Ridge Anticline (John F. Mann Jr. & Associates, 1959; Fugro West, 1996). Folding in the Ventura structural basin is ongoing, with older strata (including those that comprise deep aquifers) being more deformed than younger strata (including shallow aquifers). The limbs of these folds are gently dipping within most of the freshwater-bearing strata in Mound Basin and adjacent Oxnard Basin (United, 2018). Therefore, it is unlikely that the folds themselves have a notable direct impact on groundwater flow. However, changes in strata thickness (which affects transmissivity), outcrop area (which affects where recharge occurs), and other hydraulic properties of strata can potentially be indirectly influenced by fold geometry.

3.1.3 Soil Characteristics [§354.14 (d)(3)]

§354.14 Hydrogeological Conceptual Model.
(d) *Physical characteristics of the basin shall be represented on one or more maps that depict the following:*
(3) Soil characteristics as described by the appropriate Natural Resources Conservation Service soil survey or other applicable studies.

The hydrologic characteristics of soils in Mound Basin were downloaded from the Natural Resources Conservation Service (NRCS) online database (NRCS, 2020). Relevant soil information available from the NRCS for groundwater sustainability planning purposes includes soil infiltration capacity, which is shown on Figure 3.1-09. Most of the soils in Mound Basin are reported to have low to very low infiltration rates (Groups C and D, respectively). However, moderate-infiltration-rate soils are reportedly present in an approximately 1-mile-wide band oriented east-to-west along the axis of the Basin (Figure 3.1-09). Smaller areas of high-infiltration-rate soils are reportedly present near the Santa Clara River, Harmon Barranca, and in some of the canyons in the foothills in the north part of Mound Basin.

Some clay-rich soils within the Holocene and Pleistocene alluvial deposits present in Mound Basin may be of sufficiently low vertical permeability to allow the formation of thin, discontinuous lenses or layers of shallow, “perched” groundwater above the primary saturated zone of the Shallow Alluvial Deposits (described in the next subsection of this GSP), which is supported by the presence of tile drainage systems.

DRAFT

Municipal and agricultural return flows contribute substantial quantities of infiltrating water at land surface in Mound Basin, supplementing natural recharge of precipitation (discussed in more detail in Sections 3.1.4.2 and 3.3). When the rate of infiltration exceeds the ability of silt and clay lenses and layers to allow the water to pass through them, small saturated zones can develop in the soil. Groundwater in perched zones typically moves laterally to better-draining soils, where it can then resume its downward infiltration, or it may migrate laterally to nearby depressions in the topography, where it seeps out at land surface, evaporates, or is transpired by vegetation.

3.1.4 Principal Aquifers and Aquitards [§354.14(b)(4)(A)]

§354.14 Hydrogeological Conceptual Model.
(b) *The hydrogeologic conceptual model shall be summarized in a written description that includes the following:*
(4) Principal aquifers and aquitards, including the following information:
(A) Formation names, if defined.

Strata with distinct hydrogeologic characteristics are referred to as hydrostratigraphic units (HSUs). Aquifers have traditionally been defined as those HSUs that are capable of yielding appreciable quantities of groundwater to wells or springs. The SGMA defines "principal aquifers" as "aquifers or aquifer systems that store, transmit, and yield significant or economic quantities of groundwater to wells, springs, or surface water systems." Aquitards, on the other hand, are poorly permeable HSUs that impede groundwater movement (typically in the vertical direction) and generally do not yield appreciable quantities of groundwater to wells or springs.

The aquifers in Mound Basin consist of layers and lenses of relatively coarse-grained, permeable sediments (primarily sand and gravel) deposited within unconsolidated alluvium and the underlying, semi-consolidated San Pedro Formation (Figure 3.1-04). Aquitards present between the aquifers in Mound Basin consist of layers of poorly permeable fine-grained sediments (primarily silt and clay, Figure 3.1-04).

In Mound Basin, distinct HSUs were identified by United (2018) during their recent update of the HCM for the region. United (2018) observed that electrical-log "signatures" of the Mugu, Hueneme, and Fox Canyon aquifers (and the aquitards between these aquifers) observed in wells in the Oxnard Basin are often recognizable north of the McGrath Fault (Figure 3.1-02). The HSUs are generally grouped into three major "aquifer systems" as follows (from shallow to deep): the Shallow Alluvial Deposits, the Upper Aquifer System (UAS), and the Lower Aquifer System (LAS). Figure 3.1-04 shows the names and relationships between HSUs in Mound Basin, together with their corresponding geologic formations and ages. Details regarding the aquifers and aquitards within each aquifer system are provided below.

DRAFT

3.1.4.1 Physical Properties of Aquifers and Aquitards

3.1.4.1.1 Basin Boundary (Vertical and Lateral Extent of Basin) [§354.14(b)(2),(b)(3), and (c)]

§ 354.14 Hydrogeological Conceptual Model.

(b) *The hydrogeologic conceptual model shall be summarized in a written description that includes the following:*

(2) Lateral basin boundaries, including major geologic features that significantly affect groundwater flow.

(3) The definable bottom of the basin.

(c) The hydrogeologic conceptual model shall be represented graphically by at least two scaled cross-sections that display the information required by this section and are sufficient to depict major stratigraphic and structural features in the basin.

The lateral boundaries of Mound Basin determined by DWR (2019) are defined as follows:

- **East:** The eastern boundary is defined by the western jurisdictional boundary of the Santa Paula Basin stipulated judgment (adjudication), as approved by DWR (2019) pursuant to a formal Basin Boundary Modification. This jurisdictional boundary is approximately aligned with the Country Club Fault system (Figure 3.1-02). The Country Club Fault system offsets the aquifers (see cross-section A-A', Figure 3.1-05) and impedes groundwater flow from the Santa Paula Basin into the Mound Basin.
- **Northwest:** The northwestern boundary is defined by the hydraulic divide between Mound Basin, Lower Ventura River Subbasin (Figure 3.1-01).
- **West:** The western boundary is the Pacific Ocean shoreline. However, it should be noted that the UAS and LAS in Mound Basin extend approximately 10 miles offshore under the Pacific Ocean west of the shoreline, where they are mapped as cropping out on the continental shelf, as shown on Figure 3.1-10. The submarine outcrops may be covered with fine-grained marine sediments, such as silt and clay (Greene et al., 1978) that would tend to impede interaction of seawater with fresh water from the aquifers. Although DWR has delineated the western boundary of Mound Basin at the shoreline, the offshore portions of the principal aquifers of Mound Basin are in all likelihood capable of storing and transmitting significant quantities of fresh groundwater that has migrated westward from inland recharge areas. Because DWR (2019) does not include this offshore area within the boundaries of Mound Basin, it is not included in calculations of area of Mound Basin or volumes of groundwater in storage in each aquifer. However, it must be emphasized that fresh groundwater can flow within the aquifers of Mound Basin either to or from the offshore areas without impediment, and groundwater flowing eastward (landward) across this boundary should not be assumed to consist of seawater.
- **North:** The northern boundary is defined by the contact of the San Pedro Formation (the deepest freshwater-bearing formation in the Basin) with the underlying Santa Barbara Formation (Figure 3.1-02; the Santa Barbara Formation is mapped as the "Mudpit Claystone Member of the Pico formation" by Dibblee [1988, 1992]). The northern boundary of Mound Basin is at the northern edge of cross-section B-B', where the Fox Canyon Aquifer basal aquitard is in contact with the Santa Barbara Formation (Figure 3.1-06).

DRAFT

- **South:** The southern boundary is defined by the northern jurisdictional boundary of the FCGMA, which also serves as boundary between the Mound and Oxnard basins, as approved by DWR (2019) pursuant to a formal Basin Boundary Modification. This jurisdictional boundary is approximately aligned with the axis of the Montalvo-South Mountain-Oak Ridge Anticline and the McGrath Fault (Figure 3.1-02), which were understood at the time of formation of the FCGMA (early 1980s) to be the approximate northern limit of the Oxnard Basin.

The "bottom" of the Basin is defined by the effective base of fresh water as described by Mukae and Turner (1975), which they mapped as the base of the San Pedro Formation. The lowermost strata of the San Pedro Formation have also been referred to as the Las Posas Sand (Dibblee, 1988, 1992). In Mound Basin, the San Pedro Formation overlies poorly permeable siltstone and shale of the Santa Barbara Formation (where present) and the Pico Formation (note: some investigators, including Dibblee [1988, 1992]) include portions of the Santa Barbara Formation in the Pico Formation). The depth to these units varies from as little as 0 ft below ground surface (bgs) along the northern basin boundary to approximately 2,400 ft bgs along the axis of the Ventura-Santa Clara River syncline, as shown on cross-sections A-A' through D-D' (Figures 3.1-05 through 3.1-08).

3.1.4.1.2 Groundwater Flow Barriers [§354.14(b)(4)(C)]

§354.14 Hydrogeological Conceptual Model.
(b) *The hydrogeologic conceptual model shall be summarized in a written description that includes the following:*
(4) *Principal aquifers and aquitards, including the following information:*
(C) Structural properties of the basin that restrict groundwater flow within the principal aquifers, including information regarding stratigraphic changes, truncation of units, or other features.

Geologic structures in Mound Basin affect groundwater flow within the aquifers to varying degrees. The most common example is where upward or downward apparent displacement (throw) of aquifer materials across a fault plane disrupts an aquifer's lateral continuity. Such an offset can impede groundwater flow through the aquifer along the fault plane. In Mound Basin, faulting has caused greater displacement (and correspondingly greater potential to impede groundwater flow) in the aquifers of the LAS, which are older (and thus have undergone more faulting and folding) than the aquifers of the UAS. The following subsections describe the primary structures that are believed to impact groundwater flow.

Country Club Fault

The trace of the Country Club Fault forms a northwest-trending arc approximately corresponding with the eastern boundary of Mound Basin adjacent to Santa Paula Basin (Figure 3.1-02). It is a steeply dipping (almost vertical) reverse fault with some left-lateral displacement (Turner, 1975). United's (2012, 2018) inspection of electrical logs for oil wells in the area indicate a displacement of 1,600 to 1,800 ft, with the southwest wall displaced upward relative to the northeast wall (Figure 3.1-05), consistent with the offset reported by previous investigators (Fugro West, 1996; Geotechnical Consultants, 1972). Review of electrical logs for wells in the area suggests that only a portion of the low-permeability Santa Barbara Formation has been uplifted against the San Pedro Formation (which contains the Hueneme and Fox Canyon aquifers). With aquifers of the San Pedro Formation present on both sides of the Country Club Fault above the displaced Santa Barbara Formation, the Country Club Fault is not considered to be a

complete barrier to groundwater flow. The fault is not believed to extend upward through the undifferentiated younger alluvium (Geotechnical Consultants, 1972). Consistent with the above geologic information, previous investigators, including USGS (2003a) and United (2018), have noted a consistently steeper hydraulic gradient along the fault at the boundary between Mound Basin and Santa Paula Basin, compared with more gentle hydraulic gradients elsewhere within these basins. Such a steepening of hydraulic gradients is common along faults that impede groundwater flow. To calibrate its groundwater flow model for this area, United (2018) applied a conductance of 0.00001 square ft per day to the Country Club Fault, indicating it is a significant impedance to groundwater flow.

Oak Ridge and McGrath Faults

The Oak Ridge and McGrath Faults trend east-northeast to west-southwest in the southern Mound Basin (Figure 3.1-02). As noted by Yerkes et al. (1987), these faults are buried and known only from subsurface data in this area. Yerkes et al. (1987) describe two pressure ridges in Mound Basin as isolated, elongate northwest-trending structural uplifts. These ridges are described as compressional features and are compatible with left-lateral slip along the adjacent Oak Ridge Fault. Their existence suggests a significant strike-slip component along the Oak Ridge Fault as well as a reverse fault uplift on the south side.

Based on review of electrical logs, United (2012) determined that vertical displacement of approximately 700 ft of vertical displacement occurs along the McGrath Fault, with the up-thrown side on the south. This offset has juxtaposed the low-permeability Santa Barbara Formation against the lower section of the San Pedro Formation (Figures 3.1-06). Another notable feature is the significant difference in San Pedro Formation thickness across the McGrath Fault shown on cross-section B-B' (Figure 3.1-06). The younger deposits overlying the San Pedro Formation (Mugu Aquifer and Shallow Alluvial Deposits), do not appear to have been offset to the same degree as the LAS by either the McGrath or Oak Ridge faults (Figures 3.1-06 and 3.1-07). Calibration of groundwater flow models for the area (USGS, 2003a; United, 2018) required incorporating the Oak Ridge and McGrath faults as horizontal flow barriers, consistent with the concept that these faults restrict flow to some degree. In its regional groundwater flow model, United (2018) found that assigning a conductance to these faults of 0.0001 square ft per day resulted in an acceptable calibration.

Ventura, Pitas Point, and Foothill Faults

The Ventura and Foothill faults trend east to west in the northern part of Mound Basin (Figure 3.1-02). The Pitas Point Fault is the westerly, offshore (mostly) extension of the Ventura Fault (Greene et al., 1978). The Ventura and Pitas Point Faults are reverse faults that dip to the north at a high angle; upward movement of the north side of the fault likely contributed to formation of the foothills in the north part of Mound Basin (Yerkes at al., 1987). The Foothill Fault is included in a USGS database of Quaternary faults (Burton et al., 2011), and an inferred fault is shown in approximately the same location by Yerkes et al. (1987). It is also shown on the geologic map included in the Hopkins (2020) report for Mound Basin. United (2012) hypothesized that the Foothill Fault is a reverse fault that dips to the north, similar to the Ventura and Pitas Point Faults.

As a result of vertical offset of the San Pedro Formation along the Ventura, Pitas Point, and Foothill Faults ranging from tens to hundreds of feet (Figures 3.1-06 and 3.1-07), it is inferred that these faults impede groundwater flow in the aquifers to some degree because, as shown on cross-section B-B' (Figure 3.1-06) the faulting disrupts the lateral continuity of the aquifers and juxtaposes different HSUs across the fault

plane. However, no groundwater monitoring wells are located north and south of these faults to detect groundwater elevation changes across them that would allow estimation of conductance across the faults. Neither the USGS (2003a) nor United (2018) modeled these faults as horizontal flow barriers due to lack of data to support calibration of the barrier effect of these faults.

3.1.4.1.3 Hydraulic Properties [§354.14(b)(4)(B)]

§354.14 Hydrogeological Conceptual Model.
(b) *The hydrogeologic conceptual model shall be summarized in a written description that includes the following:*
(4) *Principal aquifers and aquitards, including the following information:*
(B) Physical properties of aquifers and aquitards, including the vertical and lateral extent, hydraulic conductivity, and storativity, which may be based on existing technical studies or other best available information.

This subsection provides a written description of the physical properties of the aquifers and aquitards within Mound Basin, including estimates of their lateral extent, thickness, hydraulic conductivity, and storativity. The lateral and vertical extents of the aquifers and aquitards are depicted on cross-sections A-A' through D-D' (Figures 3.1-05 through 3.1-08). At the time of writing of this GSP, no aquifer test results for hydraulic conductivity or storativity were found in available references. However, well information collected over the past several decades by United (now included in the MBGSA's DMS) from well completion reports includes 10 specific-capacity measurements obtained at water supply and monitoring wells in Mound Basin, which were considered when United (2018) calibrated its numerical groundwater flow model of the region.

For basin-wide estimates of hydraulic conductivity and storativity for each aquifer in Mound Basin, this GSP relies on United's calibrated flow model for the region, which was constructed in 2018 (United, 2018), then expanded and recalibrated in 2020 (United, 2021a). The United model is considered the best available information concerning aquifer and aquitard properties. These estimates are summarized in Table 3.1-01. However, it is recognized that on a local scale, hydraulic conductivity can vary by orders of magnitude over short distances, and there may be areas in Mound Basin where hydraulic conductivity is higher or lower than the values shown on Table 3.1-01.

Shallow Alluvial Deposits

The Shallow Alluvial Deposits in Mound Basin primarily consist of Holocene alluvial fan deposits (USGS, 2003b, 2003c, 2004) deposited by streams emanating from mountain canyons to the north. These deposits are composed of moderately to poorly sorted interbedded sandy clay with some gravel (USGS, 2003b, 2003c, 2004). The Shallow Alluvial Deposits are present in most areas of Mound Basin, except on the hillsides along the northern flank of the Basin (United, 2018). The alluvial fan deposits that comprise the Shallow Alluvial Deposits consist of stream terrace deposits and active wash deposits along the Santa Clara River where the alluvial fan deposits are absent (Figure 3.1-03). The stream terrace deposits include point bar and overbank deposits that consist of poorly sorted clayey sand and sandy clay with gravel (USGS 2003b). The HCM indicates thickness of the Shallow Alluvial Deposits range from less than 50 ft along the margins of Mound Basin to more than 100 ft in the central portion of the Basin (Figures 3.1-05 through 3.1-08) (United, 2018). The Shallow Alluvial Deposits are unconfined across Mound Basin (United, 2012, 2018).

Since 1979, when reporting of groundwater extraction from wells was mandated within United's service area, no extraction has been reported from the Shallow Alluvial Deposits for water supply in Mound Basin (pumping data for water supply wells are included in the Mound Basin DMS), likely due to insufficient saturated thickness and/or poor water quality. The Shallow Alluvial Deposits are not considered a "principal aquifer" at this time for the purpose of groundwater sustainability planning. The analysis and justification for not considering the Shallow Alluvial Deposits as a principal aquifer under SGMA for this GSP is presented in Appendix G.

Based on calibration of its regional groundwater flow model, United (2021a) estimated the horizontal hydraulic conductivity of the Shallow Alluvial Deposits to be 200 feet per day (ft/d) in Mound Basin, and the vertical hydraulic conductivity to be 20 ft/d. The specific yield of the Shallow Alluvial Deposits in the groundwater flow model is 15% (United, 2021a). These values do not apply to localized stream terrace deposits along the Santa Clara River where shallow groundwater interconnects with the Santa Clara River and GDEs are present (i.e. GDE Area No. 11). The presence of tile drains on agricultural lands situated on the stream terrace deposits (Figures 2.1-03 and 3.1-09) suggests that the stream terrace deposits are poorly permeable and, therefore, are not considered to be an aquifer, but may contain perched groundwater zones.

Hydrostratigraphic data, groundwater level data, groundwater quality data, and numerical modeling results demonstrate that shallow groundwater levels within the Shallow Alluvial Deposits and interconnected surface water of the Santa Clara River and its estuary are not materially influenced by extraction from the principal aquifers (please see Appendix G for details).

Upper Aquifer System

The UAS in Mound Basin consists of fine-grained Pleistocene deposits (which behaves as an aquitard) and the Mugu Aquifer. Each of these HSUs is described in more detail below.

Fine-Grained Pleistocene Deposits

United (2018) reports the presence of fine-grained Pleistocene deposits in Mound Basin, consisting primarily of a thick sequence of clays and silts, with sparse interbeds or lenses of sand and gravel. These deposits are stratigraphically equivalent to the Oxnard Aquifer of the Oxnard Basin, but do not yield significant quantities of groundwater in Mound Basin. This HSU has been logged to depths of 350 to 600 ft (typically 100 to 400 ft thick) in a number of wells in Mound Basin (Figures 3.1-05 through 3.1-08). Along the Oxnard Basin boundary these deposits abut or interfinger with the Oxnard Aquifer. Because of its fine-grained nature, this HSU generally is poorly permeable and is rarely targeted for groundwater production; therefore, few data are available regarding its hydraulic parameters. It is possible that sand and gravel layers or lenses in this HSU could contain modest volumes of fresh groundwater.

Based on calibration of its regional groundwater flow model, United (2021a) estimated the horizontal hydraulic conductivity of the fine-grained Pleistocene deposits to be 0.01 ft/d, typical of an aquitard rather than an aquifer, and vertical hydraulic conductivity to be 0.001 ft/d. The specific yield and storage coefficient for this unit were estimated by United (2021a) to be approximately 5% and 0.001 (dimensionless), respectively. This HSU acts as a confining unit for the Mugu Aquifer in Mound Basin, except along the northern margin of the Basin where the San Pedro Formation (which includes the Hueneme and Fox Canyon aquifers) is exposed at land surface and, therefore, is unconfined.

Mugu Aquifer

The Mugu Aquifer consists of marine and non-marine sands and gravels with interbedded silt and clay that lie below the fine-grained Pleistocene deposits and unconformably overlie the San Pedro Formation (Figures 3.1-05 through 3.1-08). Thickness of the Mugu Aquifer in Mound Basin is variable, ranging from approximately 100 to 425 ft, based on borehole geophysical logs reviewed by United (2018). The Mugu Aquifer is generally thickest along the northeast-southwest axis of the Basin, and thins to the north, where it pinches out south of the northern basin boundary. The Mugu Aquifer also thins (to approximately 200 ft) in the south toward the boundary with the Oxnard Basin. Several water supply wells in Mound Basin are screened in the Mugu Aquifer, as it is generally the first aquifer encountered when drilling that yields significant quantities of acceptable-quality groundwater.

Based on calibration of its regional groundwater flow model, United (2021a) estimated the horizontal hydraulic conductivity of the Mugu Aquifer to be 100 ft/d in Mound Basin, and vertical hydraulic conductivity to be 10 ft/d. The specific yield and storage coefficient used in the model (United, 2021a) were approximately 15% where unconfined (along the northern basin margin) and 0.001 (dimensionless) where confined (throughout most of the Basin), respectively.

As described in more detail in Section 3.1.4.4, the Mugu Aquifer stores, transmits, and yields significant or economic quantities of groundwater to wells; therefore, it is considered a "principal aquifer" of Mound Basin.

Lower Aquifer System

The LAS in Mound Basin includes the Hueneme and Fox Canyon aquifers, as well as the aquitards present between each aquifer. These aquifers and aquitards consist of relatively coarse- and fine-grained strata, respectively, of the San Pedro Formation, which is Pleistocene in age. The LAS, being older than the UAS, has undergone more faulting and folding. It has also been eroded, creating an unconformity that separates the UAS from the LAS (Turner, 1975). Except near the northern margin of Mound Basin, the LAS is overlain unconformably by the UAS. The San Pedro Formation crops out in the foothills near the northern boundary of the Basin, attaining a maximum thickness of 2,300 ft in this region (Geotechnical Consultants, 1972). In this area, the aquifers of the San Pedro Formation are not overlain by confining units, and, therefore, are unconfined. The aquifers of the LAS are isolated from each other vertically by relatively low-permeability silt and clay layers called the "Hueneme-Fox Canyon Aquitard." The base of the LAS is considered to be the base of fresh water (Mukae and Turner, 1975). Beneath the LAS lie older sedimentary rocks that are generally considered to contain brackish to saline water or to be poorly transmissive (Mukae and Turner, 1975) and are not used for water supply in Mound Basin. More details regarding each aquifer and aquitard comprised by the LAS are provided below.

Mugu-Hueneme Aquitard

The upper portion of the LAS in Mound Basin (immediately below the Mugu Formation) consists of poorly permeable sediments with relatively high silt and clay content. This unit is referred to by United (2018) as the Mugu-Hueneme Aquitard. Electrical logs for oil and water wells in the region show that this aquitard is present throughout most of Mound Basin between the Mugu and Hueneme aquifers, except along the northern margin of the Basin where this unit has been uplifted by the Ventura-Pitas Point Fault and eroded away. Thickness of this aquitard ranges from approximately 100 ft at the northern margins of the Basin to 200 ft near the center of the Basin (Figures 3.1-05 through 3.1-08).

Based on calibration of its regional groundwater flow model, United (2021a) estimated the horizontal hydraulic conductivity of the Mugu-Hueneme Aquitard to be approximately 0.01 ft/d in Mound Basin, and vertical hydraulic conductivity to be 0.001 ft/d. The specific yield for the Mugu-Hueneme Aquitard in Mound Basin in the model is 5% where unconfined (along the northern basin margin), and the storage coefficient is 0.0005 (dimensionless) where confined (throughout most of the Basin).

Hueneme Aquifer

A series of interbedded, water-bearing sands in the upper approximately two-thirds of the San Pedro Formation comprise the Hueneme Aquifer (United, 2018). Structural complexities have resulted in thinning of these beds in the southern part of Mound Basin (south of the Oak Ridge and McGrath faults), compared to the central axis of Mound Basin (Figures 3.1-06 and 3.1-07). In the central and northern parts of the Basin, resistivity-log signatures indicate some lithologic differences in this unit compared to its lithology in the Oxnard Basin; specifically, some of the coarse-grained strata of the Hueneme Aquifer thin or become increasingly lenticular in the northward direction (United, 2012). However, thick (up to 1,000 ft) sections of the Hueneme Aquifer (or time-equivalent strata) do occur in Mound Basin, as oil well electrical logs interpreted by United (2012) indicate variable amounts of coarse-grained (permeable) materials. Borehole geophysical (resistivity) logs reviewed by United (2018) indicate the Hueneme Aquifer is generally thickest (typically 1,000 ft) along the northeast-southwest axis of the Basin, becoming thinner (200 to 600 ft) along the northern and southern basin boundaries. Most of the water supply wells in Mound Basin are screened primarily or entirely in the Hueneme Aquifer.

Based on calibration of its regional groundwater flow model, United (2021a) estimated the horizontal hydraulic conductivity of the Hueneme Aquifer to be 20 ft/d throughout Mound Basin, and vertical hydraulic conductivity to be 2 ft/d. The specific yield for the Hueneme Aquifer in Mound Basin in the model is 10% where unconfined (along the northern basin margin), and the storage coefficient is 0.005 (dimensionless) where confined (throughout most of the Basin).

As described in more detail in Section 3.1.4.4, the Hueneme Aquifer stores, transmits, and yields significant or economic quantities of groundwater to wells; therefore, it is considered a “principal aquifer” of Mound Basin.

Hueneme-Fox Canyon Aquitard

Below the Hueneme Aquifer, laterally extensive deposits of silt and clay of the San Pedro Formation up to approximately 100 ft thick (Figures 3.1-05 through 3.1-08) with interbeds of sand and gravel form an aquitard between the Hueneme and Fox Canyon aquifers throughout Mound Basin. This HSU is referred to by United (2018) as the Hueneme-Fox Canyon Aquitard.

Based on calibration of its regional groundwater flow model, United (2021a) estimated the horizontal hydraulic conductivity of the Hueneme-Fox Canyon Aquitard to be 0.01 ft/d in most of Mound Basin, and vertical hydraulic conductivity to be 0.001 ft/d. The specific yield for the Mugu-Hueneme Aquitard in Mound Basin in the model is 5% where unconfined (along the northern basin margin), and the storage coefficient estimated to be 0.0005 (dimensionless) where confined (throughout most of the Basin).

DRAFT

Fox Canyon Aquifer

Lower portions of the San Pedro Formation consist principally of sand and gravel zones with variable thicknesses of interstratified clay and silt (United, 2018). In a northerly direction across Mound Basin, these coarser-grained water-bearing strata are somewhat lenticular and generally become thinner (John F. Mann Jr. & Associates, 1959; Geotechnical Consultants, 1972), similar to the Hueneme Aquifer. The sand and gravel zone located at or near the base of the San Pedro Formation is known as the Fox Canyon Aquifer in the Oxnard Basin, and United (2012, 2018) extends that nomenclature for this HSU to Mound Basin as well. Electrical-log data and outcrops near the base of the San Pedro Formation in the foothills on the north side of Mound Basin do not indicate the same aquifer thickness or sediment coarseness as observed at the location in Fox Canyon on the south flank of South Mountain, 11 miles southeast of Mound Basin (Geotechnical Consultants, 1972; United, 2012). However, the distinct borehole resistivity-log signature of the Fox Canyon Aquifer is discernible across Mound Basin and adjacent areas (United, 2012). The Fox Canyon Aquifer commonly occurs at depths greater than 1,000 ft in Mound Basin and is not targeted for groundwater supply (United, 2012), with the exception of two active water supply wells that are screened partly in the Fox Canyon Aquifer and partly in the overlying Hueneme Aquifer (Table 3.1-02).

Borehole resistivity logs reviewed by United (2018) indicate that the Fox Canyon Aquifer in Mound Basin is typically 400 to 600 ft thick (Figures 3.1-05 through 3.1-08). However, as discussed above, the coarser-grained layers that comprise the main water-producing zones of the Fox Canyon Aquifer thin and become more lenticular in a northerly direction across Mound Basin, as shown on the resistivity logs on Figures 3.1-06 and 3.1-07. In the Oxnard Basin, John F. Mann Jr. & Associates (1959) further divided the Fox Canyon Aquifer into a “main” (sometimes called “upper”) member and a “basal” member (at the base of the San Pedro Formation), separated by a 50-ft-thick aquitard consisting primarily of fine-grained sediments. United (2018) incorporated this subdivision of the Fox Canyon Aquifer into their regional groundwater flow model. No water supply wells in Mound Basin are screened to the depth needed to reach the basal Fox Canyon Aquifer; therefore, the hydraulic characteristics of this unit are uncertain.

Based on calibration of its regional groundwater flow model, United (2021a) estimated the horizontal hydraulic conductivity of the main Fox Canyon Aquifer to be 10 ft/d in most of Mound Basin, and vertical hydraulic conductivity to be 1 ft/d. The specific yield for the main Fox Canyon Aquifer in Mound Basin in the model is 10% where unconfined (along the northern basin margin), and the storage coefficient is 0.005 (dimensionless) where confined (throughout most of the Basin). Identical hydraulic parameters are assumed for the basal Fox Canyon Aquifer (United, 2021a).

Owing to the lack of wells screened in the Fox Canyon Aquifer, it does not meet the SGMA definition of a principal aquifer because it does not currently (and has not, historically) “store, transmit, and yield significant or economic quantities of groundwater to wells, springs, or surface water systems” in Mound Basin. If future water supply wells are screened in the Fox Canyon Aquifer, then this designation should be reconsidered as part of the required periodic GSP update process.

DRAFT

3.1.4.2 Groundwater Recharge and Discharge Areas [§354.14(d)(4)]

§354.14 Hydrogeological Conceptual Model.
(d) Physical characteristics of the basin shall be represented on one or more maps that depict the following:
(4) Delineation of existing recharge areas that substantially contribute to the replenishment of the basin, potential recharge areas, and discharge areas, including significant active springs, seeps, and wetlands within or adjacent to the basin.

Multiple sources of groundwater recharge (water that enters an underlying groundwater system from land surface) occur in Mound Basin (United, 2018), including:

- Infiltration of precipitation—Most infiltration of precipitation recharges the Shallow Alluvial Deposits, although some infiltration of precipitation occurs in outcrops of the Hueneme and Fox Canyon aquifers in the foothills in the northern part of Mound Basin.
- Mountain-front recharge—For this report, the term "mountain-front recharge" refers to infiltration of runoff from the foothills north of Mound Basin, where many of the small drainages in Mound Basin have watersheds that extend northward beyond the basin boundary. Both United (2018) and the USGS (2003a) computed monthly runoff in each of these small catchment areas based on rainfall and incorporated infiltration of this runoff into aquifers as a recharge component in their regional numerical models. Infiltration of this runoff is assumed to occur within a short distance (2,000 ft) south of the basin boundary, where the Hueneme and Fox Canyon aquifers are exposed at land surface. In Mound Basin, infiltration of this runoff recharges the Hueneme and Fox Canyon aquifers. To simplify the input to United's (2021a) regional groundwater flow model, all areal recharge (as well as mountain-front recharge) in the northern foothills of Mound Basin was simulated to infiltrate the Hueneme Aquifer. This simplification should not significantly affect the aquifer-specific groundwater budgets discussed in Section 3.3, because recharge entering the Hueneme Aquifer is allowed to flow vertically to the Fox Canyon Aquifer in the model if a downward hydraulic gradient is present between the aquifers. If the model is updated in the future such that the model grid is refined (smaller grid cells) in the northern foothills, apportionment of areal recharge between the Hueneme and Fox Canyon aquifers can potentially be revised to better reflect the outcrop area of each aquifer.
- M&I return flows—This term refers to water applied for landscape irrigation, leaked water from water supply and wastewater pipelines, and storm water that is collected in detention basins or other facilities and allowed to infiltrate into the ground. Most of these return flows recharge the Shallow Alluvial Deposits, but some may contribute to recharge of the Hueneme Aquifer and Fox Canyon Aquifer in the foothills in the north part of Mound Basin, where residential development exists on the hillsides.
- Agricultural return flows— This term refers to water applied for agricultural irrigation (in addition to rainfall) that infiltrates deeper than the root zone of crops. Some "excess" irrigation of farmland is required to leach salts from shallow soil, and some irrigation inefficiencies occur due to the variability in irrigation application and soil infiltration capacity. These infiltrating return flows may be intercepted by perched zones in near-surface soil horizons or continue downward to the uppermost aquifer, which in most of Mound Basin is the Shallow Alluvial Deposits. However, some return flows in the foothills in the north part of Mound Basin may contribute to recharge of the Hueneme Aquifer and Fox Canyon Aquifer, where avocado and other orchards are present in areas where these aquifers are present at or near land surface.

DRAFT

- Stream-channel recharge—This term refers to infiltration of surface water flows in "losing" reaches of major streams (excluding areas of mountain-front recharge as described above). The quantity of recharge occurring in the narrow channels of the barrancas in Mound Basin, most of which only flow briefly following storm events, is so small as to be considered by United (2018) to be indistinguishable from areal recharge of agricultural and M&I return flows. The Santa Clara River is the only major stream in Mound Basin, and the reach of the Santa Clara River in Mound Basin is considered to usually be the site of groundwater discharge, rather than recharge (Stillwater Sciences, 2011; United, 2018). However, the lower Santa Clara River in the area of its estuary is reported to fluctuate from gaining to losing cycles as water levels rise and fall in response to breaching of the barrier sand at the mouth of the river (Stillwater Sciences, 2011). When the elevation of surface water in the estuary rises (following closure of the barrier bar), some of the rising water infiltrates (recharges) the shallow deposits adjacent to the river. Then, typically in the following winter or spring, a large storm will produce sufficient flows in the river that it will breach the barrier bar and cause rapid decline of surface water levels in the estuary, causing groundwater in the adjacent shallow deposits to discharge back into the river over a sustained period.

Areas where these sources of recharge occur in Mound Basin are shown on Figure 3.1-11, and further discussion of the nature and quantities of these sources of recharge are discussed in Section 3.3. In addition to the types of recharge (from land surface) listed above, subsurface inflow of groundwater also occurs in Mound Basin as a result of groundwater underflow from adjacent basins (United, 2018), as discussed in Section 3.3.

Within Mound Basin, groundwater discharge occurs from the Shallow Alluvial Deposits along the lower, gaining reach of the Santa Clara River (area 11 on Figure 3.1-11), and via tile drains installed under farmland adjacent to the river, as noted on Figure 3.1-11. These areas of groundwater discharge in Mound Basin are shown on Figure 3.1-11, and their quantities are discussed in Section 3.3. As noted in Section 3.1.1.2, no springs or seeps are shown on USGS topographic maps within or adjacent to the boundaries of Mound Basin. In addition to the types of discharge listed above, extraction of groundwater also occurs in Mound Basin at water supply wells, as discussed in Section 3.1.4.4.

3.1.4.3 Groundwater Quality [§354.14(b)(4)(D)]

§354.14 Hydrogeological Conceptual Model.
(b) *The hydrogeologic conceptual model shall be summarized in a written description that includes the following:*
(4) *Principal aquifers and aquitards, including the following information:*
(D) General water quality of the principal aquifers, which may be based on information derived from existing technical studies or regulatory programs.

Available groundwater quality data and existing technical studies were reviewed to understand the age, major-ion chemistry, and spatial and temporal trends in key groundwater quality indicator constituents, such as total dissolved solids (TDS), sulfate, chloride, and nitrate, in the principal aquifers of Mound Basin.

Groundwater quality data are available from wells screened in three HSUs in Mound Basin: the fine-grained Pleistocene deposits, Mugu Aquifer, and Hueneme Aquifer. Maps of recent (2017) concentrations

of the key indicator constituents and time-series graphs of historical concentrations detected at selected wells are shown on Figures 3.1-12 through 3.1-25. Water quality data for 2017 (VCWPD, 2021) were selected for these maps because 2017 was the most recent year when a relatively large number of Mound Basin wells were sampled; fewer wells were sampled in 2018 by VCWPD due to staffing issues. The major-ion chemistry of the HSUs is shown using stiff diagrams on Figures 3.1-21 through Figure 3.1-23. Comparison of the stiff diagrams reveals that groundwater in the fine-grained Pleistocene deposits has a very different chemistry than groundwater in the principal aquifers (Mugu and Hueneme aquifers). Groundwater in the fine-grained Pleistocene deposits is 3 to 5 times more mineralized and has a different major-ion signature than groundwater in the Mugu and Hueneme aquifers. The degree of mineralization and major-ion chemistry in the Mugu and Hueneme aquifers are similar, with Hueneme Aquifer groundwater generally being slightly more mineralized. One exception is the shallow, dedicated monitoring well at Community Park (CWP-510), which is screened in the upper Hueneme Aquifer and has major-ion chemistry that bears similarities to the fine-grained Pleistocene deposits (Figure 3.1-23). The dramatic difference between groundwater chemistry in the fine-grained Pleistocene deposits versus the Mugu and Hueneme aquifers is explained by different geochemical processes operative in the shallow HSUs versus the deeper, principal aquifers. S.S. Papadopulos & Associates, Inc. (SSP&A, 2020) concluded that groundwater in the principal aquifers appears to be similar in composition to regional groundwater in other local basins; in contrast, shallow groundwater is additionally influenced by reactions with local aquifer minerals, principally gypsum and perhaps other evaporites that do not appear to be present in the principal aquifers.

SSP&A (2020) further concluded that there is no significant evidence for interactions between groundwater in the principal aquifers and shallow groundwater (CWP-510 is included here) or deeper, mineralized water. SSP&A (2020) also concluded that groundwater at the sample locations in the Basin is at least 1,000 years old. These conclusions together suggest that vertical movement of water percolating from land surface is not a major source of recharge to the principal aquifers, except where they are exposed at land surface in the northern portion of the Basin.

Groundwater quality in each of the principal aquifers, as discussed further below, is relatively stable at many Mound Basin wells having long-term groundwater quality records, consistent with the conclusion by previous investigators that natural causes are the primary source of elevated concentrations of dissolved constituents in groundwater.

The Basin Plan of the Regional Water Quality Control Board (RWQCB), Los Angeles region (RWQCB-LA) establishes groundwater quality “objectives” (WQOs) as “the allowable limits or levels of water quality constituents or characteristics which are established for the reasonable protection of beneficial uses of water or the prevention of nuisance within a specific area” (RWQCB-LA, 2019). The WQOs for Mound Basin are shown in Table 3.1-03.

Mugu Aquifer

Maximum TDS, sulfate, chloride, and nitrate concentrations detected in 2017 at five wells screened in the Mugu Aquifer (including wells with screens that extend above or below the Mugu Aquifer) were reported to or obtained by United (Figures 3.1-12 through 3.1-15). Four of these five wells are located along the west-southwest to east-northeast axis of the Basin, and one is located in the southeast quadrant of the Basin. Also shown on Figures 3.1-12 through 3.1-15 are water quality data at wells in adjacent areas of

the Oxnard and Santa Paula basins, as they may provide some insight to groundwater quality along the southern and eastern margins of Mound Basin.

The maximum TDS concentrations detected in 2017 at wells screened in the Mugu Aquifer in Mound Basin ranged from 880 to 3,040 milligrams per liter (mg/L) (Figure 3.1-12). The two highest TDS concentrations were detected at wells 02N22W07P01S (near the intersection of U.S. Highway 101 and State Highway 126, in the central portion of Mound Basin) and well 02N22W08G01S (near the intersection of State Highway 126 and Victoria Avenue, also in the central portion of Mound Basin). The TDS concentrations detected at these wells are not considered representative of Mugu Aquifer groundwater quality. After excluding the unrepresentative results, the range of maximum TDS concentrations measured in the remaining three wells is 880 to 1,420 mg/L (Figure 3.1-12). For comparison and as shown in Table 3.1-03, the RWQCB-LA WQO for TDS in confined aquifers of the lower Santa Clara River basins (including Mound Basin) is 1,200 mg/L (RWQCB-LA, 2013). The California Division of Drinking Water (DDW) lists a "recommended secondary" maximum contaminant level (MCL) range (MCLR) for TDS in public water supplies of 500 mg/L.

The maximum sulfate concentrations detected in 2017 at wells screened in the Mugu Aquifer in Mound Basin ranged from 312 to 1,550 mg/L (Figure 3.1-13). Similar to TDS, the two highest TDS concentrations were detected at wells 02N22W07P01S and well 02N22W08G01S, in the central portion of the Basin. Similar to TDS, the sulfate results from these wells are not considered representative of Mugu Aquifer groundwater quality. After excluding the unrepresentative results, the range of maximum sulfate concentrations measured in the remaining three wells is 312 to 698 mg/L (Figure 3.1-13). The RWQCB-LA's applicable WQO for sulfate (Table 3.1-03) in Mound Basin is 600 mg/L (RWQCB-LA, 2013). The DDW-recommended secondary MCLR for sulfate in public water supplies is 250 mg/L. DDW also lists an "upper secondary" MCLR for sulfate in public water supplies of 500 mg/L.

The maximum chloride concentrations detected in wells screened in the Mugu Aquifer in Mound Basin ranged from 45 to 138 mg/L (Figure 3.1-14). Similar to TDS and sulfate, the two highest TDS concentrations were detected at wells 02N22W07P01S and well 02N22W08G01S, in the central portion of the Basin. Similar to TDS and sulfate, the chloride results from these wells are not considered representative of Mugu Aquifer groundwater quality. After excluding the unrepresentative results, the range of maximum chloride concentrations measured in the remaining three wells is 45 to 76 mg/L (Figure 3.1-14). The RWQCB-LA's applicable WQO for chloride (Table 3.1-03) in Mound Basin is 150 mg/L (RWQCB-LA, 2013). DDW's recommended secondary MCLR for chloride in public water supplies is 250 mg/L and DDW's upper MCLR for chloride in public water supplies is 500 mg/L.

The maximum nitrate as (as nitrate [NO_3]) concentrations detected in 2017 at wells screened in the Mugu Aquifer in Mound Basin ranged from less than the detection limit (0.4 mg/L) to 64.6 mg/L (Figure 3.1-15). Nitrate concentrations are occasionally reported by laboratories in equivalent weight as nitrogen; in this GSP, nitrate results reported as nitrogen have been recalculated to equivalent concentrations as NO_3, unless otherwise noted. Similar to the other common dissolved constituents noted above, the highest nitrate concentrations in the Mugu Aquifer in 2017 were detected at wells 02N22W07P01S and well 02N22W08G01S, in the central portion of the Basin. Similar to TDS, sulfate, and chloride, the nitrate concentrations in these wells are anomalously high compared to other Mugu Aquifer wells in the Basin, suggesting influence of shallow groundwater through a possibly compromised well seal or well casing. Nitrate concentrations were below the detection limit at two of the three remaining (representative) wells

in the Mugu Aquifer and 8.4 mg/L at well 02N22W09K01S (Figure 3.1-15). The RWQCB-LA's applicable WQO for nitrate (as NO_3) in Mound Basin is 45 mg/L (RWQCB-LA, 2013). Similarly, DDW lists a "primary" MCL for nitrate in public water supplies of 45 mg/L (as NO_3).

Figures 3.1-20 through 3.1-25 show times series of measured historical TDS, chloride, and sulfate in selected wells in Mound Basin, including three wells screened in the Mugu Aquifer. At Well 02N23W14K01S, which is screened in both the Mugu and Hueneme aquifers, TDS exceeded the WQO of 1,200 mg/L for the Basin from the early 1930s to 1957. However, for the rest of the period of historical record (from the mid-1960s through the early 1980s), TDS concentrations at well 02N23W14K01S remained below the current WQO, with the exception of two samples from the late 1960s. Sulfate concentrations measured at the same well have been below the current WQO of 150 mg/L from the early 1930s through the last sample taken in the early 1980s, with the exception of one sample from the early 1960s that appears to be an outlier. Chloride concentrations measured at the same well have been below the WQO of 150 mg/L from the early 1930s through the last sample taken in the early 1980s, with the exception of one sample (also from the early 1960s) that appears to be an outlier. TDS, chloride, and sulfate concentrations at other wells (Figure 3.1-21 and 3.1-22) have been at or below the WQO throughout the available period of record from 1995 through 2020, with the exception of three detections of TDS above the WQO of 1,200 mg/L prior to 2010. TDS, sulfate, and chloride concentrations have been below the RWQCB-LA WQOs for the entire period of record at Marina Park and Camino Real Park monitoring wells 02N23W15J02S and 02N22W07M02S, screened in the Mugu Aquifer (Figures 3.1-21 and 3.1-22).

Measured historical boron concentration slightly exceeded the Basin WQO in October of 2013 at only one well (02N22W07P01S). The average boron concentration measured at Well 02N22W07P01S over the available period of record of 2000 to 2017 was 0.71 mg/L. The one-time exceedance was likely due to the major drought that occurred in 2013. It is also noted that this well has consistently had anomalously high concentrations of common constituents, suggesting influence of shallow groundwater within this well, possibly through a compromised well seal or well casing; therefore, boron results from this well are considered non-representative of the Mugu Aquifer. All the samples taken after October 2013 at the same well had concentrations less than the Basin WQO and did not show any specific trend.

Hueneme Aquifer

Maximum TDS, sulfate, chloride, and nitrate concentrations detected in 2017 at nine wells screened in the Hueneme Aquifer (including wells with screens that extend above or below the Hueneme Aquifer) were reported to or obtained by United (Figures 3.1-16 through 3.1-19). Five of these nine wells are located along the west-southwest to east-northeast axis of the Basin, and four are located in the southeast quadrant of the Basin. Figures 3.1-21 through 3.1-25 show concentrations of TDS, sulfate, and chloride over time at selected wells with historical data available in Mound Basin, including six wells screened in the Hueneme Aquifer. It is noted that wells 02N23W13K03S, 02N22W08F01S, and 02N22W09L04S exhibit anomalously high concentrations of TDS, sulfate, chloride, and nitrate, suggesting influence of shallow groundwater, possibly through a compromised well seal or well casing. Thus, the elevated concentrations of TDS, sulfate, and chloride reported for these wells should not be considered representative of Hueneme Aquifer groundwater quality.

The maximum TDS concentrations detected in 2017 at wells screened in the Hueneme Aquifer in Mound Basin ranged from 1,060 to 6,390 mg/L (Figure 3.1-16). The highest TDS concentration was detected at

monitoring well 02N22W09L04S, in the southeast quadrant of the Basin. As stated above, the TDS result from this well and two others are not considered representative of Hueneme Aquifer groundwater quality. After excluding the unrepresentative results, the range of maximum TDS concentrations measured in the remaining six wells is 1,060 to 1,420 mg/L (Figure 3.1-16). Four of the six representative wells have TDS concentrations below the RWQCB-LA WQO and two are above.

The maximum sulfate concentrations detected in 2017 at wells screened in the Hueneme Aquifer in Mound Basin ranged from 412 to 3,620 mg/L (Figure 3.1-17). Similar to TDS in the Hueneme Aquifer, the single highest sulfate concentration was detected at monitoring well 02N22W09L04S, in the southeast quadrant of the Basin. As stated above, the sulfate result from this well and two others are not considered representative of Hueneme Aquifer groundwater quality. After excluding the unrepresentative results, the range of maximum sulfate concentrations measured in the remaining six wells is 412 to 698 mg/L (Figure 3.1-17). Five of the six representative wells have sulfate concentrations below the RWQCB-LA WQO and one is above.

The maximum chloride concentrations detected in 2017 at wells screened in the Hueneme Aquifer in Mound Basin ranged from 67 to 181 mg/L (Figure 3.1-18). Similar to TDS and sulfate in the Hueneme Aquifer, the single highest chloride concentration was detected at monitoring well 02N22W09L04S, in the southeast quadrant of the Basin. As stated above, the chloride result from this well and two others are not considered representative of Hueneme Aquifer groundwater quality. After excluding the unrepresentative results, the range of maximum chloride concentrations measured in the remaining six wells is 67 to 86 mg/L (Figure 3.1-18). All six representative wells have chloride concentrations below the RWQCB-LA WQO.

The maximum nitrate concentrations detected in 2017 at wells screened in the Hueneme Aquifer in Mound Basin ranged from less than the laboratory detection limit (0.4 mg/L) to 136 mg/L (Figure 3.1-19). Similar to the other common dissolved constituents detected in the Hueneme Aquifer, the single highest nitrate concentration in the Hueneme Aquifer was detected at monitoring well 02N22W09L04S, in the southeast quadrant of the Basin. It is noted that the nitrate concentrations in this well (together with well 02N23W13K03S) are anomalously high compared to other Hueneme Aquifer wells in Mound Basin, suggesting influence of shallow groundwater, possibly through a compromised well seal or well casing. Nitrate concentrations were below the detection limit at five wells in the Hueneme Aquifer in Mound Basin (Figure 3.1-19).

Municipal water supply well 02N22W08F01S (Victoria 2) is one of the few wells in Mound Basin where increasing trends are clearly discernible in past (1995 to 2006) TDS and sulfate concentrations (Figure 3.1-24). This well has three screened intervals (580 to 640; 900 to 940; and 1,060 to 1,180 ft bgs) in the Hueneme Aquifer. As noted above, concentrations of these constituents are anomalously high, suggesting a potential influence of an overlying HSU on water quality at these wells, possibly through a compromised well seal or well casing. As groundwater production increased from this well in the 1990s, TDS concentrations increased from approximately 1,000 mg/L to approximately 1,500 mg/L by 2006. Concentrations have since stabilized and have not increased further. The cause of the groundwater quality changes at this well is currently unknown. It is noted that all other wells screened in the Hueneme Aquifer with historical water quality data exhibit generally stable trends for all constituents (Figures 3.1-21 through 3.1-25).

Measured historical boron concentrations have exceeded the Basin WQO at five wells screened in the Hueneme Aquifer. The maximum measured boron concentrations at these wells ranged from 1.05 to 1.30 with the exception of one well (02N23W24G01S), which only had reported data during the 1950s. The reported concentrations at Well 02N23W24G01S show that boron was 7.0 mg/L in October 1953, whereas the rest of the reported concentrations at the same well were below 0.59 mg/L. The 7.0 mg/L reported for October 1953 appears to be an outlier and thus should not be considered. Boron concentrations at the remaining four wells screened in the Hueneme Aquifer show boron concentrations below the Basin WQO for the entire period of record with the exception of one or two samples from one well (02N22W08F01S); these results are not typical of the record of sampling data, which are consistently below the WQO.

3.1.4.4 Primary Beneficial Uses [§354.14(b)(4)(E)]

§354.14 Hydrogeological Conceptual Model.
(b) *The hydrogeologic conceptual model shall be summarized in a written description that includes the following:*
(4) *Principal aquifers and aquitards, including the following information:*
(E) Identification of the primary use or uses of each aquifer, such as domestic, irrigation, or municipal water supply.

The primary uses of each principal aquifer in Mound Basin (Mugu and Hueneme) are reflected in the extraction records that are reported to United (and included in the MBGSA DMS). Importantly, there are no active or recently active domestic wells in the Basin. Recent (as of 2019) extraction records for groundwater in Mound Basin reported to United include agricultural water supply (at 22 wells) and M&I water supply (at 4 wells). In 2019, 2,873 AF (45% of the total of 6,319 AF of groundwater extracted from Mound Basin) was used for agriculture, and 3,446 AF (55% of the total) was used for M&I purposes. The locations of all 26 water supply wells active in Mound Basin in 2019 and relative volumes of groundwater extracted by each well are shown on Figure 3.1-26. The quantities of groundwater extracted for agricultural and M&I uses from the principal aquifers underlying Mound Basin during the past 40 years (1980 through 2019) are shown on Figures 3.1-27 through 3.1-29. None of the wells active in 2019 were reportedly used for domestic supply, likely due to the availability of potable water from Ventura Water and the significant expense required to drill a domestic water supply well to the depth required to reach a principal aquifer in Mound Basin. The following subsections provide more detail regarding the primary uses of groundwater extracted from each principal aquifer in Mound Basin.

Shallow Alluvial Deposits

No wells extract groundwater from the Shallow Alluvial Deposits in the Basin.

Mugu Aquifer Extraction

Five active wells are screened solely in the Mugu Aquifer and one active well is believed to produce water primarily from the Mugu Aquifer, despite possibly being screened partly in the Hueneme Aquifer (Table 3.1-02). In 2019, five of these six wells supplied 948 AF of groundwater for agricultural use, which was approximately 15% of the total extracted from Mound Basin that year. The remaining well supplied 1,740 AF of groundwater for M&I use, which was approximately 28% of the total extracted from Mound Basin in 2019.

Hueneme Aquifer Extraction

Ten active wells are screened solely in the Hueneme Aquifer and one active well is believed to produce water primarily from the Hueneme Aquifer, despite possibly being screened partly in the Mugu Aquifer (Table 3.1-02). In 2019, three of these wells supplied 1,706 AF of groundwater for M&I use, which was approximately 27% of the total extraction from Mound Basin. The remaining eight wells supplied 1,129 AF of groundwater for agricultural use, which was approximately 18% of the total extracted from Mound Basin in 2019.

Extraction from Wells Screened Across Multiple Aquifers

Four active water supply wells are screened in (and are assumed to withdraw significant quantities of groundwater from) both the Mugu and Hueneme aquifers; all groundwater extracted from these wells is used for agricultural purposes (Table 3.1-02). In 2019, a total of 134 AF was extracted from these wells, which was approximately 2% of the total extracted from Mound Basin that year.

Two active water supply wells are screened in both the Hueneme and Fox Canyon aquifers; the water extracted from these wells is used for agricultural purposes (Table 3.1-02). In 2019, a total of 191 AF was extracted from this well, which was about 3% of the total quantity of groundwater extracted from Mound Basin that year. Due to the generally higher hydraulic conductivity and transmissivity of the Hueneme Aquifer in Mound Basin compared to the Fox Canyon Aquifer, most of the groundwater extracted from these wells likely was derived from the Hueneme Aquifer.

Extraction from Wells with Unknown Screened Intervals

The depths of the screened intervals for three active water supply wells in Mound Basin have not been reported. The water extracted from these wells is used for agricultural purposes (Table 3.1-02). In 2019, a total of 472 AF was extracted from these wells, which was approximately 7% of the total extracted from Mound Basin that year.

Other Beneficial Uses

In addition to groundwater production from the principal aquifers, discharge of small quantities of groundwater from the Shallow Alluvial Deposits to the lower reach of the Santa Clara River in Mound Basin may contribute to GDEs. This potential beneficial groundwater use is further described in Section 3.2.7 and Appendix G.

3.1.5 Data Gaps and Uncertainty [§354.14(b)(5)]

§354.14 Hydrogeological Conceptual Model.
(b) *The hydrogeologic conceptual model shall be summarized in a written description that includes the following:*
(5) Identification of data gaps and uncertainty within the hydrogeologic conceptual model.

The discussion of data gaps and uncertainty within the HCM of Mound Basin is provided below, organized according to the HCM elements listed in the GSP Emergency Regulations.

Topography [§354.14(d)(1)]

No data gaps or significant uncertainties were identified.

Surface Water Bodies [§354.14(d)(5)]

No data gaps or significant uncertainties were identified.

Imported Water [§354.14(d)(6)]

No data gaps or significant uncertainties were identified.

Regional Geology and Structural Setting [§354.14(b)(1),(d)(2)]

No data gaps or significant uncertainties were identified.

Soil Characteristics [§354.14(d)(3)]

No data gaps or significant uncertainties were identified.

Vertical and Lateral Extent of Mound Basin [§354.14(b)(2),(b)(3),(c)]

The precise location, orientation, and hydraulic impact of the Basin-bounding McGrath Fault (south boundary) and Country Club Fault (east boundary) are not known precisely because they do not offset surficial units within the Basin. However, the south and east boundaries are jurisdictional and thus do not depend on precise knowledge of the fault locations. Going forward, MBGSA will work with the adjacent basin institutions (Santa Paula Basin Technical Advisory Committee and FCGMA), as well as United, to improve the understanding of the location and hydraulic barrier effects of the Basin-bounding faults, when opportunities arise.

With regard to the western Basin boundary, it is defined as the Pacific Ocean shoreline, of which the location is known with certainty. From a purely hydraulic perspective, the western Basin boundary is more appropriately considered to be the location where the principal aquifers are exposed to seawater. The principal aquifers of Mound Basin are believed to extend up to approximately 10 miles offshore under the Pacific Ocean west of the shoreline, to the location where they are mapped as cropping out on the continental shelf edge, as shown on Figure 3.1-10. However, it is unknown if the aquitards that separate the principal aquifers from the seafloor have been eroded away or otherwise compromised by faulting or folding between the shoreline and the continental shelf edge. This is a very significant uncertainty in the HCM that directly impacts management relative to the seawater intrusion sustainability indicator.

The vertical extent (definable bottom) of the Basin is known only from a relatively small number of oil well logs. This is because few wells tap the deepest freshwater aquifer and none fully penetrate it. The uncertainty in the vertical extent of the Basin is not considered a significant data gap or uncertainty in the HCM because there is little, if any, groundwater extracted from the deepest freshwater aquifer.

DRAFT

Groundwater Flow Barriers [§354.14(b)(4)(C) and (c)]

The prior discussion of uncertainty concerning the location, orientation, and hydraulic impact of the Basin-bounding faults (McGrath and Country Club Faults) also applies to this part of the HCM.

In addition, the hydraulic impact of Pitas Point, Ventura, and Foothill faults, located in the northern portion of the Basin, are uncertain. These faults have uplifted the principal aquifers in the northern portion of the Basin, exposing them at land surface. Given the significant offset of the principal aquifers and the juxtaposition of different HSUs across the fault plane, it can be inferred that these faults likely impede groundwater flow in the principal aquifers to some degree. There are no groundwater monitoring wells located north and immediately south of these faults to detect groundwater elevation change across the faults. Neither the USGS (2003a) nor United (2018) regional groundwater flow models incorporated these faults as horizontal flow barriers because of this lack of data. This is considered a significant uncertainty in the HCM because MBGSA's knowledge of groundwater flow directions is largely derived from United's groundwater model (2021a), which currently assumes no impedance of flow from the principal aquifer outcrops north of these faults. If these faults impede flow, the groundwater flow directions and water budget for Mound Basin derived from the groundwater flow model might be significantly different. MBGSA will work with United to test alternative model calibrations that consider varying degrees of potential barrier effects of these faults to evaluate uncertainty in groundwater flow directions and water budget and the resulting impact on Basin management decisions.

Formation Names and Hydraulic Properties [§354.14(b)(4)(A), (b)(4)(B)]

The lateral and vertical extents of the Basin HSUs are well established, except for the bottom of the deepest freshwater aquifer, as discussed above.

As noted in Section 3.1.4, no aquifer tests have been reported in the literature. The best available information for aquifer and aquitard hydraulic properties in Mound Basin is from the calibrated regional groundwater flow model (United, 2018). Use of model-derived hydraulic properties values is considered appropriate and, therefore, the lack of aquifer tests results is not considered a significant data gap or uncertainty at this time. Going forward, MBGSA will work with well owners in the Basin to conduct aquifer tests when opportunities arise, such as when new or replacement wells are constructed.

Groundwater Recharge and Discharge Areas [§354.14(d)(4)]

No data gaps or significant uncertainties were identified; however, as described above, the degree of hydraulic connectivity of the principal aquifer outcrops in the northern part of Mound Basin with the remainder of the Basin (south of the Ventura, Pitas Point, and Foothills faults) is uncertain.

Water Quality [§354.14(b)(4)(D)]

Groundwater in the principal aquifers in the northern and western portions of Mound Basin has not been sampled in recent years (and in some areas, it has never been sampled) for water quality analysis. No wells currently are known to exist that can be used to obtain samples in these areas. However, there is no groundwater production in these portions of the basins, so this is not considered to be a significant data gap or uncertainty in the HCM.

Primary Beneficial Uses [§354.14(b)(4)(E)]

No data gaps or significant uncertainties were identified.

3.2 Groundwater Conditions [§354.16]

This subsection provides a description of current and historical groundwater conditions in the principal aquifers of the Mound Basin, based on best available information. Groundwater conditions during the past 10 years, and particularly from 2015 to present, are the primary focus of this subsection, although historical data are also discussed where such data provide relevant information about long-term trends in groundwater conditions. Additional details regarding historical groundwater conditions in Mound Basin and the vicinity in the first half of the 20th century are provided by Mukae and Turner (1975) and John F. Mann Jr. & Associates (1959). In addition, USGS (2003a) estimated groundwater levels and movement throughout the region from the 1890s to the early 1990s, based on data synthesis and modeling. United and other local agencies have been collecting groundwater elevation and groundwater quality data from wells in Mound Basin and adjacent basins since the 1920s. United maintains a comprehensive, up-to-date database of groundwater elevations in Mound Basin, incorporating selected data from the VCWPD and other sources that supplement the data collected by United. Therefore, the source of most of the data relied upon in this subsection is United's database, supplemented with additional data from the City of Ventura, the County of Ventura, and other agencies as appropriate. All of the above-described data have been incorporated into the MBGSA DMS.

3.2.1 Groundwater Elevations [§354.16(a)]

Maps of groundwater elevation data combined with hydrographs showing changes in groundwater elevations over time can help illustrate groundwater occurrence and movement in an aquifer system. Groundwater elevation data are available for nearly 60 wells located within Mound Basin. However, not all of these wells are being monitored at present. The distribution of wells is heavily skewed towards the southern half of the Basin, with relatively few wells existing in the northern half of the Basin (north of Highway 126). As noted in Section 3.1, faults near the southern and eastern boundaries of the Basin affect groundwater movement. Therefore, groundwater level data from adjacent areas of the Oxnard and Santa Paula basins are also presented in this section to help define lateral gradients along the eastern and southern boundaries of Mound Basin.

3.2.1.1 Groundwater Elevation Contours [§354.16(a)(1)]

> **§354.16 Groundwater Conditions.** *Each Plan shall provide a description of current and historical groundwater conditions in the basin, including data from January 1, 2015, to current conditions, based on the best available information that includes the following:*
>
> ***(a)*** *Groundwater elevation data demonstrating flow directions, lateral and vertical gradients, and regional pumping patterns, including:*
>
> ***(1) Groundwater elevation contour maps depicting the groundwater table or potentiometric surface associated with the current seasonal high and seasonal low for each principal aquifer within the basin.***

The contouring of groundwater levels in Mound Basin is complicated by the sparse data, particularly in the northern portion of the Basin. Groundwater level measurements obtained from wells screened in the

Mugu and Hueneme aquifers (the principal aquifers in Mound Basin) during 2012 and 2019 are shown on Figures 3.2-01 through 3.2-08. Year 2012 was the most recent year when groundwater levels in Mound Basin were representative of average conditions, while year 2019 represents more recent conditions, which continue to be influenced by overall drought conditions that started in 2012 and the associated deficit of groundwater recharge compared to discharge. The groundwater elevations posted on Figures 3.2-01 through 3.2-08 are seasonal high and seasonal low groundwater levels, which typically occur during the spring and fall, respectively, of each year. Data shown were generally collected in March or April (for spring highs) and September or October (for fall lows). Due to the limited distribution of wells where groundwater elevations can be measured, groundwater elevations simulated by United using the Ventura Regional Groundwater Flow Model (United, 2018, 2021a, 2021b) for the Mugu and Hueneme aquifers in 2012 and 2019 were contoured to illustrate groundwater flow directions and horizontal groundwater gradients throughout Mound Basin and are shown on Figures 3.2-01 through 3.2-08.

As discussed in the HCM (Section 3.1), Mound Basin is structurally complex. The main groundwater flow pattern is from east-northeast to the west-southwest, along the axis of the Mound Basin, towards the Pacific Ocean (United, 2012). Available information indicates that Mound Basin receives groundwater underflow from both the Santa Paula Basin to the east and the Oxnard Forebay/ Oxnard Plain to the south (United, 2018). Generalized conceptual groundwater flow paths in the principal aquifers of Mound Basin are depicted on Figure 3.2-09. More detail regarding inflows and outflows of groundwater in Mound Basin are presented in Section 3.3.

Figures 3.2-01 and 3.2-02 show modeled groundwater elevation contours in the Mugu Aquifer during spring and fall of 2012, together with spring-high and fall-low groundwater level measurements reported for wells screened in the Mugu Aquifer. Overall, the pattern of groundwater contours in the Basin during spring and fall are similar, with groundwater levels about 10 ft lower in the fall than spring. The groundwater flow direction in the Mugu Aquifer is consistent with the typical flow pattern, from the eastern side of the Basin to the west-southwest toward the Pacific Ocean, with a gradient of approximately 0.002 ft/ft. Groundwater flows from areas of high groundwater elevation to areas of low groundwater elevation. The highest contoured groundwater elevation in the Mugu Aquifer during 2012, 210 ft msl, occurred in the northeastern portion of the Basin. The lowest contoured groundwater elevations in the Mugu Aquifer in 2012, 20 ft msl and 10 ft msl, occurred during spring and fall, respectively, in the central portion of Mound Basin. During the fall, a 5 ft msl contour in the Oxnard Basin extends slightly into the southwest corner of the Mound Basin.

Figures 3.2-03 and 3.2-04 show modeled groundwater elevation contours in the Hueneme Aquifer during spring and fall of 2012, together with spring-high and fall-low groundwater levels measured at wells screened in the Hueneme Aquifer. The groundwater flow direction in the Hueneme Aquifer during the spring was consistent with the typical flow pattern, from the eastern side of the Basin to the west-southwest toward the Pacific Ocean, with a gradient of approximately 0.002 ft/ft. However, during the fall of 2012, groundwater flow was to the south toward the boundary with the Oxnard Basin with a gradient of approximately 0.002 ft/ft. Groundwater levels in the Basin were more than 10 ft lower in the fall than spring. The highest contoured groundwater elevation in the Hueneme Aquifer during 2012, 295 ft msl, again occurred in the northeastern portion of the Basin. The lowest contoured groundwater elevation in the Hueneme Aquifer during spring 2012, 15 ft msl, occurred in the southwest portion of Mound Basin. The lowest contoured groundwater elevation in the Hueneme Aquifer in fall 2012, 0 ft msl (equal to mean sea level), occurred at the southern boundary with Oxnard Basin.

DRAFT

Figures 3.2-05 and 3.2-06 show modeled groundwater elevation contours in the Mugu Aquifer during spring and fall of 2019, together with spring-high and fall-low groundwater level measurements reported for wells screened in the Mugu Aquifer. Contours show the ongoing effects of the 2012-2016 drought in the region, with groundwater elevations across much of the Basin below sea level during both spring and fall. Overall, the pattern of groundwater contours in Mound Basin during spring and fall are similar, with groundwater levels about 5 ft lower in the fall than spring. The hydraulic gradients (groundwater flow directions) in both the Mugu and Hueneme aquifers in spring and fall of 2019 are consistently toward the southwest in the east part of the Basin (magnitude of the hydraulic gradient in this area is approximately 0.002 ft/ft), shifting southward in the central area of the Basin. The potentiometric surface is nearly flat in the central and western portions of the Basin in 2019. The highest contoured groundwater elevation in the Mugu Aquifer during 2019, 220 ft msl, occurred in the northeastern portion of the Basin. The lowest contoured groundwater elevations in the Mugu Aquifer in 2019, -15 ft msl and -20 ft msl (spring and fall, respectively), occurred in the central and west portions of Mound Basin.

Figures 3.2-07 and 3.2-08 show modeled groundwater elevation contours in the Hueneme Aquifer during spring and fall of 2019, together with spring-high and fall-low groundwater levels measured at wells screened in the Hueneme Aquifer. Similar to the Mugu Aquifer, contours show drought conditions, with heads in much of the Basin measured below sea level. The groundwater flow direction in the Hueneme Aquifer was westward in the eastern portion of the Basin (magnitude of the hydraulic gradient was approximately 0.002 ft/ft), shifting southward in the central part of Mound Basin. Overall, the pattern of groundwater contours in Mound Basin during spring and fall are similar, with groundwater levels about 5 ft lower in the fall than spring. Again, the potentiometric surface is nearly flat in the central and western portions of the Basin in 2019. The highest contoured groundwater elevation in the Hueneme Aquifer during spring 2019, 295 ft msl, occurred in the northeastern portion of the Basin. The lowest contoured groundwater elevations in the Hueneme Aquifer in 2019, -15 ft msl and -25 ft msl (spring and fall, respectively) occurred at the southern boundary with Oxnard Basin.

3.2.1.2 Groundwater Elevation Hydrographs [§354.16(a)(2)]

§354.16 Groundwater Conditions. *Each Plan shall provide a description of current and historical groundwater conditions in the basin, including data from January 1, 2015, to current conditions, based on the best available information that includes the following:*

(a) *Groundwater elevation data demonstrating flow directions, lateral and vertical gradients, and regional pumping patterns, including:*

(2) Hydrographs depicting long-term groundwater elevations, historical highs and lows, and hydraulic gradients between principal aquifers.

Groundwater elevations in Mound Basin fluctuate in response to seasonal, annual, and longer-term changes in rainfall, which influences several water-balance components in Mound Basin (as discussed in Section 3.3). Changes in groundwater levels can vary both by location and by aquifer within Mound Basin, although the general patterns of decline and recovery are similar throughout the Basin within the principal aquifers. The cumulative departure from the average precipitation is used to identify historical wet and dry periods to aid in interpretation of groundwater level trends over time. The cumulative departure from average precipitation is calculated by accumulating the annual differences between annual precipitation and the long-term average annual precipitation. Precipitation records from rain gage station 222 (at "Ventura, Thille Ranch") and station 222A (at the Ventura County Government Center) were used to

calculate the cumulative departure curves, which are shown on the graphs included in Figures 3.2-10 through 3.2-13. These stations were selected because of their central location and long period of record (1926 to present). During this period, the calculated average annual precipitation in the central Mound Basin is 15.56 inches. For the discussion of groundwater elevation hydrographs below, wells have been grouped geographically within Mound Basin (south, north, central, east, west) with locations shown on Figures 3.2-10 through 3.2-13. In general, extended periods of low groundwater levels were recorded between the late 1920s and early 1930s, late 1940s and early 1950s, mid-1980s, early 1990s, and 2012 to 2018. These time periods are coincident with multi-year droughts, as shown in the declining limb of the curve showing cumulative departure from average precipitation, plotted on Figures 3.2-10 through 3.2-13. Groundwater elevations in both principal aquifers briefly declined below sea level during the historical droughts, but recovered during the subsequent wet periods.

Measured groundwater levels in southern Mound Basin have varied over about a 120-ft range over the period of record, ranging from approximately -60 to +60 ft msl (Figure 3.2-10). Groundwater levels generally rise and fall consistent with the cumulative departure curve for rainfall (Figure 3.2-10). Groundwater elevations at wells located south of the Oak Ridge Fault are similar to groundwater elevations measured at wells in the adjacent Oxnard Basin, to the south (Figure 3.2-10). Wells located in the southeast Mound Basin closest to the Forebay area of the Oxnard Basin (e.g., well 02N22W16K01S) exhibit the greatest annual variability in groundwater elevations, as a response to the large volumes of artificial recharge and extraction that occur in the Forebay area, although the range of recorded groundwater levels in Mound Basin is smaller than the range in the Forebay area (United, 2017b).

Groundwater level records are known to exist for only one well in the northern portion of Mound Basin, 02N23W01P01S, with a total depth of 300 ft (Figure 3.2-11). No information about the screened interval of this well is available; only total depth was provided by the VCWPD. However, the total depth of 300 ft suggests this well likely is screened in the fine-grained Pleistocene deposits instead of a principal aquifer. Groundwater level records for this well are available solely for the mid-1970s; at that time, groundwater levels at this well were about 100 ft higher than in wells located in the central portion of the Basin.

Measured groundwater levels in central Mound Basin have varied about a 120-ft range over the period of record, ranging from approximately -40 to +80 ft msl (Figure 3.2-11). The high groundwater levels shown for monitoring well 02N22W07M03S reflect groundwater levels in the fine-grained Pleistocene deposits.

Measured groundwater levels in eastern Mound Basin have varied over about a 140-ft range during the period of record, ranging from approximately -40 to +100 ft msl (Figure 3.2-12). Groundwater elevations in some principal aquifer wells in the eastern Mound Basin are approximately 80 to more than 100 ft lower than similarly screened wells in western Santa Paula Basin (Figures 3.2-01 through 3.2-08). This differential in groundwater elevations produces a large hydraulic gradient across the basin boundary between Santa Paula Basin and Mound Basin (DBSA, 2017; United, 2018). However, groundwater elevations at other wells in this area are similar to western Santa Paula Basin groundwater levels (Figure 3.2-12). These differences are likely related to the complex structural geology in the eastern Mound Basin area that is associated with the intersection of the Country Club and Oak Ridge faults. The time domain electromagnetic (TDEM) surface geophysical survey conducted by United (2020), documented changes in resistivity of the sediments across the Mound-Santa Paula and adjacent Oxnard Basin (Forebay area) boundaries. Anomalous zones of high and low resistivity (indicating sands/gravels and silts/clays, respectively) were

DRAFT

observed in eastern Mound Basin, consistent with structural complexities related to faulting in this area (United, 2020).

Measured groundwater levels in western Mound Basin have varied over about a 60-ft range over the period of record, ranging from approximately -20 to +40 ft msl (Figure 3.2-13). Near the coast, few wells existed prior to the 1990s. In 1995, United and the City of Ventura jointly funded installation of three monitoring wells at Marina Park near the north side of Ventura Harbor to assess groundwater conditions at the coast. Artesian conditions (aquifer with sufficient water pressure to cause the groundwater level in a cased well to rise above land surface) are common in the shallowest of these wells, 02N23W15J03S, which is screened in the fine-grained Pleistocene deposits (170 to 240 ft bgs), as shown on Figure 3.2-13. Artesian heads of 30 ft above land surface are commonly recorded at this well. Coincident with overall drought conditions since 2012, groundwater levels in most wells in the western Mound Basin have been below sea level since approximately 2014, but heads in the monitoring well screened in the fine-grained Pleistocene deposits have remained artesian. The deeper wells at Marina Park (well 02N23W15J02S, screened from 480 to 660 ft bgs in the Mugu Aquifer and 02N23W15J01S (screened from 970 to 1070 ft bgs in the Hueneme Aquifer) commonly displayed weak artesian conditions before the recent drought began in 2012. In the agricultural area east of Ventura Harbor, groundwater levels commonly are below sea level during dry periods (Figure 3.2-13). For example, groundwater elevations of 25 ft below sea level were recorded in 1991 and 14 ft below sea level in 2004; since 2014 groundwater levels have declined up to 20 ft below sea level.

Vertical groundwater gradients between principal aquifers in Mound Basin are measured using groundwater level data collected at two of the three monitoring well clusters in Mound Basin. One cluster-well site is at Marina Park (wells 02N23W15J01S, 02N23W15J02S, 02N23W15J03S), located at the coast north of the Ventura Harbor (Figure 3.2-14). Another site is at Camino Real Park (wells 02N22W07M01S, 02N22W07M02S, 02N22W07M03S), located 2 miles inland near the intersection of U.S. Highway 101 and State Highway 126 (Figure 3.2-15). The last site (wells 02N22W09L03S, 02N22W09L04S) is farther east at the Community Water Park on Kimball Rd (Figure 3.2-16), but both wells in this cluster are interpreted to be screened within the Hueneme Aquifer. The sites at Marina Park and Camino Real Park have three monitoring wells, one screened in each of the following HSUs: fine-grained Pleistocene deposits, Mugu Aquifer, and Hueneme Aquifer. Hydrographs for these monitoring wells are shown on Figures 3.2-14 through 3.2-16. Groundwater levels in the shallowest wells, screened in the fine-grained Pleistocene deposits, are shown with a green line; groundwater levels in the middle depth wells, screened in the Mugu Aquifer, are shown with an orange line; and groundwater levels in the deepest wells, screened in the Hueneme Aquifer, are shown with a blue line. Since the monitoring wells at the Community Water Park are both screened in the Hueneme Aquifer, the groundwater level for the deeper screened well is shown in a darker blue than the groundwater level record for the shallower well. Table 3.2-01 provides the calculated vertical gradients at the three monitoring well sites. This includes the vertical gradient from the fine-grained Pleistocene deposits to the underlying Mugu Aquifer and from the Mugu Aquifer to the underlying Hueneme Aquifer at Marina Park and Camino Real Park. The vertical gradient is also calculated from upper to deeper strata of the Hueneme Aquifer at the Community Water Park, near Kimball Road. Vertical gradients were calculated using the available data record, from 1995 through 2019 at Marina Park and Camino Real Park and from 2008 through 2019 at the Community Water Park near Kimball Road. A positive vertical gradient value represents downward flow, and a negative vertical gradient value represents an upward flow.

DRAFT

Near the coast, groundwater levels in the well screened in the fine-grained Pleistocene deposits at Marina Park are significantly higher than those in the deeper wells (Figure 3.2-14), indicating that this aquitard is in poor hydraulic communication with the underlying principal aquifers of Mound Basin. The vertical gradient from the fine-grained Pleistocene deposits to the underlying Mugu Aquifer ranged from 0.009 to 0.120 ft/ft and averaged 0.075 ft/ft. Groundwater levels in the well screened in the Mugu Aquifer at this location are generally higher than the deepest well, which is screened in the Hueneme Aquifer, indicating a downward vertical gradient. Since the recent drought began in 2012, groundwater levels for the wells screened in the Mugu and Hueneme aquifers are similar (Figure 3.2-14). The vertical gradient from the Mugu Aquifer to the underlying Hueneme Aquifer ranged from -0.020 to 0.033 ft/ft and averaged 0.008 ft/ft.

Farther inland at Camino Real Park, groundwater levels in the well screened in the fine-grained Pleistocene deposits are significantly higher than the deeper wells (Figure 3.2-15), again indicating limited hydraulic communication with deeper aquifers. The vertical gradient from the fine-grained Pleistocene deposits to the underlying Mugu Aquifer ranged from 0.219 to 0.325 ft/ft and averaged 0.276 ft/ft. Prior to 2010, groundwater levels in the well screened in the Mugu Aquifer at this location were generally higher than those in the deepest well, indicating a downward vertical gradient. After 2010, groundwater levels in the deepest well, screened in the Hueneme Aquifer, were usually similar to or occasionally higher than the groundwater level in the well screened in the Mugu Aquifer, indicating neutral to slightly upward vertical gradient. The vertical gradient from the Mugu Aquifer to the underlying Hueneme Aquifer ranged from -0.028 to 0.043 ft/ft and averaged 0.008 ft/ft.

The monitoring well site furthest inland at the Community Water Park at Kimball Road show that groundwater levels in the shallower well are usually higher than the deeper well, indicating a downward vertical gradient (Figure 3.2-16). The vertical gradient from the shallow to deeper depth in the Hueneme Aquifer ranged from -0.018 to 0.070 ft/ft and averaged 0.038 ft/ft. Both wells in this cluster are interpreted to be screened within the Hueneme Aquifer. The electric log at this location indicates the Hueneme Aquifer consists of a series of coarse-grained zones separated by fine-grained zones of varying thickness. The electric log shows fine-grained zones between the monitoring well screen intervals, including a 30-ft-thick clay unit. The water quality data from the upper well at this location show anomalous major-ion chemistry, and groundwater levels recover very slowly after sampling events, sometimes taking several months to return to a similar groundwater level as before the sampling event. Thus, the vertical gradients reported at this location may not be representative of vertical gradients throughout the Hueneme Aquifer.

3.2.2 Change in Storage [§354.16(b)]

§354.16 Groundwater Conditions. *Each Plan shall provide a description of current and historical groundwater conditions in the basin, including data from January 1, 2015, to current conditions, based on the best available information that includes the following:*

(b) A graph depicting estimates of the change in groundwater in storage, based on data, demonstrating the annual and cumulative change in the volume of groundwater in storage between seasonal high groundwater conditions, including the annual groundwater use and water year type.

DRAFT

The annual change in volume of groundwater stored in a basin is the product of change in potentiometric head (measured as groundwater elevation), the storativity, and the area of each HSU. Similar to contouring of groundwater levels in Mound Basin (as described above), estimation of historical changes in groundwater stored in the Basin is complicated by sparse groundwater elevation data, particularly in the northern portion of the Basin and in HSUs with few monitoring points. Due to these limitations, annual and cumulative changes in groundwater in storage were estimated using United's (2018, 2021a, 2021b) groundwater flow model, which is generally well calibrated on a regional scale to groundwater elevation measurements.

Figure 3.2-17 graphically depicts the estimated annual change in groundwater storage in Mound Basin from 1986 through 2019, which is the historical period used to calibrate and validate United's (2018, 2021a, 2021b) model. The changes in storage estimated by the model from March 31 of a given year to March 31 of the subsequent year is depicted on Figure 3.2-17 as "estimated annual change in groundwater in storage" (seasonal high groundwater elevations in Mound Basin most commonly occur in March or April of each year). Also depicted on Figure 3.2-17 are:

- the cumulative change in storage, calculated as the sum of annual changes in storage up to the given year.
- the estimated groundwater use (volume of groundwater extracted) in Mound Basin during each water year.
- water year type.

The annual changes in groundwater storage in Mound Basin result from multiple groundwater inflows and outflows, as described in Section 3.3 of this GSP. However, some notable general trends are apparent from inspection of Figure 3.2-17, including:

- During most years with below-average rainfall ("dry years") and near-average rainfall ("average years"), groundwater in storage typically declined modestly (2,000 to 5,000 AF), although greater declines in storage (up to 9,000 AF annually) occurred during the exceptional droughts of 1987-1990 and 2012-2016. The greatest annual decreases in storage have not consistently been associated with years of the highest extraction rates, suggesting that other water budget components can have a significant influence on groundwater in storage.
- During most years with above-average rainfall ("wet years"), groundwater in storage often increased by 7,000 to 13,000 AF. These increases in groundwater storage were typically much larger than the annual declines observed during dry and average years, reflecting the importance of the region's infrequent wet years in recharging groundwater basins.
- The estimated cumulative change in groundwater in storage in Mound Basin declined markedly during the two exceptional droughts that occurred in the region (1987-1990 and 2012-2016). Cumulative change in storage quickly rebounded to pre-drought conditions in the four years following the 1987-1990 drought, and remained positive (greater than initial conditions in 1986) until the next exceptional drought in the region (2012-2016). During the 2012-2016 exceptional drought, cumulative change in groundwater in storage sharply declined again, although not to the same magnitude as occurred from 1987-1990, likely due to the smaller volumes of groundwater extracted from Mound Basin in the past decade compared to the late 1980s. Unlike the 1987-1990 drought, wet years did not immediately follow the 2012-2016

DRAFT

drought; consequently, cumulative change in storage remained at approximately 2016 levels through 2019.

3.2.3 Seawater Intrusion [§354.16(c)]

§354.16 Groundwater Conditions. *Each Plan shall provide a description of current and historical groundwater conditions in the basin, including data from January 1, 2015, to current conditions, based on the best available information that includes the following:*

(c) Seawater intrusion conditions in the basin, including maps and cross-sections of the seawater intrusion front for each principal aquifer.

SGMA defines seawater intrusion as "the advancement of seawater into a groundwater supply that results in degradation of water quality in the basin, and includes seawater from any source." The primary cause for seawater intrusion in coastal aquifers is development of a landward hydraulic gradient in areas where groundwater extraction has caused groundwater elevations to decline below the hydraulic head necessary to prevent landward movement of seawater. If groundwater elevations inland of the coast fall below this protective elevation, and assuming there is a pathway for seawater to enter one of the principal aquifers, then landward migration of seawater from the ocean into freshwater aquifers can occur. This process is referred to herein as "lateral seawater intrusion." The principal aquifers of the adjacent Oxnard Basin are highly vulnerable to lateral seawater intrusion due to the existence of two deep submarine canyons just offshore from Port Hueneme and Point Mugu where erosion during periods of lower sea level (ice age) exposed the aquifers to seawater in the canyon walls at a very close distance to the shoreline (Figure 3.1-10). However, no such submarine canyons exist offshore of Mound Basin, greatly reducing the likelihood that seawater can find a near-shore path for intrusion into the principal aquifers (Mugu and Hueneme aquifers) (Figure 3.1-10). Instead, the Mound Basin principal aquifers may only be exposed to seawater where they crop out on the continental shelf edge, approximately 10 miles offshore (Figure 3.1-10).

Previous investigators (John F. Mann Jr. & Associates, 1959; Geotechnical Consultants, 1972; Fugro West, 1996) did not find evidence of lateral seawater intrusion into the principal aquifers of Mound Basin. Geotechnical Consultants (1972) conducted the most detailed review to that point and determined that "to date, there is no evidence that seawater intrusion has occurred historically or that it is occurring presently in Mound Basin." Their report notes that a landward hydraulic gradient existed in the area of Pierpont Bay from 1957 to 1961, as a result of extraction from municipal water supply wells in the Pierpont Bay area. Those wells have since been decommissioned. The landward gradient was a concern as a potential source of seawater intrusion at that time, and chloride concentrations increased at the former Pierpont Bay wells in the same general timeframe. However, Geotechnical Consultants (1972) proposed that downward movement of poor-quality groundwater from shallower aquifer zones via "improper well seals and/or over-extended gravel envelopes" was the cause for the increasing chloride concentrations detected at the Pierpont Bay wells, rather than seawater intrusion. Monitoring data at the Marina Park cluster of monitoring wells, located near Pierpont Bay, have shown no signs of seawater intrusion in the principal aquifers (Figure 3.1-21).

Consistent with the findings of Geotechnical Consultants (1972) nearly 50 years ago, recent water quality data for wells near the coast do not show evidence of lateral seawater intrusion into the aquifers of Mound Basin. The maximum recorded chloride concentrations from the 2017 calendar year are shown on

DRAFT

Figures 3.1-14 and 3.1-18 (data for 2017 are shown because data are available for most wells in Mound Basin; fewer wells were sampled in 2018 by VCWPD due to staffing issues). Most coastal well samples contained chloride concentrations below 100 mg/L; however, four wells located farther inland (Figures 3.1-14 and 3.1-18) had chloride concentrations at or above 100 mg/L, a target water quality threshold for many agricultural operations. These chloride concentrations are not believed to be associated with seawater intrusion, as they are farther inland than coastal monitoring wells that did not show indications of seawater intrusion. The shallowest well in the Marina Park coastal monitoring well cluster, 02N23W15J03S (Figure 3.1-21), is screened from 170 to 240 ft bgs in the fine-grained Pleistocene deposits and has the poorest water quality in the area. In this well, TDS concentrations are above 3,000 mg/L and chloride values average nearly 100 mg/L. However, strong artesian heads (well above sea level) are consistently measured in this well (Figure 3.2-14). The high artesian heads in this well indicate offshore groundwater gradients in this vicinity. Groundwater quality in the principal aquifers at the Marina Park monitoring well cluster have not shown any evidence of seawater intrusion (Figure 3.1-21). Groundwater levels in the principal aquifers at this location have been typically above sea level, except briefly in 2004 and since 2014, suggesting that offshore groundwater flow has occurred more frequently than onshore flow (Figure 3.2-14). Well 02N23W14K01S, located approximately 0.75 miles inland of the Marina Park monitoring well cluster (Figure 3.1-20), has produced groundwater of good quality for the period of record (1933 to 1981). Concentrations for most analytes are fairly stable, with TDS concentrations averaging less than 1,200 mg/L (Figure 3.1-20). This agricultural well is screened in the Mugu Aquifer from 475 to 915 ft bgs. One outlier of elevated chloride (376 mg/L) was detected in 1962; otherwise, water quality data from this coastal production well show no evidence of saltwater intrusion. In summary, available data do not indicate that seawater is or has been present in the onshore portions of the principal aquifers to date. There are no available data concerning the presence or absence of seawater in the offshore portions of the aquifers.

Due to the lack of evidence of seawater intrusion in onshore portions of the Basin and lack of data concerning the location of any offshore seawater intrusion front in the principal aquifers, the maps and cross-sections of the seawater intrusion front required pursuant to §354.16(c) cannot be prepared.

3.2.4 Groundwater Quality Impacts [§354.16(d)]

§354.16 Groundwater Conditions. *Each Plan shall provide a description of current and historical groundwater conditions in the basin, including data from January 1, 2015, to current conditions, based on the best available information that includes the following:*

(d) Groundwater quality issues that may affect the supply and beneficial uses of groundwater, including a description and map of the location of known groundwater contamination sites and plumes.

This section describes groundwater quality issues that may affect the supply and beneficial uses of groundwater.

Groundwater Contamination Sites and Plumes

Information available on the State Water Resources Control Board (SWRCB) GeoTracker mapping site (SWRCB, 2020) and the Department of Toxic Substances Control (DTSC) mapping website (DTSC, 2020) were reviewed for locations of known groundwater contamination sites and plumes. Sixteen sites out of approximately 200 leaking underground storage tank (LUST) sites and other soil or groundwater cleanup

sites are identified as open cases in Mound Basin on GeoTracker. None of the DTSC sites were noted as having groundwater contamination. A map showing the locations of the open Geotracker cases is presented in Figure 3.2-18. Based on review of the open LUST cases, none are reported to have impacted groundwater quality in the principal aquifers (Mugu and Hueneme aquifers). The uppermost principal aquifer in the developed portion of Mound Basin is the Mugu Aquifer, which is vertically separated from the known waste sites by the fine-grained Pleistocene deposits aquitard (generally 350 to 585 ft thick in Mound Basin) and the Shallow Alluvial Deposits (typically 50 to 100 ft thick). Releases from most LUST sites in southwestern Ventura County, which typically involve fuel spills, do not commonly impact groundwater below the shallowest water table. No contamination sites were identified where the deeper aquifers crops out at land surface in the hillside area along the northern margin of Mound Basin (this is in an area of mostly undeveloped land, approximately 1 mile from the nearest currently active water supply well). Based on the review of open cases, the principal aquifers in Mound Basin do not appear to have been impacted by contamination sites and plumes.

Nitrate concentrations in excess of the drinking water MCL of 45 mg/L (as NO_3) were detected at three agricultural water supply wells that are screened in principal aquifers (Mugu and Hueneme aquifers) in Mound Basin in 2017 (the most recent year with abundant water quality data), as follows:

- 02N22W07P01S—Nitrate was detected at a concentration of 64.6 mg/L at this well screened in the Mugu Aquifer near the center of Mound Basin (Figure 3.1-15).
- 02N23W13K03S—Nitrate was detected at a concentration of 61.4 mg/L at this well screened in the Hueneme Aquifer in the southwest part Mound Basin (Figure 3.1-19).
- 02N22W09L04S—Nitrate was detected at a concentration of 136 mg/L at this well screened in the Hueneme Aquifer in the southeast part Mound Basin (Figure 3.1-19).

It should be noted that none of these wells are used for municipal or industrial water supply, and that wells 02N22W07P01S, 02N23W13K03S, and 02N22W09L04 also exhibit anomalously high concentrations of TDS, sulfate, and chloride, suggesting influence of shallow groundwater, possibly through a compromised well seal or well casing (as discussed in Section 3.1.4.3), rather than presence of nitrate "plumes" in the Mugu and Hueneme aquifers in Mound Basin. It is further noted that other wells in the Basin do not exhibit elevated nitrate concentrations, further reinforcing the conclusion that nitrate is not a widespread issue in the Mound Basin principal aquifers.

As discussed in Section 3.1.4.3, the common ion chemistry of the groundwater in the Mugu and Hueneme principal aquifers is not ideal, but is beneficially used by municipal and agricultural users across the Basin. Common ions with RWQCB-LA WQOs include sulfate, boron, and chloride (RWQCB-LA, 2013). TDS also has a WQO. In general, TDS, sulfate, boron, and chloride concentrations are lower in the Mugu Aquifer and meet the WQOs with few exceptions. In general, TDS, sulfate, boron, and chloride concentrations are higher in the Hueneme Aquifer and meet the WQOs for the majority of the sampled locations. Dissolved constituents are derived from natural sources, and groundwater extraction does not appear to be correlated with common ion chemistry concentrations. Elevated TDS and sulfate concentrations relative to drinking water secondary MCLRs are mitigated by blending with other water sources by the City of Ventura. The City of Ventura is pursuing its VenturaWaterPure Project (fully advanced treated recycled water) and an interconnection to facilitate delivery of its SWP entitlement, both of which may provide further opportunities to blend water produced from its Mound Basin wells.

Groundwater Quality Trends at Clustered Monitoring Wells

Three monitoring wells (02N23W15J01S, 02N23W15J02S, and 02N23W15J03S), jointly funded by United and the City of Ventura, were installed in 1995 in a cluster near the coast at Marina Park, on the north side of Ventura Harbor. Groundwater quality in these three wells has been fairly stable since the wells were installed, as indicated by the chemical hydrographs shown on Figure 3.1-21. The shallowest well at this location, well 02N23W15J03S, is screened in the fine-grained Pleistocene deposits from 170 to 240 ft bgs and has the poorest groundwater quality, with TDS typically above the WQO, exceeding 3,000 mg/L; however, there is no groundwater production from this unit in the Basin. The deepest well, screened in the Hueneme Aquifer from 970 to 1,070 ft bgs, routinely records TDS concentrations near 1,300 mg/L, slightly above the WQO, and sulfate concentrations of approximately 500 mg/L, below the WQO. Well 02N23W15J02S, screened in the Mugu Aquifer between 480 and 660 ft bgs, records lower TDS and sulfate concentrations, with TDS around 900 mg/L and sulfate around 400 mg/L, both below WQOs. Chloride concentrations at all three of these wells typically are approximately 100 mg/L, which is less than the RWQCB-LA WQO and lower than chloride concentrations detected at many of the wells located farther inland in Mound Basin, indicating that none of the monitored zones at this location are impacted by seawater intrusion. Additionally, results from a geochemical investigation by SSP&A (2020) suggest that groundwater from the shallow well is not impacted by seawater intrusion, noting that samples were more depleted in bromide, boron, and iodide compared to typical groundwater that has mixed with saline water.

A cluster of three monitoring wells (02N22W07M01S, 02N22W07M02S, and 02N22W07M03S) was also installed by United and the City of Ventura at Camino Real Park in the central portion of the Basin. These wells are the site of the only groundwater quality samples collected from north of Highway 126 in Mound Basin. As with the Marina Park wells, solute concentrations are slightly higher in the Hueneme Aquifer (well 02N22W07M01S, with a screen depth of 1,200 to 1,280 ft bgs) than in the Mugu Aquifer (well 02N22W07M02S, with a screen depth of 710 to 780 ft bgs). In the deeper screened interval, TDS concentrations of 1,100 mg/L are commonly recorded, which is below the WQO for the Basin. TDS is generally less than 1,000 mg/L in the well screened in the Mugu Aquifer (Figure 3.1-22), which is less than the RWQCB-LA WQO. Sulfate accounts for about half of the TDS of the groundwater, as is typical for other wells in the Basin. Well 02N22W07M03S, which is the shallowest of the three wells at the Camino Real Park site (screened from 210 to 280 ft bgs in the fine-grained Pleistocene deposits), has the poorest water quality in the cluster. TDS in this well sometimes exceeds 5,000 mg/L. Chloride and nitrate are also found at high concentrations in this well. However, there is no groundwater production from this unit in the Basin. The recent geochemical investigation by SSP&A (2020) found that the primary dissolved anion in samples collected from the shallow well was sulfate, which if derived from local aquifer minerals and evaporates implies a potential similar evaporitic origin for chloride.

Two monitoring wells (2N22W09L04S and 2N22W09L03S) were installed in Mound Basin near Kimball and Telegraph Roads in 2008 as part of a siting study for a potential new production well for the City of Ventura (Hopkins, 2009). These two wells are in the southeast quadrant of Mound Basin near the boundary between Mound and Santa Paula Basins. Groundwater quality data are available for these wells since 2011. Groundwater quality has consistently been very poor in the shallower well (2N22W09L04S, which is screened in the upper strata of the Hueneme Aquifer, from 480 to 510 ft bgs). Groundwater samples from this well routinely contain TDS concentrations over 6,000 mg/L and sulfate concentrations over 3,500 mg/L. Nitrate and chloride concentrations are also high. Such concentrations exceed the WQOs for the Basin. Groundwater samples from the deeper well (screened in deeper strata of the Hueneme Aquifer,

DRAFT

from 890 to 950 ft bgs) contain dissolved constituent concentrations that are more typical of Hueneme Aquifer elsewhere (Figures 3.1-16 through 3.1-19).

3.2.5 Land Subsidence [§354.16(e)]

§354.16 Groundwater Conditions. *Each Plan shall provide a description of current and historical groundwater conditions in the basin, including data from January 1, 2015, to current conditions, based on the best available information that includes the following:*

(e) The extent, cumulative total, and annual rate of land subsidence, including maps depicting total subsidence, utilizing data available from the Department, as specified in Section 353.2, or the best available information.

A review of available reports during preparation of this GSP did not indicate any documented groundwater-related subsidence. DWR (2014) prepared a summary of recent, historical, and future subsidence potential for groundwater basins, described in detail in DWR Bulletin 118 (DWR, 2021a). The stated intent of the document was to provide screening-level information with respect to subsidence. Mound Basin was listed as having a "low" overall estimated potential for future subsidence.

DWR provides subsidence data on their "SGMA Data Viewer" web-based geographic information system (GIS) viewer (DWR, 2020) to support development of GSPs. The DWR data includes land subsidence estimates for Mound Basin based on interferometric synthetic aperture radar (InSAR) measurements for the period from June 13, 2015, through September 19, 2019 (TRE Altamira, 2020). This subsidence dataset is provided by DWR as a raster image depicting the range of estimated average vertical displacement values in 100-ft by 100-ft grid cells throughout Mound Basin and adjacent groundwater basins. This subsidence dataset was downloaded, mapped, and reviewed (as presented in Figure 3.2-19). The data accuracy report for the InSAR data (Towill, 2020) states that "InSAR data accurately models change in ground elevation to an accuracy tested to be 16 millimeters (mm) at 95% confidence." The measurement accuracy when converting from the raw InSAR data to the maps provided by DWR is 0.048 feet with 95% confidence level. The total estimated error is therefore 0.1 ft.

Areas falling below the reported accuracy are shown in gray on Figure 3.2-19. Areas depicted in color on Figure 3.2-19 indicate measurable subsidence above the accuracy tolerance. Although a sizeable area of the Basin shows measured subsidence that exceeds the accuracy tolerance of the InSAR data, there are several considerations that should be accounted for when evaluating the data.

As shown on Figure 3.2-19, the highest subsidence rate reported in the InSAR raster data set are concentrated in the southwestern area of the Basin. This InSAR raster data set was apparently derived by interpolating the data points shown on the same figure as black squares. As shown on the figure, there is relatively sparse coverage by the InSAR data points used to derive a full coverage of raster data within this area. In addition, it appears that deriving this high subsidence rate area was highly influenced by interpolating data points that represent a hot spot located outside the Basin. Such a hot spot represents a landfill that is located in the Oxnard Basin. It also appears that values in the southwestern portion of the Mound Basin were estimated by interpolating data points from outside the Basin across the McGrath Fault, which appears to have resulted in erroneous estimates of subsidence in the southwestern portion of the Mound Basin.

DRAFT

Another important consideration is the fact that the InSAR results do not differentiate between subsidence caused by groundwater withdrawal and other potential causes, such as tectonic activity. The Mound Basin is located in a high tectonic activity area characterized by north-south compression. In fact, the Mound Basin is a synclinal basin, caused by ongoing downwarping associated with this compression. The west-east axis of the Basin follows along the Ventura-Santa Clara River Syncline (a downwarp or downward fold) that plunges (deepens) to the west. Additionally, the Mound Basin is bounded by faults to the north (Ventura-Pitas Point Fault) and south (McGrath Fault), along which the majority of the Basin is being down-dropped (Figures 3.1-05 through 3.1-08). Thus, it is to be expected that tectonic activity may be causing the observed subsidence. In fact, inspection of the InSAR data (Figure 3.2-19) reveals that the limits of measurable subsidence are constrained by the Ventura-Pitas Point Fault on the north and narrow to the west, consistent with a west-plunging synclinal structure. Unfortunately, the lack of InSAR data points to the south, and interpolation artifacts associated with the Oxnard Basin landfill prevent further evaluation of tectonic origins of subsidence along the southern Mound Basin boundary.

In addition to the InSAR results, data from a continuous Ground Positioning System (GPS), VNCO, which is maintained by a non-profit university consortium, were reviewed (Figure 3.2-19) (UNAVCO, 2020). The VNCO site is the only continuous GPS location in the Basin. The VNCO GPS site indicates a steady decline in ground position during the period of record, which began in 2000. Comparison with groundwater level data shows that the rate of ground position decline does not vary with groundwater levels, suggesting that the subsidence is unrelated to groundwater levels or extraction (Figure 3.2-19). This comparison further suggests that the measured subsidence in the Basin is of tectonic origin.

In summary, available data suggest that the Mound Basin south of the Ventura-Pitas Point Fault is subsiding at steady rate of approximately 5 mm per year due to tectonic activity. Further investigation may be warranted to confirm these conclusions and more conclusively rule out groundwater levels as a causal factor in the observed subsidence.

3.2.6 Interconnected Surface Water Systems [§354.16(f)]

§354.16 Groundwater Conditions. *Each Plan shall provide a description of current and historical groundwater conditions in the basin, including data from January 1, 2015, to current conditions, based on the best available information that includes the following:*

(f) Identification of interconnected surface water systems within the basin and an estimate of the quantity and timing of depletions of those systems, utilizing data available from the Department, as specified in Section 353.2, or the best available information.

Available data and numerical modeling analysis suggest that depletion of interconnected surface water systems within Mound Basin caused by groundwater use does not occur. The following paragraphs summarize available information regarding groundwater-surface water interaction that support this conclusion. Detailed information is provided in Appendix G.

Santa Clara River

The lowest approximate 1-mile reach of the Santa Clara River from its mouth (at the Pacific Ocean), including its estuary and adjacent areas of riparian vegetation, is within Mound Basin. The Santa Clara River flows perennially during most years along some or all of the 5-mile reach upstream from its mouth to approximately one-quarter mile northeast of the U.S. Highway 101 bridge between the cities of Ventura

and Oxnard (Figure 3.1-11) at the southwest limit of the Forebay area of the Oxnard Basin. Baseflow in the perennial reach has been estimated at approximately 2 cubic feet per second (cfs), which is equivalent to an annual discharge of 1,500 AF/yr (Stillwater Sciences, 2018). Much of this baseflow is groundwater discharge from the semi-perched aquifer of the Oxnard Basin (approximately ¾ of the perennial reach of the Santa Clara River overlies the Oxnard Basin). Total annual flow (including storm flows) in the Santa Clara River, like most streams in southern California, is highly variable, and can exceed 400,000 AF/yr during particularly wet years. Figure 3.2-20 shows records for three stream gages located along the Santa Clara River near Mound Basin; all three gages are located in the adjacent Oxnard Basin (gage locations are shown on Figure 3.1-01). No permanent stream gages have ever existed on the Santa Clara River within Mound Basin. Thus, any change in baseflow downstream of the gage 723, including within Mound Basin, is not known. It should be noted that gage 723 is poorly calibrated to low flows in the river (Stillwater Sciences, 2018).

There are multiple inferred sources of baseflow in the perennial reach of the Santa Clara River. These sources include discharge from the stream terrace deposits of the Mound Basin, discharge from the semi-perched aquifer in Oxnard Basin, agricultural tile drain systems present in both basins, and urban runoff via storm drains. The contributions of these different sources have not been documented in literature.

As discussed in Section 3.1.4.1.3, the presence of tile drains on agricultural lands situated on the stream terrace deposits (Figure 3.1-10) suggests that the stream terrace deposits are poorly permeable and, therefore, are not considered to be an aquifer, despite the occurrence of perched water in these deposits. Perched water within the stream terrace deposits, fed by percolating rainfall and agricultural return flows, is the primary groundwater that is interconnected with Santa Clara River baseflow within Mound Basin. It can be concluded that there is no direct depletion of interconnected surface water of the Santa Clara River and its estuary because there is no groundwater extraction from the Shallow Alluvial Deposits. Indirect depletion of Santa Clara River flows by groundwater extraction from the deeper, principal aquifers does not occur at material rates because the thick zone of fine-grained materials that lies between the Shallow Alluvial Deposits and the Mugu Aquifer significantly limits the propagation of hydraulic responses between these units. A detailed analysis of the potential for indirect depletion is presented in Appendix G. The results of that analysis indicated that there is no material depletion of surface water. The lack of material indirect depletion of interconnected Santa Clara River flows will be further confirmed with data obtained from a future monitoring well planned for the construction at the Ventura Wastewater Treatment Plant (WWTP) and planned interim shallow groundwater data collection and analysis along the Santa Clara River (see Sections 5.3.1 and 6.6).

Barrancas

Surface water flows in the various barrancas crossing Mound Basin are brief in response to precipitation events. These flows may be briefly interconnected with the Shallow Alluvial Deposits or perched groundwater, but this cannot be verified with available data. Regardless of the questions and uncertainty surrounding interconnection of the Shallow Alluvial Deposits with surface water flows in the barrancas, it can be concluded that there is no direct depletion of interconnected surface water in the barrancas because the Shallow Alluvial Deposits do not have any known groundwater extractions within the Mound Basin. Additionally, there is no groundwater extraction north of the Pitas Point-Ventura-Foothill Faults in the northern portion of the Basin where the principal aquifers are exposed and underlie the barrancas. Based on the foregoing, extraction from the principal aquifers is not believed to deplete surface water in

DRAFT

the barrancas. Indirect depletion of barranca flows by groundwater extraction from the deeper, principal aquifers does not occur at material rates because the thick zone of fine-grained materials that lies between the Shallow Alluvial Deposits and the Mugu Aquifer significantly limits the propagation of hydraulic responses between these units. A detailed analysis of the potential for indirect depletion of the Santa Clara River is presented in Appendix G, which also applies to the brief flows in the barrancas. The results of that analysis indicated that there is no material depletion of surface water.

3.2.7 Groundwater-Dependent Ecosystems [§354.16(g)]

§354.16 Groundwater Conditions. *Each Plan shall provide a description of current and historical groundwater conditions in the basin, including data from January 1, 2015, to current conditions, based on the best available information that includes the following:*

(g) Identification of groundwater dependent ecosystems within the basin, utilizing data available from the Department, as specified in Section 353.2, or the best available information.

This section summarizes the current best available information concerning potential GDEs in Mound Basin. Detailed assessment of potential GDEs is presented in Appendix H. This understanding is primarily informed by regional information sources including (1) the DWR statewide database of iGDEs and supporting documentation and (2) descriptions of vegetation alliances from the United States Department of Agriculture (USDA) Classification and Assessment with Landsat of Visible Ecological Groupings (CALVEG), which generally correspond with the Natural Communities Commonly Associated with Groundwater (NCCAG) classifications discussed below.

The Natural Communities (NC) dataset is a compilation of 48 publicly available state and federal agency datasets that map vegetation, wetlands, springs, and seeps in California. A working group comprised of DWR, the California Department of Fish and Wildlife (CDFW), and The Nature Conservancy (TNC) reviewed the compiled dataset and conducted a screening process to exclude vegetation and wetland types less likely to be associated with groundwater and retain types commonly associated with groundwater, based on criteria described in Klausmeyer et al. (2018) and available online from the California Natural Resources Agency (2020). Because there is uncertainty in the knowledge of when and how plants and animals depend on groundwater, the spatial database identifies ecosystems that potentially rely on groundwater and, therefore, are referred to as "indicators of groundwater-dependent ecosystems (iGDEs)" (TNC, 2019). TNC suggests using the iGDEs as a starting point for the identification and analysis of GDEs under SGMA, including specifically steps to validate the groundwater dependency of iGDEs with local information (TNC, 2019). Determining whether an iGDE is actually a GDE requires local detailed data about the land use, groundwater levels, surface water hydrology, and geology. Per TNC guidance (TNC, 2019), it is suggested that this statewide database be refined using local information to ensure that the map accurately reflects local conditions. Once a connection from the iGDE to groundwater is determined/ground-truthed, the Basin's GDE map can be finalized (TNC, 2019).

The iGDEs are categorized into the following two NCCAG classifications:

- Wetland features commonly associated with the surface expression of groundwater under natural, unmodified conditions. Note, the wetlands class also includes wetlands within the channel of rivers which may also be referred to as aquatic habitat in other publications.

- Vegetation types commonly associated with the subsurface presence of groundwater (phreatophytes) (CNRA, 2020).

Figure 3.1-11 shows areas of iGDEs mapped in Mound Basin. A map of each numbered iGDE area is presented in Appendix H, indicating the NCCAG class or classes mapped. Each iGDE was screened in general accordance with TNC recommendations to evaluate groundwater dependency (TNC, 2018). The screening results are presented in Appendix H.

As presented in Appendix H, iGDE areas 1 through 10 have been screened out and are not considered GDEs, because the plants present in the mapped iGDE areas appear to meet their transpiration needs using non-groundwater sources of water, such as urban runoff (iGDEs mapped along barrancas) or irrigation (iGDEs located within or adjacent to parks or backyards).

The Area 11 iGDEs is retained as a GDE because the vegetation in this area appears to be at least partially dependent on groundwater encountered within the Shallow Alluvial Deposits (specifically, groundwater and agricultural drainage encountered within the stream terrace deposits). However, it is noted that there is no known groundwater extraction from the Shallow Alluvial Deposits within Mound Basin. Indirect impacts from deep, principal aquifer groundwater extractions on shallow groundwater levels—and, hence, the Area 11 GDE—do not occur because the thick zone of fine-grained materials that lies between the Shallow Alluvial Deposits and the Mugu Aquifer significantly limits the propagation of hydraulic responses between these units. A detailed analysis of the potential for deep, principal aquifer extraction effects on shallow groundwater levels and the Area 11 GDE is presented in Appendix G. The results of that analysis indicated that there are no material effects. The lack of material effects on the Area 11 GDE will be further confirmed with data obtained from a future monitoring well planned for the construction at the Ventura WWTP and planned limited-duration shallow groundwater level monitoring the Santa Clara River (see Sections 5.3.1 and 6.6). Additionally, MBGSA will monitor well permit applications for proposed uses of shallow groundwater in the vicinity of Area 11 and take appropriate actions if the potential for significant and unreasonable effects is indicated by analysis of the proposed uses.

Area 11 includes federally designated critical habitat for southern California Distinct Population Segment steelhead, tidewater goby, western snowy plover, and southwestern willow flycatcher. Additionally, the area provides potential habitat for eight special status plant species and twenty-eight special status wildlife species. As such, the Area 11 GDE Unit is of high ecological value. See Appendix H for more information on the GDEs within Area 11.

DRAFT

3.3 Water Budget [§354.18]

§354.18 Water Budget.

(a) *Each Plan shall include a water budget for the basin that provides an accounting and assessment of the total annual volume of groundwater and surface water entering and leaving the basin, including historical, current and projected water budget conditions, and the change in the volume of water stored. Water budget information shall be reported in tabular and graphical form.*

(b) *The water budget shall quantify the following, either through direct measurements or estimates based on data:*

- ***(1)*** *Total surface water entering and leaving a basin by water source type.*
- ***(2)*** *Inflow to the groundwater system by water source type, including subsurface groundwater inflow and infiltration of precipitation, applied water, and surface water systems, such as lakes, streams, rivers, canals, springs and conveyance systems.*
- ***(3)*** *Outflows from the groundwater system by water use sector, including evapotranspiration, groundwater extraction, groundwater discharge to surface water sources, and subsurface groundwater outflow.*
- ***(4)*** *The change in the annual volume of groundwater in storage between seasonal high conditions.*
- ***(6)*** *The water year type associated with the annual supply, demand, and change in groundwater stored.*

(d) *The Agency shall utilize the following information provided, as available, by the Department pursuant to Section 353.2, or other data of comparable quality, to develop the water budget:*

- ***(1)*** *Historical water budget information for mean annual temperature, mean annual precipitation, water year type, and land use.*
- ***(2)*** *Current water budget information for temperature, water year type, evapotranspiration, and land use.*
- ***(3)*** *Projected water budget information for population, population growth, climate change, and sea level rise.*

(e) *Each Plan shall rely on the best available information and best available science to quantify the water budget for the basin in order to provide an understanding of historical and projected hydrology, water demand, water supply, land use, population, climate change, sea level rise, groundwater and surface water interaction, and subsurface groundwater flow. If a numerical groundwater and surface water model is not used to quantify and evaluate the projected water budget conditions and the potential impacts to beneficial uses and users of groundwater, the Plan shall identify and describe an equally effective method, tool, or analytical model to evaluate projected water budget conditions.*

This section presents the estimated water budgets for the Mound Basin, including information required by the SGMA Regulations and information that is important for developing an effective plan to achieve sustainability. In accordance with the SGMA Regulations §354.18, the GSP must include a water budget for the Basin that provides an accounting and assessment of the total annual volume of surface water and groundwater entering and leaving the Basin, including historical, current, and projected water budget conditions, and the change in the volume of water stored. Water budgets must be reported in graphical and tabular formats, where applicable. A description of each water budget term and data sources is provided below, and the historical, current, and projected (future) quantitative water budgets for Mound Basin are presented below in Subsections 3.3.1, 3.3.2, and 3.3.3, respectively.

In accordance with GSP Emergency Regulations §354.18(e), MBGSA relied up on the best available information and best available science to quantify the water budget for the Basin in order to provide an understanding of historical and projected hydrology, water demand, water supply, land use, population, climate change, sea level rise, groundwater and surface water interaction, and subsurface groundwater

flow. A numerical groundwater flow model was used to quantify and evaluate the projected water budget conditions and the potential impacts to beneficial uses and users of groundwater (United, 2018, 2021a, 2021b, 2021c). The numerical model is based on available hydrogeologic and land use data from the past several decades, previous studies of Basin hydrogeologic conditions, and an earlier version of the model (United, 2018). The numerical model gives insight into how the complex hydrologic processes are operating in the Basin. During previous studies, available data and a peer-review process were used to calibrate the numerical model to Basin hydrogeologic conditions (United 2018). Results of the previous calibration process demonstrated that the modeled groundwater and surface water flow conditions were similar to observed conditions. The numerical model was updated in 2020 (United, 2021a), and the calibration was improved compared to the previous model (United, 2021a). Based on the developments of the model, it is considered appropriate for the GSP.

Estimates and projections of groundwater flow components made with the numerical model have uncertainty due to limitations in available data and limitations from assumptions made to develop the model (United, 2018, 2021a). Model uncertainty was considered when developing the water budgets during the planning process and is discussed in Section 3.3.3.

In accordance with GSP Emergency Regulations §354.18(d), MBGSA utilized the following required information, provided by DWR or other data of comparable quality, to develop the water budget:

- Historical water budget information for mean annual temperature, mean annual precipitation, water year type, and land use;
- Current water budget information for temperature, water year type, evapotranspiration (ET), and land use; and
- Projected water budget information for population, population growth, climate change, and sea level rise.

Precipitation (specifically rainfall, as snow is extremely uncommon in Mound Basin) is not a direct groundwater or surface water budget component. However, precipitation is an important parameter that strongly influences several groundwater and surface water budget components directly or indirectly, such as groundwater recharge and surface water flows in streams. Data sources are provided in Table 3.3-01.

Qualitative descriptions of each inflow or outflow component of the water budgets are detailed below:

Surface Water Entering and Leaving Mound Basin

Surface water enters and leaves Mound Basin via the Santa Clara River and several smaller and ephemeral streams (barrancas) where they cross the Basin's boundaries, as shown on Figure 3.1-01. More detail regarding characteristics and sources of data are discussed in Section 3.1.1.2, and how these surface water components are incorporated in the water budget is discussed below:

Santa Clara River

Surface water flows in the Santa Clara River enter Mound Basin along the Basin's southern boundary (Figure 3.1-01) and leave Mound Basin approximately 1 mile downstream from this entry point, discharging into the Pacific Ocean.

DRAFT

Stream gages for surface flows in the Santa Clara River are located upstream from Mound Basin (Figure 3.1-01), in the Oxnard Basin. These gages are operated by the VCWPD and USGS. Stillwater Sciences (2018) noted the following uncertainties regarding stream gaging data in the Santa Clara River: "The Santa Clara River discharge is based upon a stage versus flow rating curve over a large width with a seasonally variable cross-section due to sediment mobilization. In addition to periodic stage measurement equipment malfunctions, the Santa Clara River discharge rating curve is inaccurate at low flows (i.e., when water depth is below the lowest rating curve value) and during periods after storms between rating curve adjustments." However, considering the negligible interaction between surface water and groundwater in the principal aquifers of Mound Basin (as described in Section 3.2.6 and Appendix G), the uncertainty in surface water flow rates does not impact the groundwater sustainable management of the Basin. Surface water flows and rates of groundwater recharge from and discharge to the Santa Clara River are estimated using United's (2021a, 2021b, 2021c) numerical models, as discussed later in this section.

It is noted that United diverts surface water from the Santa Clara River via the Vern Freeman Diversion located approximately 10 miles upstream of where the Santa Clara River enters the Mound Basin. The water budgets presented in this GSP account for historical and projected diversions by United.

Ephemeral streams that cross Mound Basin's boundaries

Review of USGS topographic maps for the Oxnard (1949), Ventura (1951), and Saticoy (1967) 7.5-minute quadrangles indicates the presence of five subwatersheds in the foothills north of Mound Basin that convey ephemeral surface water flows across the northern boundary of Mound Basin (Figure 3.1-01). These subwatersheds north of Mound Basin include the areas supplying ephemeral flows to:

- an unnamed drainage north of Kalorama Street in northwestern Mound Basin (289 acres).
- Sanjon Barranca (171 acres).
- Prince Barranca and Hall Canyon (2,878 acres).
- the combined subwatershed areas of Sexton Canyon, Barlow Canyon, and Arundell Barranca (2,261 acres).
- Harmon Canyon and Barranca (1,838 acres).

Surface flows in these five subwatersheds are most likely to occur during and immediately following moderate to heavy rainfall events, typically in winter and spring. Some of this stormflow infiltrates permeable sediments of the San Pedro Formation along the northern Mound Basin boundary (Figure 3.1-11) in a process referred to as mountain-front recharge by United (2018) and is described as "ungauged streamflow" by the USGS (2003a). The remainder of these ephemeral flows are rapidly conveyed across Mound Basin in barrancas, some of which are partially lined with concrete, before discharging to the Pacific Ocean or Santa Clara River.

Within Mound Basin, the VCWPD operates one stream gage each in Prince, Arundell, and Harmon barrancas (Figure 3.1-01). Records are available for storm-event peak discharges in Prince (period of record from 1974 through 2017) and Harmon (1971-2018) barrancas, while both storm-event peak discharges (1963-2016) and average daily flows (1963-2006) are available for Arundell Barranca. The locations of these gages (in the central portion of Mound Basin) do not allow calculation of the difference between ephemeral surface water flows that enter and exit Mound Basin via these or the other, smaller

DRAFT

drainage courses. However, average daily flow data available for Arundell Barranca were used to estimate annual (water year) surface flows in all five of the watersheds and subwatersheds in Mound Basin from 1986 through 2006 and extrapolated to estimate flows for the remainder of the historical period (1986-2015; Section 3.3.1) and current period (2016-2019; Section 3.3.2). The data was also used to estimate future annual surface flows for the projected period (2022-2096; Section 3.3.3). Specifically, VCWPD data for rainfall at Ventura County Government Center and average daily streamflow in Arundell Barranca for 1986-2006 (VCWPD, 2021) were compared to develop a correlation between annual rainfall (in inches) and annual streamflow (in AF) at the Arundell stream gage (Station 700), per acre of watershed area contributing to flows in Arundell Barranca (7,452 acres total, including 2,261 acres north of Mound Basin and 5,191 acres within Mound Basin upstream from Station 700). The linear best-fit regression is:

*Annual streamflow in Arundell Barranca (at Station 700) per acre of watershed area = 0.043 * annual rainfall – 0.1652*

The coefficient of determination (R-squared) for this relationship is 0.93, indicating a good correlation. This relationship was applied to the subwatersheds draining into Mound Basin (excluding the Santa Clara River, which is discussed separately, above) to estimate total surface water flows entering Mound Basin in the barrancas each year. To estimate surface water exiting Mound Basin from the barrancas, surface water flows generated within Mound Basin in response to rainfall (applying the above relationship to the total area of Mound Basin) were added to the water entering Mound Basin in the barrancas (as described above). The volume of surface flows in the barrancas were then calculated by United's (2021a, 2021b, 2021c) model to be "lost" to mountain-front recharge each year and were subtracted from the surface water budget.

The surface water entering the Basin via these ephemeral drainages consist chiefly of storm flows, which are conveyed rapidly across the Basin in narrow and sometimes lined channels and discharge to the ocean or the Santa Clara River. The surface water flows are expected to have a small to negligible interaction with groundwater in Mound Basin, and ET of these surface flows is assumed to be negligible. Rates of recharge resulting from these flows were estimated from precipitation data and input to United's (2021a) groundwater flow model, as discussed later in this section. Interaction between surface water and groundwater in the Harmon Barranca was modeled (United 2021a) explicitly using MODFLOW's (McDonald and Harbaugh, 1988) stream (SFR) package, due to the relatively large area of its watershed compared to other barrancas in Mound Basin.

Imported water

Surface water and groundwater are imported from adjacent basins via pipeline for M&I and agricultural uses in Mound Basin (see Section 3.1.1.3; B. Bondy, 2020; United, 2021c; Ventura Water, 2020b). Surface water is imported to Mound Basin via pipeline from Casitas MWD and from Ventura Water's groundwater extraction facilities at Foster Park in the Upper Ventura River Basin. In addition, the City of Ventura is planning to begin importing SWP water to Mound Basin by 2025 (Ventura Water, 2020b). Each purveyor reports the quantities of imported water conveyed to Mound Basin. Surface water imported to Mound Basin by Ventura Water (from Casitas MWD) is primarily used for M&I purposes; therefore, the majority of this surface water "exits" the Basin via consumptive use. Specifically, after use it is assumed that 95% of this imported surface water is either conveyed to Ventura's WWTP for treatment and discharge to the Santa Clara River estuary (immediately upstream from the Pacific Ocean) or evapotranspired following

application to outdoor landscaping and parks. The remaining 5% of imported surface water is estimated to recharge underlying HSUs as M&I return flows, as described below.

Inflows to the Groundwater System by Water Source Type

Subsurface groundwater inflow

As described in Sections 3.1 and 3.2, groundwater underflow into and out of Mound Basin occurs at the boundaries with the adjacent Santa Paula and Oxnard Basins. The boundary between Mound Basin and the Lower Ventura River Basin consists of a hydraulic divide, which by definition means little to no groundwater underflow occurs across this boundary. The direction and magnitude of inflow and outflow from Santa Paula and Oxnard Basins vary by aquifer, location, and time, depending largely on the direction of the hydraulic gradient within each aquifer at any given time. Another factor affecting groundwater underflow between basins is the nature of each boundary: the boundary between Santa Paula Basin and Mound Basin consists of a low-permeability fault zone with an offset of bedding, which constrains the quantity of groundwater that can flow between the two basins (see Section 3.2.1.1). Hydrogeologic conditions underlying the boundary between Oxnard Basin and Mound Basin are more complex, including a fault, a fold, and stratigraphic changes (described in Section 3.1.4.1). These features allow underflow to varying degrees, depending on depth (aquifer) and location along the boundary. In addition to groundwater underflow across basin boundaries, subsurface groundwater inflow to (or outflow from) Mound Basin may occur along the coastline for portions of the aquifers that extend west of Mound Basin under the floor of the Pacific Ocean. Because of the complexity and variability of subsurface inflow to Mound Basin, United's (2021a) calibrated groundwater flow model is the best available tool for estimating quantities of interbasin flows and was therefore used to quantify subsurface flows for the water budget.

Recharge to the groundwater system

Precipitation, runoff, streamflow, or other indirect sources of recharge that infiltrate to the underlying aquifer are collectively defined as recharge. The sources of recharge known to occur in Mound Basin are described in Section 3.1.4.2 of this GSP. Similar to groundwater underflow, described above, recharge is subject to temporal and spatial variability. Details regarding how recharge rates were estimated for input to United's (2018, 2021a, 2021c) groundwater model for the region are summarized as follows:

- **Infiltration of Precipitation**: Infiltration of precipitation can recharge aquifers exposed at land surface, including the Shallow Alluvial Deposits, Hueneme Aquifer, and Fox Canyon Aquifer in Mound Basin. Monthly precipitation from Ventura County (VCWPD, 2021) and land use data from Southern California Association of Governments (SCAG) (SCAG, 2008) were utilized to estimate infiltration of precipitation. Land use changes throughout the historical model period were updated using the California Department of Conservation's "Farmland Monitoring and Mapping Program" GIS data (California Department of Conservation, 2018) at years 1990, 1996, 2002, 2008, and 2012 to adjust the baseline land use (from SCAG) designations over time. On agricultural and undeveloped land, United (2018) estimated infiltration of precipitation based on monthly precipitation. Specifically, when monthly precipitation in an agricultural or undeveloped area exceeded 0.75 inches, a fraction of that precipitation ranging from 10 to 30% of the monthly total was assumed to infiltrate deeply enough to become recharge. For developed lands, including residential, commercial, and industrial areas, a fixed ratio of 5% of monthly precipitation was assumed to become recharge. In United's (2018, 2021a) model,

DRAFT

infiltration of precipitation includes all recharge that occurs in response to rainfall, unless explicitly modeled as mountain-front recharge or stream-channel recharge in the Santa Clara River and Harmon Barranca.

- **Mountain-front Recharge**: United (2018, 2021a) uses the term mountain-front recharge to describe infiltration of runoff at a small portion of the San Pedro formation in the northern margin of Mound Basin (Figure 3.1-11). The source of this surface water is rainfall in the small sub-watersheds in the foothills immediately north of Mound Basin. The USGS (2003a) describes this as "ungauged streamflow" in their modeling report for the Santa Clara-Calleguas watersheds. The USGS estimated this ungauged streamflow as a percentage of the precipitation occurring in each mountain sub-watershed area that drains to the study area. Similar to the USGS (2003a) approach, United (2021a, 2021c) estimated mountain-front recharge rates in outcrops of the San Pedro Formation in the northern part of Mound Basin based on monthly precipitation rates and the area of each sub-watershed receiving the precipitation. As described in the HCM (Section 3.1.4.2), the United model (2021a) assumes mountain-front recharge in the northern Mound Basin to model layers representing the Hueneme and Fox Canyon aquifers of the San Pedro formation. The Mugu Aquifer is not known to crop out at land surface within Mound Basin (Figures 3.1-07 and 3.1-08), as it underlies the fine-grained Pleistocene deposits. Therefore, the Mugu Aquifer does not receive direct areal recharge. This assumption does not have a substantial effect on the water budgets for the Basin or for individual aquifers.
- **M&I Return Flows**: M&I return flows include leakage from distribution pipelines, recharge of "excess" water applied to residential and municipal landscaping, and infiltration of storm water that is retained in urban or suburban areas of communities. Sources for M&I water supply that contribute to M&I return flow in Mound Basin include groundwater extracted from within Mound Basin and imported groundwater and surface water from other basins, as described in Section 3.1.4.4. The magnitude of these M&I return flows varies substantially in both location and timing. Most of the City of Ventura overlies alluvial and stream terrace deposits; therefore, infiltrating M&I return flows have the potential to reach the Shallow Alluvial Deposits if they are not intercepted by the thin perched groundwater zones described in Section 3.1.3. In developed hillside areas of the City that directly overlie the San Pedro Formation, M&I return flows may contribute to recharge in the Hueneme and Fox Canyon aquifers. The United (2018) groundwater model applied M&I return flows of 5% of the total M&I water use, which resulted in a good model calibration. During development of the Ventura Regional Groundwater Flow Model (VRGWFM), a study of urban recharge in a portion of Los Angeles County was completed by the Water Replenishment District of Southern California and the USGS (Hevesi and Johnson, 2016). Their investigation used a daily precipitation runoff model to estimate recharge and runoff for the greater Los Angeles area, and found average recharge in the urban portion of their study area to be 8% of the combined inflow from precipitation and urban irrigation. Applying the Hevesi and Johnson (2016) results to urban portions of the United (2018, 2021a) model area, and assuming that 50% of M&I water is used for outdoor irrigation (landscaping and parks), the calculated percentage of M&I water that becomes return-flow recharge is 4%, which is close to the 5% adopted by United (2018).
- **Agricultural Return Flows**: Farmers apply irrigation water to meet evaporation, transpiration, and salt-leaching requirements on their fields when rainfall is insufficient to meet those demands, with the goal of maintaining acceptable crop yields. The primary sources of water

DRAFT

used for agricultural irrigation in Mound Basin are groundwater extracted from wells in Mound Basin, and groundwater extracted from wells in Santa Paula and Oxnard Basins that is imported to Mound Basin via pipeline (Section 3.1.1.3 of this GSP). The salt-leaching requirement is the percentage of "excess" irrigation water required to control salt concentrations in the root zone of agricultural fields. Water applied to meet the leaching requirement is assumed to flow past the root zone to recharge the underlying groundwater. Initially, United (2018) input agricultural return flows of 14% of applied water on farmland (based on previous research in the region [United, 2013]), and assumed that the leaching requirement was the sole driver for "excess" irrigation. However, during model calibration the initial agricultural return-flow estimates were evaluated and adjusted upward or downward to improve calibration. In Mound Basin, increasing model-input agricultural return flows to 20% resulted in improved model calibration. Most agriculture in Mound Basin occurs in the southern half of the Basin; therefore, most of the agricultural return flows provide recharge to units located above the principal aquifers. Tile drains are present under some farmland in southern Mound Basin (Figure 3.1-11), which intercept agricultural return flows almost immediately after infiltration, then convey them to the Santa Clara River via drainage ditches. In avocado and citrus orchards present in the foothills where the San Pedro Formation crops out, agricultural return flows are modeled as contributing to recharge in the Hueneme and Fox Canyon aquifers.

- **Stream-channel Recharge**: As described in Sections 3.1.4.2 and 3.2.6 a small amount of stream-channel recharge may occur in the barrancas flowing across the alluvial and stream terrace deposits in Mound Basin, which may reach the Shallow Alluvial Deposits. This stream-channel recharge is distinct from mountain-front recharge, as it occurs throughout the Basin—not just along the northern margins. Stream-channel recharge in most of the barrancas in Mound Basin (excluding Harmon Barranca) was modeled as part of United's (2021a) estimates of "infiltration of precipitation" determined during model calibration, as described above. Stream-channel recharge in Harmon Barranca and the Santa Clara River in Mound Basin was modeled explicitly by United (2021a) using MODFLOW's (McDonald and Harbaugh, 1988) stream (STR) package.

Outflows from the Groundwater System

Evapotranspiration

ET of groundwater occurs where the water table is present at very shallow depths (in United's [2018, 2021a] groundwater flow model, ET is assumed to occur within the upper 5 ft of the soil zone). In Mound Basin, such conditions occur in and adjacent to the Santa Clara River in the southwest part of the Basin, and ET rates in these areas are computed by United's (2021a) groundwater model based on computed groundwater elevations and estimates of the other parameters that control ET (ET surface elevation, extinction depth, and maximum flux rate).

Groundwater extraction (by use sector)

Historical groundwater extractions by use sector (M&I and agriculture) in Mound Basin are described in detail in Section 3.1.4.4 and illustrated on Figures 3.1-27 through 3.1-29. Extraction (pumping) data for water supply wells in Mound Basin consist of records for two 6-month periods (January 1 through June 30 and July 1 through December 31) reported to United by pumpers each year as required by United pursuant the authority provided in California Water Code §74500-74554. For the purpose of estimating monthly

extraction from each well during a given year, United developed a precipitation-weighted formula that assumes an inverse relationship between groundwater extraction and rainfall (United, 2018), since both agricultural and, to a lesser extent, M&I water demand are inversely correlated with monthly precipitation.

United's (2021a) MODFLOW (McDonald and Harbaugh, 1988) groundwater flow model is calculated with uniform 2,000 ft X 2,000 ft grid cells, which do not align precisely with the boundaries of Mound Basin (i.e., there is a small amount of overlap and undercutting of no more than a few hundred feet). As a result, one well in Oxnard Basin (02N22W19J03S), located approximately 130 ft south of Mound Basin's boundary, is captured within the model grid. Extraction from this well is included in the water budget estimates and represents around 5% of the total groundwater extraction rates from Mound Basin; thus, inclusion of this well in the water budget is not considered to create a significant discrepancy. Extraction from this well cannot simply be subtracted from the modeled groundwater budget for Mound Basin without creating a small imbalance in the modeled groundwater flow budget. Therefore, it was determined that it would be better to retain the extraction at this well in the Mound Basin groundwater budget for the purpose of developing this GSP. If United's model grid is discretized differently in future model updates, this issue can be revisited.

Groundwater discharge to surface water

As described in Section 3.2.6, groundwater discharge from the Shallow Alluvial Deposits may contribute to the perennial flow observed during most years in the Santa Clara River in the southwestern part of Mound Basin, together with discharge from tile drains, drainage ditches, and perched zones in shallow soils of the Mound Basin and sources from the Oxnard Basin. Similar to stream-channel recharge, as described above, groundwater discharge to the Santa Clara River is dependent on the difference between river stage and groundwater elevations in the underlying perched zones or the Shallow Alluvial Deposits, as well as the physical characteristics of the riverbed (width and slope) and is calculated by United's (2021a) groundwater flow model. Discharge of groundwater from the principal aquifers (Mugu and Hueneme) to the barrancas in Mound Basin is not known to occur and is not included in United's (2021a) groundwater flow model for the region.

Groundwater discharge to tile drains

Tile or other agricultural drainage systems are reported (Isherwood and Pillsbury, 1958) to have been installed across much of the Oxnard Plain in the 20th century and extend into the southern Mound Basin (United, 2018; location shown on Figure 3.1-11 of this GSP). Tile drains were installed to prevent waterlogging of the roots of crops in areas where the water table may rise close to land surface. In the area of Mound Basin where tile drains exist, the water table in the Shallow Alluvial Deposits could potentially approach land surface if tile drains were not present. Similar to groundwater discharge to stream channels, as described above, the rate of groundwater discharge to tile drains depends on the difference between the depth and conductance of tile drains and groundwater elevations in the underlying Shallow Alluvial Deposits. Groundwater discharge from the Shallow Alluvial Deposits to tile drains is calculated by United's (2021a) groundwater flow model using MODFLOW's (McDonald and Harbaugh, 1988) drain (DRN) package.

DRAFT

Subsurface groundwater outflow

Similar to subsurface groundwater inflow, subsurface groundwater outflow can occur from Mound Basin to the adjacent Santa Paula and Oxnard Basins. Subsurface groundwater outflow from Mound Basin may also occur along the coastline at the Basin's western boundary to portions of the aquifers which extend offshore under the floor of the Pacific Ocean. As noted previously in this section, United's (2021a) calibrated groundwater flow model is the best available tool for quantifying these flows.

Change in the Annual Volume of Groundwater in Storage between Seasonal high Conditions

Annual changes in the volume of groundwater in storage in the Basin reflect annual imbalances between inflows and outflows. In years when inflow (recharge) exceeds outflow (discharge), the volume of groundwater in storage increases; such conditions manifest as a rise in groundwater levels in wells. Conversely, when outflows exceed inflows, the volume of groundwater in storage in an aquifer decreases (referred to in this GSP as "groundwater released from storage"), and declining groundwater levels are observed in wells. Groundwater storage cannot be directly measured; rather it can only be estimated using groundwater levels and knowledge of the basin geometry and subsurface hydraulic properties., There is a significant amount of uncertainty in such an approach, particularly in a basin such as the Mound Basin that has a multiple principal aquifers and a significant uncertainty in the distribution of storage properties between HSUs and within the transitional areas between confined and unconfined portions of the Basin. Therefore, United's (2021a) groundwater flow model is considered to be the best available tool for estimating changes in groundwater storage in the Mound Basin.

Water Year Types

GSP Emergency Regulations §354.18(b)(6) requires presentation of the water year type associated with annual water budget terms. GSP Emergency Regulation §351(an) defines "water year type" as the "classification provided by the Department to assess the amount of annual precipitation in a basin." DWR provided a water year type designation for each year (from 1931 through 2018) for the entire Santa Clara River watershed—including the portion in Los Angeles County. The DWR based their designation system on spatially averaged rainfall throughout the watershed in a given year and the previous year, relative to the 30-year moving average rainfall amounts for the region (DWR, 2021b). Unfortunately, the DWR designations do not correlate well with observed groundwater conditions (i.e., rising and falling groundwater levels) in Mound Basin. Therefore, MBGSA elected to develop an alternative water year type classification that is more representative of local trends. Years when rainfall is 75% or less of the average are referred to herein as "dry years." Years when rainfall is 125% or more of the average are referred to as "wet years." Years when annual rainfall is between 75 and 125% of the average are referred to as "near-average years." These quantitative breakpoints for defining dry, near-average, and wet years correlate well with periods of increasing, approximately stable, and decreasing groundwater elevations in Mound Basin, as described subsequently in this section.

DRAFT

3.3.1 Historical Water Budget [§354.18(c)(2)(B)]

§354.18 Water Budget.

(c) *Each Plan shall quantify the current, historical, and projected water budget for the basin as follows:*

(2) *Historical water budget information shall be used to evaluate availability or reliability of past surface water supply deliveries and aquifer response to water supply and demand trends relative to water year type. The historical water budget shall include the following:*

(B) *A quantitative assessment of the historical water budget, starting with the most recently available information and extending back a minimum of 10 years, or as is sufficient to calibrate and reduce the uncertainty of the tools and methods used to estimate and project future water budget information and future aquifer response to proposed sustainable groundwater management practices over the planning and implementation horizon.*

The SGMA Regulations require that the historical surface water and groundwater budget be based on a minimum of 10 years of historical data. Water years 1986 through 2015 (30 years) were selected to represent the historical water budget. Water year 1986 is the first complete water year included in United's regional groundwater flow model (United, 2021a), which is the primary source of information for several key water budget components estimated for Mound Basin. Prior to January 1985, groundwater extraction data were increasingly sparse, which is why United selected water year 1986 as the first year for their historical model calibration. The historical period is long enough to capture typical climate variations and include two significant drought cycles (1987-1990 and 2012-2016).

The historical surface water and groundwater budgets are presented in the following tables and figures and described below:

- Surface Water Budget: Table 3.3-02 and Figure 3.3-01
- Basin Groundwater Budget: Table 3.3-03 and Figures 3.3-02 and 3.3-03
- Hydrostratigraphic Unit Groundwater Budgets: Table 3.3-04

Historical Surface Water Budget

Inspection of Table 3.3-02 and Figure 3.3-01 indicates that the largest source of surface water inflow to and outflow from Mound Basin during the historical period is the Santa Clara River, with inflows ranging from less than 100 AF/yr during drought periods to over 1,000,000 AF/yr during high-rainfall years. The historical average of surface flows in the Santa Clara River entering and exiting Mound Basin is nearly an order of magnitude or greater than the average of all other inflows or outflows combined (Table 3.3-02). As noted previously, much of this flow occurs during or soon after (days to weeks) major storms; baseflow in the Santa Clara River is estimated to be only about 1,500 AF/yr (Section 3.2.6). Surface water inflows and outflows in the Santa Clara River during water years 1993, 1995, 1998, and 2005 were particularly large, correlating with El Nino/Southern Oscillation (ENSO) and Pacific Decadal Oscillation (PDO)-driven high-rainfall events. As shown on Figure 3.1-01, the length of the reach of the Santa Clara River that is within Mound Basin is only 1 mile; therefore, high flows that follow storm events pass rapidly through this reach with little groundwater interaction (Section 3.2.6). However, a small fraction of these flows infiltrates the river channel and banks to become stream-channel recharge to the underlying Shallow Alluvial Deposits during high-flow years (Table 3.3-02).

DRAFT

Ephemeral streamflows entering, generated within, and leaving Mound Basin in barrancas are typically the next largest components of surface water inflows and outflows, after Santa Clara River. Identical to the Santa Clara River, the majority of the higher flows occur during and immediately following storms, with little to no baseflow other than leakage of return flows from perched zones of the Shallow Alluvial Deposits and fine-grained Pleistocene deposits, as described in Section 3.2.6. Imported surface water to Mound Basin can exceed ephemeral streamflows during some years, particularly those with low rainfall (Table 3.3-02).

Historical Groundwater Budget

Inspection of Tables 3.3-03 and 3.3-04, and Figure 3.3-02 and 3.3-03, indicates that the largest sources of groundwater inflow to Mound Basin during the historical period included underflow from the Santa Paula Basin, areal recharge (the sum of infiltration of precipitation, M&I return flows, and agricultural irrigation return flows), and mountain-front recharge. Surface water percolation from Santa Clara River and Harmon Barranca provided considerably less recharge to the Basin. Outflow of groundwater from Mound Basin largely occurs as groundwater extractions (pumping) and groundwater outflow to the Oxnard Basin during dry periods. Groundwater flow to the offshore portions of HSUs, ET from the Shallow Alluvial Deposits, and groundwater discharge from the Shallow Alluvial Deposits to surface water are secondary mechanisms of discharge.

Some groundwater budget components are consistently positive (representing inflows to Mound Basin), including underflow from Santa Paula Basin, areal recharge, mountain-front recharge, and return flows. Other components are consistently negative (outflows from Mound Basin), including groundwater extractions (pumping from wells), ET from the Shallow Alluvial Deposits, and discharge to tile drains. Some water budget components vary in sign (negative, representing outflow; to positive, representing inflow) over time, which is largely dependent on rainfall (i.e., recharge), as shown on Figure 3.3-02.

Each of these variable components is described further as follows:

- **Groundwater Underflow between the Mound and Oxnard Basins**: Groundwater underflow between the Mound and Oxnard Basins typically occurred as outflow from Mound Basin during dry years, and as inflow to Mound Basin during wet years. During near-average years, a modest volume of groundwater (usually less than 2,000 AF) flowed either into or out of Mound Basin along its boundary with Oxnard Basin. During the droughts in 1987-1990 and 2012-2016, groundwater underflow from Mound Basin to Oxnard Basin was typically the second-largest outflow component of the groundwater budget for Mound Basin, after groundwater extractions from wells. During the extended wet period from 1992 through 2005, this condition reversed, and groundwater underflow from Oxnard Basin to Mound Basin was frequently an important inflow component of the groundwater budget for Mound Basin, occasionally exceeding the annual volumes of recharge in Mound Basin and underflow from Santa Paula Basin. The reversal in flow direction is correlated with United's artificial recharge operations in the Oxnard Basin.
- **Groundwater Exchange Between Onshore and Offshore Areas**: Groundwater underflow between the Mound Basin and offshore areas west of the coastline has typically consisted of net outflow from Mound Basin (Figure 3.3-02 and Table 3.3-03). However, modest volumes of inflow to Mound Basin occurred across the coastline during the droughts from 1987-1990 and 2012-2016. As described in Section 3.1.4 and depicted in Figure 3.1-10, the offshore portions of

DRAFT

the principal aquifers of Mound Basin store significant quantities of fresh groundwater. For this reason, groundwater flowing into Mound Basin from across the coastline during droughts should not be assumed to consist of seawater. As described in Section 3.2.3 of this GSP, there are no historical or recent data suggesting that seawater intrusion has occurred in the principal aquifers within Mound Basin.

- **Groundwater Exchange with Santa Clara River**: Figure 3.3-02 and Table 3.3-03 indicate a modest volume (generally less than 2,000 AF) of groundwater has discharged from the Shallow Alluvial Deposits to the lower Santa Clara River in Mound Basin during most average to dry years. During wet years and two average years (2017 and 2019), the stage in the Santa Clara River was higher than groundwater elevations in the Shallow Alluvial Deposits, resulting in surface water percolating into the Shallow Alluvial Deposits as recharge. These modeled surface water and groundwater interactions are consistent with field observations of discharge to the Santa Clara River (Stillwater Sciences, 2018).
- **Groundwater Exchange with Harmon Barranca**: In every year except 1998, the model estimated that the net effect of groundwater/surface water interaction in Harmon Barranca was to provide a small volume of recharge to the underlying aquifers. The sole exception, water year 1998, had the highest rainfall total during the historical period (1986-2015); the model estimated that a small volume (142 AF) of groundwater was discharged to the channel of Harmon Barranca that year (Table 3.3-03).
- **Groundwater Storage**: In response to the annual variability in inflows and outflows to the groundwater system in Mound Basin, the volume of groundwater in storage in the Basin has increased or decreased, reflected in rising and falling groundwater elevations that can be measured in wells. In wet years, groundwater inflows (e.g., recharge) often exceeded outflows (e.g., groundwater extraction from wells), resulting in rising groundwater levels and adding to the volume of groundwater in storage in the Basin. When groundwater is added to storage in the Basin, for accounting purposes it is counted as an outflow from the groundwater budget. That groundwater added to storage remains in the Basin as a "reserve" of groundwater that can be drawn from in subsequent dry years. When that reserve of groundwater in storage is used for water supply or flows out of the Basin—corresponding to declining groundwater elevations—it is counted in the groundwater budget as an inflow. As can be seen on Figure 3.3-02, these changes in the volume of groundwater in storage in Mound Basin balance any difference between inflows and outflows each year (shown by white bars with a dashed black outline) such that total inflows equaled total outflows. The result is that the groundwater budget each year remained in balance on both an annual basis and over the historical period, with an average net decline in groundwater in storage of 469 AF/yr.

While the GSP Emergency Regulations do not require water budgets for each principal aquifer, sustainable management of the Mound Basin benefits from such an understanding. The historical water budget for each HSU, including the principal aquifers, is presented in Table 3.3-04. Review of water budget components for specific aquifers (Table 3.3-04) indicates that average groundwater inflows and outflows have varied substantially from aquifer to aquifer within Mound Basin. Table 3.3-04 also shows average vertical groundwater flow volumes between aquifers within Mound Basin; with this information, the model-estimated groundwater budget for each aquifer was balanced (sum of all components for each

aquifer equals zero). Following are some of the salient conclusions that can be drawn from review of the HSU breakdown of the historical water budget:

- As expected, all ET, discharge to tile drains, and interaction between groundwater and surface water in the Santa Clara River occurred in the Shallow Alluvial Deposits, which is the uppermost aquifer across most of Mound Basin. Most areal recharge (including infiltration of precipitation, agricultural return flows, and M&I return flows) infiltrated to the Shallow Alluvial Deposits, with smaller volumes infiltrating into outcrops of the Hueneme and Fox Canyon aquifers in the foothills of the north part of Mound Basin. The Mugu Aquifer is not known to crop out at land surface within Mound Basin (Figures 3.1-07 and 3.1-08), as it underlies the fine-grained Pleistocene deposits. Therefore, the Mugu Aquifer does not receive direct areal recharge. A significant volume (approximately 2,600 AF) of mountain-front recharge occurred in Mound Basin in the northern foothills, primarily into the Hueneme Aquifer.
- Nearly all groundwater extraction (pumping from wells) occurred in the Mugu and Hueneme aquifers, as was described in Section 3.1.4.4 of this GSP. A minor amount of groundwater extraction occurred in the Fox Canyon Aquifer and no extraction occurred in the Shallow Alluvial Deposits.
- Vertical exchanges of groundwater with overlying and underlying HSUs can be important flow components for the principal aquifers.
- Most groundwater inflow to Mound Basin from Santa Paula Basin occurred in the Hueneme and Fox Canyon aquifers. Although the Country Club fault system at the boundary between the Mound and Santa Paula basins impedes groundwater flow to some degree (evidenced by steeper groundwater elevation contours along this boundary as described in Section 3.1.4 of this GSP), approximately 4,400 AF/yr of groundwater flow into Mound Basin occurred during the historical water budget period.
- Most of the groundwater inflow to the Mound Basin from Oxnard Basin (approximately 2,600 AF/yr, on average) during the historical period occurred in the Shallow Alluvial Deposits and in the fine-grained Pleistocene deposits, which is stratigraphically equivalent to the Oxnard Aquifer in the Oxnard Basin (Section 3.1 of this GSP). Most of the groundwater outflow from Mound Basin to Oxnard Basin (approximately 3,900 AF/yr, on average) occurred in the Hueneme and Fox Canyon aquifers
- Approximately 1,800 AF/yr of groundwater flowed from Mound Basin to the offshore (submarine) areas of the aquifers in the Shallow Alluvial Deposits during the historical period, while much smaller volumes of groundwater outflow occurred in the Mugu and Fox Canyon aquifers. A modest quantity (500 AF/yr) of groundwater flowed into Mound Basin from offshore areas in the Hueneme Aquifer. As noted above and in Section 3.2.3, significant quantities of fresh groundwater are present in the aquifers offshore from Mound Basin. Intrusion of seawater has not been detected in the aquifers of Mound Basin to date.
- Cumulative changes in groundwater in storage (from April of each year through March of the next year) in the principal aquifers (Mugu and Hueneme), together with annual groundwater extractions in Mound Basin, are shown on Figure 3.3-03. Changes in storage in the principal aquifers generally correlate with changes in storage in the Basin as a whole but are more subdued.

DRAFT

3.3.1.1 Reliability of Historical Surface Water Supplies [§354.18(c)(2)(A)]

§354.18 Water Budget.
(c) *Each Plan shall quantify the current, historical, and projected water budget for the basin as follows:*
(2) *Historical water budget information shall be used to evaluate availability or reliability of past surface water supply deliveries and aquifer response to water supply and demand trends relative to water year type. The historical water budget shall include the following:*
(A) *A quantitative evaluation of the availability or reliability of historical surface water supply deliveries as a function of the historical planned versus actual annual surface water deliveries, by surface water source and water year type, and based on the most recent ten years of surface water supply information.*

As described in Section 3.1.1.3 and summarized at the beginning of Section 3.3, surface water is imported to Mound Basin via pipeline from Casitas MWD by the City of Ventura for use within the Casitas MWD service area (Figure 2.2-01).

Figure 3.3-04 shows surface water deliveries and groundwater production for the City of Ventura in Mound Basin for the past 10 years. Inspection of Figure 3.3-04 indicates that during 2010 and 2011, prior to the 2012-2016 drought in Ventura County, total surface water imports from the Ventura River to Mound Basin averaged approximately 4,100 AF/yr. From 2012 through 2014 (the first three years of the 2012-2016 drought), total surface water imports declined to approximately 3,600 AF/yr. Conservation and increased groundwater extraction from the City's wells in Mound Basin and Oxnard Basin increased to make up the difference. From 2016 through 2019, total surface water imports declined further to an average of approximately 1,500 AF/yr. Table 3.3-05 summarizes the City of Ventura's planned (Kennedy/Jenks Consultants, 2011; 2016) and actual (Ventura Water, 2020b) imports of surface water from Casitas MWD for the 10-year period from 2010 through 2019. The values shown on this table include surface water imports from Casitas MWD delivered to the City's entire service area, not just the portion in Mound Basin. Review of the differences between planned and actual surface water deliveries indicates that less surface water from Casitas MWD was actually delivered than was planned from 2012 through 2019; this period included an exceptional drought from 2012 through 2016. The lower-than-anticipated surface water deliveries were related to a combination of factors, including mandated conservation goals along with the associated penalties.

3.3.1.2 Impact of Historical Conditions on Basin Operations [§354.18(c)(2)(C)]

§354.18 Water Budget.
(c) *Each Plan shall quantify the current, historical, and projected water budget for the basin as follows:*
(2) *Historical water budget information shall be used to evaluate availability or reliability of past surface water supply deliveries and aquifer response to water supply and demand trends relative to water year type. The historical water budget shall include the following:*
(C) *A description of how historical conditions concerning hydrology, water demand, and surface water supply availability or reliability have impacted the ability of the Agency to operate the basin within sustainable yield. Basin hydrology may be characterized and evaluated using water year type.*

DRAFT

GSP Emergency Regulations §354.18(c)(2)(C) require a description of how historical water budget conditions have impacted the ability of MBGSA to operate that Basin within sustainable yield. The estimated sustainable yield for Mound Basin is provided in Section 3.3.4. Prior to adoption of this GSP, MBGSA has had neither the regulatory authority nor the technical justification to "operate the basin within sustainable yield." Thus, GSP Emergency Regulations §354.18(c)(2)(C) appear inapplicable to the Mound Basin. However, the impacts of historical conditions can provide insight into what challenges MBGSA may have faced had it existed historically and with authority to manage the Basin.

Review of the historical water budgets indicates that a small amount of declining groundwater storage occurred over time (the average groundwater released from storage between seasonal highs is 469 AF/yr; Table 3.3-03). This suggests a relatively minor amount of overdraft may have occurred during the historical period equal to approximately 6.3% of the average groundwater extraction rates during that timeframe. However, undesirable results were not reported during the historical period, suggesting negligible, if any, impacts on the ability of the Basin to operate within the sustainable yield.

The existence of multiple sources of water (local groundwater, imported groundwater, and imported surface water) available to meet demand in Mound Basin is a key reason why the Mound Basin has not historically experienced undesirable results for the sustainability indicators. The City of Ventura seeks to maximize wet-year water supplies from Casitas MWD and its facilities in the Upper Ventura River Basin and rely less on Mound Basin groundwater and other basin groundwater supplies and vice versa. In addition, the City implements a water shortage contingency plan to reduce water demands through increased conservation. The diverse water supply portfolio and conservation actions have helped reduce pressure on Mound Basin groundwater supplies, keeping basin operations within the sustainable yield and preventing significant and unreasonable effects from occurring.

3.3.2 Current Water Budget [§354.18(c)(1)]

§354.18 Water Budget.
(c) *Each Plan shall quantify the current, historical, and projected water budget for the basin as follows:*
(1) *Current water budget information shall quantify current inflows and outflows for the basin using the most recent hydrology, water supply, water demand, and land use information.*

The SGMA Regulations require that the current surface water and groundwater budget be based on the most recent hydrology, water supply, water demand, and land use information. Water year 2019 is the last complete water year included in United's regional groundwater flow model (United, 2021b), which is the primary source of information for most water budget components estimated for Mound Basin. Therefore, water years 2016 through 2019 were selected to represent the current water budget, as they are representative of recent water use trends and groundwater conditions in Mound Basin. The current water budget period corresponds to a period of average to dry annual precipitation, with an average of about 14% less precipitation than the historical average. It should also be noted that the current water budget period was preceded by an exceptional drought that occurred in the region from 2012 through 2016. As a result of the antecedent groundwater conditions caused by this drought (i.e., record- or near-record-low groundwater elevations at most wells in Mound Basin and adjacent basins), combined with below-average rainfall during water year 2018, estimated volumes for some of the water budget components during the current period are significantly different than they were during the historical

period. As a result, the current water budget period represents a drier than average condition with antecedent drought conditions in the Basin and is therefore not appropriate for sustainability planning.

The current surface water and groundwater budgets are presented in the following tables and figures and described below:

- Surface Water Budget: Table 3.3-02 and Figure 3.3-01
- Basin Groundwater Budget: Table 3.3-03 and Figures 3.3-02 and 3.3-03
- Hydrostratigraphic Unit Groundwater Budgets: Table 3.3-04

Current Surface Water Budget

Inspection of Table 3.3-02 and Figure 3.3-01 indicates that the largest source of surface water inflow and outflow for Mound Basin during the current period is the Santa Clara River, consistent with the historical water budget. A notable difference is that both average inflow from the Santa Clara River and from imported water from Casitas MWD during the current water budget period are both less than half of what they were during the historical water budget period (Table 3.3-02). This difference is due to the relatively low average rainfall during the current period compared to the historical period. The averages for most other surface water budget components during the current period largely remained similar to values estimated for the historical period, although they are overall less than the historical, resulting from overall drier conditions can be seen in Table 3.3-02.

Current Groundwater Budget

Average volumes of groundwater estimated to comprise each component of the current water budget for the principal aquifers together with the Shallow Alluvial Deposits and fine-grained Pleistocene deposits HSU in Mound Basin are quantified in Table 3.3-03.

Following are key aspects of the current groundwater budget and notable differences compared to the historical groundwater budget:

- Groundwater underflow from Mound Basin to Oxnard Basin was substantially greater during the current period compared to the average over the historical period. This increase in outflow comprises the largest difference between the historical and current groundwater budgets for Mound Basin and is a result of greater drawdown in the Oxnard Basin than in Mound Basin since 2012 (largely due to the 2012-2016 drought). This differential drawdown temporarily created a steeper hydraulic gradient—inducing greater groundwater underflow—from the Mound Basin to Oxnard Basin.
- The net direction and magnitude of groundwater underflow across the coastline (to and from areas where the aquifers underlie the seafloor) changed substantially during the current period as compared to the historical period. During the historical period, the net direction of groundwater underflow was seaward (toward the ocean), with small to modest volumes of landward flow, on average, in the fine-grained Pleistocene deposits and the Hueneme Aquifer. During the current period, landward groundwater underflow occurred in all HSUs, except for the Shallow Alluvial Deposits (where seaward flow continued). However, monitoring results do

DRAFT

not indicate intrusion of seawater into the aquifers of the Mound Basin during this period, as described in Section 3.2.3 of this GSP.

- As a result of below-average annual rainfall during the current water budget period, recharge volumes were also less than the average historical values during the current water budget period.
- Less ET and discharge to tile drains occurred during the current water budget period compared to the historical period, due to lower groundwater elevations in the Shallow Alluvial Deposits.
- Average annual groundwater extraction rates (pumping from wells) were lower in the current period than in the historical period.
- As can be seen on Figure 3.3-03 and Tables 3.3-03 and 3.3-04, a small decline in the quantity of groundwater stored in Mound Basin (and the principal aquifers) occurred during the current water budget period.

3.3.3 Projected Water Budget

SGMA Regulations require the development of a projected surface water and groundwater budget to estimate future baseline conditions of supply, demand, and aquifer response to GSP implementation. The future water budget provides a baseline against which management actions will be evaluated over the GSP implementation period from 2022-2041. The projected water budget was developed for a 77-year period that is subdivided into three periods, including the 20-year implementation period required under SGMA (water years 2022-2041), the 30-year sustaining period under SGMA (water years 2042-2071), and a 25-year post-SGMA period (water years 2072-2096). This section describes the methods used to estimate the projected water budget for Mound Basin, provides a quantitative estimate for each projected water budget component, and evaluates uncertainty in the projected water budget by considering potential effects of future DWR-recommended climate change scenarios. The DWR's climate change scenarios could result in changes to inflows and outflows in Mound Basin compared to the "baseline" future water budget.

DRAFT

3.3.3.1 Projected Water Budget Calculation Methods [§354.18(d)(1),(d)(2),(d)(3),(e), and (f)]

§354.18 Water Budget.

(d) *The Agency shall utilize the following information provided, as available, by the Department pursuant to Section 353.2, or other data of comparable quality, to develop the water budget:*

- ***(1)*** *Historical water budget information for mean annual temperature, mean annual precipitation, water year type, and land use.*
- ***(2)*** *Current water budget information for temperature, water year type, evapotranspiration, and land use.*
- ***(3)*** *Projected water budget information for population, population growth, climate change, and sea level rise.*

(e) *Each Plan shall rely on the best available information and best available science to quantify the water budget for the basin in order to provide an understanding of historical and projected hydrology, water demand, water supply, land use, population, climate change, sea level rise, groundwater and surface water interaction, and subsurface groundwater flow. If a numerical groundwater and surface water model is not used to quantify and evaluate the projected water budget conditions and the potential impacts to beneficial uses and users of groundwater, the Plan shall identify and describe an equally effective method, tool, or analytical model to evaluate projected water budget conditions.*

(f) *The Department shall provide the California Central Valley Groundwater-Surface Water Simulation Model (C2VSIM) and the Integrated Water Flow Model (IWFM) for use by Agencies in developing the water budget. Each Agency may choose to use a different groundwater and surface water model, pursuant to Section 352.4.*

The projected water budget for Mound Basin was developed using the same tools and methods as the historical and current water budgets, and is primarily based on United's (2018, 2021a, 2021b, 2021c) surface water and groundwater flow modeling, modified to incorporate projections of future hydrology and demand, as described in the following subsections. The future projections utilize United's best available estimates of future surface water diversions from the Santa Clara River via the Vern Freeman Diversion.

3.3.3.1.1 Projected Hydrology [§354.18(c)(3)(A)]

§354.18 Water Budget.

(c) *Each Plan shall quantify the current, historical, and projected water budget for the basin as follows:*

- ***(3)*** *Projected water budgets shall be used to estimate future baseline conditions of supply, demand, and aquifer response to Plan implementation, and to identify the uncertainties of these projected water budget components. The projected water budget shall utilize the following methodologies and assumptions to estimate future baseline conditions concerning hydrology, water demand and surface water supply availability or reliability over the planning and implementation horizon:*
  - ***(A)*** *Projected hydrology shall utilize 50 years of historical precipitation, evapotranspiration, and streamflow information as the baseline condition for estimating future hydrology. The projected hydrology information shall also be applied as the baseline condition used to evaluate future scenarios of hydrologic uncertainty associated with projections of climate change and sea level rise.*

In accordance with GSP Emergency Regulations §354.18 (c)(3)(A), the future water budget must be based on 50 years of historical precipitation, ET, and streamflow information. To satisfy this regulation, the

forward version of the numerical model used for the projected water budget includes 77 years of historical precipitation, ET, and streamflow data from the period 1943-2019, which supports a time period from 2022-2096. The streamflow values were modified to incorporate United's best available estimates of future surface water diversions from the Santa Clara River via the Vern Freeman Diversion.

It is believed that the selected historical period is representative and is the best available information for groundwater sustainability planning purposes. This period includes two major drought cycles for the Santa Clara River watershed and was therefore preferred over any single 50-year period (the minimum timeframe required under SGMA regulations) available in DWR's historical dataset, which includes water years 1931-2019 for rainfall (DWR, 2021b) and 1916-2011 for streamflow change factors (DWR, 2018).

Baseline future streamflow in the Santa Clara River and its major contributing tributaries (including Santa Paula Creek, Sespe Creek, Pole Creek, Hopper Creek, Piru Creek, and Castaic Creek, all of which are located east and upstream of Mound Basin) was projected based on historical stream gaging records provided by the USGS and VCWPD. Streamflow in the small subwatersheds present in the foothills north of Mound Basin that contribute to mountain-front recharge, as described in the introduction to Section 3.3, was projected to change in direct proportion to increases or decreases in rainfall in accordance with 2030 and 2070 climate change factors provided by DWR (2018), and is described further below. Projected annual rainfall rates assumed under future baseline, 2030, and 2070 climate change scenarios are shown on Figure 3.3-05. The future baseline scenario assumed no sea level rise, the 2030 climate change scenario assumed 15 centimeters (6 inches) of sea level rise, and the 2070 climate change scenario assumed 45 centimeters (18 inches) of sea level rise, consistent with DWR (2018) guidance. Sea level rise was addressed by increasing the head along the general-head boundary representing the Pacific Ocean in United's (2021c) groundwater model. These changes in model boundary conditions were forecasted to have small impacts on groundwater elevations and groundwater budget components in Mound Basin and are discussed further in Section 3.3.3.2.

For the purpose of projecting future streamflows in the Santa Clara River, the historical stream gage records were modified and supplemented as follows:

- Where data gaps existed in the 1943-2019 records for specific stream gages, correlations with nearby stream gages were developed to fill those gaps. Suitable stream gage records were available to populate all data gaps in gaging data within the Santa Clara River watershed.
- Outflows for Lake Piru and Castaic Lake were simulated using reservoir operations models with historical upstream creek flows as reservoir inputs. Current reservoir operations were applied to the entire future baseline modeling period.
- Historical surface water discharge from the urban and suburban areas of the Santa Clarita Valley to the Santa Clara River was adjusted upwards, with more significant flow increases applied to older data, to reflect current levels of urban impervious area in this drainage area that underwent significant development between 1943 and 2019.
- Historical streamflow in the reach of Santa Clara River in Los Angeles County was adjusted to reflect anticipated future discharges from Water Reclamation Facilities (WRFs).

Uncertainty in future hydrology associated with potential climate change was evaluated by applying DWR (2018) streamflow change factors from their 2030 and 2070 central-tendency scenarios to the historical

streamflow records for Castaic Lake (reservoir) inflows, Santa Clara River upstream of Castaic Creek (excluding WRF discharges which were added after applying streamflow change factors), Middle Piru Creek (inflow to Lake Piru), Pole Creek, Hopper Creek, Sespe Creek, and Santa Paula Creek. Daily historical flow records were adjusted to 2030 and 2070 future conditions by applying the annual and monthly streamflow change factors provided for the Santa Clara River watershed (designated HUC8_18070102 by DWR), utilizing the methodology for application of time-series change-factor data described in DWR (2018) guidance. DWR (2018) streamflow change factors are available for water years 1916-2011. Change factors for water years 2012-2019 were modeled by selecting analogous water years in the historical record and applying the streamflow change factors published for these analogous water years. Analogous water years were determined using the monthly precipitation record for VCWPD rain gage 245 (Santa Paula), which has a complete data record from 1915-2019, and is representative of the average annual precipitation observed in much of the Santa Clara River watershed, particularly the Ventura County portion. Analogous water years for 2012-2019 were determined by calculating the root mean square error (RMSE) based on monthly precipitation with each water year from 1915-2011. Generally, the year with the lowest RMSE was selected as the analogous water year.

Compared to historical streamflow between 1943 and 2019, annual average streamflow decreased by 3.8-4.7% for the 2030 climate change scenario, and by 2.6-3.5 % for the 2070 climate change scenario. The calculated change in streamflow for the 2030 and 2070 climate change scenarios is mostly driven by the monthly change factors provided by DWR (as opposed to annual change factors). The Santa Clara River watershed (HUC8_18070102) monthly change factors vary significantly between years, especially during the months of January through March, when much of the precipitation occurs in the Santa Clara River watershed. During these months, projected streamflow may increase or decrease in the 2030 and 2070 climate change scenarios and are more variable for the 2070 climate change scenario. Monthly change factors are mostly less than 1.0—indicating reduced flow compared to the historical period—during the months April, May, June, October, and November. Therefore, streamflow in the Santa Clara River is projected to decrease outside the main wet season under the 2030 and 2070 climate change scenarios.

A more detailed description of the surface water hydrology models utilized to simulate reservoir operations, modifications to streamflow records for future hydrology, application of DWR streamflow change factors, and interaction between the surface water and groundwater models is presented in United's model documentation (United, 2021a, 2021c).

3.3.3.1.2 Projected Water Demand [§354.18(c)(3)(B)]

§354.18 Water Budget.

(c) *Each Plan shall quantify the current, historical, and projected water budget for the basin as follows:*

(3) *Projected water budgets shall be used to estimate future baseline conditions of supply, demand, and aquifer response to Plan implementation, and to identify the uncertainties of these projected water budget components. The projected water budget shall utilize the following methodologies and assumptions to estimate future baseline conditions concerning hydrology, water demand and surface water supply availability or reliability over the planning and implementation horizon:*

(B) *Projected water demand shall utilize the most recent land use, evapotranspiration, and crop coefficient information as the baseline condition for estimating future water demand. The projected water demand information shall also be applied as the baseline condition used to evaluate future scenarios of water demand uncertainty associated with projected changes in local land use planning, population growth, and climate.*

GSP Emergency Regulations §354.18(c)(3)(B) require use of the most recent land use, ET, and crop coefficient information as the baseline condition for estimating future water demand and as a baseline condition used to evaluate future scenarios of water demand uncertainty associated with projected changes in local land use planning,

For the purpose of developing a projected water budget for Mound Basin, baseline future water demand in Mound Basin was input to United's (2021c) groundwater flow model using current (most recent) land use information, agricultural and M&I water use trends, and assumptions regarding future climatic conditions (including rainfall and ET).

Projected Agricultural Water Demands

Projected agricultural groundwater demand was provided by MBAWG (Section 2.3). MBAWG was provided historical groundwater extraction data and was asked to provide input on future groundwater demands. MBAWG advised that baseline average year irrigation demands are estimated to be 3,300 AF/yr. Wet year and dry year baseline irrigation demands were assumed to be slightly lower (2,873 AF/yr) and higher (3,548 AF/yr), respectively. Climate change effects on irrigation demand were also considered by accounting for changes in future precipitation and temperature. Future precipitation projections were developed based on historical precipitation records (with baseline conditions taken from 1943-2019) and climate change factors provided by DWR (2018) for SGMA planning purposes. Irrigation demands for future wet, average, and dry conditions (based on total precipitation for the water year) were based on historical irrigation demands for similar wet, average, and dry conditions (based on reported historical groundwater extraction). To account for future increased temperatures due to climate change, the future annual irrigation demands were further scaled by a factor representing the average annual increase (over the projected period of 1943-2019) in future ET (calculated from ET climate change factors provided by DWR). The average ET climate change factor for the 2030s was 1.0359 (increase of 3.6%) and for the 2070s was 1.0825 (increase of 8.25%); hence irrigation demand was increased by the corresponding factors to account for higher ET uptake (demand) of irrigation water. Similar to the ET climate change factors, the net agricultural demand for groundwater extracted from Mound Basin was estimated to increase 3.6% and 8.5% for the 2030 and 2070 climate change scenarios, respectively, as compared to baseline conditions. The baseline and climate change projections of agricultural water demand also apply to groundwater imported from the Santa Paula and Oxnard Basins for agricultural use, which is reflected in the return flow calculations.

Projected Municipal and Industrial Demands

The City of Ventura provides most of the municipal and industrial water supply in the Basin. The City of Ventura forecasts that it will extract 4,000 AF/yr from the Mound Basin during 2021-2030 on average (Ventura Water, 2020a). As described in Section 3.1.1.3, the City has a diverse water supply portfolio, making it impossible to predict how its Mound Basin groundwater extraction might vary from year to year. Thus, the projected water budget assumes a fixed value of 4,000 AF of groundwater extraction each year. The projected groundwater extraction for the two private industrial wells in the Basin were assumed to continue at historical average rates.

Changes in future application of local and imported water sources in Mound Basin also change future agricultural and M&I return flows in Mound Basin. Changes in return flows each year are simulated in United's (2021c) groundwater flow model as a function of changes in water demand (described above)

DRAFT

and adjusted by precipitation (as described in the beginning of Section 3.3). The methodology for calculating the projected changes in return flow and the associated values for the baseline, 2030, and 2070 scenarios are further described in the model documentation (United 2021c).

Land Use and Population Change Effects on Water Demand

As described in Section 2.2.3, changes in land use that could have a significant impact on groundwater demand are not expected in the foreseeable future.

As of December 2019, there are 47 infill development projects within the City of Ventura that are either approved or under construction, which collectively have an estimated 921 AF/yr of water demand (Ventura Water, 2020a). These new demands are accounted for in the City's projected Mound Basin groundwater extraction estimate of 4,000 AF/yr, discussed above.

Any additional future development (and associated population increase) is not expected to impact water demands for groundwater in the Mound Basin because the City's Water Rights Dedication and Water Resource Net Zero Fee Ordinance and Resolution ("Net Zero Policy", adopted June 6, 2016), requires all new and intensified development to offset the demand associated with its impact on the City's potable water system. Offsets can take the form of water rights dedication (i.e. transfer existing rights to extract groundwater from the Mound Basin or the adjacent Oxnard or Santa Clara basins) or payment of a fee that funds development of new City water supplies. Future water supplies include VenturaWaterPure (potable reuse of advanced treated tertiary treated effluent from the VWRF) and an interconnection with Calleguas MWD that will allow the City to access its 10,000 AF/yr Table A entitlement from the California SWP.

Significant development of agricultural land or open space is not expected because agricultural land and open space in the Basin is subject to the City of Ventura and County of Ventura SOAR voter initiatives currently approved through 2050 (County of Ventura, 2020). The SOAR initiatives require a majority vote of the people to rezone unincorporated open space, agricultural, or rural land for development. In addition to the SOAR initiatives, the City of Ventura HVPAA (City of Ventura, 2005), also approved through 2050, requires voter approvals for development or the extension of City urban services into the hillsides. The existence of the SOAR and HVPPA make it very unlikely that a material change in land use will occur during the foreseeable future. Because agricultural land and open space is not expected to convert to other uses, it is assumed that there is little potential for new development that could impact basin recharge or water demands. These assumptions will be revisited during each five-year GSP assessment.

DRAFT

3.3.3.1.3 Projected Surface Water Supply [§354.18(c)(3)(C)]

§354.18 Water Budget.

(c) *Each Plan shall quantify the current, historical, and projected water budget for the basin as follows:*

(3) *Projected water budgets shall be used to estimate future baseline conditions of supply, demand, and aquifer response to Plan implementation, and to identify the uncertainties of these projected water budget components. The projected water budget shall utilize the following methodologies and assumptions to estimate future baseline conditions concerning hydrology, water demand and surface water supply availability or reliability over the planning and implementation horizon:*

(C) *Projected surface water supply shall utilize the most recent water supply information as the baseline condition for estimating future surface water supply. The projected surface water supply shall also be applied as the baseline condition used to evaluate future scenarios of surface water supply availability and reliability as a function of the historical surface water supply identified in Section 354.18(c)(2)(A), and the projected changes in local land use planning, population growth, and climate.*

As explained in Section 3.1.1.3 and summarized at the beginning of Section 3.3, surface water from Casitas MWD is imported to Mound Basin as part of the City's M&I water supply. The City of Ventura's projected future water deliveries from Casitas MWD are calculated for normal years and drought years at approximately 6,000 AF/yr and 3,400 AF/yr, respectively (Ventura Water, 2020b). These values are consistent with actual surface water deliveries for normal to wet years 2010 and 2011, and the average for dry to near-average water years 2012 through 2019 (Table 3.3-05). The City's diverse water supply portfolio must be considered when evaluating the reliability of surface water supplies because the diversity tends to compensate for shortages of one supply. In addition, the City is pursuing new water supplies including VenturaWaterPure (potable reuse of advanced treated tertiary treated effluent from the VWRF) and an interconnection with Calleguas MWD that will allow the City to access its 10,000 AF/yr Table A entitlement from the California SWP. Based on the foregoing, changes in surface water supply availability would not necessarily impact the City's Mound Basin groundwater extraction. Based on the foregoing, MBGSA concludes that the GSP Emergency Regulations §354.18(c)(3)(C) requirement to "evaluate future scenarios of surface water supply availability and reliability as a function of the historical surface water supply…" is not particularly relevant to the Mound Basin GSP. Surface water supply availability and any impacts on the Mound Basin will be evaluated during each five-year GSP assessment.

3.3.3.2 Projected Water Budget

The projected baseline surface water and groundwater budgets are presented in the following tables and figures and described below:

- Surface Water Budget: Table 3.3-06 and Figure 3.3-07
- Basin Groundwater Budget: Table 3.3-07 and Figures 3.3-08 and 3.3-09
- Hydrostratigraphic Unit Groundwater Budgets: Table 3.3-08

Projected Surface Water Budget

Average annual volumes for each component of the projected baseline surface water budget in Mound Basin are quantified in Table 3.3-06. The projected surface water budget is subdivided into three periods, including the 20-year implementation period required under SGMA (water years 2022-2041), the 30-year

sustaining period under SGMA (water years 2042-2071), and a 25-year post-SGMA period (water years 2072-2096). Baseline projected annual Basin totals for each surface water budget component are shown graphically on Figure 3.3-07. Following are salient results of modeling the baseline projected surface water budget, focusing on notable differences compared to the historical and current water budgets (shown on Table 3.3-02):

- Similar to the historical and current surface water budget periods, the largest source of surface water inflow to and outflow from Mound Basin in the projected water budget is the Santa Clara River, with inflows ranging from zero during drought periods to over 1,000,000 AF/yr during high-rainfall years (Table 3.3-06). Ephemeral streamflows typically comprise the next largest sources of inflows and outflows, although imports of surface water (from Casitas MWD) are greater than ephemeral streamflows during dry years.
- Surface water inflows and outflows in the Santa Clara River and ephemeral streamflows are projected to be substantially smaller during the implementation period than during the sustaining and post-SGMA periods, largely as a result of the smaller average rainfall assumed during the implementation period (Table 3.3-06).
- The long-term average inflow and outflow in the Santa Clara River during the projected water budget period are approximately 4% smaller than long-term average inflow and outflow during the historical and current periods (combined). This difference is partly explained by slightly lower (1% less) rainfall assumed during the projected period compared to rainfall during the combined historical and current periods. The remainder of this difference likely results from changes in hydrologic and groundwater conditions modeled by United (2021c) upstream from Mound Basin in the Santa Clara River watershed (less than 1% of the Santa Clara River's watershed is within Mound Basin).

As was described in Section 3.3.3.1.1 of this GSP, the projected surface water budget was also modeled under two climate change scenarios (2030 and 2070) in accordance with DWR (2018) guidance. Projected surface water budget components under the 2030 climate change scenario are summarized in Table 3.3-09 and graphically illustrated on Figure 3.3-10. Projected surface water budget components under the 2070 climate change scenario are summarized in Table 3.3-10 and graphically illustrated on Figure 3.3-11. The effect of the simulated climate change scenarios on the projected surface water budget components is small; the largest change in long-term average flow projections is less than 3% (larger) compared to baseline surface water budget components.

Projected Groundwater Budget

Average annual volumes of groundwater that comprise each component of the baseline projected water budget for the principal aquifers, Shallow Alluvial Deposits, and fine-grained Pleistocene deposits HSU in Mound Basin are quantified in Table 3.3-08. The projected water budget is subdivided into three periods, including the 20-year implementation period required under SGMA (water years 2022-2041), the 30-year sustaining period under SGMA (water years 2042-2071), and a 25-year post-SGMA period (water years 2072-2096). Baseline projected annual Basin totals for each groundwater budget component are provided in Table 3.3-07 and shown graphically on Figure 3.3-08. Following are salient results of modeling the baseline projected groundwater budget, focusing on notable differences compared to the historical and current water budgets (shown on Tables 3.3-03 and 3.3-04):

DRAFT

- Groundwater underflow (considering all aquifers) between Oxnard Basin and Mound Basin nearly always comprises net inflow to Mound Basin under the future baseline scenario instead of fluctuating between inflow and outflow during the historical period. Exceptions to this net positive inflow to Mound Basin are small amounts of net outflow projected to occur during or immediately after droughts. The overall projected increase in underflow into Mound Basin comprises the largest difference between the baseline projected water budget compared to the historical and current groundwater budgets for Mound Basin. The increase in groundwater inflow from Oxnard Basin to Mound Basin is in large part due to projected increases in groundwater elevations in Oxnard Basin (that increase the hydraulic gradient towards Mound Basin), which in turn are expected to result from implementation of the GSP for the Oxnard Basin (Dudek, 2019). It should be noted that a modest quantity of net outflow from Mound Basin to Oxnard Basin is projected to occur in the Hueneme and Fox Canyon aquifers, albeit at significantly lower rates (Table 3.3-08).
- The net direction and magnitude of groundwater underflow across the coastline (between Mound Basin and areas to the west where the aquifers underlie the seafloor) during the baseline projected water budget period also changed substantially compared to the historical and current periods. During the projected baseline period, the net direction of groundwater underflow for all aquifers combined is forecasted to be nearly always seaward (toward the ocean), including during drought periods, at a rate of approximately 5,000 AF/yr; during the historical and current periods, influx of water across the coastline occurred during drought periods. However, small to modest quantities of landward flow are projected across the coastline during the GSP implementation period (water years 2022-2041) in the Hueneme and Fox Canyon aquifers. However, seawater intrusion into the aquifers of Mound Basin is not projected to occur as a result of this landward flow, owing to the presence of fresh water in the offshore areas of the Hueneme and Fox Canyon aquifers.
- The projected annual volume of groundwater inflow to Mound Basin from Santa Paula Basin is approximately 800 AF/yr less during the baseline future water budget period (decreasing slightly from the implementation period through the post-SGMA period), compared to the historical and current water budget periods. This decrease in groundwater inflow from Santa Paula Basin is primarily due to projected increases in groundwater elevations in Mound Basin, which would decrease the hydraulic gradient between Santa Paula and Mound Basins.
- The magnitude of groundwater/surface water interaction in the Santa Clara River during the baseline projected water budget period is substantially different compared to the historical and current periods. During the projected baseline period, the net effect of groundwater/surface water interaction is recharge to the Shallow Alluvial Deposits from surface flows in the Santa Clara River, at rates of approximately 1,000 AF/yr, on average, during the implementation period; 1,600 AF/yr during the sustaining period; and 1,300 AF/yr during the post-SGMA period (Table 3.3-08). However, during the historical period, groundwater discharge to the river was approximately equal to infiltration of surface flows into the Shallow Alluvial Deposits (net discharge of approximately 30 AF/yr on average to the river from the shallow aquifer), becoming 270 AF/yr of recharge to the Shallow Alluvial Deposits on average during the current period.
- The net volume of groundwater released from storage in Mound Basin during the entire baseline projected water budget period is approximately -80 AF/yr on average, meaning a small

DRAFT

amount of groundwater is projected to be added to storage (associated with rising groundwater levels) on average (Table 3.3-07 and Figure 3.3-09). This is compared with an average of 550 AF/yr of groundwater storage loss during the combined historical and current period.

- Differences in the remaining projected baseline water budget components compared to historical and current water budget components are modest to negligible, as can be seen by comparing Table 3.3-07 and Figure 3.3-08 to Table 3.3-03 and Figure 3.3-02.

As was described in Section 3.3.3.1.1 of this GSP, the projected groundwater budget was also modeled under two climate change scenarios (2030 and 2070) in accordance with DWR (2018) guidance. Projected groundwater budget components under the 2030 climate change scenario are summarized in Tables 3.3-11 and 3.3-12 and Figures 3.3-12 and 3.3-13. Projected groundwater budget components under the 2070 climate change scenario are summarized in Tables 3.3-13 and 3.3-14 and Figures 3.3-14 and 3.3-15. The effect of the simulated climate change scenarios on the projected water budget components is small; the largest change is an 8% decrease in groundwater underflow from the Oxnard Basin to Mound Basin in the 2070 climate change scenario compared to the baseline scenario. The simulated effects of climate change on other water budget components are smaller, ranging from less than 1% to a few percent. It should be noted that existing cyclical climate phenomena, such as the ENSO and PDO, have historically had a greater effect on water budget components in Mound Basin than the projected effects of the 2030 and 2070 climate change scenarios. In other words, the effects of existing climate cycles (ENSO and PDO) likely will have greater impacts on future groundwater conditions in Mound Basin than the longer-term climate change assumptions recommended by DWR (2018) to evaluate potential uncertainty in the projected water budget.

3.3.4 Overdraft Assessment and Sustainable Yield Estimate [§354.18(b)(5) and (b)(7)]

§354.18 Water Budget.
(b) *The water budget shall quantify the following, either through direct measurements or estimates based on data:*
(5) *If overdraft conditions occur, as defined in Bulletin 118, the water budget shall include a quantification of overdraft over a period of years during which water year and water supply conditions approximate average conditions.*
(7) *An estimate of sustainable yield for the basin.*

3.3.4.1 Overdraft Assessment

GSP Emergency Regulations § 354.18(b)(5) requires quantification of overdraft over a period of years during which water year and water supply conditions approximate average conditions if overdraft conditions exist.

Bulletin 118, Update 2003 (DWR, 2003) describes groundwater overdraft as "[t]he condition of a groundwater basin or subbasin in which the amount of water withdrawn by extraction exceeds the amount of water that recharges the basin over a period of years, during which the water supply conditions approximate average conditions. Overdraft can be characterized by groundwater levels that decline over

a period of years and never fully recover, even in wet years. If overdraft continues for a number of years, significant adverse impacts may occur, including increased extraction costs, costs of well deepening or replacement, land subsidence, water quality degradation, and environmental impacts."

Review of the historical, current and projected groundwater budgets indicate small amounts of declining groundwater storage over time (469 and 147 for the historical and current periods, respectively), as shown in Table 3.3-03. These results suggest a minor amount of overdraft may have occurred during the historical and current period of 6.3% and 2.3%, respectively, of the groundwater extraction during that timeframe. However, these values are considered to be within the range of uncertainty of the water budget calculations and no undesirable results have been reported historically. Therefore, it is does not appear that overdraft has occurred historically in the Basin.

The projected water budget suggests that groundwater in storage would increase slightly (68 to 84 AF/yr) between 2022 and 2096, under the assumed future precipitation rates modeled. During the implementation period (2022-2041), declines in storage range from 4 to 38 AF/yr are projected, depending on the climate change assumptions (Tables 3.3-07, 3.3-11, and 3.3-13). These values are considered to be within the range of uncertainty of the water budget calculations. Therefore, MBGSA concludes that overdraft during the 50-year GSP planning horizon is not likely under the assumed conditions.

Although the water budget projections suggest groundwater storage will not decline significantly during the 50-year GSP planning horizon, the model results indicate 318 to 458 AF/yr of groundwater inflow will occur from offshore portions of the Hueneme Aquifer into onshore portions of the aquifer during the implementation period (2022-2041), depending on climate change assumptions (Tables 3.3-08, 3.3-12, and 3.3-14). Modeled flow across the coastline during the next 55 years (sustaining and post-GSP periods, 2042-2096) is projected to reverse (consist of outflow from Mound Basin to the offshore areas), on average. As discussed in Section 3.2.3, available data do not indicate that seawater is or has been present in the onshore portions of the principal aquifers to date. With projected average net outflows of groundwater from Mound Basin to the offshore areas west of the coastline of approximately 5,000 AF/yr (Tables 3.3-08, 3.3-11, and 3.3-14), seawater intrusion into Mound Basin is considered unlikely to occur. Additionally, Section 4.6 presents model results of particle tracking analyses, which suggest that it will take more than 100 years for the seawater front in the Hueneme Aquifer to reach the shoreline of the Mound Basin. This is clearly beyond the 50-year GSP planning horizon and neither SGMA nor the GSP Emergency Regulations explicitly require consideration of potential undesirable results that could manifest after the 50-year GSP planning horizon. Nonetheless, this GSP prudently includes SMC and a monitoring network for seawater intrusion. A contingency plan for unexpected seawater intrusion during the 50-year GSP planning horizon will also be developed and can survive following the 50-year GSP planning horizon and be used to address any future potential landward movement of seawater in the Hueneme Aquifer.

3.3.4.2 Sustainable Yield

GSP Emergency Regulations § 354.18(b)(7) requires an estimate of the sustainable yield for the Basin. Water Code §10721(w) defines "Sustainable yield" as the maximum quantity of water, calculated over a base period representative of long-term conditions in the Basin and including any temporary surplus that can be withdrawn annually from a groundwater supply without causing an undesirable result.

Modeling results for the future projection periods indicate that the projected inflow and outflows will be approximately balanced during the 20-year GSP implementation period (change in storage ranging from 4 to 38 AF/yr; Tables 3.3-07, 3.3-10, and 3.3-13), depending on climate change assumptions. The modeling results also suggest that the minimum thresholds will not be exceeded. Therefore, an estimate of the sustainable yield is approximately equal to the projected extraction (averaging 7,900 to 8,200 AF/yr), depending on climate change assumptions (Tables 3.3-07, 3.3-10, and 3.3-13). It is recognized that increasing extraction rates above these amounts could increase underflow from adjacent basins, thereby increasing the sustainable yield of the Mound Basin; however, this could impact sustainable management of the adjacent Santa Paula and/or Oxnard basins and is not included the sustainable yield estimate at this time.

3.4 Management Areas [§354.20]

No management areas were established for this GSP.

DRAFT

4.0 Sustainable Management Criteria [Article 5, SubArticle 3]

4.1 Introduction to Sustainable Management Criteria [§354.22]

§354.22 Introduction to Sustainable Management Criteria. *This Subarticle describes criteria by which an Agency defines conditions in its Plan that constitute sustainable groundwater management for the basin, including the process by which the Agency shall characterize undesirable results, and establish minimum thresholds and measurable objectives for each applicable sustainability indicator.*

This chapter defines the conditions that direct sustainable groundwater management in the Mound Basin, discusses the process by which MBGSA characterized undesirable results, and established minimum thresholds, measurable objectives, and interim milestones for each applicable sustainability indicator.

Defining the SMC requires a significant level of analysis and scrutiny; this section presents the data and methods used to develop the SMC for the Mound Basin and explains how the SMC affect the interests of beneficial uses and users of groundwater and/or land uses and property interests. The SMC presented in this Section were developed using the best available science and information for the Basin. As noted in this GSP, data gaps exist in the HCM, and uncertainty caused by these data gaps was considered during SMC development. The SMC will be reevaluated during each Plan assessment and potentially modified in the future as new data become available.

The layout for this GSP groups the SMC by each sustainability indicator, and their order is kept consistent with the SGMA regulatory text for minimum thresholds (§354.28). For this GSP, land subsidence is the most limiting sustainability indicator, and it may benefit the reader to understand the SMC for Section 4.8 before reading Sections 4.4 through 4.7. The following sustainability indicators are applicable in the Basin:

- Chronic lowering of groundwater levels (Section 4.4)
- Reduction in groundwater storage (Section 4.5)
- Seawater Intrusion (Section 4.6)
- Degraded water quality (Section 4.7)
- Land subsidence (Section 4.8)

The sixth sustainable management criterion, depletion of interconnected surface water, is not applicable in the Basin because surface water is not materially affected by groundwater extraction for the reasons described in the Basin Setting (see Sections 3.1.4.2, 3.2.6, and 3.3, and Appendix G for further information). There is no direct depletion of interconnected surface water of the Santa Clara River and its estuary because there is no groundwater extraction from the Shallow Alluvial Deposits. Indirect depletion of Santa Clara River flows by groundwater extraction from the deeper, principal aquifers does not occur at material rates because the thick zone of fine-grained materials that lies between the Shallow Alluvial Deposits and the Mugu Aquifer significantly limits the propagation of hydraulic responses between these units. A detailed analysis of the potential for indirect depletion is presented in Appendix G. The results of that analysis indicated that there is no material depletion of surface water.

DRAFT

To retain an organized approach, this chapter follows the same structure for each sustainability indicator. The description of each SMC contains all the information required by §354.22 et seq. of the SGMA regulations and outlined in DWR BMP 6, Sustainable Management Criteria (DWR, 2017), including:

- Description of undesirable results:
  - Potential effects on beneficial uses and users of groundwater, on land uses and property interests, and other potential effects (§354.26(b)(3)).
  - The cause of groundwater conditions that would lead to or has led to undesirable results (§354.26(b)(1)).
  - The criteria used to define when and where the effects of groundwater conditions cause undesirable results (i.e., the combination of minimum threshold exceedances that cause significant and unreasonable effects in the basin) (§354.26(b)(2)).
- How minimum thresholds were developed:
  - The information and methodology used to develop minimum thresholds (§354.28 (b)(1)).
  - The relationship between minimum thresholds and the relationship of these minimum thresholds to other sustainability indicators (§354.28 (b)(2)).
  - The effect of minimum thresholds on neighboring basins (§354.28 (b)(3)).
  - The effect of minimum thresholds on beneficial uses and users (§354.28 (b)(4)).
  - How minimum thresholds relate to relevant Federal, State, or local standards (§354.28 (b)(5)).
  - The method for quantitatively measuring minimum thresholds (§354.28 (b)(6)).
- How measurable objectives and interim milestones were developed:
  - The methodology for setting measurable objectives (§354.30).
  - Interim milestones (§354.30 (a), §354.30 (e), §354.34 (g)(3)).

Minimum thresholds, measurable objectives, and interim milestones have been established to evaluate chronic lowering of groundwater levels, reduction in groundwater storage, and land subsidence (Table 4.1-01), water quality (Tables 4.1-02 and 4.1-03), and seawater intrusion (Table 4.1-03). For this GSP and pursuant to GSP Emergency Regulations §354.28(d), a groundwater elevation minimum threshold serves as the metric for chronic lowering of groundwater levels (Section 4.4), depletion of groundwater storage (Section 4.5), and land subsidence (Section 4.8) sustainability indicators. Adequate evidence demonstrating groundwater levels are a reasonable proxy is presented in Sections 4.4.2, 4.5.2, and 4.8.2. More information about specific minimum thresholds, measurable objectives, and interim milestones relating to each groundwater condition is available in Sections 4.4 through 4.9.

To facilitate discussion of the land subsidence minimum thresholds the Basin is divided into a “western half,” “eastern half,” and “coastal area” (Figure 4.1-01), and these terms are used throughout the GSP.

DRAFT

4.2 Sustainability Goal [§354.24]

§354.24 Sustainability Goal. *Each Agency shall establish in its Plan a sustainability goal for the basin that culminates in the absence of undesirable results within 20 years of the applicable statutory deadline. The Plan shall include a description of the sustainability goal, including information from the basin setting used to establish the sustainability goal, a discussion of the measures that will be implemented to ensure that the basin will be operated within its sustainable yield, and an explanation of how the sustainability goal is likely to be achieved within 20 years of Plan implementation and is likely to be maintained through the planning and implementation horizon.*

The sustainability goal is key to the SMC development process because it provides policy guidance for defining undesirable results and desirable conditions for each applicable sustainability indicator and for the Basin as a whole. Recognizing the importance of the sustainability goal, MBGSA's SMC process began with developing and adopting the sustainability goal. MBGSA used a deliberate process to develop the sustainability goal, which included providing ample opportunity for input on the goal. Sustainability goal outreach included a GSP newsletter article, web-posting, multiple email notices to the interested parties list, discussion at a GSP Workshop, and discussion at four Board of Director meetings. The sustainability goal was adopted by the Board of Directors on September 17, 2020, after three months of outreach. Information from the Basin setting used to establish the sustainability goal is described in the subsections for each individual sustainability indicator.

The sustainability goal for the MBGSA GSP is as follows:

> *The goal of this Groundwater Sustainability Plan (GSP) is to sustainably manage the groundwater resources of the Mound Basin for the benefit of current and anticipated future beneficial users of groundwater and the welfare of the general public who rely directly or indirectly on groundwater. Sustainable groundwater management will ensure the long-term reliability of the Mound Basin groundwater resources by avoiding undesirable results pursuant to the Sustainable Groundwater Management Act (SGMA) no later than 20 years from GSP adoption through implementation of a data-driven and performance-based adaptive management framework. It is the express goal of this GSP to develop sustainable management criteria and plan implementation measures to avoid undesirable results for the applicable SGMA sustainability indicators by:*
>
> 1. *Using best available science and information, including consideration of uncertainty in the basin setting and groundwater conditions;*
> 2. *Conducting active and meaningful stakeholder engagement;*
> 3. *Considering potential impacts on the management of adjacent basins and, where necessary coordinating with adjacent basins; and*
> 4. *Balancing economic, social, and environmental impacts and benefits associated with current and anticipated future beneficial users of groundwater, by considering:*
>
>   a. *Water supply reliability for agriculture and municipal and industrial users;*
>   b. *Availability of alternative water sources for domestic groundwater beneficial users;*
>   c. *Identifying and considering potential impacts to groundwater-dependent ecosystems;*

d. State, federal, or local standards relevant to applicable sustainability indicators;

e. Feasibility of projects and management actions necessary to achieve proposed measurable objectives; and

f. Economic impact of projects and management actions necessary to achieve proposed measurable objectives on all beneficial users, with special consideration of disadvantage communities and agricultural landowners lacking alternative land use options.

The measures that will be implemented to ensure that the Basin will be operated within its sustainable yield, and an explanation of how the sustainability goal is likely to be achieved within 20 years of Plan implementation (and is likely to be maintained through the planning and implementation horizon) is presented in Section 6 (Projects and Management Actions) and Section 7 (Plan Implementation).

4.3 Process for Establishing Sustainable Management Criteria [§354.26(a), §354.34(g)(3)]

§354.26 Undesirable Results.

(a) *Each Agency shall describe in its Plan the processes and criteria relied upon to define undesirable results applicable to the basin. Undesirable results occur when significant and unreasonable effects for any of the sustainability indicators are caused by groundwater conditions occurring throughout the basin.*

§354.34 Monitoring Network

(g) *Each Plan shall describe the following information about the monitoring network:*

(3) *For each sustainability indicator, the quantitative values for the minimum threshold, measurable objective, and interim milestones that will be measured at each monitoring site or representative monitoring sites established pursuant to Section 354.36.*

On June 18, 2020, the MBGSA Board of Directors adopted a deliberate process for developing SMC for this GSP (depicted in Figure 4.3-01 below).

As shown in Figure 4.3-01, a key part of the SMC development process is defining undesirable results (GSP Emergency Regulations §354.26(a)). The process for defining undesirable results was modified as the work was completed and consisted of multiple steps:

1. First, potential effects on the beneficial uses and users of groundwater, on land uses and property interests, and other effects were evaluated and described qualitatively.
2. This qualitative undesirable results statement was then translated and quantified into minimum thresholds at specific monitoring network sites (existing and proposed).
3. Lastly, a combination of minimum threshold exceedances representing undesirable results (when significant and unreasonable effects occur on any of the sustainability indicators) in the Basin was established.

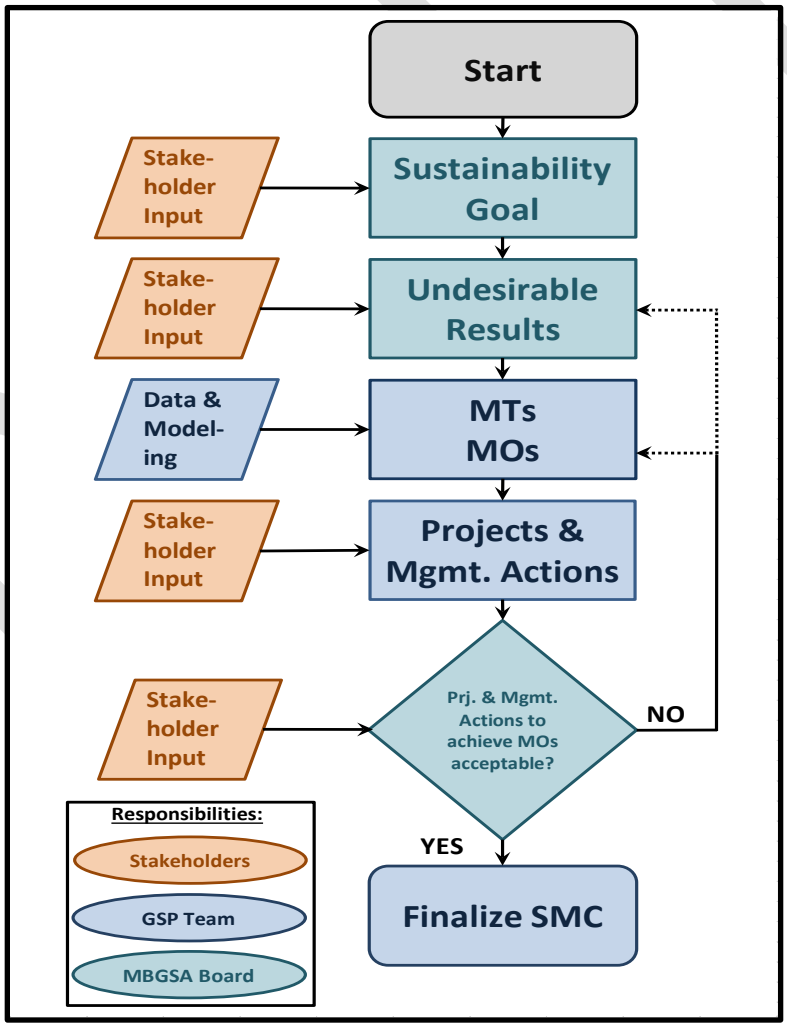
The Board of Directors and stakeholders reviewed SMC proposals prepared by staff. Written proposals were provided in the form of staff reports and presentations at numerous Board of Directors meetings, which included information on SGMA requirements, relevant information from the Basin Setting section, and results of additional analyses completed to support SMC development. Meeting summaries (minutes)

were posted on the MBGSA website to reflect the discussions that took place for each sustainability indicator.

SMC were also presented at two GSP workshops. The first GSP workshop was held on September 3, 2020, and focused on providing foundational information for SMC development, including the Basin setting, groundwater model, SMC development process, and sustainability goal. The second GSP workshop was held on March 4, 2021, and focused on detailed SMC proposals. The Board approved the SMC for inclusion in the draft GSP on March 18, 2021.

The proposed SMC were also subject to review and comment during the Draft GSP comment period. Outreach was performed throughout the SMC development process to encourage input on the proposed SMC, including GSP newsletters, e-mails to the interested parties list, social media posts, telephone communications with stakeholders, updates at the Santa Clara River Watershed Committee, public notices, and a bilingual bill stuffer in the City of Ventura's consumer water bills.

Figure 4.3-01 Sustainable Management Criteria Development Process



4.4 Chronic Lowering of Groundwater Levels

4.4.1 Undesirable Results [§354.26(a),(b)(1),(b)(2),(b)(3),(c), and (d)]

§354.26 Undesirable Results.

(a) *Each Agency shall describe in its Plan the processes and criteria relied upon to define undesirable results applicable to the basin. Undesirable results occur when significant and unreasonable effects for any of the sustainability indicators are caused by groundwater conditions occurring throughout the basin.*

(b) *The description of undesirable results shall include the following:*

(1) *The cause of groundwater conditions occurring throughout the basin that would lead to or has led to undesirable results based on information described in the basin setting, and other data or models as appropriate.*

(2) *The criteria used to define when and where the effects of the groundwater conditions cause undesirable results for each applicable sustainability indicator. The criteria shall be based on a quantitative description of the combination of minimum threshold exceedances that cause significant and unreasonable effects in the basin.*

(3) *Potential effects on the beneficial uses and users of groundwater, on land uses and property interests, and other potential effects that may occur or are occurring from undesirable results.*

(c) *The Agency may need to evaluate multiple minimum thresholds to determine whether an undesirable result is occurring in the basin. The determination that undesirable results are occurring may depend upon measurements from multiple monitoring sites, rather than a single monitoring site.*

(d) *An Agency that is able to demonstrate that undesirable results related to one or more sustainability indicators are not present and are not likely to occur in a basin shall not be required to establish criteria for undesirable results related to those sustainability indicators.*

Process and Criteria for Defining Undesirable Results [§354.26(a)]

The overall process relied upon to define undesirable results for this GSP is described in Section 4.3. The specific process and criteria for defining undesirable results applied to the chronic lowering of groundwater levels sustainability indicator are described below.

Evaluation of Potential Effects on Beneficial Uses and Users, Land Uses, and Property Interests [§354.26(b)(3)]

The process for defining undesirable results for chronic lowering of groundwater levels began with considering the potential effects on beneficial uses and users of groundwater, land uses, and property interests.

Potential effects on beneficial uses and users of groundwater include the following:

- Impact on the ability of existing and future wells to produce groundwater at an adequate rate for beneficial uses, and
- Significant financial burden to groundwater beneficial users related to increased extraction costs, well repairs or modifications, and well replacements.

Potential effects on land uses and property interests include decreased property values resulting from decreased well yields and/or increased costs to produce water or purchase supplemental water.

The above-listed potential effects were analyzed by evaluating information about the following:

- Historical groundwater elevation data;
- Depths and locations of existing wells; and
- Numerical modeling results of groundwater level conditions from the 50-year projected water budget.

Chronic lowering of groundwater levels has not historically occurred and is not currently occurring in the Basin. The results of the analysis indicate that groundwater levels could decline by a considerable amount below historical low levels in many areas of the Basin before a significant and unreasonable depletion of supply would occur. The reason for this available groundwater level decline is related to the fact that wells are located in the confined portion of the Basin and the aquifers occur at considerable depths (see Figures 3.1-05 through 3.1-08). In short, there is a high enough water column in most wells to support large groundwater declines before a significant loss of production capacity would occur. The analysis results are supported by the lack of reported pumping problems during historical periods of lowered groundwater levels. While accessing water from depths below historical low groundwater levels may require deeper pump settings than current, the cost for lowering pumps is not considered significant and unreasonable. Significant and unreasonable effects are assumed to occur if wells could no longer be used as designed. Because wells in the Basin are designed to produce from confined aquifers, this means maintaining pumping levels above the top of the aquifers.

Based on the foregoing, the qualitative description of undesirable results is chronic lowering of groundwater levels that causes a significant number of wells in the Basin to no longer be capable of being operated as designed for the confined aquifers of the Mound Basin.

Cause of Groundwater Conditions That Could Lead to Undesirable Results [§354.26(b)(1)]

The cause of groundwater conditions that could lead to undesirable results would be lowering of the groundwater potentiometric surface to depths that cause pumping levels to drop below an operable height above the top of the principal aquifer in a significant number of wells.

The following factors could result in groundwater levels declining to such levels:

1. Mound Basin groundwater extractions rates that significantly exceed those assumed for the projected water budget analysis.
2. Droughts that exceed the duration and severity of droughts included in the hydrologic period used for the projected water budget analysis.
3. If Oxnard Basin does not meet the sustainability goal in its GSP, which would impact underflow between the basins to the detriment of the Mound Basin.
4. Increased groundwater extraction in the adjacent Oxnard Basin near the boundary with the Mound Basin, which would impact underflow between the basins to the detriment of the Mound Basin.
5. Increased groundwater extraction in the adjacent Santa Paula Basin near the boundary with the Mound Basin, which would impact underflow between the basins to the detriment of the Mound Basin.

DRAFT

6. Combinations of items 1 through 5.

Criteria Used to Define Undesirable Results [§354.26(b)(2)]

The combination of minimum threshold exceedances that is deemed to cause significant and unreasonable effects in the Basin for chronic lowering of groundwater levels is minimum threshold exceedances in 50% of the groundwater level monitoring sites in either principal aquifer. Exceedances beyond 50% would indicate widespread significant and unreasonable effects in either principal aquifer leading to undesirable results in the Basin.

4.4.2 Minimum Thresholds [§354.28]

The minimum thresholds for the chronic lowering of groundwater levels are set at the historical low groundwater level for each monitoring well (Appendix I). The basis, description, and definition for the minimum threshold is discussed in the subsequent sections below.

4.4.2.1 Information and Criteria to Define Minimum Thresholds [§354.28(a),(b)(1),(c)(1)(A),(c)(1)(B), and (e)]

§354.28 Minimum Thresholds.

(a) *Each Agency in its Plan shall establish minimum thresholds that quantify groundwater conditions for each applicable sustainability indicator at each monitoring site or representative monitoring site established pursuant to Section 354.36. The numeric value used to define minimum thresholds shall represent a point in the basin, that, if exceeded, may cause undesirable results as described in Section 354.26.*

(b) *The description of minimum thresholds shall include the following:*

(1) *The information and criteria relied upon to establish and justify the minimum thresholds for each sustainability indicator. The justification for the minimum threshold shall be supported by information provided in the basin setting, and other data or models as appropriate, and qualified by the uncertainty in the understanding of the basin setting.*

(c) *Minimum thresholds for each sustainability indicator shall be defined as follows:*

(1) *Chronic Lowering of Groundwater Levels. The minimum threshold for chronic lowering of groundwater levels shall be the groundwater elevation indicating a depletion of supply at a given location that may lead to undesirable results. Minimum thresholds for chronic lowering of groundwater levels shall be supported by the following:*

(A) *The rate of groundwater elevation decline based on historical trend, water year type, and projected water use in the basin.*

(B) *Potential effects on other sustainability indicators.*

(e) *An Agency that has demonstrated that undesirable results related to one or more sustainability indicators are not present and are not likely to occur in a basin, as described in Section 354.26, shall not be required to establish minimum thresholds related to those sustainability indicators.*

The evaluation of potential effects on beneficial uses and users, land uses, and property interests that would be affected by chronic lowering of groundwater levels was described in the evaluation of undesirable results (Section 4.4.1). Summarizing Section 4.4.1, significant and unreasonable effects from chronic lowering of groundwater levels would be causing wells to no longer be capable of being operated as designed for the confined aquifers of the Mound Basin. Wells are designed to not have the screens desaturate. For the confined aquifers in the Mound Basin, this means the maximum available drawdown is generally limited by the water column above the top of the aquifer (Driscoll, 1986). Drawing

groundwater levels into the screen and aquifer causes cascading water in the well, which can cause pump cavitation and can accelerate biofouling, corrosion, and encrustation of the well screen. These effects can rapidly cause a significant loss of well production capacity and can render wells inoperable. Therefore, preventing significant and unreasonable effects requires that static groundwater levels be maintained at levels that provide sufficient water column for pumping levels to remain above the top of the aquifers.

With respect to the undesirable results described above, the groundwater elevations that indicate depletion of supply were calculated for each monitoring location to evaluate potential minimum thresholds for chronic lowering of groundwater levels. The calculations were completed by adding the estimated drawdown for a typical pumping well to 40 ft above the top elevation of the aquifer (see Appendix I for additional details and results of these calculations). Although this calculation was considered for the minimum threshold for the chronic lowering of groundwater levels sustainability indicator, it was noted that some calculated levels are several hundred feet lower in elevation than the measured historical low groundwater elevation (especially for the Hueneme aquifer), while others are similar to the historical low elevations. This is due to the significant folding of the principal aquifers that create a variable depth to the top of aquifer throughout the Basin. Other considerations include the prevention of land subsidence, avoiding potentially unrecoverable reduction of groundwater storage, and impacting underflows to/from the adjacent Oxnard Basin. After considering these factors, the minimum thresholds for the chronic lowering of groundwater levels were set at the historical low groundwater elevations in the monitoring wells. This approach will protect the wells near anticlines (upward folds), prevent land subsidence, prevent the Basin groundwater levels from falling beyond a point from which groundwater storage may not fully recover, and ensure that underflow to/from the Oxnard Basin is not unduly impacted. The resulting minimum thresholds are provided in Table 4.1-01 and are depicted on the time-series plots (hydrographs) included in Appendix I.

Pursuant to GSP Emergency Regulations §354.28(c)(1)(A), the rate of groundwater elevation decline based on historical trend, water year type, and projected water use in the Basin were considered during development of the minimum thresholds for chronic lowering of groundwater levels. Declining groundwater levels have been observed during periods of multiple consecutive dry water years or sequences with alternating dry and normal water years (e.g. Figures 3.2-10 through 3.2-13 and 3.3-02). Projected water use in the Basin is accounted for in the numerical modeling of the 50-year projected period and the modeling results suggest that projected extraction rates will not cause minimum threshold exceedances (Appendix I).

4.4.2.1.1 Evaluation of Representative Minimum Thresholds [§354.28(d)]

§354.28 Minimum Thresholds.
(d) *An Agency may establish a representative minimum threshold for groundwater elevation to serve as the value for multiple sustainability indicators, where the Agency can demonstrate that the representative value is a reasonable proxy for multiple individual minimum thresholds as supported by adequate evidence.*

As discussed in Section 4.8, InSAR data is not adequate for monitoring land subsidence in the western half of the Basin. Because of this inadequacy, groundwater level elevations are used as a proxy for land subsidence minimum thresholds in the western half of the Basin. As such, groundwater elevation is used as a representative minimum threshold for multiple sustainability indicators (land subsidence and chronic lowering of groundwater levels in the western half of the Basin). Groundwater levels are a reasonable

proxy for multiple minimum thresholds for these sustainability indicators because they are closely correlated. Groundwater levels could decline below historical low levels without causing undesirable results for the chronic lowering of groundwater levels sustainability indicator at some locations in the western half of the Basin based on the drawdown analysis described in Appendix I. However, undesirable results for land subsidence could occur in the "Coastal Area" (see Figure 4.1-01) if groundwater levels decline below historical low levels in the western half of the Basin. Therefore, it is appropriate to use the historical low as minimum thresholds for the land subsidence and chronic lowering of groundwater levels sustainability indicators in the western half of the Basin. Appendix I describes the calculation of the minimum thresholds and measurable objectives for each monitoring well in the Basin.

4.4.2.2 Relationships Between Minimum Thresholds and Sustainability Indicators [§354.28(b)(2)]

§354.28 Minimum Thresholds.
(b) *The description of minimum thresholds shall include the following:*
(2) *The relationship between the minimum thresholds for each sustainability indicator, including an explanation of how the Agency has determined that basin conditions at each minimum threshold will avoid undesirable results for each of the sustainability indicators.*

The relationships between the minimum thresholds for the chronic lowering of groundwater levels sustainability indicator and other sustainability indicators are described in Section 4.4.2.5.

4.4.2.3 Minimum Thresholds in Relation to Adjacent Basins [§354.28(b)(3)]

§354.28 Minimum Thresholds.
(b) *The description of minimum thresholds shall include the following:*
(3) *How minimum thresholds have been selected to avoid causing undesirable results in adjacent basins or affecting the ability of adjacent basins to achieve sustainability goals.*

The minimum thresholds for the chronic lowering of groundwater levels sustainability indicator are based on historical low groundwater elevations, which is considered protective of both the Mound Basin and the adjacent Oxnard Basin. Deeper groundwater levels could potentially increase underflow into the Mound Basin from the Oxnard and/or Santa Paula Basins (or decrease underflow to the Oxnard Basin), which could potentially contribute to undesirable results in those Basins. Underflow between the basins will be estimated during Plan implementation using groundwater level data near the basin boundary and numerical modeling to evaluate whether the minimum thresholds are unduly impacting sustainable management of the Oxnard Basin.

4.4.2.4 Impact of Minimum Thresholds on Beneficial Uses and Users [§354.28(b)(4)]

§354.28 Minimum Thresholds.
(b) *The description of minimum thresholds shall include the following:*
(4) *How minimum thresholds may affect the interests of beneficial uses and users of groundwater or land uses and property interests.*

The chronic lowering of groundwater levels minimum thresholds may have several effects on beneficial users and land uses in the Basin:

Groundwater Beneficial Users (All Types)

The minimum thresholds will prevent significant and unreasonable depletions of supply and prevent significant financial burdens for well repairs and well replacements. Numerical modeling results suggest that the future groundwater levels will be above the minimum thresholds and achieve the measurable objective without the need for extraction rate reductions or any projects or other management actions. Therefore, the minimum thresholds are not anticipated to limit the beneficial use of groundwater.

Land Uses and Property Interests (All Types)

The minimum thresholds will prevent significant and unreasonable effects on land uses and property interests by preserving water supply for beneficial uses, thereby helping maintain property values. As discussed in Section 2.2.3.1, agricultural land and open space in the Basin is subject to the City of Ventura and County of Ventura SOAR voter initiatives currently approved through 2050 (SOAR, 2015). The SOAR initiatives require a majority vote of the people to rezone unincorporated open space, agricultural, or rural land for development. The existence of SOAR makes it very unlikely that agricultural land could be developed. Therefore, it is important to ensure that agricultural beneficial uses of groundwater are protected by the minimum thresholds because there is no practical alternative land use for most agricultural land in the Basin. Absent groundwater supplies, agricultural property values would likely be significantly impacted. The impact on property values for other land uses and property uses in the Basin is less directly tied to Mound Basin groundwater because the City of Ventura (water supplier for majority of the non-agricultural areas of the Basin) has a diverse water supply portfolio that includes multiple supplies derived from sources located outside of the Basin.

4.4.2.5 Potential Effects on other Sustainability Indicators [§354.28(c)(1)(B)]

§354.28 Minimum Thresholds.
(c) *Minimum thresholds for each sustainability indicator shall be defined as follows:*
(1) *Chronic Lowering of Groundwater Levels. The minimum threshold for chronic lowering of groundwater levels shall be the groundwater elevation indicating a depletion of supply at a given location that may lead to undesirable results. Minimum thresholds for chronic lowering of groundwater levels shall be supported by the following:*
(B) *Potential effects on other sustainability indicators.*

Pursuant to GSP Emergency Regulations §354.28(c)(1)(B), potential effects on other sustainability indicators were considered. The following effects were identified:

- **Land Subsidence in the Western Half of the Basin**: As discussed in Section 4.8, InSAR data is not adequate for monitoring land subsidence in the western half of the Basin; therefore, groundwater level elevations are used as a proxy for land subsidence minimum thresholds. The minimum thresholds are the same for the chronic lowering of groundwater levels and land subsidence sustainability indicators in the western half of the Basin. The potential effect of the chronic lowering of groundwater levels minimum thresholds is prevention of minimum

threshold exceedances for the land subsidence sustainability indicator in the western half of the Basin.

Land Subsidence in the Eastern Half of the Basin: As discussed in Section 4.8, InSAR data is adequate for monitoring land subsidence in the eastern half of the Basin and the land subsidence minimum thresholds are a rate and extent of subsidence. The chronic lowering of groundwater levels minimum threshold is the historical low groundwater level elevations, which should prevent inelastic subsidence. Thus, the potential effect of the chronic lowering of groundwater levels minimum thresholds is prevention of minimum threshold exceedances for the land subsidence sustainability indicator in the eastern half of the Basin.

- **Reduction of Groundwater Storage**: Managing groundwater levels above historical lows is expected to prevent unrecoverable groundwater storage loss because the Basin has been demonstrated to recover from historical low groundwater elevations historically. Thus, the potential effect of the chronic lowering of groundwater levels minimum thresholds is prevention of unrecoverable reduction of groundwater storage.
- **Seawater Intrusion**: Numerical modeling results suggest that seawater intrusion is not anticipated during the 50-year SGMA planning and implementation period (Section 4.6). In addition, the Mugu and Hueneme aquifers crop out on the continental shelf approximately 10 miles offshore without any submarine canyons (Figure 3.1-10), greatly reducing the likelihood that seawater can find a near-shore path for intrusion. Several investigations have concluded that seawater intrusion is not occurring for Mound Basin. Therefore, the effect of groundwater level minimum thresholds on the seawater intrusion sustainability indicators is not significant. However, it is noted that maintaining groundwater levels above historical low levels will help limit inland gradients in the Hueneme Aquifer that could eventually lead to onshore migration of seawater in the future (beyond the 50-year SGMA planning and implementation period).
- **Degraded Water Quality**: Managing groundwater levels above historical lows is expected to prevent water quality degradation associated with groundwater extraction because the Basin has not experienced degradation of water quality in the principal aquifers during periods of historical low groundwater elevations. Thus, the potential effect of the chronic lowering of groundwater levels minimum thresholds is prevention of degradation of water quality associated with groundwater extraction.
- **Depletion of Interconnected Surface Water**: This sustainability indicator is not applicable to the Mound Basin.

4.4.2.6 Current Standards Relevant to Sustainability Indicator [§354.28(b)(5)]

§354.28 Minimum Thresholds.
(b) *The description of minimum thresholds shall include the following:*
(5) *How state, federal, or local standards relate to the relevant sustainability indicator. If the minimum threshold differs from other regulatory standards, the Agency shall explain the nature of and basis for the difference.*

MBGSA is unaware of any federal, state, or local standards for chronic lowering of groundwater levels.

4.4.2.7 Measurement of Minimum Thresholds [§354.28(b)(6)]

§354.28 Minimum Thresholds.
(b) *The description of minimum thresholds shall include the following:*
(6) *How each minimum threshold will be quantitatively measured, consistent with the monitoring network requirements described in Subarticle 4.*

Groundwater elevations will be directly measured to determine their relation to minimum thresholds. Groundwater level monitoring will be conducted in accordance with the monitoring plan outlined in Section 5. Section 7 Plan Implementation includes an implementation budget to install additional monitoring sites identified in Section 5.

4.4.3 Measurable Objectives and Interim Milestones [§354.30(a),(b),(c),(d),(e),(g)]

§354.30 Measurable Objectives.
(a) *Each Agency shall establish measurable objectives, including interim milestones in increments of five years, to achieve the sustainability goal for the basin within 20 years of Plan implementation and to continue to sustainably manage the groundwater basin over the planning and implementation horizon.*
(b) *Measurable objectives shall be established for each sustainability indicator, based on quantitative values using the same metrics and monitoring sites as are used to define the minimum thresholds.*
(c) *Measurable objectives shall provide a reasonable margin of operational flexibility under adverse conditions which shall take into consideration components such as historical water budgets, seasonal and long-term trends, and periods of drought, and be commensurate with levels of uncertainty.*
(d) *An Agency may establish a representative measurable objective for groundwater elevation to serve as the value for multiple sustainability indicators where the Agency can demonstrate that the representative value is a reasonable proxy for multiple individual measurable objectives as supported by adequate evidence.*
(e) *Each Plan shall describe a reasonable path to achieve the sustainability goal for the basin within 20 years of Plan implementation, including a description of interim milestones for each relevant sustainability indicator, using the same metric as the measurable objective, in increments of five years. The description shall explain how the Plan is likely to maintain sustainable groundwater management over the planning and implementation horizon.*
(g) *An Agency may establish measurable objectives that exceed the reasonable margin of operational flexibility for the purpose of improving overall conditions in the basin, but failure to achieve those objectives shall not be grounds for a finding of inadequacy of the Plan.*

4.4.3.1 Description of Measurable Objectives

The chronic lowering of groundwater levels measurable objectives were developed by applying the concept of providing a reasonable margin of operational flexibility under adverse conditions (GSP Emergency Regulations §354.30(c)). Adverse conditions for the Mound Basin include drought-phases of the long-term and climatic-driven groundwater level cycles, as described in Section 3.2 (Groundwater Conditions). The reasonable margin of operational flexibility was determined to be groundwater levels following wet phases that are sufficiently high to prevent groundwater levels from dropping below the minimum thresholds during a subsequent drought phase (Figures 3.2-10 through 3.2-13). The measurable objectives were developed for each monitoring site using the following approach:

1. Modeled groundwater level data were plotted for the projected period for each monitoring site.

2. The maximum modeled groundwater level decline during the 50-year GSP planning and implementation horizon was determined and, when necessary, adjusted using professional judgment based on model calibration results (see Appendix I for additional details on the methodology);
3. The maximum projected groundwater level decline was added to the minimum threshold to establish the range of operational flexibility.

The measurable objectives are listed along with minimum thresholds for each monitoring site in Table 4.1-01 (§354.30(b)) and apply following wet phases of the climate cycle. Failure to meet the measurable objectives during other times shall not be considered failure to sustainably manage the Basin. Time-series plots (hydrographs) showing the measured and modeled groundwater elevation data and measurable objectives are included in Appendix I.

4.4.3.2 Interim Milestones [§354.30(e)]

§354.30 Measurable Objective.
(e) *Each Plan shall describe a reasonable path to achieve the sustainability goal for the basin with 20 years of Plan implementation, including a description of interim milestones for each relevant sustainability indicator, using the same metric as the measurable objective, in increments of five years. The description shall explain how the Plan is likely to maintain sustainable groundwater management over the planning and implementation horizon.*

Interim milestones were developed to illustrate a reasonable path to achieve the sustainability goal for the Basin within 20 years of Plan implementation. Development of interim milestones is significantly complicated by the fact that the hydrologic conditions for the next 20 years cannot be predicted. Currently, groundwater levels in the Basin are below the measurable objectives for approximately ⅓ of the wells because the Basin has experienced overall dry conditions for much of the past decade. It is anticipated that groundwater levels will rise during the next wet period and as a result of Oxnard Basin GSP implementation. It is anticipated that the measurable objectives will be met at some point during the 20-year GSP planning period and then may fluctuate above or below the measurable objective thereafter. Because of the uncertainty concerning when the measurable objectives will be met, the interim milestones are shown as a linear path toward the measurable objective over the 20-year sustainability timeframe. This interim milestone path should not be taken literally because it is climate dependent. The interim milestones and path to sustainability will be reviewed during each required five-year GSP assessment (GSP Emergency Regulations §354.38(a)). The interim milestones are listed in Table 4.1-01 and are plotted on the time-series plots (hydrographs) included in Appendix I.

Once the measurable objectives are met, numerical modeling results suggests that sustainability will be maintained during the remainder of the 50-year GSP planning and implementation horizon (Appendix I). The causes of groundwater conditions that could lead to undesirable results for the land subsidence sustainability indicator (described in Section 4.8.1) will be carefully reviewed during each required five-year GSP assessment. The GSP will be updated to include any projects or management actions deemed necessary to maintain sustainable conditions in the Basin.

DRAFT

4.5 Reduction of Groundwater Storage

4.5.1 Undesirable Results [§354.26]

§354.26 Undesirable Results.

(a) *Each Agency shall describe in its Plan the processes and criteria relied upon to define undesirable results applicable to the basin. Undesirable results occur when significant and unreasonable effects for any of the sustainability indicators are caused by groundwater conditions occurring throughout the basin.*

(b) *The description of undesirable results shall include the following:*

(1) *The cause of groundwater conditions occurring throughout the basin that would lead to or has led to undesirable results based on information described in the basin setting, and other data or models as appropriate.*

(2) *The criteria used to define when and where the effects of the groundwater conditions cause undesirable results for each applicable sustainability indicator. The criteria shall be based on a quantitative description of the combination of minimum threshold exceedances that cause significant and unreasonable effects in the basin.*

(3) *Potential effects on the beneficial uses and users of groundwater, on land uses and property interests, and other potential effects that may occur or are occurring from undesirable results.*

(c) *The Agency may need to evaluate multiple minimum thresholds to determine whether an undesirable result is occurring in the basin. The determination that undesirable results are occurring may depend upon measurements from multiple monitoring sites, rather than a single monitoring site.*

(d) *An Agency that is able to demonstrate that undesirable results related to one or more sustainability indicators are not present and are not likely to occur in a basin shall not be required to establish criteria for undesirable results related to those sustainability indicators.*

Process and Criteria for Defining Undesirable Results [§354.26(a)]

The overall process relied upon to define undesirable results for this GSP was described in Section 4.3. The specific process and criteria for defining undesirable results applied to the reduction of groundwater storage sustainability indicator are described below.

Pursuant to Water Code §10721(x)(2) the undesirable result for the reduction of groundwater storage sustainability indicator is a "significant and unreasonable reduction of groundwater storage." The reduction in groundwater storage sustainability indicator is measured as the "total volume of groundwater that can be withdrawn from the basin without causing conditions that may lead to undesirable results" (GSP Emergency Regulations §354.28(c)(2)).

The HCM for the Mound Basin describes the principal aquifers (Mugu and Hueneme) as extensively deep and confined, except where the Hueneme unit outcrops in the higher elevations to the north (Section 3.1.4.1.3). The principal aquifers are also regional flow-through units, with groundwater underflow from the upgradient Santa Paula Basin contributing to rebound from declines in storage associated with drier periods (Figure 3.3-03). In addition, historical low groundwater levels are consistently well above the top of the principal aquifer units (Figures 3.1-05 – 3.1-07). Storage is not directly measured for the Basin; therefore there are no storage targets or goals associated with groundwater use. These combinations of factors indicate that groundwater storage is not a directly relevant sustainability indicator for the Basin. Regardless, the potential impacts of the reduction of groundwater storage are evaluated under the guidelines of the GSP Emergency Regulations to maintain compliance.

In many basins, including the Mound Basin, the effects of decreasing groundwater storage would manifest as effects for other sustainability indicators; the reduction of groundwater storage is associated with chronic lowering of groundwater levels and subsidence. For example, a key concern for the Mound Basin would be a reduction in groundwater storage that causes groundwater levels to decline to a point that undesirable results for the land subsidence sustainability indicator occur.

Based on the foregoing, the qualitative description of undesirable results is reduction of groundwater storage that will likely cause other sustainability indicators to have undesirable results.

Evaluation of Potential Effects on Beneficial Uses and Users, Land Uses, and Property Interests [§354.26(b)(3)]

The evaluation of potential effects on beneficial uses and users, land uses, and property interests for the reduction of groundwater storage sustainability indicator is the same as for the other sustainability indicators and is incorporated herein by reference to Sections 4.4.2.4, 4.6.2.4, and 4.7.2.4.

Reduction of groundwater storage has the potential to impact the beneficial uses and users of groundwater in the Mound Basin by limiting the volume of groundwater available that can be economically extracted for agricultural, municipal, and industrial use. These impacts can affect all users of groundwater in the Mound Basin. Groundwater elevations are used to determine whether significant and unreasonable reduction of groundwater in storage is occurring.

Cause of Groundwater Conditions That Could Lead to Undesirable Results [§354.26(b)(1)]

The cause of groundwater conditions that could lead to undesirable results would be reduction of groundwater storage that subsequently causes undesirable results for the other sustainability indicators.

The following factors could result in groundwater storage reductions that could lead to undesirable results for the other sustainability indicators:

1. Mound Basin groundwater extractions rates that significantly exceed those assumed for the projected water budget analysis.
2. Droughts that exceed the duration and severity of droughts included in the hydrologic period used for the projected water budget analysis.
3. If Oxnard Basin does not meet the sustainability goal in its GSP, which would impact underflow between the basins to the detriment of the Mound Basin.
4. Increased groundwater extraction in the adjacent Oxnard Basin near the boundary with the Mound Basin, which would impact underflow between the basins to the detriment of the Mound Basin.
5. Increased groundwater extraction in the adjacent Santa Paula Basin near the boundary with the Mound Basin, which would impact underflow between the basins to the detriment of the Mound Basin.
6. Combinations of items 1 through 5.

DRAFT

Criteria Used to Define Undesirable Results [§354.26(b)(2)]

Because there is a single minimum threshold that applies to the entire Basin, the criteria used to define undesirable results for the reduction of groundwater storage sustainability indicator is the exceedance of the minimum threshold. If the reduction of groundwater storage minimum threshold is exceeded, MBGSA will assess the other sustainability indicators to determine if undesirable results are occurring or are likely to occur.

4.5.2 Minimum Thresholds [§354.28]

The minimum threshold for the reduction of groundwater storage sustainability indicator is the estimated sustainable yield of 8,200 AF/yr of the Basin calculated over a long-term, balanced hydrologic period. Because the minimum threshold applies over an averaging period, groundwater extractions exceeding the minimum threshold in any given year will not automatically be considered to indicate undesirable results are occurring in the Basin (please see Section 4.5.1).

4.5.2.1 Information and Criteria to Define Minimum Thresholds [§354.28(a),(b)(1),(c)(2), and (e)]

§354.28 Minimum Thresholds.

(a) *Each Agency in its Plan shall establish minimum thresholds that quantify groundwater conditions for each applicable sustainability indicator at each monitoring site or representative monitoring site established pursuant to Section 354.36. The numeric value used to define minimum thresholds shall represent a point in the basin that, if exceeded, may cause undesirable results as described in Section 354.26.*

(b) *The description of minimum thresholds shall include the following:*

(1) *The information and criteria relied upon to establish and justify the minimum thresholds for each sustainability indicator. The justification for the minimum threshold shall be supported by information provided in the basin setting, and other data or models as appropriate, and qualified by the uncertainty in the understanding of the basin setting.*

(c) *Minimum thresholds for each sustainability indicator shall be defined as follows:*

(2) *Reduction of Groundwater Storage. The minimum threshold for reduction of groundwater storage shall be a total volume of groundwater that can be withdrawn from the basin without causing conditions that my lead to undesirable results. Minimum thresholds for reduction of groundwater storage shall be supported by the sustainable yield of the basin, calculated based on historical trends, water year type, and projected water use in the basin.*

(e) *An Agency that has demonstrated that undesirable results related to one or more sustainability indicators are not present and are not likely to occur in a basin, as described in Section 354.26, shall not be required to establish minimum thresholds related to those sustainability indicators.*

Groundwater storage cannot be directly measured; rather it can only be estimated using measured or modeled groundwater levels and knowledge of basin geometry and subsurface hydraulic properties, and there is a calibrated numerical model that is used to relate groundwater levels to storage (United, 2021c). Groundwater extraction values from the Basin's principal aquifers are a more direct and reliable measure as compared to estimated storage changes. For these reasons, groundwater extraction rates will be used for the reduction of groundwater storage sustainability indicator. The information used to define the minimum threshold (sustainable yield) is the water budgets presented in Section 3.3, which are based on the numerical modeling performed for GSP development.

4.5.2.1.1 Evaluation of Representative Minimum Thresholds [§354.28(d)]

§354.28 Minimum Thresholds.
(d) *An Agency may establish a representative minimum threshold for groundwater elevation to serve as the value for multiple sustainability indicators, where the Agency can demonstrate that the representative value is a reasonable proxy for multiple individual minimum thresholds as supported by adequate evidence.*

This requirement is not applicable to the reduction of groundwater storage sustainability indicator.

4.5.2.2 Relationships Between Minimum Thresholds and Sustainability Indicators [§354.28(b)(2)]

§354.28 Minimum Thresholds.
(b) *The description of minimum thresholds shall include the following:*
(2) *The relationship between the minimum thresholds for each sustainability indicator, including an explanation of how the Agency has determined that basin conditions at each minimum threshold will avoid undesirable results for each of the sustainability indicators.*

The relationships between the minimum thresholds for the reduction of groundwater storage sustainability indicator and other sustainability indicators are as follows:

- **Chronic Lowering of Groundwater Levels**: Extraction rates directly influence groundwater levels within the principal aquifers, so there is a direct relationship between the reduction of groundwater storage and the chronic lowering of groundwater levels minimum thresholds. Maintaining the long-term average groundwater extraction rates to below the sustainable yield is expected to minimize minimum threshold exceedances for the chronic lowering of groundwater levels sustainability indicator.
- **Land Subsidence:** A lowering of groundwater levels below the historical low levels could cause land subsidence in the Basin. Because extraction rates directly influence groundwater levels within the principal aquifers, the groundwater storage minimum threshold has a direct relationship to land subsidence if groundwater levels fall below the historical low. Maintaining the long-term average groundwater extraction rates to below the sustainable yield should minimize minimum threshold exceedances for the land subsidence sustainability indicator.
- **Seawater Intrusion**: Numerical modeling results suggest that seawater intrusion is not anticipated during the 50-year SGMA planning and implementation period (Section 4.6). In addition, the Mugu and Hueneme aquifers crop out on the continental shelf approximately 10 miles offshore without any submarine canyons (Figure 3.1-10), greatly reducing the likelihood that seawater can find a near-shore path for intrusion. Several investigations have concluded that seawater intrusion is not occurring for Mound Basin. Therefore, the relationship between reduction of groundwater storage minimum thresholds and the seawater intrusion sustainability indicator is not significant. Nevertheless, maintaining the long-term average groundwater extraction rates to below the sustainable yield should further minimize any potential for seawater intrusion.
- **Degraded Water Quality**: A lowering of groundwater levels below the historical low levels could cause degradation of water quality in the principal aquifers. Maintaining the long-term average

groundwater extraction rates to below the sustainable yield will help prevent degradation of water quality associated with groundwater extraction.

- **Depletion of Interconnected Surface Water**: This sustainability indicator is not applicable to the Mound Basin.

4.5.2.3 Minimum Thresholds in Relation to Adjacent Basins [§354.28(b)(3)]

§354.28 Minimum Thresholds.
(b) *The description of minimum thresholds shall include the following:*
(3) *How minimum thresholds have been selected to avoid causing undesirable results in adjacent basins or affecting the ability of adjacent basins to achieve sustainability goals.*

The minimum threshold for the reduction of groundwater storage sustainability indicator will ensure groundwater storage does not decrease over long-term, average hydrologic conditions. This is considered protective of both the Mound Basin and the adjacent Oxnard Basin. If storage was allowed to decline over a long-term period of average hydrologic conditions, deeper groundwater levels would result, which could potentially increase underflow into the Mound Basin from the Oxnard and/or Santa Paula basins (or decrease underflow to the Oxnard Basin), which could potentially contribute to undesirable results in those basins. Underflow between the basins will be estimated during Plan implementation using groundwater level data near the basin boundary and numerical modeling to evaluate whether the minimum thresholds are unduly impacting sustainable management of the Oxnard Basin.

4.5.2.4 Impact of Minimum Thresholds on Beneficial Uses and Users [§354.28(b)(4)]

§354.28 Minimum Thresholds.
(b) *The description of minimum thresholds shall include the following:*
(4) *How minimum thresholds may affect the interests of beneficial uses and users of groundwater or land uses and property interests.*

The effects on beneficial users and land uses in the Basin are the same as analyzed for the other sustainability indicators and are incorporated herein by reference.

4.5.2.5 Current Standards Relevant to Sustainability Indicator [§354.28(b)(5)]

§354.28 Minimum Thresholds.
(b) *The description of minimum thresholds shall include the following:*
(5) *How state, federal, or local standards relate to the relevant sustainability indicator. If the minimum threshold differs from other regulatory standards, the Agency shall explain the nature of and basis for the difference.*

MBGSA is unaware of any federal, state, or local standards for reduction of groundwater storage.

4.5.2.6 Measurement of Minimum Thresholds [§354.28(b)(6)]

§354.28 Minimum Thresholds.
(b) *The description of minimum thresholds shall include the following:*
(6) *How each minimum threshold will be quantitatively measured, consistent with the monitoring network requirements described in Subarticle 4.*

Groundwater extractions will be directly measured and recorded to determine their relation to minimum thresholds. Extraction rate monitoring will be conducted in accordance with the monitoring plan outlined in Section 5.

4.5.3 Measurable Objectives and Interim Milestones [§354.30(a),(b),(c),(d),(e),(g)]

§354.30 Measurable Objectives.
(a) *Each Agency shall establish measurable objectives, including interim milestones in increments of five years, to achieve the sustainability goal for the basin within 20 years of Plan implementation and to continue to sustainably manage the groundwater basin over the planning and implementation horizon.*
(b) *Measurable objectives shall be established for each sustainability indicator, based on quantitative values using the same metrics and monitoring sites as are used to define the minimum thresholds.*
(c) *Measurable objectives shall provide a reasonable margin of operational flexibility under adverse conditions which shall take into consideration components such as historical water budgets, seasonal and long-term trends, and periods of drought, and be commensurate with levels of uncertainty.*
(d) *An Agency may establish a representative measurable objective for groundwater elevation to serve as the value for multiple sustainability indicators where the Agency can demonstrate that the representative value is a reasonable proxy for multiple individual measurable objectives as supported by adequate evidence.*
(e) *Each Plan shall describe a reasonable path to achieve the sustainability goal for the basin within 20 years of Plan implementation, including a description of interim milestones for each relevant sustainability indicator, using the same metric as the measurable objective, in increments of five years. The description shall explain how the Plan is likely to maintain sustainable groundwater management over the planning and implementation horizon.*
(g) *An Agency may establish measurable objectives that exceed the reasonable margin of operational flexibility for the purpose of improving overall conditions in the basin, but failure to achieve those objectives shall not be grounds for a finding of inadequacy of the Plan.*

4.5.3.1 Description of Measurable Objectives

The reduction of groundwater storage measurable objective is 90% of the sustainable yield (i.e., 7,400 AF/yr), based on professional judgement and to account for uncertainty in the sustainable yield estimate. Like the minimum threshold, the measurable objective applies over a long-term period of average hydrology. It is anticipated that the measurable objective will be met in wet periods, but not met in drier than average periods and perhaps some average years. Failure to meet the measurable objective during average to dry years shall not be considered failure to sustainably manage the Basin. The measurable objective will be tracked over time and updated based on measured and recorded extraction rates for the Basin.

4.5.3.2 Interim Milestones [§354.30(e)]

§354.30 Measurable Objective.
(e) *Each Plan shall describe a reasonable path to achieve the sustainability goal for the basin with 20 years of Plan implementation, including a description of interim milestones for each relevant sustainability indicator, using the same metric as the measurable objective, in increments of five years. The description shall explain how the Plan is likely to maintain sustainable groundwater management over the planning and implementation horizon.*

Interim milestones were developed to illustrate a reasonable path to achieve the sustainability goal for the Basin within 20 years of Plan implementation. Development of interim milestones is significantly complicated by the fact that the hydrologic conditions for the next 20 years cannot be predicted. The historical and current average groundwater extractions are lower than the minimum threshold value (7,391 and 7,288 AF/yr compared to 8,200 AF/yr). The historical and current average groundwater extractions are also less than the measurable objective (7,400 AF/yr), so the interim milestones are set to be equal to the measurable objective. Numerical modeling results suggest that sustainability will be maintained during the remainder of the 50-year GSP planning and implementation horizon (Appendix I).

4.6 Seawater Intrusion

As described in Section 3.2.3 Seawater Intrusion, available data indicate that seawater has not been present in the onshore portions of the principal aquifers to date. Section 3.2.3 also explains that the Mound Basin principal aquifers may only be exposed to seawater where they crop out on the continental shelf edge, approximately 10 miles offshore, greatly reducing the likelihood that seawater can find a near-shore path for intrusion into the principal aquifers (Figure 3.1-10).

Additional numerical modeling analysis of seawater intrusion potential was conducted to support SMC development. Particle tracking was performed to estimate historical movement of seawater over the last approximate 100-year period to represent groundwater flow conditions since predevelopment. The calibrated MODFLOW model was coupled with MODPATH (Pollock, 2016) for this analysis. Particles were released at the offshore aquifer subcrop locations to simulate seawater movement in the principal aquifers over the 100-year period. The particle tracking results suggests that seawater has moved an average of approximately 0.5 miles from the offshore subcrop toward the shoreline in the Hueneme Aquifer during the past 100 years (Figure 4.6-01). The particle tracking results suggest no migration occurred in the Mugu Aquifer during the same period.

Particle tracking results demonstrate onshore migration of seawater did not occur under historical conditions and is not anticipated during the 50-year SGMA planning and implementation horizon. This is due to the large distance between the shoreline and the edge of the continental shelf where the aquifers are hydraulically connected to seawater. The travel time for seawater to reach the coast is estimated to be multiple centuries or more. This is in contrast with the adjacent Oxnard Plain Basin, where the aquifers are highly vulnerable to lateral seawater intrusion due to the existence of two deep submarine canyons at Port Hueneme and Point Mugu that expose the aquifers to seawater in the walls of the canyons at a very close distance to the shoreline. Although the numerical model results indicate onshore flow in the Hueneme Aquifer, it is believed this water will most likely continue to consist of fresh groundwater from the offshore portion of the aquifer.

DRAFT

While the above-described modeling results are encouraging, it is necessary to consider the possibility that a short-circuit pathway for seawater could exist nearshore (for example along the Oak Ridge Fault). A nearshore short-circuit pathway could allow seawater to enter the aquifer and potentially migrate onshore during the SGMA planning horizon. The impact of potential short-circuit pathways for seawater was evaluated with additional particle tracking simulations. The 50-year baseline numerical model simulation performed for the projected water budget was coupled with MODPATH for this analysis. Particles were released in each principal aquifer at the shoreline to simulate seawater migration from a hypothetical near-shore short-circuit pathway. This simulation provides information for the worst-case scenario of potential seawater intrusion, in the event that seawater is just offshore and migrates onshore due to inland hydraulic gradients. Particles traces were exported after 20 and 50 years of migration to provide results for the 20-year GSP implementation period and the full 50-year SGMA planning period (Figures 4.6-02 and 4.6-03). As shown in Figures 4.6-02 and 4.6-03, the particle traces indicate an approximate average of 500 and 800 ft of potential migration (under the worst-case scenario) over the 20-year implementation and 50-year planning periods, respectively. Even under the worst-case scenario the inland extent of seawater migration is approximately 1 mile from the nearest active production well. It is recognized that migration rates in the more permeable portions of the aquifers could be several times higher than the average rates simulated. Even so, the results of these simulations indicate that it is unlikely that beneficial users of groundwater would be impacted during the 50-year SGMA planning and implementation horizon (see active wells plotted on Figures 4.6-02 and 4.6-03) by onshore migration of seawater via potential short-circuit pathways located near the coast.

Despite the very encouraging model results for seawater intrusion, SMC are included in the GSP to protect current and future beneficial users and users and property interests against potential unexpected seawater intrusion.

4.6.1 Undesirable Results [§354.26]

§354.26 Undesirable Results.

(a) *Each Agency shall describe in its Plan the processes and criteria relied upon to define undesirable results applicable to the basin. Undesirable results occur when significant and unreasonable effects for any of the sustainability indicators are caused by groundwater conditions occurring throughout the basin.*

(b) *The description of undesirable results shall include the following:*

- ***(1)*** *The cause of groundwater conditions occurring throughout the basin that would lead to or has led to undesirable results based on information described in the basin setting, and other data or models as appropriate.*
- ***(2)*** *The criteria used to define when and where the effects of the groundwater conditions cause undesirable results for each applicable sustainability indicator. The criteria shall be based on a quantitative description of the combination of minimum threshold exceedances that cause significant and unreasonable effects in the basin.*
- ***(3)*** *Potential effects on the beneficial uses and users of groundwater, on land uses and property interests, and other potential effects that may occur or are occurring from undesirable results.*

(c) *The Agency may need to evaluate multiple minimum thresholds to determine whether an undesirable result is occurring in the basin. The determination that undesirable results are occurring may depend upon measurements from multiple monitoring sites, rather than a single monitoring site.*

(d) *An Agency that is able to demonstrate that undesirable results related to one or more sustainability indicators are not present and are not likely to occur in a basin shall not be required to establish criteria for undesirable results related to those sustainability indicators.*

DRAFT

Process and Criteria for Defining Undesirable Results [§354.26(a)]

The overall process relied upon to define undesirable results for this GSP is described in Section 4.3. The specific process and criteria for defining undesirable results applied to the seawater intrusion sustainability indicator are described below.

Evaluation of Potential Effects on Beneficial Uses and Users, Land Uses, and Property Interests [§354.26(b)(3)]

The process for defining undesirable results for seawater intrusion began with considering the potential effects on beneficial uses and users of groundwater, land uses, and property interests.

The potential effect on beneficial uses and users of groundwater would be that seawater intrusion would render groundwater unusable for beneficial use. Current and future anticipated beneficial uses of groundwater lie east of Harbor Boulevard. Based on land use designations, there are no current or future anticipated beneficial uses of groundwater in the Coastal Area located west of Harbor Boulevard (Figure 2.1-03).

Given that the beneficial uses immediately east of Harbor Boulevard are agricultural, the potential effect of seawater intrusion on land uses and property interests would be the economic impacts of decreased agricultural activity and decreased property values resulting from the inability to produce water for agricultural activities. As discussed in Section 2.2.3.1, agricultural land and open space in the Basin lies is subject to the City of Ventura and County of Ventura SOAR voter initiatives currently approved through 2050 (SOAR, 2015). The SOAR initiatives require a majority vote of the people to rezone unincorporated open space, agricultural or rural land for development. The existence of the SOAR makes it very unlikely that agricultural land could be developed. Therefore, it is important to ensure that agricultural beneficial uses of groundwater are protected by the minimum thresholds because there is no practical alternative land use for most agricultural land in the Basin.

Based on the foregoing, the qualitative description of undesirable results is seawater intrusion extending east of Harbor Boulevard into areas with current or anticipated future beneficial uses.

Cause of Groundwater Conditions That Could Lead to Undesirable Results [§354.26(b)(1)]

As discussed in Section 4.6, undesirable results for seawater intrusion are not anticipated during the 50-year SGMA planning and implementation period even if a near-shore short-circuit pathway for seawater intrusion exists.

The following combination of factors would be required for seawater intrusion to cause undesirable results during the 50-year SGMA planning and implementation period:

1. A near-shore short-circuit pathway for seawater to enter the principal aquifers would need to exist;
2. Onshore groundwater flow rates would need to be significantly greater than simulated (note the model suggest there is offshore flow in the Mugu Aquifer). This could potentially occur in the highest permeability zones of the aquifer, particularly if the onshore

groundwater flow gradient increases above that observed historically. The groundwater flow gradient could increase as a result of the following:

a. Mound Basin groundwater extractions rates that significantly exceed those assumed for the projected water budget analysis.

b. Droughts that exceed the duration and severity of droughts included in the hydrologic period used for the projected water budget analysis.

c. If Oxnard Basin does not meet the sustainability goal in its GSP, which would impact underflow between the basins to the detriment of the Mound Basin.

d. Increased groundwater extraction in the adjacent Oxnard Basin near the boundary with the Mound Basin, which would impact underflow between the basins to the detriment of the Mound Basin.

e. Increased groundwater extraction in the adjacent Santa Paula Basin near the boundary with the Mound Basin, which would impact underflow between the basins to the detriment of the Mound Basin.

f. Combinations of items a through e.

Criteria Used to Define Undesirable Results [§354.26(b)(2)]

The criteria used to define when and where the effects of the groundwater conditions cause undesirable results is based on the qualitative description of undesirable result, which is seawater intrusion extending east of Harbor Boulevard into areas with current or anticipated future beneficial uses. Preventing undesirable results for seawater intrusion means that the chloride concentrations should be maintained below concentration indicative of seawater intrusion impacts at monitoring sites along Harbor Boulevard. Therefore, the combination of minimum threshold exceedances that is deemed to cause significant and unreasonable effects would be an isocontour line that exceeds the minimum threshold at or east of Harbor Boulevard (Table 4.1-01).

DRAFT

4.6.2 Minimum Thresholds [§354.28]

4.6.2.1 Information and Criteria to Define Minimum Thresholds [§354.28(a), (b)(1),(c)(3)(A),(c)(3)(B), and (e)]

§354.28 Minimum Thresholds.

(a) *Each Agency in its Plan shall establish minimum thresholds that quantify groundwater conditions for each applicable sustainability indicator at each monitoring site or representative monitoring site established pursuant to Section 354.36. The numeric value used to define minimum thresholds shall represent a point in the basin that, if exceeded, may cause undesirable results as described in Section 354.26.*

(b) *The description of minimum thresholds shall include the following:*

(1) *The information and criteria relied upon to establish and justify the minimum thresholds for each sustainability indicator. The justification for the minimum threshold shall be supported by information provided in the basin setting, and other data or models as appropriate, and qualified by the uncertainty in the understanding of the basin setting.*

(c) *Minimum thresholds for each sustainability indicator shall be defined as follows:*

(3) *Seawater Intrusion. The minimum threshold for seawater intrusion shall be defined by a chloride concentration isocontour for each principal aquifer where seawater intrusion may lead to undesirable results. Minimum thresholds for seawater intrusion shall be supported by the following:*

(A) *Maps and cross-sections of the chloride concentration isocontour that defines the minimum threshold and measurable objective for each principal aquifer.*

(B) *A description of how the seawater intrusion minimum threshold considers the effects of current and projected sea levels.*

(e) *An Agency that has demonstrated that undesirable results related to one or more sustainability indicators are not present and are not likely to occur in a basin, as described in Section 354.26, shall not be required to establish minimum thresholds related to those sustainability indicators.*

Contrary to the general rule for setting minimum thresholds for other sustainability indicators, seawater intrusion minimum thresholds do not have to be set at individual monitoring sites. Rather, the minimum threshold is set along an isocontour (GSP Emergency Regulations §354.28(c)(3). However, for practical purposes of monitoring the isocontour, minimum thresholds are set at the monitoring and production wells used to define the isocontour.

Information used for establishing the chloride isocontour seawater intrusion minimum thresholds and measurable objectives include:

- Description of undesirable results (Section 4.6.1);
- Depths, locations, and logged lithology of existing wells used to monitor groundwater quality;
- Historical and current chloride concentrations in monitoring and production wells near the coast; and
- Minimum thresholds for chloride for the degraded water quality sustainability indictor.

Based on analysis of the above-listed factors, the seawater intrusion minimum threshold was established as a 150 mg/L chloride concentration isocontour along Harbor Boulevard. The minimum threshold is the same for both principal aquifers.

Figures 4.6-04 and 4.6-05 show the minimum threshold isocontour in map view and cross-section view for both principal aquifers, as required by GSP Emergency Regulations §354.28(c)(3)(A). Table 4.1-03 summarizes the seawater intrusion minimum threshold and measurable objective for the Mugu and Hueneme aquifers for the planned monitoring wells discussed in Section 4.6.2.6 below.

GSP Emergency Regulations §354.28(c)(3)(B) requires a description of how the seawater intrusion minimum threshold considers the effects of current and projected sea levels. As described in Section 3.3, modeling for the 50-year projected water budget includes scenarios the considered 2030 and 2070 climate change conditions. The future baseline scenario assumed no sea level rise, the 2030 climate change scenario assumed 15 centimeters (6 inches) of sea level rise, and the 2070 climate change scenario assumed 45 centimeters (18 inches) of sea level rise, consistent with DWR (2018) guidance. The projected sea level rise amounts were incorporated into the general head boundary used to simulate the offshore seawater interface with the aquifer. The results of the 2030 and 2070 climate change model simulations are not significantly different from the baseline (no climate change) model simulation (Appendix I).

4.6.2.1.1 Evaluation of Representative Minimum Thresholds [§354.28(d)]

§354.28 Minimum Thresholds.
(d) *An Agency may establish a representative minimum threshold for groundwater elevation to serve as the value for multiple sustainability indicators, where the Agency can demonstrate that the representative value is a reasonable proxy for multiple individual minimum thresholds as supported by adequate evidence.*

This requirement is not applicable to the seawater intrusion sustainability indicator because groundwater levels are not used as proxy.

4.6.2.2 Relationships Between Minimum Thresholds and Sustainability Indicators [§354.28(b)(2)]

§354.28 Minimum Thresholds.
(b) *The description of minimum thresholds shall include the following:*
(2) *The relationship between the minimum thresholds for each sustainability indicator, including an explanation of how the Agency has determined that basin conditions at each minimum threshold will avoid undesirable results for each of the sustainability indicators.*

The relationships between the minimum thresholds for the sweater intrusion sustainability indicator and other sustainability indicators are as follows:

- **Chronic Lowering of Groundwater Levels**: Numerical modeling results suggest that seawater intrusion is not anticipated during the SGMA planning and implementation periods. Therefore, the relationship between the seawater intrusion and chronic lowering of groundwater levels sustainability indicator is not significant. However, it is noted that maintaining groundwater levels above historical low levels will help limit inland gradients in the Hueneme Aquifer that could eventually lead to onshore migration of seawater in the future (beyond the 50-year SGMA planning and implementation period).
- **Reduction of Groundwater Storage:** Numerical modeling results suggest that seawater intrusion is not anticipated during the SGMA planning and implementation periods. Therefore, the relationship between the seawater intrusion and reduction of groundwater storage

sustainability indicator is not significant. However, it is noted that maintaining groundwater extraction totals will help limit the onshore movement of fresh groundwater in the Hueneme Aquifer that could eventually lead to onshore migration of seawater.

- **Land Subsidence**: Numerical modeling results suggest that seawater intrusion is not anticipated during the SGMA planning and implementation periods. Therefore, the relationship between the land subsidence sustainability and seawater intrusion indicators is not significant. However, it is noted that maintaining groundwater levels above historical low levels for the land subsidence sustainability indicator in the western half of the Basin will help limit the onshore movement of fresh groundwater in the Hueneme Aquifer that could eventually lead to onshore migration of seawater.
- **Degraded Water Quality**: The minimum threshold for seawater intrusion is consistent with the chloride minimum threshold for the degraded water quality sustainability indicator.
- **Depletion of Interconnected Surface Water**: This sustainability indicator is not applicable to the Mound Basin.

4.6.2.3 Minimum Thresholds in Relation to Adjacent Basins [§354.28(b)(3)]

§354.28 Minimum Thresholds.
(b) *The description of minimum thresholds shall include the following:*
(3) *How minimum thresholds have been selected to avoid causing undesirable results in adjacent basins or affecting the ability of adjacent basins to achieve sustainability goals.*

The seawater intrusion minimum thresholds do not affect management of the adjacent Oxnard and Santa Paula basins.

4.6.2.4 Impact of Minimum Thresholds on Beneficial Uses and Users [§354.28(b)(4)]

§354.28 Minimum Thresholds.
(b) *The description of minimum thresholds shall include the following:*
(4) *How minimum thresholds may affect the interests of beneficial uses and users of groundwater or land uses and property interests.*

Seawater intrusion minimum thresholds affect beneficial users and land uses in the Basin in the following ways:

Groundwater Beneficial Users (All Types)

The minimum thresholds will prevent significant and unreasonable degradation of groundwater quality by seawater intrusion, thereby avoiding loss of groundwater supply. Numerical modeling results suggest that the minimum thresholds will be met without the need for extraction rate reductions or any projects or management actions. Therefore, the minimum thresholds are not anticipated to limit the beneficial use of groundwater.

Land Uses and Property Interests (All Types)

The minimum thresholds will prevent significant and unreasonable effects on land uses and property interests by preserving water supply for beneficial uses, thereby helping maintain property values. As discussed in Section 4.6.1, the existence of SOAR makes it very unlikely that agricultural land could be developed. Therefore, it is important to ensure that agricultural beneficial uses of groundwater are protected by the minimum thresholds because there is no practical alternative land use for most agricultural land in the Basin. Absent useable groundwater supplies, agricultural property values would likely be significantly impacted. The impact on property values for other land uses and property uses in the Basin is not applicable because M&I wells are located inland, away from area that could be impacted by seawater intrusion.

4.6.2.5 Current Standards Relevant to Sustainability Indicator [§354.28(b)(5)]

§354.28 Minimum Thresholds.
(b) *The description of minimum thresholds shall include the following:*
(5) *How state, federal, or local standards relate to the relevant sustainability indicator. If the minimum threshold differs from other regulatory standards, the Agency shall explain the nature of and basis for the difference.*

MBGSA is unaware of any federal, state, or local standards for seawater intrusion other than the WQOs included in the RWQCB-LA Basin Plan (RWQCB-LA, 2019). The minimum threshold for seawater intrusion is equal to the RWQCB Basin Plan WQO for chloride.

4.6.2.6 Measurement of Minimum Thresholds [§354.28(b)(6)]

§354.28 Minimum Thresholds.
(b) *The description of minimum thresholds shall include the following:*
(6) *How each minimum threshold will be quantitatively measured, consistent with the monitoring network requirements described in Subarticle 4.*

Chloride concentrations will be directly measured to determine their relation to the minimum threshold. Groundwater quality monitoring will be conducted in accordance with the monitoring plan outlined in Section 5.

A minimum of two monitoring sites are needed along Harbor Boulevard to monitor chloride concentrations relative to the minimum threshold chloride isocontour. As described in Section 5, two monitoring sites are planned to satisfy this requirement. In addition, a potential shoreline "early warning" well may eventually augment cluster well 02N23W15J0X. This well will be evaluated following the five-year GSP review. The shoreline wells will provide early detection of seawater intrusion, thereby providing time to react to any unexpected landward migration of seawater before the minimum thresholds are exceeded. Section 7 on Plan Implementation includes an implementation budget to install additional monitoring sites identified in Section 5.

4.6.3 Measurable Objectives and Interim Milestones [§354.30(a),(b),(c),(d),(e),(g)]

§354.30 Measurable Objectives.

(a) *Each Agency shall establish measurable objectives, including interim milestones in increments of five years, to achieve the sustainability goal for the basin within 20 years of Plan implementation and to continue to sustainably manage the groundwater basin over the planning and implementation horizon.*

(b) *Measurable objectives shall be established for each sustainability indicator, based on quantitative values using the same metrics and monitoring sites as are used to define the minimum thresholds.*

(c) *Measurable objectives shall provide a reasonable margin of operational flexibility under adverse conditions which shall take into consideration components such as historical water budgets, seasonal and long-term trends, and periods of drought, and be commensurate with levels of uncertainty.*

(d) *An Agency may establish a representative measurable objective for groundwater elevation to serve as the value for multiple sustainability indicators where the Agency can demonstrate that the representative value is a reasonable proxy for multiple individual measurable objectives as supported by adequate evidence.*

(e) *Each Plan shall describe a reasonable path to achieve the sustainability goal for the basin within 20 years of Plan implementation, including a description of interim milestones for each relevant sustainability indicator, using the same metric as the measurable objective, in increments of five years. The description shall explain how the Plan is likely to maintain sustainable groundwater management over the planning and implementation horizon.*

(g) *An Agency may establish measurable objectives that exceed the reasonable margin of operational flexibility for the purpose of improving overall conditions in the basin, but failure to achieve those objectives shall not be grounds for a finding of inadequacy of the Plan.*

The seawater intrusion sustainability indicator measurable objectives and interim milestones are based on the chloride measurable objectives and interim milestones developed for the degraded water quality sustainability indicator. As such, the measurable objective is a 75-mg/L chloride isocontour for the Mugu Aquifer and a 100-mg/L chloride isocontour for the Hueneme Aquifer, both along Harbor Boulevard (Figures 4.6-04 and 4.6-05). Based on available water quality data, it is anticipated that the measurable objective will already be met. However, this cannot be confirmed until the planned monitoring wells are drilled and sampled. Therefore, interim milestones are assumed to be equal to the measurable objective, but this needs to be confirmed in the first GSP update.

Please see section 4.7.3 for more information concerning basis for the measurable objectives and interim milestones.

4.7 Degraded Water Quality

GSP Emergency Regulations 354.28(c)(4) requires GSAs to address migration of contaminant plumes that impair water supplies or other indicator of water quality as determined by the Agency that may lead to undesirable results. As discussed in Section 3.2.4, Groundwater Quality Impacts, there are no known contaminant plumes in the Basin. Potential impacts related to elevated concentrations of common ions and nitrate are there the focus for the degraded water quality sustainability indicator. It is noted that DWR has been consistent in its responses when asked about this sustainability indicator that GSAs are only responsible for managing water quality degradation that is caused by groundwater extraction or GSP projects or management actions. The SMC for the water quality degradation sustainability indicator were developed with this construct in mind.

As described in Section 3.1.4.3, Groundwater Quality, and Section 3.2.4, Groundwater Quality Impacts, the common ion chemistry of the groundwater in the Mugu and Hueneme principal aquifers is not ideal, but is beneficially used by municipal and agricultural users across the Basin. Common ions with RWQCB WQOs include sulfate, boron, and chloride. TDS also has a WQO. In general, TDS, sulfate, boron, and chloride concentrations are lower in the Mugu Aquifer and meet the WQOs with few exceptions. In general, TDS, sulfate, boron, and chloride concentrations are higher in the Hueneme Aquifer and meet the WQOs at most of the locations. The dissolved constituents are derived from natural sources, and groundwater extraction does not appear to be correlated with common ion chemistry concentrations.

It is noted that the City of Ventura has experienced elevated TDS and sulfate concentrations relative to secondary MCLs and detectable nitrate in extracted water from its wells. Based on comparison with monitoring data from other wells in the Basin, the elevated concentrations of sulfate and TDS in the City's wells appear to be related to well seal or casing integrity issues that facilitate intrusion of very poor-quality water from the shallow groundwater system into the well. This is considered a well construction/condition issue and not an indicator of regional degradation of water quality in the principal aquifer that can or should be managed by the GSA. This same pattern is also observed in some agricultural wells.

Nitrate can impact drinking water beneficial uses. The nitrate MCL is 45 mg/L (as NO_3; equivalent to 10 mg/L as N). Nitrate concentrations in excess of the drinking water MCL have been detected in groundwater samples from three agricultural wells that are screened in principal aquifers in Mound Basin (Mugu and Hueneme aquifers). Nitrate is also detected frequently in one of the two City of Ventura wells at concentrations above background but below the MCL. The other City of Ventura well has periodic low-level detections of nitrate. All of these wells exhibit anomalously high concentrations of TDS, sulfate, and chloride, suggesting influence of shallow groundwater through a possibly compromised well seal or well casing rather than presence of nitrate "plumes" in the Mugu and Hueneme aquifers in Mound Basin. It is further noted that other wells in the Basin do not exhibit elevated nitrate concentrations, further reinforcing the conclusion that nitrate is not a widespread issue in the Mound Basin principal aquifers.

In summary, groundwater quality in the Mound Basin is marginal due to natural geochemical processes, and groundwater extraction does not appear to exacerbate these natural processes. Occurrences of elevated sulfate, TDS, and nitrate concentrations appear to be related to well construction/condition issues that facilitate intrusion of very poor-quality water from the shallow groundwater system into these wells, as opposed to being an indicator of regional water quality degradation in the principal aquifers. In conclusion, it does not appear that significant or unreasonable groundwater quality degradation has occurred in the Mound Basin. However, it is recognized that potential future increases in Mugu Aquifer groundwater extraction could induce downward movement of very poor-quality water from the shallow groundwater system into the Mugu Aquifer, which could potentially lead to undesirable results. Additionally, improperly constructed wells that remain in use and abandoned wells that have not been properly destroyed (backfilled) can provide conduits for downward movement of very poor-quality water from the shallow groundwater system into the Mugu and/or Hueneme aquifers. Therefore, MBGSA must establish water quality sustainability criteria and monitor groundwater quality relative to those criteria.

DRAFT

4.7.1 Undesirable Results [§354.26]

§354.26 Undesirable Results.

(a) *Each Agency shall describe in its Plan the processes and criteria relied upon to define undesirable results applicable to the basin. Undesirable results occur when significant and unreasonable effects for any of the sustainability indicators are caused by groundwater conditions occurring throughout the basin.*

(b) *The description of undesirable results shall include the following:*

- ***(1)*** *The cause of groundwater conditions occurring throughout the basin that would lead to or has led to undesirable results based on information described in the basin setting, and other data or models as appropriate.*
- ***(2)*** *The criteria used to define when and where the effects of the groundwater conditions cause undesirable results for each applicable sustainability indicator. The criteria shall be based on a quantitative description of the combination of minimum threshold exceedances that cause significant and unreasonable effects in the basin.*
- ***(3)*** *Potential effects on the beneficial uses and users of groundwater, on land uses and property interests, and other potential effects that may occur or are occurring from undesirable results.*

(c) *The Agency may need to evaluate multiple minimum thresholds to determine whether an undesirable result is occurring in the basin. The determination that undesirable results are occurring may depend upon measurements from multiple monitoring sites, rather than a single monitoring site.*

(d) *An Agency that is able to demonstrate that undesirable results related to one or more sustainability indicators are not present and are not likely to occur in a basin shall not be required to establish criteria for undesirable results related to those sustainability indicators.*

Process and Criteria for Defining Undesirable Results [§354.26(a)]

The overall process relied upon to define undesirable results for this GSP is described in Section 4.3. The specific process and criteria for defining undesirable results applied to the degraded water quality sustainability indicator are described below.

Evaluation of Potential Effects on Beneficial Uses and Users, Land Uses, and Property Interests [§354.26(b)(3)]

The process for defining undesirable results for degraded water quality began with considering the potential effects on beneficial uses and users of groundwater, land uses, and property interests.

Potential effects on municipal beneficial uses would be increased costs for treatment or blending to meet drinking water standards. Potential effects on agricultural beneficial uses could include lower quality crops, increased water use to meet leaching requirements, and implementation of treatment or blending to reduce salinity. The potential effects on agricultural beneficial uses would result in increased costs and potential impacts on lease rates and land values.

The above-listed potential effects were analyzed by evaluating information about the following:

- Historical groundwater quality data;
- Relevant local, state, and federal water quality standards applicable to the Basin; and
- The 50-year projected water budget.

The analysis revealed that the common ion chemistry of the groundwater in the Mugu and Hueneme principal aquifers is not ideal but has been and continues to be beneficially used by municipal and agricultural users across the Basin. Based on the foregoing, the qualitative description of undesirable results is groundwater quality that exceed historical concentrations and significantly impacts beneficial uses.

Cause of Groundwater Conditions That Could Lead to Undesirable Results [§354.26(b)(1)]

Potential future increases in Mugu Aquifer extraction could potentially induce downward movement of very poor-quality water from the shallow groundwater system into the Mugu Aquifer, which could potentially lead to undesirable results. Additionally, improperly constructed wells that remain in use and abandoned wells that have not been properly destroyed (backfilled) can provide conduits for downward movement of very poor-quality water from the shallow groundwater system into the Mugu and/or Hueneme aquifers.

Criteria Used to Define Undesirable Results [§354.26(b)(2)]

The effects of groundwater conditions deemed to cause undesirable results is considered to occur when all representative monitoring wells in a principal aquifer exceed the minimum threshold concentration for a constituent for two consecutive years.

4.7.2 Minimum Thresholds [§354.28]

4.7.2.1 Information and Criteria to Define Minimum Thresholds [§354.28(a),(b)(1),(c)(4), and (e)]

§354.28 Minimum Thresholds.

(a) *Each Agency in its Plan shall establish minimum thresholds that quantify groundwater conditions for each applicable sustainability indicator at each monitoring site or representative monitoring site established pursuant to Section 354.36. The numeric value used to define minimum thresholds shall represent a point in the basin that, if exceeded, may cause undesirable results as described in Section 354.26.*

(b) *The description of minimum thresholds shall include the following:*

(1) *The information and criteria relied upon to establish and justify the minimum thresholds for each sustainability indicator. The justification for the minimum threshold shall be supported by information provided in the basin setting, and other data or models as appropriate, and qualified by the uncertainty in the understanding of the basin setting.*

(c) *Minimum thresholds for each sustainability indicator shall be defined as follows:*

(4) *Degraded Water Quality. The minimum threshold for degraded water quality shall be the degradation of water quality, including the migration of contaminant plumes that impair water supplies or other indicator of water quality as determined by the Agency that may lead to undesirable results. The minimum threshold shall be based on the number of supply wells, a volume of water, or a location of an isocontour that exceeds concentrations of constituents determined by the Agency to be of concern for the basin. In setting minimum thresholds for degraded water quality, the Agency shall consider local, state, and federal water quality standards applicable to the basin.*

(e) *An Agency that has demonstrated that undesirable results related to one or more sustainability indicators are not present and are not likely to occur in a basin, as described in Section 354.26, shall not be required to establish minimum thresholds related to those sustainability indicators.*

Minimum thresholds were developed to address the qualitative description of undesirable results provided in Section 4.7.1: "groundwater quality that exceed historical concentrations and significant impacts beneficial uses." The potential effects on beneficial uses and users were considered together with applicable local, state, and federal water quality standards applicable to the Basin.

These criteria were considered when developing the minimum thresholds:

- **Primary MCLs**: Applicable to nitrate only. It is desirable to maintain existing water quality at levels suitable potable water for human consumption for current and future beneficial uses. Widespread occurrence of nitrate in excess of the MCL is considered a significant and unreasonable effect.
- **Secondary MCLs**: Applicable to TDS, sulfate, and chloride. It is desirable to maintain water quality at levels acceptable to consumers. Widespread occurrence of TDS, sulfate, or chloride concentrations in excess of the short-term consumer acceptance level established by the DDW would be considered a significant and unreasonable effect.
- **RWQCB WQOs**: These standards are designed to protect beneficial uses and preserve existing water quality at the time of RWQCB Basin Plan (RWQCB-LA, 2019) development from degradation, consistent with the Porter-Cologne Act and SWRCB Antidegradation Policy (Resolution No. 68-16).
- **Agricultural Thresholds**: Certain crops grown in the Basin are sensitive to chloride and boron in irrigation water. The RWQCB WQOs were developed, in part to protect agricultural beneficial uses of water. Therefore, widespread chloride or boron concentrations in excess of WQOs for these constituents would be considered a significant and unreasonable effect.
- **Existing Water Quality**: Current groundwater quality is known to support beneficial uses in the Basin and there is an absence of significant and unreasonable effects due to water quality. Therefore, minimum thresholds should be set equal to or greater than existing water quality to recognize the absence of significant and unreasonable effects at present.
- **MBGSA's Ability to Improve Water Quality**: TDS, sulfate, chloride, and boron are naturally occurring constituents that are derived from groundwater interaction with subsurface sediments. The GSA has no feasible means of reducing the existing in situ concentrations of these constituents in the Basin. The GSA can take measures to minimize the downward migration of these constituents and nitrate from the shallow groundwater into the principal aquifers.

In general, the minimum thresholds were selected be consistent with the RWQCB WQOs. The one exception is TDS in the Hueneme Aquifer, which has historically exceeded the RWQCB WQO. The TDS minimum threshold was set higher than the RWQCB WQO based on the upper range of concentrations observed in representative monitoring wells during the previous 10 years. Setting the minimum threshold above the RWQCB WQO is not considered an issue because there are no direct potable uses of groundwater and the City of Ventura manages water quality through blending within its system. It is also noted that the minimum threshold is less than the short-term consumer acceptance level established by the DDW. The minimum thresholds and specific rationale for each water quality constituent minimum threshold are provided in Table 4.1-02. The minimum thresholds and measurable objectives with respect

DRAFT

to each aquifer are shown on Table 4.1-03. The minimum thresholds are also shown on the water quality plots provided in Appendix J.

4.7.2.1.1 Evaluation of Representative Minimum Thresholds [§354.28(d)]

§354.28 Minimum Thresholds.
(d) *An Agency may establish a representative minimum threshold for groundwater elevation to serve as the value for multiple sustainability indicators, where the Agency can demonstrate that the representative value is a reasonable proxy for multiple individual minimum thresholds as supported by adequate evidence.*

The requirement is not applicable to the degraded water quality sustainability indicator because groundwater elevations are not used as a proxy for the minimum thresholds.

4.7.2.2 Relationships Between Minimum Thresholds and Sustainability Indicators [§354.28(b)(2)]

§354.28 Minimum Thresholds.
(b) *The description of minimum thresholds shall include the following:*
(2) *The relationship between the minimum thresholds for each sustainability indicator, including an explanation of how the Agency has determined that basin conditions at each minimum threshold will avoid undesirable results for each of the sustainability indicators.*

The relationships between the minimum thresholds for the degraded water quality and other sustainability indicators are as follows:

- **Chronic Lowering of Groundwater Levels**: Managing groundwater levels above historical lows is expected to prevent water quality degradation associated with groundwater extraction because the Basin has not experienced degradation of water quality in the principal aquifers during periods of historical low groundwater elevations. Thus, the potential effect of the chronic lowering of groundwater levels minimum thresholds is prevention of degradation of water quality associated with groundwater extraction.
- **Reduction of Groundwater Storage**: A lowering of groundwater levels below the historical low levels could cause degradation of water quality in the principal aquifers. Maintaining the long-term average groundwater extraction rates below the sustainable yield will help prevent degradation of water quality associated with groundwater extraction.
- **Land Subsidence**: The land subsidence minimum thresholds are designed to minimize future potential inelastic land subsidence. Because poor-quality water is expelled from clays when inelastic subsidence occurs, minimizing inelastic land subsidence helps prevent significant and unreasonable effects for the degraded water quality sustainability indicator.
- **Seawater Intrusion**: The seawater intrusion minimum threshold is consistent with the degraded water quality minimum threshold for chloride.
- **Depletion of Interconnected Surface Water**: This sustainability indicator is not applicable to the Mound Basin.

4.7.2.3 Minimum Thresholds in Relation to Adjacent Basins [§354.28(b)(3)]

§354.28 Minimum Thresholds.
(b) *The description of minimum thresholds shall include the following:*
(3) *How minimum thresholds have been selected to avoid causing undesirable results in adjacent basins or affecting the ability of adjacent basins to achieve sustainability goals.*

The degraded water quality minimum thresholds help protect that quality of groundwater that underflows into the adjacent Oxnard Basin.

4.7.2.4 Impact of Minimum Thresholds on Beneficial Uses and Users [§354.28(b)(4)]

§354.28 Minimum Thresholds.
(b) *The description of minimum thresholds shall include the following:*
(4) *How minimum thresholds may affect the interests of beneficial uses and users of groundwater or land uses and property interests.*

Groundwater Beneficial Users (All Types)

The minimum thresholds will prevent significant and unreasonable degradation of groundwater quality that would limit the beneficial use of groundwater. Potential effects on municipal beneficial uses would be increased costs for treatment or blending to meet drinking water standards. Potential effects on agricultural beneficial uses could include lower quality crops, increased water use to meet leaching requirements, and implementation of treatment or blending to reduce salinity. The potential effects on agricultural beneficial uses would result in increased costs and potential impacts on lease rates and land values.

Land Uses and Property Interests (All Types)

The minimum thresholds will prevent significant and unreasonable effects on land uses and property interests by preserving water supply for beneficial uses, thereby helping maintain property values. As discussed in Section 2.2.3.1, agricultural land and open space in the Basin lies is subject to the City of Ventura and County of Ventura SOAR voter initiatives currently approved through 2050 (SOAR, 2015). The SOAR initiatives require a majority vote of the people to rezone unincorporated open space, agricultural or rural land for development. The existence of the SOAR makes it very unlikely that agricultural land could be developed. Therefore, it is important to ensure that agricultural beneficial uses of groundwater are protected by the minimum thresholds because there is no practical alternative land use for most agricultural land in the Basin. Absent useable groundwater supplies, agricultural property values would likely be significantly impacted. The impact on property values for other land uses and property uses in the Basin is less directly tied to Mound Basin groundwater because the City of Ventura (water supplier for majority of the non-agricultural areas of the Basin) has a diverse water supply portfolio that includes multiple supplies derived from sources located outside of the Basin.

DRAFT

4.7.2.5 Current Standards Relevant to Sustainability Indicator [§354.28(b)(5)]

§354.28 Minimum Thresholds.
(b) *The description of minimum thresholds shall include the following:*
(5) *How state, federal, or local standards relate to the relevant sustainability indicator. If the minimum threshold differs from other regulatory standards, the Agency shall explain the nature of and basis for the difference.*

The state, federal, and local standards applicable to the degraded water quality sustainability indicator are discussed in Section 4.7.2.1.

4.7.2.6 Measurement of Minimum Thresholds [§354.28(b)(6)]

§354.28 Minimum Thresholds.
(b) *The description of minimum thresholds shall include the following:*
(6) *How each minimum threshold will be quantitatively measured, consistent with the monitoring network requirements described in Subarticle 4.*

Groundwater quality will be directly measured to determine where dissolved constituent concentrations are in relation to minimum thresholds. Groundwater quality monitoring will be conducted in accordance with the monitoring plan outlined in Section 5.

4.7.3 Measurable Objectives and Interim Milestones [§354.30(a),(b),(c),(d),(e),(g)]

§354.30 Measurable Objectives.
(a) *Each Agency shall establish measurable objectives, including interim milestones in increments of five years, to achieve the sustainability goal for the basin within 20 years of Plan implementation and to continue to sustainably manage the groundwater basin over the planning and implementation horizon.*
(b) *Measurable objectives shall be established for each sustainability indicator, based on quantitative values using the same metrics and monitoring sites as are used to define the minimum thresholds.*
(c) *Measurable objectives shall provide a reasonable margin of operational flexibility under adverse conditions which shall take into consideration components such as historical water budgets, seasonal and long-term trends, and periods of drought, and be commensurate with levels of uncertainty.*
(d) *An Agency may establish a representative measurable objective for groundwater elevation to serve as the value for multiple sustainability indicators where the Agency can demonstrate that the representative value is a reasonable proxy for multiple individual measurable objectives as supported by adequate evidence.*
(e) *Each Plan shall describe a reasonable path to achieve the sustainability goal for the basin within 20 years of Plan implementation, including a description of interim milestones for each relevant sustainability indicator, using the same metric as the measurable objective, in increments of five years. The description shall explain how the Plan is likely to maintain sustainable groundwater management over the planning and implementation horizon.*
(g) *An Agency may establish measurable objectives that exceed the reasonable margin of operational flexibility for the purpose of improving overall conditions in the basin, but failure to achieve those objectives shall not be grounds for a finding of inadequacy of the Plan.*

The measurable objectives were developed using the same information and criteria used to develop the minimum thresholds, which are described in Section 4.7.2.1. In general, the measurable objectives were selected to preserve existing water quality for beneficial uses in the Basin. The measurable objectives and

specific rationale for each water quality constituent measurable objective are provided in Table 4.1-02. The measurable objectives provide a reasonable range of operational flexibility above the minimum thresholds and historical concentrations observed in the Basin, as shown in the water quality plots provided in (Appendix J).

4.7.3.1 Interim Milestones [§354.30(e)]

§354.30 Measurable Objective.
(e) *Each Plan shall describe a reasonable path to achieve the sustainability goal for the basin with 20 years of Plan implementation, including a description of interim milestones for each relevant sustainability indicator, using the same metric as the measurable objective, in increments of five years. The description shall explain how the Plan is likely to maintain sustainable groundwater management over the planning and implementation horizon.*

Based on available water quality data, the measurable objectives are already being met. Therefore, interim milestones are equal to the measurable objective.

4.8 Land Subsidence

As described in Section 3.2.5 Land Subsidence, no land subsidence due to groundwater extraction has been documented historically in the Mound Basin. Section 3.2.5 also explains that the Mound Basin is considered to have a low estimated potential for inelastic land subsidence. Numerical modeling for the water budget suggests that future groundwater levels will remain above historical low levels, which would prevent inelastic subsidence due to groundwater extraction (Appendix I). Despite these factors, sustainable management is prudent because groundwater levels could decline below historical levels and trigger inelastic land subsidence if actual future conditions differ significantly from those assumed in the projected water budget analysis.

DRAFT

4.8.1 Undesirable Results [§354.26]

§354.26 Undesirable Results.

(a) *Each Agency shall describe in its Plan the processes and criteria relied upon to define undesirable results applicable to the basin. Undesirable results occur when significant and unreasonable effects for any of the sustainability indicators are caused by groundwater conditions occurring throughout the basin.*

(b) *The description of undesirable results shall include the following:*

- ***(1)*** *The cause of groundwater conditions occurring throughout the basin that would lead to or has led to undesirable results based on information described in the basin setting, and other data or models as appropriate.*
- ***(2)*** *The criteria used to define when and where the effects of the groundwater conditions cause undesirable results for each applicable sustainability indicator. The criteria shall be based on a quantitative description of the combination of minimum threshold exceedances that cause significant and unreasonable effects in the basin.*
- ***(3)*** *Potential effects on the beneficial uses and users of groundwater, on land uses and property interests, and other potential effects that may occur or are occurring from undesirable results.*

(c) *The Agency may need to evaluate multiple minimum thresholds to determine whether an undesirable result is occurring in the basin. The determination that undesirable results are occurring may depend upon measurements from multiple monitoring sites, rather than a single monitoring site.*

(d) *An Agency that is able to demonstrate that undesirable results related to one or more sustainability indicators are not present and are not likely to occur in a basin shall not be required to establish criteria for undesirable results related to those sustainability indicators.*

Process and Criteria for Defining Undesirable Results [§354.26(a)]

The overall process relied upon to define undesirable results for this GSP was described in Section 4.3. The specific process and criteria for defining undesirable results applied to the land subsidence sustainability indicator are described below.

Evaluation of Potential Effects on Beneficial Uses and Users, Land Uses, and Property Interests [§354.26(b)(3)]

The process for defining undesirable results for land subsidence began with considering the potential effects on beneficial uses and users of groundwater, land uses, and property interests. Beneficial uses and users of groundwater are not anticipated to be affected by the low amounts of land subsidence that could potentially occur in this basin (i.e. potential subsidence does not appear sufficient to damage wells). Therefore, the process for defining undesirable results focused on assessing potential effects on land uses and property interests in the Basin. This was accomplished by reviewing best available information concerning land uses (existing and planned), 100-year floodplain extents, infrastructure, sea level rise and related coastal hazards. The City of Ventura, which overlies most of the Basin, was consulted in this process.

Evaluation of the above-listed factors revealed that the Coastal Area located west of Harbor Boulevard is particularly susceptible to impacts of land subsidence (Figure 4.1-01). Primary sewer lines to the City's wastewater treatment plant run along Harbor Boulevard and have a low slope that could be impacted by relatively small amounts of land subsidence. Available studies indicate that the developed areas located west of Harbor Boulevard, including the Pierpont community and Ventura Harbor, will be impacted by sea level rise (Figure 4.8-01a and 4.8-01b) (VCWPD, 2018). Inelastic land subsidence in this area would

unreasonably exacerbate the already significant impacts associated with sea level rise. For these reasons it was determined that any measurable (0.1 ft or greater) inelastic land subsidence in the Coastal Area could potentially result in undesirable results, particularly as the effects of sea level rise act to increase coastal hazards in the Coastal Area during the planning and implementation horizons. The potential impact of land subsidence on the remainder of the Basin is less clear.

Based on the foregoing, the qualitative description of undesirable results is:

> *Land subsidence in the Coastal Area that exacerbates coastal hazards associated sea level rise or that impacts the City of Ventura's sewer mains along Harbor Boulevard and/or that substantially interferes with surface land uses in elsewhere in the Basin.*

Cause of Groundwater Conditions That Could Lead to Undesirable Results [§354.26(b)(1)]

The cause of groundwater conditions that could lead to undesirable results would be groundwater levels that decline below historical low levels resulting in inelastic land subsidence in the Coastal Area.

The following factors could result in groundwater levels declining below historical low levels:

1. Mound Basin groundwater extractions rates that significantly exceed those assumed for the projected water budget analysis.
2. Droughts that exceed the duration and severity of droughts included in the hydrologic period used for the projected water budget analysis.
3. If Oxnard Basin does not meet the sustainability goal in its GSP, which would impact underflow between the basins to the detriment of the Mound Basin.
4. Increased groundwater extraction in the adjacent Oxnard Basin near the boundary with the Mound Basin, which would impact underflow between the basins to the detriment of the Mound Basin.
5. Increased groundwater extraction in the adjacent Santa Paula Basin near the boundary with the Mound Basin, which would impact underflow between the basins to the detriment of the Mound Basin.
6. Combinations of items 1 through 5.

Criteria Used to Define Undesirable Results [§354.26(b)(2)]

The criteria used to define when and where the effects of the groundwater conditions cause undesirable results is based on the qualitative description of undesirable result, which is land subsidence in the Coastal Area (Figure 4.1-01) that exacerbates coastal hazards associated with sea level rise or that impacts the City of Ventura's sewer mains along Harbor Boulevard and/or that substantially interferes with surface land uses elsewhere in the Basin.

InSAR is the best available method for measuring the rate and extent of land subsidence over large areas, such as a groundwater basin. As described in Section 4.8.2, InSAR data utility is impacted by a significant lack of coverage in the western half of the Mound Basin as well as other factors (Figure 3.2-19) and is inadequate to be relied upon for developing the land subsidence sustainability indicators. As a result, the minimum thresholds described in Section 4.8.2 were developed using groundwater levels as a proxy for the western

half of the Basin. Subsidence rates that will be monitored using InSAR are used for the minimum threshold for the eastern half of the Basin because there is adequate InSAR coverage in that area.

Western Half of Mound Basin

For the Coastal Area, preventing undesirable results for land subsidence would mean that the groundwater levels are maintained above historical low levels, which avoids inelastic land subsidence. Because land subsidence can propagate radially away from an area of depressed groundwater levels, it is also necessary to maintain groundwater levels above historical lows in the remainder of the western half of the Basin to prevent inelastic land subsidence that could propagate into the Coastal Area. Based on the foregoing, the combination of minimum threshold exceedances that is deemed to cause significant and unreasonable effects in the western half of the Basin for land subsidence is minimum threshold exceedances in 50% of monitoring sites (Table 4.1-01). This combination is intended to indicate significant and unreasonable effects are widespread in the western half of the Basin. If InSAR coverage and other data issues are resolved in the future, MBGSA will update the GSP to use a rate and extent of land subsidence for the minimum threshold in the western half of the Basin.

Eastern Half of Mound Basin

By regulation, the land subsidence undesirable result is a quantitative combination of subsidence minimum threshold exceedances. For the eastern half of the Mound Basin, no land subsidence that substantially interferes with surface land uses is acceptable. Therefore, the combination of minimum threshold exceedances that may cause undesirable results in the eastern half of the Basin for land subsidence is as follows: in any one year, there will be zero exceedances of the minimum thresholds for subsidence *caused by groundwater conditions*, as indicated by InSAR. To determine whether InSAR-indicated land surface elevation changes were caused by groundwater conditions, InSAR data will only be considered when groundwater levels are below historical low levels. The InSAR data will be adjusted to account for rates of subsidence related to tectonic activity using continuous GPS data historical trends to determine if the minimum threshold has been exceeded.

DRAFT

4.8.2 Minimum Thresholds [§354.28]

4.8.2.1 Information and Criteria to Define Minimum Thresholds [§354.28(a),(b)(1),(c)(5)(A),(c)(5)(B), and (e)]

§354.28 Minimum Thresholds.

(a) *Each Agency in its Plan shall establish minimum thresholds that quantify groundwater conditions for each applicable sustainability indicator at each monitoring site or representative monitoring site established pursuant to Section 354.36. The numeric value used to define minimum thresholds shall represent a point in the basin that, if exceeded, may cause undesirable results as described in Section 354.26.*

(b) *The description of minimum thresholds shall include the following:*

(1) *The information and criteria relied upon to establish and justify the minimum thresholds for each sustainability indicator. The justification for the minimum threshold shall be supported by information provided in the basin setting, and other data or models as appropriate, and qualified by the uncertainty in the understanding of the basin setting.*

(c) *Minimum thresholds for each sustainability indicator shall be defined as follows:*

(5) *Land Subsidence. The minimum threshold for land subsidence shall be the rate and extent of subsidence that substantially interferes with surface land uses and may lead to undesirable results. Minimum thresholds for land subsidence shall be supported by the following:*

(A) *Identification of land uses and property interests that have been affected or are likely to be affected by land subsidence in the basin, including an explanation of how the Agency has determined and considered those uses and interests, and the Agency's rationale for establishing minimum thresholds in light of those affects.*

(B) *Maps and graphs showing the extent and rate of land subsidence in the basin that defines the minimum threshold and measurable objectives.*

(e) *An Agency that has demonstrated that undesirable results related to one or more sustainability indicators are not present and are not likely to occur in a basin, as described in Section 354.26, shall not be required to establish minimum thresholds related to those sustainability indicators.*

Land uses and property interests that would be affected by land subsidence in the Basin were described in the evaluation of undesirable results (Section 4.8.1). Summarizing Section 4.8.1, the Coastal Area of the Basin is particularly vulnerable to land subsidence impacts because land subsidence in this area would exacerbate coastal hazards associated with sea level rise in the Pierpont community and Ventura Harbor and could impact the City of Ventura's sewer mains that feed the City's WWTP. Section 4.8.1 concluded that any measurable inelastic land subsidence in the Coastal Area could potentially result in undesirable results, particularly as the effects of sea level rise act to increase coastal hazards in the Coastal Area during the planning and implementation horizons. However, because land subsidence can propagate radially away from an area of depressed groundwater levels, it is also important to prevent land subsidence in proximal areas adjacent to the Coastal Area in order to prevent inelastic land subsidence from propagating into the Coastal Area. It was further concluded that the potential impact of land subsidence on the remainder of the Basin is less clear.

Western Half of Mound Basin

Pursuant to GSP Emergency Regulations §354.28(c)(5), the minimum threshold for land subsidence shall be the rate and extent of subsidence that substantially interferes with surface land uses and may lead to undesirable results. InSAR is the best available method for measuring the rate and extend of land

subsidence over large areas, such as a groundwater basin. However, the interpolated InSAR data for the Mound Basin are impacted by multiple factors:

1. There is a significant lack of coverage in the western half of the Mound Basin (Figure 3.2-19), which causes the interpolated InSAR subsidence rates to be unreliable.
2. InSAR data provided by DWR are interpolated across the basin boundary between Mound and Oxnard basins. This is not appropriate because of the faults and folds that comprise the basin boundary. These structures likely impact the propagation of any subsidence between the basins (Figures 3.1-02, 3.1-06, and 3.2-19).
3. There is a subsidence "hotspot" that corresponds with a landfill located just south of the Mound Basin in the adjacent Oxnard Basin, which would be representing natural land compaction at the landfill. Careful inspection of the InSAR interpolation reveals that the hotpot greatly influences the subsidence values in the western portion of the Mound Basin, which lacks InSAR data (Figure 3.2-19).

For these reasons, InSAR is not considered a reliable method for measuring land subsidence in the western half of the Mound Basin and groundwater levels will be used as a proxy minimum threshold, as provided for in GSP Emergency Regulations §354.28(d). This regulation section allows the use of groundwater levels as a proxy for other sustainability indicators if a significant correlation between groundwater elevations and the other sustainability indicators can be demonstrated. The preconsolidation stress, the effective stress threshold at which inelastic compaction begins, generally is exceeded when groundwater levels decline past historical low levels (California Water Foundation, 2014). Therefore, groundwater levels are an appropriate proxy for monitoring inelastic land subsidence due to groundwater extraction. Based on the Section 4.8.1 discussion of undesirable results, minimum thresholds must be established to prevent inelastic land subsidence caused by groundwater conditions in the Coastal Area of the Basin. This means that the GSP should prevent groundwater levels from declining below historical low levels within the Coastal Area. Because land subsidence propagates radially away from an area of depressed groundwater levels, it is also necessary to maintain groundwater levels above historical lows in the remainder of the western half of the Basin to prevent inelastic land subsidence that could propagate into the Coastal Area. Therefore, the minimum thresholds for land subsidence in the western half of the Basin are defined as the historical low groundwater levels (Table 4.1-01).

The historical low groundwater elevations which define the minimum thresholds in the western half of the Basin were established using the following approach:

1. Review of available historical data presented in the Basin Setting (Section 3; Figures 3.2-10 through 3.2-13), suggests that historical low groundwater levels occurred in late 1990 to early 1991.
2. Measured and modeled groundwater level data were plotted for the historical period for each monitoring site.
3. If measured data are available during late 1990 to early 1991, the historical low groundwater elevation was established using the lowest measured groundwater levels during this period.
4. If measured data were not available during late 1990 to early 1991, the historical low groundwater elevations were estimated based on numerically modeled groundwater levels,

accounting for bias in simulated low water levels compared to observed groundwater levels (where available) from the recent drought (Appendix I).

Time-series plots (hydrographs) showing the measured and modeled groundwater elevation data and minimum thresholds are included in Appendix I.

Eastern Half of Mound Basin

For the eastern half of the Basin, InSAR provides adequate coverage and there are no apparent interpolation issues. As such, the minimum threshold for land subsidence for the eastern half of the Basin is the rate and extent of subsidence that substantially interferes with surface land uses and may lead to undesirable results. Section 3.2.5 explains that available reports do not indicate any documented groundwater-related subsidence in the Mound Basin, and the DWR (2014) screening of the Mound Basin indicated a "low" overall estimated potential for future subsidence. Thus, significant and unreasonable effects from inelastic land subsidence caused by groundwater conditions are considered unlikely in the eastern half of the Basin. No basin-specific data exist to determine rate and extent of subsidence that substantially interferes with surface land uses and may lead to undesirable results (GSP Emergency Regulations §354.28(c)(5)). MBGSA staff consulted with land subsidence expert Michelle Sneed of the USGS concerning methods for predicting rates of subsidence that could substantially interfere with surface land uses. Ms. Sneed was unaware of any studies or proven methodologies for predicting rates of subsidence that could substantially interfere with surface land uses (M. Sneed of USGS, personal communication, 2020). Given the apparent lack of a published methodology for predicting rates of subsidence that could substantially interfere with surface land uses in the eastern half of the Basin, MBGSA estimated these rates of subsidence based on a literature review of subsidence case studies. The case studies provide insight into subsidence amounts that have led to significant and unreasonable impacts in other groundwater basins. A summary of case studies from the 10 basins identified in the literature review is presented in Table 4.8-01. As indicated in Table 4.8-01, the rates of subsidence that led to undesirable results ranged from approximately 1.2 to 4.5 inches per year (0.1 to 0.38 feet per year [ft/yr]). Reported cumulative subsidence ranged from 0.6 to 10 ft. MBGSA concluded that it may be reasonable to assume a threshold for potential significant and unreasonable effects based on the low end of the values reported from the case studies (i.e., 0.1 ft/yr, 0.6 ft cumulative). These values were selected as the basis for minimum thresholds for the eastern half of the Basin and will be revised later if basin-specific information becomes available. To determine whether InSAR-indicated land surface elevation changes were caused by groundwater conditions, InSAR data will only be considered when groundwater levels are at or below historical low levels. The InSAR data will be adjusted to account for subsidence related to tectonic activity using continuous GPS data and historical trends to determine if the minimum threshold has been exceeded.

Figure 4.8-02 shows the minimum thresholds and measurable objectives in map view, as required pursuant to GSP Emergency Regulations §354.28(c)(5)(B).

4.8.2.1.1 Evaluation of Representative Minimum Thresholds [§354.28 (d)]

§354.28 Minimum Thresholds.
(d) *An Agency may establish a representative minimum threshold for groundwater elevation to serve as the value for multiple sustainability indicators, where the Agency can demonstrate that the representative value is a reasonable proxy for multiple individual minimum thresholds as supported by adequate evidence.*

DRAFT

As discussed in Section 4.8.2.1, InSAR data is not adequate for monitoring land subsidence in the western half of the Basin. Because of this, groundwater level elevations are used as a proxy for land subsidence minimum thresholds. As such, groundwater elevation is used as a representative minimum threshold for multiple sustainability indicators (land subsidence and chronic lowering of groundwater levels) in the Basin. Numerical modeling results (Appendix I) indicate that groundwater levels could decline below historical low levels without causing undesirable results for the chronic lowering of groundwater levels sustainability indicator for some locations in the western half of the Basin. However, undesirable results for land subsidence could occur in the Coastal Area if groundwater levels decline below historical low levels in the western half of the Basin. Therefore, it is appropriate to use groundwater level elevations as representative minimum thresholds for the land subsidence sustainability indicator.

4.8.2.2 Relationships Between Minimum Thresholds and Sustainability Indicators [§354.28(b)(2)]

§354.28 Minimum Thresholds.
(b) *The description of minimum thresholds shall include the following:*
(2) *The relationship between the minimum thresholds for each sustainability indicator, including an explanation of how the Agency has determined that basin conditions at each minimum threshold will avoid undesirable results for each of the sustainability indicators.*

The relationships between the minimum thresholds for the land subsidence sustainability indicator and other sustainability indicators are as follows:

- **Chronic Lowering of Groundwater Levels in the Western Half of the Basin:** The minimum thresholds are the same for the land subsidence and chronic lowering of groundwater levels sustainability indicators in the western half of the Basin. The potential effect of the chronic lowering of groundwater levels minimum thresholds is prevention of minimum threshold exceedances for the land subsidence sustainability indicator in the western half of the Basin.
- **Chronic Lowering of Groundwater Levels in the Eastern Half of the Basin:** The chronic lowering of groundwater levels minimum threshold is the historical low groundwater level elevations, which should prevent inelastic subsidence. Thus, the potential effect of the chronic lowering of groundwater levels minimum thresholds is prevention of minimum threshold exceedances for the land subsidence sustainability indicator in the eastern half of the Basin.
- **Reduction of Groundwater Storage:** A lowering of groundwater levels below the historical low levels could cause land subsidence in the Basin, and because extraction rates directly influence groundwater levels within the principal aquifers, the groundwater storage minimum threshold has a direct relationship to land subsidence if groundwater levels fall below the historical low. Maintaining the long-term average groundwater extraction rates below the sustainable yield should prevent minimum threshold exceedances for the land subsidence sustainability indicator.
- **Seawater Intrusion**: Numerical modeling results suggest that seawater intrusion is not anticipated during the SGMA planning and implementation periods. Therefore, the relationship between the land subsidence sustainability and seawater intrusion indicators is not significant. However, it is noted that maintaining groundwater levels above historical low levels for the land subsidence sustainability indicator in the western half of the Basin will help limit inland

gradients in the Hueneme Aquifer that could eventually lead to onshore migration of seawater in the future (beyond the 50-year SGMA planning and implementation period).

- **Degraded Water Quality**: The land subsidence sustainability indicator minimum thresholds will limit future groundwater level declines, which will help prevent downward movement of very poor-quality water from the shallow groundwater system into the Mugu Aquifer, which could potentially lead to undesirable results.
- **Depletion of Interconnected Surface Water**: This sustainability indicator is not applicable to the Mound Basin.

4.8.2.3 Minimum Thresholds in Relation to Adjacent Basins [§354.28(b)(3)]

§354.28 Minimum Thresholds.
(b) *The description of minimum thresholds shall include the following:*
(3) *How minimum thresholds have been selected to avoid causing undesirable results in adjacent basins or affecting the ability of adjacent basins to achieve sustainability goals.*

The land subsidence sustainability indicator minimum thresholds will limit future groundwater level declines, thereby minimizing impacts to underflow, which will help prevent undesirable results in the adjacent Oxnard and Santa Paula basins.

4.8.2.4 Impact of Minimum Thresholds on Beneficial Uses and Users [§354.28(b)(4)]

§354.28 Minimum Thresholds.
(b) *The description of minimum thresholds shall include the following:*
(4) *How minimum thresholds may affect the interests of beneficial uses and users of groundwater or land uses and property interests.*

Land subsidence minimum thresholds may have several effects on beneficial users and land uses in the Basin:

Groundwater Beneficial Users (All Types

Beneficial uses and users of groundwater are not anticipated to be affected by the low amounts of land subsidence that could potentially occur in this basin (i.e. potential subsidence does not appear sufficient to damage wells); therefore, the minimum thresholds do not effect groundwater beneficial uses and users. Numerical modeling results suggest that the minimum thresholds will be met without the need for groundwater extraction reductions or any projects or management actions. Therefore, the minimum thresholds are not anticipated to limit the beneficial use of groundwater.

Land Uses and Property Interests (All Types)

The minimum thresholds will protect land uses and property interests against significant and unreasonable inelastic land subsidence.

4.8.2.5 Current Standards Relevant to Sustainability Indicator [§354.28(b)(5)]

§354.28 Minimum Thresholds.
(b) *The description of minimum thresholds shall include the following:*
(5) *How state, federal, or local standards relate to the relevant sustainability indicator. If the minimum threshold differs from other regulatory standards, the Agency shall explain the nature of and basis for the difference.*

MBGSA is unaware of any federal, state, or local standards for land subsidence.

4.8.2.6 Measurement of Minimum Thresholds [§354.28(b)(6)]

§354.28 Minimum Thresholds.
(b) *The description of minimum thresholds shall include the following:*
(6) *How each minimum threshold will be quantitatively measured, consistent with the monitoring network requirements described in Subarticle 4.*

For the western half of the Basin, groundwater elevations will be directly measured to determine their relation to minimum thresholds. Groundwater level monitoring will be conducted in accordance with the monitoring plan outlined in Section 5. Section 7, Plan Implementation, includes an implementation budget to install additional monitoring sites identified in Section 5.

For the eastern half of the Basin, InSAR data will be used to measure inelastic subsidence in relation to the minimum thresholds. To determine whether InSAR data indicated land surface elevation changes were caused by groundwater conditions, InSAR data will only be considered when groundwater levels are below historical low levels. The InSAR data will be adjusted to account for subsidence related to tectonic activity using continuous GPS data and historical trends to determine if the minimum threshold has been exceeded.

DRAFT

4.8.3 Measurable Objectives and Interim Milestones [§354.30(a),(b),(c),(d),(e),(g)]

§354.30 Measurable Objectives.

(a) *Each Agency shall establish measurable objectives, including interim milestones in increments of five years, to achieve the sustainability goal for the basin within 20 years of Plan implementation and to continue to sustainably manage the groundwater basin over the planning and implementation horizon.*

(b) *Measurable objectives shall be established for each sustainability indicator, based on quantitative values using the same metrics and monitoring sites as are used to define the minimum thresholds.*

(c) *Measurable objectives shall provide a reasonable margin of operational flexibility under adverse conditions which shall take into consideration components such as historical water budgets, seasonal and long-term trends, and periods of drought, and be commensurate with levels of uncertainty.*

(d) *An Agency may establish a representative measurable objective for groundwater elevation to serve as the value for multiple sustainability indicators where the Agency can demonstrate that the representative value is a reasonable proxy for multiple individual measurable objectives as supported by adequate evidence.*

(e) *Each Plan shall describe a reasonable path to achieve the sustainability goal for the basin within 20 years of Plan implementation, including a description of interim milestones for each relevant sustainability indicator, using the same metric as the measurable objective, in increments of five years. The description shall explain how the Plan is likely to maintain sustainable groundwater management over the planning and implementation horizon.*

(g) *An Agency may establish measurable objectives that exceed the reasonable margin of operational flexibility for the purpose of improving overall conditions in the basin, but failure to achieve those objectives shall not be grounds for a finding of inadequacy of the Plan.*

4.8.3.1 Description of Measurable Objectives

Western Half of Mound Basin

The measurable objectives for land subsidence in the western half of the Basin were developed by applying the concept of providing a reasonable margin of operational flexibility under adverse conditions (GSP Emergency Regulations §354.30(c)). Adverse conditions for the Mound Basin include long-term drought phases and climatic-driven groundwater level cycles, as described in Section 3.2 (Groundwater Conditions). The reasonable margin of operational flexibility was determined to be groundwater levels following wet phases that are sufficiently high to prevent groundwater levels from dropping below the minimum thresholds during a subsequent drought phase (Figures 3.2-10 through 3.2-13). The measurable objectives were developed for each monitoring site using the following approach:

1. Modeled groundwater level data were plotted for the projected period for each monitoring site.
2. The maximum modeled groundwater level decline during the 50-year GSP planning and implementation horizon was determined and, when necessary, adjusted using professional judgment based on model calibration results (see Appendix I for additional details on the methodology).
3. The maximum projected groundwater level decline was added to the minimum threshold.

The measurable objectives along with minimum thresholds for each monitoring site are listed in Table 4.1-01 (354.30 (b)) and apply following wet phases of the climate cycle. Failure to meet the measurable

objectives during other times shall not be considered failure to sustainably manage the Basin. Time-series plots (hydrographs) showing the measured and modeled groundwater elevation data and measurable objectives are included in Appendix I.

Eastern Half of Mound Basin

The measurable objective for land subsidence for the eastern half of the Basin is no measurable inelastic land subsidence due to groundwater level declines. Measurable inelastic land subsidence is the minimum amount of subsidence that can be detected using the InSAR method when water levels are at or below historical lows. The InSAR data provided by DWR are subject to measurement error. DWR has stated that on a statewide level for the total vertical displacement measurements between June 2015 and June 2018, the errors are as follows (Paso Robles GSA, 2020):

1. The error between InSAR data and continuous GPS data is 16 mm (0.052 ft) with a 95% confidence level, and
2. The measurement accuracy when converting from the raw InSAR data to the maps provided by DWR is 0.048 ft with 95% confidence level.

The total estimated error, therefore, is 0.1 ft. A land surface change of less than 0.1 ft, therefore, is within the noise of the data collection and processing and is considered equivalent to no measurable subsidence in this GSP. The measurable objective is, therefore, equal to the minimum threshold for the eastern half of the Basin. To determine whether InSAR-indicated land surface elevation changes are caused by groundwater conditions, InSAR data will only be considered when groundwater levels are below historical low levels. The InSAR data will be adjusted to account for subsidence related to tectonic activity using continuous GPS data and historical trends to determine if the minimum threshold has been exceeded.

4.8.3.2 Interim Milestones [§354.30(e)]

§354.30 Measurable Objective.
(e) *Each Plan shall describe a reasonable path to achieve the sustainability goal for the basin with 20 years of Plan implementation, including a description of interim milestones for each relevant sustainability indicator, using the same metric as the measurable objective, in increments of five years. The description shall explain how the Plan is likely to maintain sustainable groundwater management over the planning and implementation horizon.*

Western Half of Mound Basin

Interim milestones were developed to illustrate a reasonable path to achieve the sustainability goal for the Basin within 20 years of Plan implementation for the western half of the Basin. Development of interim milestones is significantly complicated by the fact that there is significant uncertainty in predicting hydrologic conditions for the next 20 years. Currently, groundwater levels in the Basin are below the measurable objectives for approximately ⅓ of the wells because the Basin has experienced overall dry conditions for the better part of the last decade. It is anticipated that groundwater levels will rise during the next wet period and as a result of Oxnard Basin GSP implementation. It is anticipated that the measurable objectives will be met at some point during the 20-year GSP implementation period and then may fluctuate above or below the measurable objective thereafter. Because of the uncertainty concerning when the measurable objectives will be met, the interim milestones are shown as a linear path toward

the measurable objective over the 20-year sustainability timeframe. This interim milestone path should not be taken literally because it is climate dependent. The interim milestones and path to sustainability will be reviewed during each required five-year GSP assessment (GSP Emergency Regulations §354.38(a)). The interim milestones are listed in Table 4.1-01 and are plotted on the time-series plots (hydrographs) included in Appendix I.

Once the measurable objectives are met, numerical modeling results suggest that sustainability will be maintained during the remainder of the 50-year GSP planning and implementation horizon (Appendix I). The causes of groundwater conditions that could lead to undesirable results described in Section 4.8.1 will be carefully reviewed during each required five-year GSP assessment. The GSP will be updated to include any projects or management actions deemed necessary to maintain sustainable conditions in the Basin.

Eastern Half of Mound Basin

The InSAR data available for GSP development indicate that the measurable objective for the eastern half of the Basin is already met. Therefore, the land subsidence interim milestones for the eastern half of the Basin are equal to the measurable objective.

4.9 Depletions of Interconnected Surface Water

Depletions of interconnected surface water is not an applicable indicator of groundwater sustainability in the Mound Basin and, therefore, no SMC are set. Section 3.2.6, Interconnected Surface Water Systems, and Appendix G provides the evidence for the inapplicability of this sustainability indicator.

4.10 Measurable Objectives and Interim Milestones for Additional Plan Elements [§354.30(f)]

§354.30 Measurable Objectives.
(f) *Each Plan may include measurable objectives and interim milestones for additional Plan elements described in Water Code Section 10727.4 where the Agency determines such measures are appropriate for sustainable groundwater management in the basin.*

No measurable objectives were developed for the additional plan elements included in the GSP.

DRAFT

5.0 Monitoring Networks [Article 5, SubArticle 4]

5.1 Introduction to Monitoring Networks [§354.32]

§354.32 Introduction to Monitoring Networks. *This Subarticle describes the monitoring network that shall be developed for each basin, including monitoring objectives, monitoring protocols, and data reporting requirements. The monitoring network shall promote the collection of data of sufficient quality, frequency, and distribution to characterize groundwater and related surface water conditions in the basin and evaluate changing conditions that occur through implementation of the Plan.*

Section 5 describes existing monitoring networks and improvements to those monitoring networks that will be developed as part of GSP implementation. Section 5 is prepared in accordance with the GSP Emergency Regulations §354.32 - §354.40 and includes monitoring objectives, monitoring protocols, data reporting requirements, assessment of the monitoring network, and DMS.

Consistent with GSP Emergency Regulations §354.34(e), the monitoring networks presented in this chapter are based primarily on existing monitoring sites. The existing monitoring networks in the Basin have been used for several decades to collect information to demonstrate short-term, seasonal, and long-term trends in groundwater and related surface water conditions. The monitoring networks include features for the collection of data to monitor the groundwater sustainability indicators applicable to the Basin. Additional monitoring sites will be added to enhance the existing monitoring network based on the assessment herein, pursuant to GSP Emergency Regulations §354.38. The additional monitoring sites are necessary to fully demonstrate sustainability and will also help refine the HCM and improve the numerical model.

Monitoring networks are described for each applicable sustainability indicator, and data gaps are identified for each, as appropriate in the following sections. As discussed in Sections 3 and 4, depletion of interconnected surface water is not an applicable sustainability indictor in the Basin and therefore monitoring of surface water flow is not included in the monitoring network. Section 3.3 and Table 3.3-01 do, however, include the sources of publicly available surface water monitoring data.

DRAFT

5.2 Monitoring Network Objectives and Design Criteria [§354.34(a),(b)(1),(b)(2),(b)(3),(b)(4),(d),(f)(1),(f)(2),(f)(3), and (f)(4)]

§354.34 Monitoring Network.

(a) *Each Agency shall develop a monitoring network capable of collecting sufficient data to demonstrate short-term, seasonal, and long-term trends in groundwater and related surface conditions, and yield representative information about groundwater conditions as necessary to evaluate Plan implementation.*

(b) *Each Plan shall include a description of the monitoring network objectives for the basin, including an explanation of how the network will be developed and implemented to monitor groundwater and related surface conditions, and the interconnection of surface water and groundwater, with sufficient temporal frequency and spatial density to evaluate the affects and effectiveness of Plan implementation. The monitoring network objectives shall be implemented to accomplish the following:*

- ***(1)*** *Demonstrate progress toward achieving measurable objectives described in the Plan.*
- ***(2)*** *Monitor impacts to the beneficial uses or users of groundwater.*
- ***(3)*** *Monitor changes in groundwater conditions relative to measurable objectives and minimum thresholds.*
- ***(4)*** *Quantify annual changes in water budget components.*

(d) *The monitoring network shall be designed to ensure adequate coverage of sustainability indicators. If management areas are established, the quantity and density of monitoring sites in those areas shall be sufficient to evaluate conditions of the basin setting and sustainable management criteria specific to that area.*

(f) *The Agency shall determine the density of monitoring sites and frequency of measurements required to demonstrate short-term, seasonal, and long-term trends based upon the following factors:*

- ***(1)*** *Amount of current and projected groundwater use.*
- ***(2)*** *Aquifer characteristics, including confined or unconfined aquifer conditions, or other physical characteristics that affect groundwater flow.*
- ***(3)*** *Impacts to beneficial uses and users of groundwater and land uses and property interests affected by groundwater production, and adjacent basins that could affect the ability of that basin to meet the sustainability goal.*
- ***(4)*** *Whether the Agency has adequate long-term existing monitoring results or other technical information to demonstrate an understanding of aquifer response.*

5.2.1 Monitoring Network Objectives

The GSP Emergency Regulations require monitoring networks be developed to collect data of sufficient quality, frequency, and spatial distribution to characterize groundwater and related surface water conditions (if applicable) in the Basin, and to evaluate changing conditions that occur during implementation of the GSP. Monitoring networks should accomplish the following (§354.34(b)):

- Demonstrate progress toward achieving measurable objectives described in the GSP.
- Monitor impacts to the beneficial uses and users of groundwater.
- Monitor changes in groundwater conditions relative to measurable objectives and minimum thresholds.
- Quantify annual changes in water budget components.

Each of these objectives is described further below with specific discussion relevant to the planned Mound Basin GSP monitoring network:

1. **Demonstrate progress toward achieving measurable objectives described in Section 4 of this GSP:** As described in Section 4 of this GSP, the depletion of interconnected surface water indicator is not applicable to this basin. The remaining five sustainability indicators are applicable but have already met the corresponding measurable objectives historically and are expected to meet them going forward. Therefore, the focus of this objective for the Mound Basin is to demonstrate continued compliance with the measurable objectives as opposed to progress toward meeting the measurable objectives.
2. **Monitor impacts to the beneficial uses or users of groundwater:** The beneficial uses of groundwater in the primary aquifers (i.e., Mugu and Hueneme aquifers) of Mound Basin include municipal, industrial, and agricultural water supply. The beneficial users include the City of Ventura, owners of wells that are pumped for industrial water supply (two as of 2021), and owners of 22 wells used for agricultural water supply. These uses and users could be impacted by degradation of water quality, seawater intrusion, and declining groundwater levels and storage (which are an important causative factor in land subsidence). Key design criteria considered in developing a network to monitor these potential impacts on uses and users of groundwater include the following:
   - Monitoring Parameters: Monitoring groundwater levels, extraction rates, and groundwater quality can indicate trends that could precede land subsidence or seawater intrusion, as well as trends that could affect operation and associated costs of production wells (e.g., declining groundwater elevations may require setting a pump deeper in a well, combined with greater energy requirements to pump each AF of water). Monitoring common dissolved constituents in groundwater at or near active water supply wells can detect changes in groundwater quality that might affect groundwater users. Groundwater levels can be directly measured at monitoring wells using a manual sounder (where monthly, quarterly, or semiannual measurement is appropriate) or an installed pressure transducer with datalogger (where high-frequency measurement is needed). Groundwater extraction rates and amounts are reported to United by the well owners pursuant to Water Code §75611. Monitoring for seawater intrusion is commonly performed by analyzing groundwater samples for chloride, although analysis for other dissolved ions can be helpful for distinguishing chloride resulting from seawater intrusion versus other potential sources. In addition, rates of inland movement of fresh groundwater from offshore portions of the aquifer can be provided by monitoring groundwater elevations inland from the coast.
   - Monitoring Locations: As noted in DWR's best management practices for monitoring networks (DWR, 2016c), "Areas that are subject to greater groundwater pumping, greater fluctuations in conditions, significant recharge areas, or specific projects may require more monitoring (temporal and/or spatial) than areas that experience less activity or are more static." Under this guidance, appropriate monitoring sites in Mound Basin are in the southern portion of Mound Basin where all the Basin's active water supply wells are located (Figure 3.1-26) and groundwater levels are known to fluctuate. Monitoring in the northern portion of the Basin is low priority due to the lack of beneficial uses. In the event that seawater is detected in shoreline monitoring wells, additional monitoring wells may be warranted to ensure protection of beneficial users of groundwater in the western portion

DRAFT

of the Basin. DWR's BMPs for monitoring networks also notes that "[u]nderstanding conditions at or across basin boundaries is important." Variable groundwater underflow occurs along the southern boundary of Mound Basin adjacent to Oxnard Basin; therefore, coverage of this area by the Mound Basin monitoring network can help confirm underflow estimated in the water budget. Finally, monitoring groundwater quality and elevations along the coastline and just inland from the coast can provide early warning of any unexpected seawater intrusion during the SGMA implementation period, as well as rates of movement of fresh groundwater to or from offshore portions of the aquifer.

- Screened Intervals (depths) of Monitoring Wells: In basins with multiple aquifers, such as Mound Basin, the depth of monitoring is an important consideration. For Mound Basin, this means ensuring monitoring takes place in both principal aquifers in the Basin (i.e., the Mugu and Hueneme aquifers). However, the emphasis should be on monitoring the Hueneme Aquifer because most of the groundwater extracted from the Basin is from wells screened in this aquifer.
- Monitoring Frequency: In Mound Basin, where groundwater elevations are subject to both seasonal fluctuations (due to changes in groundwater extraction and recharge rates) and longer-term cyclical fluctuations (due to climatic variability), the frequency of groundwater level measurements, extraction rate reporting, and groundwater quality sampling is an important design consideration. Therefore, this objective for Mound Basin includes a frequency of groundwater level measurements and extraction rates sufficient to capture the range (seasonal highs and lows) of groundwater elevations occurring within the Basin over the course of each year. For monitoring seawater intrusion, the frequency of sampling should be sufficient to detect unexpected inland advancement of seawater in time to institute mitigation measures that can prevent undesirable results (e.g., before chloride concentrations at agricultural water supply wells increase to the point that they become harmful to crops). Due to the relatively slow rate of groundwater movement, annual monitoring for seawater intrusion should suffice with the caveat that the sampling frequency should be increased if indications of seawater are detected. The frequency of groundwater level measurement and groundwater quality sampling at or near active water supply wells should be sufficient to detect any long-term trends in water quality that could result from vertical migration of poor-quality water into the principal aquifers. Due to the relatively slow rate of potential vertical migration, annual water quality monitoring should suffice.

3. **Monitor changes in groundwater conditions relative to measurable objectives and minimum thresholds:** Similar to #1 above, the focus of this objective for the Mound Basin is to demonstrate continued compliance with the measurable objectives. As discussed in Section 4, groundwater levels are used as proxies for the land subsidence minimum threshold in the western half of the Basin. The reduction of groundwater storage sustainability indicator is monitored by reported extraction rates. Thus, monitoring of changes in groundwater conditions relative to minimum thresholds and measurable objectives will be accomplished using groundwater level, extraction rate, and groundwater quality monitoring. Monitoring in the Mound Basin should focus on whether the trend of these parameters is deviating from a pattern that is consistent with continued maintenance of groundwater conditions relative to the measurable objectives. If a significant change from historical extraction rate patterns or groundwater quality were to occur in the future (e.g., groundwater extraction from an aquifer

that was largely unused historically, or new reports of discharge of contaminants to groundwater in an area of the Basin with few monitoring wells), then modifications to the monitoring network could be required.

4. **Quantify annual changes in water budget components:** As described in Section 3 of this GSP, United's (2021a) groundwater flow model is the best tool currently available for estimating the quantities of most of the water budget components involving groundwater flow in the Mound Basin. Exceptions include:
   - Groundwater extractions, which are measured by well owners and reported to the MBGSA and United semiannually.
   - Groundwater imports from adjacent basins, which are recorded by the City of Ventura, FICO, and Alta MWC. Quantities of imported water are available to the MBGSA upon request. Imports from the California SWP, when Ventura's SWP Interconnection Project is completed, will also be recorded by the City of Ventura and made available to the MBGSA upon request.
   - Areal recharge, which can be quantified based on rainfall data and land use information. Rainfall data are collected by the VCWPD, and land use data are updated annually to biennially by several county and state agencies and can be downloaded from their websites.

The above data will be input to United's flow model for calculating future annual changes in subsurface water budget components and change in storage. Surface flows in the Santa Clara River are measured daily by the VCWPD at flow-gaging station "723 - Santa Clara River at Victoria Ave" located outside of the Basin. Data from this station are available online and can be downloaded annually to update this surface water component of the Mound Basin water budget (VCWPD, 2021). MBGSA intends to continue using data from these existing sources as input to United's model, which will in turn be used periodically to quantify changes in water budget components. At present, this GSP does not contemplate development of a new monitoring network or modification of existing monitoring networks to obtain data regarding groundwater extraction, imported water, or recharge quantities because it is MBGSA's opinion that these water budget components are currently adequate for sustainable management of the Basin.

5.2.2 Monitoring Network Design Criteria

Design criteria are discussed for each sustainability indicator regarding GSP Emergency Regulations §354.34(c)(1) through (6) and are addressed in the subsections that discuss the monitoring networks specific to each sustainability indicator.

GSP Emergency Regulations §354.34(d) adds the overarching design criteria, which echo the third monitoring network objective described in GSP Emergency Regulations §354.34(b)(3) (see #3 in Section 5.2.1 above), to "[e]nsure adequate coverage of sustainability indicators." No management areas have been established for the Basin, so the sufficient quantity and density of monitoring sites is addressed for each sustainability indicator for the entire Basin.

GSP Emergency Regulations §354.34(f) provide additional design considerations for the density of monitoring sites and frequency of measurements required to demonstrate short-term, seasonal, and long-term trends based upon the following factors:

- Amount of current and projected groundwater use.
- Aquifer characteristics, including confined or unconfined aquifer conditions, or other physical characteristics that affect groundwater flow.
- Impacts to beneficial uses and users of groundwater and land uses and property interests affected by groundwater production, and adjacent basins that could affect the ability of that basin to meet the sustainability goal.
- Whether the Agency has adequate long-term existing monitoring results or other technical information to demonstrate an understanding of aquifer response.

Other criteria from DWR BMP 2, Monitoring Networks and Identification of Data Gaps (DWR, 2016c), were also considered in developing the monitoring network. These include:

- **Access issues**: Most of the land within Mound Basin has been developed for urban/suburban uses or consists of privately owned farmland. The majority of open land occurs on the steep hillsides in the northern portion of the Basin, where access by drilling rigs would be difficult. Due to the large depth to the principal aquifers in most parts of the Basin, drilling and construction of new groundwater monitoring wells will likely require a large construction "footprint." Therefore, construction of new monitoring wells will be difficult in much of the Basin and may not be feasible in some areas. Although some new monitoring wells are proposed in this GSP (in Sections 5.3 and 5.5), existing wells should be used for monitoring to the extent practicable.
- **Consider all sustainability indicators**: DWR (2016c) recognizes that "GSAs should look for ways to efficiently use monitoring sites to collect data for more than one or all of the sustainability indicators," including those indicators that are not currently known to affect (or be affected by) uses and users of groundwater from the principal aquifers. In keeping with DWR (2016c) guidance, to the extent practicable, the proposed Mound Basin GSP monitoring network is designed to collect the most data possible with a minimum of monitoring points/resources. Potential opportunities for modifying the existing monitoring network to provide additional data regarding groundwater quality, land subsidence, and interconnected surface water in Mound Basin are provided in the following subsections of this GSP.
- **Cost**: Cost is a critical factor for MBGSA because of the small amount of groundwater extraction in this basin, compared to most medium- and high-priority basins. This means there is a significantly greater cost burden on each groundwater user to fund additional monitoring sites as compared to groundwater users in most other basins.

5.2.3 Monitoring Network Design Analysis

The objectives and design criteria set forth in the GSP Emergency Regulations were analyzed in a Basin-specific context. The analysis resulted in the following key monitoring network design factors:

DRAFT

1. The applicable sustainability indicator measurable objectives have been met historically and are expected to be met going forward. Therefore, the focus of this objective for the Mound Basin is to demonstrate continued compliance with the measurable objectives as opposed to progress toward meeting the measurable objectives.
2. The depletion of interconnected surface water indicator is not applicable to this basin and percolation of surface water is not a significant water budget element. Therefore, surface water monitoring is not a priority for the Mound Basin.
3. Because groundwater levels are used as a proxy for the land subsidence in the western half of the Basin (see Figure 4.1-01), the reduction of groundwater storage is monitored using extraction rates, and surface water is not an important factor in the Mound Basin, monitoring should focus on groundwater levels, extraction rates, and groundwater quality monitoring.
4. No management areas have been established in the Mound Basin under this GSP. Therefore, adequate coverage of the sustainability indicators applies at the basin level.
5. The area of greatest risk for undesirable results is in the western half of the Basin due to the sensitivity of land uses and critical infrastructure to land subsidence in the Coastal Area, and proximity of agricultural beneficial users to the shoreline for any unexpected seawater intrusion. Thus, MBGSA's highest priority for its limited fiscal resources is to ensure adequate monitoring near the coast to protect land uses and beneficial uses relative to the land subsidence and seawater intrusion sustainability indicators.
6. Current and projected groundwater beneficial uses and users are limited to the southern portion of the Basin. Monitoring sites should be prioritized in the southern portion of the Basin, and MBGSA's limited fiscal resources should be prioritized to address monitoring needs in this area, as opposed to the northern portion of the Basin which has no groundwater extraction.
7. Data limitations in the northern portion of the Basin are not believed to limit MBGSA's ability to sustainably manage the Basin as there are no beneficial uses in that area and because the numerical model can be used to estimate the potentiometric surface and storage change in that area.
8. Current and projected groundwater extractions for beneficial uses are heavily skewed toward the Hueneme Aquifer. Therefore, the monitoring sites should be prioritized in the Hueneme Aquifer. All other factors being equal, MBGSA's limited fiscal resources should be prioritized to address monitoring needs in Hueneme Aquifer, as opposed to the Mugu and non-principal aquifers in the Basin.
9. Groundwater underflow from Oxnard Basin is more variable than underflow from the Santa Paula Basin, as described in Section 3.3 of this GSP. Additionally, sustainable groundwater management of the Mound Basin will be affected by the implementation of the Oxnard Basin GSP by the FCGMA, whereas Santa Paula Basin is adjudicated. Therefore, monitoring that supports the assessment of underflow should be prioritized along the Oxnard Basin boundary as compared to the Santa Paula Basin boundary.
10. Monitoring Frequencies: The following circumstances were considered when evaluating monitoring frequencies:

DRAFT

a. Measurable objectives have consistently been met historically;

b. MBGSA has long-term existing monitoring results;

c. The Basin has a relatively small amount of groundwater extraction; and

d. The aquifers are deep and confined and, therefore, do not exhibit large seasonal changes (in response to climate variations) in groundwater levels and storage and are not susceptible to rapid changes in groundwater quality from surface activities.

Based on the foregoing, high-frequency monitoring is not necessary to characterize short-term, seasonal, and long-term trends in groundwater levels, quality, and water budget components. Quarterly groundwater level monitoring, semiannual extraction rate reporting, and annual groundwater quality sampling frequencies are considered adequate. More frequent monitoring may be desirable, but not considered necessary for sustainable management of the Basin, unless conditions change. The monitoring frequencies, among other aspects, should be evaluated during the periodic Plan assessments.

How the monitoring objectives and design criteria were specifically applied to each SMC to develop the GSP monitoring network is described in the following subsections.

5.3 Groundwater Levels Monitoring Network [§354.34(e),(g)(3),(h), and (j)]

§354.34 Monitoring Network.
(e) *A Plan may utilize site information and monitoring data from existing sources as part of the monitoring network.*
(g) *Each Plan shall describe the following information about the monitoring network:*
(3) *For each sustainability indicator, the quantitative values for the minimum threshold, measurable objective, and interim milestones that will be measured at each monitoring site or representative monitoring sites established pursuant to Section 354.36.*
(h) *The location and type of each monitoring site within the basin displayed on a map, and reported in tabular format, including information regarding the monitoring site type, frequency of measurement, and the purposes for which the monitoring site is being used.*
(j) *An Agency that has demonstrated that undesirable results related to one or more sustainability indicators are not present and are not likely to occur in a basin, as described in Section 354.26, shall not be required to establish a monitoring network related to those sustainability indicators.*

Table 5.3-01 summarizes construction and other information for the 23 existing wells in Mound Basin that have regularly been used for groundwater level monitoring historically. These wells are referred to as the "existing groundwater level monitoring network." Locations of groundwater level monitoring wells screened in the Mugu and Hueneme aquifers are shown on Figures 5.3-01 and 5.3-02, respectively. Inspection of Table 5.3-01 indicates that most (15) existing groundwater level monitoring wells are screened exclusively or almost exclusively in the Hueneme Aquifer, which is one of the two principal aquifers in the Basin and supplies most of the groundwater extracted from Mound Basin (Table 3.1-02). Five wells are screened solely in the Mugu Aquifer, which is the other principal aquifer. One well is screened in portions of both the Hueneme and Fox Canyon aquifers, and one well is screened across significant intervals of both the Mugu and Hueneme aquifers. Two wells in the existing monitoring well network are screened in the fine-grained Pleistocene Deposits overlying the Mugu Aquifer. Wells

screened in the fine-grained Pleistocene Deposits, the Fox Canyon Aquifer, or across multiple aquifers are shown on Figure 5.3-03.

Wells 02N22W07M01S/02S/03S and 02N23W07J01S/02S/03S are clustered wells that were jointly installed by United and the City of Ventura in the 1990s and provide data concerning vertical hydraulic gradients between the principal aquifers and the fine-grained Pleistocene deposits.

Two additional monitoring well clusters are planned in the Coastal Area to provide monitoring sites for implementation of the seawater intrusion sustainability indicator (Sites A and B on Table 5.3-02 and Figures 5.3-01 and 5.3-02). These monitoring well clusters will include discrete screen intervals in each principal aquifer, which will provide additional definition of the potentiometric surface in both principal aquifers and additional vertical gradient data. Site C is a potential "early warning" well and the plans to install this well will be evaluated following the five-year review.

Ventura Water monitors several shallow wells located along the Santa Clara River, which are not part of the Mound Basin GSP monitoring network. Shallow groundwater levels from these wells will be collected and analyzed as part of the interim shallow groundwater data collection and analysis described in Section 6.6.

5.3.1 Attainment of Monitoring Objectives and Other Requirements [§354.34(c)(1)(A),(c)(1)(B), and (g)(1)]

§354.34 Monitoring Network.
(c) *Each monitoring network shall be designed to accomplish the following for each sustainability indicator:*
(1) *Chronic Lowering of Groundwater Levels. Demonstrate groundwater occurrence, flow directions, and hydraulic gradients between principal aquifers and surface water features by the following methods:*
(A) *A sufficient density of monitoring wells to collect representative measurements through depth-discrete perforated intervals to characterize the groundwater table or potentiometric surface for each principal aquifer.*
(B) *Static groundwater elevation measurements shall be collected at least two times per year, to represent seasonal low and seasonal high groundwater conditions.*
(g) *Each Plan shall describe the following information about the monitoring network:*
(1) *Scientific rationale for the monitoring site selection process.*

In accordance with GSP Emergency Regulations §354.34(b) and (d), the groundwater level monitoring network sites have been selected using MBGSA's scientific judgment to (1) demonstrate progress toward achieving measurable objectives described in the GSP, (2) monitor impacts to the beneficial uses and users of groundwater, (3) monitor changes in groundwater conditions relative to measurable objectives and minimum thresholds, (4) quantify annual changes in water budget components, and (5) to provide adequate coverage of sustainability indicators. Importantly, there is no groundwater extraction in the northern portion of the Basin; thus, the sustainability indicators that rely on groundwater levels directly (or as a proxy) and the groundwater monitoring network are necessarily focused on the southern portion of the Basin. The monitoring network has a special focus in areas of greatest risk for undesirable results: the western half of the Basin where land uses and critical infrastructure are sensitive to land subsidence effects, and agricultural beneficial users proximal to the coastline would be at risk if unexpected seawater intrusion occurs. Additional monitoring well clusters are proposed in the western half of the Basin to address these concerns.

Pursuant to GSP Emergency Regulations §354.34(c)(1)(A), the groundwater level monitoring network sites have been selected to provide a sufficient density of monitoring wells to collect representative measurements through depth-discrete intervals to characterize the potentiometric surface for each principal aquifer. The existing and planned groundwater level monitoring wells screened in the Hueneme Aquifer and the Mugu Aquifer provide sufficient density for the following scientific and practical reasons consistent with the key Basin-specific monitoring network design factors discussed in Section 5.2:

- The groundwater level monitoring sites (existing and proposed) were selected to provide focused monitoring of groundwater gradients and flow directions over time in the western half of the Basin where the greatest risk for undesirable results exists.
- The groundwater level monitoring sites (existing and proposed) were selected to provide coverage across the southern portion of the Basin to monitor the regional groundwater gradient and flow direction over time in the area where current and projected groundwater beneficial uses exist.
- Groundwater level monitoring sites are located along the southern Basin boundary to monitor gradients and flow to/from the Oxnard Basin.
- The lack of monitoring sites in the northern portion of the Basin is not believed to limit MBGSA's ability to sustainably manage the Basin because there are no beneficial uses in that area and the numerical model can be used as needed to estimate the potentiometric surface and storage changes in this area.
- A higher density of groundwater level monitoring sites has been selected in the Hueneme Aquifer commensurate with the fact that this aquifer supplies most of the water extracted from the Basin.
- The relatively limited number of groundwater level monitoring sites in the Mugu Aquifer is not believed to limit MBGSA's ability to sustainably manage the Basin because there is limited groundwater extraction from this aquifer and the existing and proposed monitoring sites provide sufficient coverage to map the regional potentiometric surface in the Mugu Aquifer.

Consistent with to GSP Emergency Regulations §354.34(c)(1)(B), static groundwater levels will be measured quarterly (or more frequently, as feasible) at wells in the groundwater level monitoring network to represent seasonal-low and seasonal-high groundwater conditions. Groundwater elevations have been measured manually on a monthly, bi-monthly, or quarterly basis at wells in the groundwater level monitoring network, exceeding the SGMA requirement for semiannual (fall and spring) measurements. In addition, United collects automated groundwater elevation measurements at 4-hour intervals in four Mound Basin monitoring wells screened in principal aquifers (Figures 5.3-01 and 5.3-02) to provide high-frequency data useful for understanding daily to seasonal variability in groundwater elevations. This is helpful for more accurately determining the precise timing of spring-high and fall-low groundwater elevations each year and for evaluating the interference effects of nearby groundwater extraction on static groundwater levels.

Additional factors considered during selection of the groundwater level monitoring sites include:

1. From a scientific perspective, monitoring sites were selected to provide data in areas where groundwater elevations and hydraulic gradients are known to fluctuate over time. In Mound Basin, such fluctuations occur chiefly in the vicinity of water supply wells, which are limited

to the southern portion of the Basin, and along the boundary with the Oxnard Basin to evaluate interbasin underflow.

2. To the extent practicable, existing wells have been used as monitoring sites to avoid the cost and public nuisance associated with drilling new wells in a largely urban setting. However, in areas where groundwater level monitoring would provide crucial information, but no existing wells are present (or are unsuitable for some reason, such as being screened at a depth that would not provide useful data), new wells have been installed in parks and other public spaces in Mound Basin in the past.
3. DWR's BMP for developing monitoring networks (2016c) cites guidance stating that the density of monitoring wells should be 6.3 wells per 100 square miles (mi^2) (Sophocleous, 1983) to 4.0 wells per 100 mi^2 (Hopkins, 1994; applies to basins with groundwater extractions of more than 10,000 AF per 100 mi^2). In the principal aquifers of the Mound Basin (which has an area of approximately 23 mi^2), there are five existing groundwater level monitoring wells (density of 22 wells per 100 mi^2) screened solely in the Mugu Aquifer and 13 existing groundwater level monitoring wells (density of 57 wells per 100 mi^2) screened solely in the Hueneme Aquifer. Therefore, the density of monitoring sites in the existing groundwater level monitoring network exceeds the metrics recommended by DWR.

5.3.2 Data and Reporting Standards [§354.34(g)(2)]

§354.34 Monitoring Network.
(g) *Each Plan shall describe the following information about the monitoring network:*
(2) *Consistency with data and reporting standards described in Section 352.4. If a site is not consistent with those standards, the Plan shall explain the necessity of the site to the monitoring network, and how any variation from the standards will not affect the usefulness of the results obtained.*

The groundwater level monitoring sites are generally consistent with applicable data and reporting standards set forth in GSP Emergency Regulations §352.4. Exceptions to the standards are described below:

- Two existing monitoring sites—wells 02N22W09K05S and 02N22W08G01S—are screened across two aquifers, as shown on Table 5.3-01. DWR (2016b) notes that groundwater levels measured at wells screened across multiple aquifers should be considered composite groundwater levels rather than being representative of specific aquifers, and that these data must be used with caution. Fortunately, wells 02N22W09K05S and 02N22W08G01S are located near other wells that are screened in individual aquifers and are monitored by United (Figures 5.3-01 and 5.3-02). Therefore, the composite groundwater levels measured at wells 02N22W09K05S and 02N22W08G01S are not necessary for evaluating groundwater elevations in the principal aquifers or for preparing groundwater elevation contour maps, but are included in the GSP groundwater level monitoring network for completeness because they are part of the existing monitoring program in the Basin.
- The depth of the screened interval for well 02N22W16H01S is not reported (Table 5.3-01); therefore, the aquifer that this well is screened in is unknown. The well is part of the existing groundwater level monitoring network and is included as such but is not relied upon for meeting SGMA and GSP regulatory requirements.

5.3.3 Monitoring Protocols [§354.34(i)]

§354.34 Monitoring Network.
(i) *The monitoring protocols developed by each Agency shall include a description of technical standards, data collection methods, and other procedures or protocols pursuant to Water Code Section 10727.2(f) for monitoring sites or other data collection facilities to ensure that the monitoring network utilizes comparable data and methodologies.*

United, VCWPD, and the City of Ventura collect and report groundwater elevation data from the groundwater level monitoring network in general conformance with the CASGEM program's "Procedures for Monitoring Entity Reporting" (DWR, 2010) and DWR BMP 1 for monitoring protocols, standards, and sites (DWR, 2016b). Some key elements of DWR guidance include (but are not limited to) the following:

- Depth to groundwater must be measured relative to an established reference point on the well casing;
- Depth to groundwater must be measured to an accuracy of 0.1 ft below the reference point (it is preferable to measure depth to groundwater to an accuracy of 0.01 ft);
- Transducers must be able to record groundwater levels with an accuracy of 0.1 ft;
- Transducer data should periodically be checked against hand-measured groundwater levels to monitor electronic drift or cable movement.

More details are provided in the referenced guidance documents (DWR, 2010, 2016b), and are not repeated in this GSP. It is presently anticipated that United, VCWPD, and the City of Ventura will continue collecting groundwater level data from the existing monitoring network, including any improvements or modifications made in the future, and report those data to CASGEM and the MBGSA.

DRAFT

5.3.4 Assessment and Improvement of Monitoring Network [§354.38(a),(b),(c)(1),(c)(2),(d),(e)(1),(e)(2),(e)(3), and (e)(4)]

§354.38 Assessment and Improvement of Monitoring Network.

(a) *Each Agency shall review the monitoring network and include an evaluation in the Plan and each five-year assessment, including a determination of uncertainty and whether there are data gaps that could affect the ability of the Plan to achieve the sustainability goal for the basin.*

(b) *Each Agency shall identify data gaps wherever the basin does not contain a sufficient number of monitoring sites, does not monitor sites at a sufficient frequency, or utilizes monitoring sites that are unreliable, including those that do not satisfy minimum standards of the monitoring network adopted by the Agency.*

(c) *If the monitoring network contains data gaps, the Plan shall include a description of the following:*

- ***(1)*** *The location and reason for data gaps in the monitoring network.*
- ***(2)*** *Local issues and circumstances that limit or prevent monitoring.*

(d) *Each Agency shall describe steps that will be taken to fill data gaps before the next five-year assessment, including the location and purpose of newly added or installed monitoring sites.*

(e) *Each Agency shall adjust the monitoring frequency and density of monitoring sites to provide an adequate level of detail about site-specific surface water and groundwater conditions and to assess the effectiveness of management actions under circumstances that include the following:*

- ***(1)*** *Minimum threshold exceedances.*
- ***(2)*** *Highly variable spatial or temporal conditions.*
- ***(3)*** *Adverse impacts to beneficial uses and users of groundwater.*
- ***(4)*** *The potential to adversely affect the ability of an adjacent basin to implement its Plan or impede achievement of sustainability goals in an adjacent basin.*

The existing groundwater level monitoring network is considered generally suitable for groundwater sustainability planning relative to the criteria provided in DWR's GSP and CASGEM guidance (DWR, 2016c, 2010), and has met the needs of United, the City of Ventura, and VCWPD for the past three decades relative to their objectives for monitoring groundwater conditions.

Pursuant to GSP Emergency Regulations §354.38, MBGSA has assessed the existing groundwater level monitoring network and determined that certain data gaps exist. These data gaps and, where applicable, planned actions to address the data gaps before the next five-year assessment are discussed below.

Western Half of Mound Basin

The western half of the Basin has the greatest risk for undesirable results due to the vulnerability of land uses and critical infrastructure to land subsidence in the Coastal Area and the proximity of agricultural beneficial users to the shoreline for any unexpected seawater intrusion. This area is MBGSA's highest priority for expending its limited fiscal resources, to ensure adequate monitoring near the coast to protect land uses and beneficial uses relative to the land subsidence and seawater intrusion sustainability indicators. Two additional monitoring well clusters are planned in the Coastal Area to provide additional monitoring sites for implementation of the seawater intrusion sustainability indicator (Sites A and B on Figures 5.3-01, 5.3-02, 5.3-04, and 5.3-05). These monitoring well clusters will include discrete intervals in each principal aquifer, which will provide additional definition of the potentiometric surface in both principal aquifers and additional vertical gradient data. Site C is an additional potential "early warning" shoreline well and the plans to install the well will be evaluated following the five-year review.

- Site A is planned for construction in 2021 (supported by a SGMA Technical Support Services [TSS] grant from DWR). The wells in this cluster will be screened in the Mugu and Hueneme

aquifers. The primary purpose of this monitoring site is to provide a location for application of minimum thresholds and measurable objectives for the seawater intrusion sustainability indicator. This monitoring site will also be used for the land subsidence sustainability indicator and, more generally, to better define the potentiometric surface near the coast and provide additional vertical gradient data.

- Site B is planned for construction prior to the first five-year GSP assessment. Site B is located along Harbor Boulevard and its primary purpose is to monitor groundwater in relation to the minimum thresholds and measurable objectives for the seawater intrusion sustainability indicator. This site will also be used for the land subsidence sustainability indicator and, more generally, to better define the potentiometric surface near the coast and provide additional vertical gradient data.
- Site C is a potential "early warning" monitoring well cluster planned for construction following review of the first five-year GSP assessment. Site C is located near the coastline and its primary purpose would be to provide early warning for unexpected seawater intrusion. This site would also be used to better define the potentiometric surface near the coast and provide additional vertical gradient data.

Northern Portion of Mound Basin

The northern portion of the Basin lacks groundwater level monitoring sites screened in the principal aquifers. The lack of groundwater level monitoring sites is due to the lack of water supply wells. Future groundwater beneficial uses are not anticipated in the northern portion of the Basin due to the dominance of residential tract housing, which is supplied with potable water from the City of Ventura. Because there are no current or anticipated future beneficial uses and because the calibrated numerical model can be used to estimate the potentiometric surface in areas without data (the model can integrate existing monitoring data with modeled results to provide estimates to the northern area), this data gap is not considered a limiting factor for sustainable management of the Basin and will not be addressed unless changing conditions in the Basin warrant monitoring sites.

In addition to the efforts to address the above-described data gaps, MBGSA will consider expanding the monitoring network as opportunities arise. For example, when new or replacement wells are drilled, MBGSA will consider working with the owner to obtain access for monitoring.

DRAFT

5.4 Groundwater Storage Monitoring Network [§354.34(e),(g)(3),(h), and (j)]

23 Cal. Code Regs. §354.34 Monitoring Network.
(e) *A Plan may utilize site information and monitoring data from existing sources as part of the monitoring network.*
(g) *Each Plan shall describe the following information about the monitoring network:*
(3) *For each sustainability indicator, the quantitative values for the minimum threshold, measurable objective, and interim milestones that will be measured at each monitoring site or representative monitoring sites established pursuant to Section 354.36.*
(h) *The location and type of each monitoring site within the basin displayed on a map, and reported in tabular format, including information regarding the monitoring site type, frequency of measurement, and the purposes for which the monitoring site is being used.*
(j) *An Agency that has demonstrated that undesirable results related to one or more sustainability indicators are not present and are not likely to occur in a basin, as described in Section 354.26, shall not be required to establish a monitoring network related to those sustainability indicators.*

As noted in DWR's (2016c) BMP for monitoring networks, changes in groundwater storage are not a directly measurable condition. Rather, estimation of changes in groundwater storage relies on collection of accurate groundwater levels. Measured groundwater level changes can then be used to calculate changes in storage based on understanding of aquifer thickness, porosity, and connectivity (DWR, 2016c), or can be calculated using a groundwater model. Therefore, the "groundwater storage monitoring network" consists of the groundwater level monitoring network, which is described above in Section 5.3.

An additional component of monitoring for the reduction of groundwater storage sustainability indicator involves tracking the groundwater extraction rates against the measurable objectives and minimum thresholds. The network consists of the pumping well owners and the extraction rates are reported semiannually to United by the well owners pursuant to Water Code §75611.

5.4.1 Attainment of Monitoring Objectives and Other Requirements [§354.34(c)(2) and (g)(1)]

§354.34 Monitoring Network.
(c) *Each monitoring network shall be designed to accomplish the following for each sustainability indicator:*
(2) *Reduction of Groundwater Storage. Provide an estimate of the change in annual groundwater in storage.*
(g) *Each Plan shall describe the following information about the monitoring network:*
(1) *Scientific rationale for the monitoring site selection process.*

The reduction of groundwater storage monitoring network design criterion provided in GSP Emergency Regulations §354.34(c)(2) is to provide an estimate of the change in annual storage.

As noted in Section 5.3, static groundwater levels and groundwater extraction rates will be measured and reported twice (or more) per year at wells in the groundwater level monitoring network and active extraction wells, respectively to achieve the overall monitoring objectives described in Section 5.2, and additionally to estimate annual change in groundwater in storage in the two principal aquifers used for water supply in Mound Basin—the Mugu and Hueneme aquifers. Spring is the time of year when aquifers in the region typically are in a positive water-balance condition (inflows exceed outflows) and

potentiometric surfaces are at their highest; therefore, the spring-high groundwater levels will be used for annual estimates of changes in storage. Fall-low groundwater levels in Mound and adjacent basins can be strongly influenced by short-term, local factors such as timing of the first winter rainfall event and the presence or absence of Santa Ana winds in fall (which can result in a significant increase in demand for irrigation). Therefore, fall groundwater elevations provide a less reliable indicator of annual changes in groundwater in storage compared to spring groundwater elevations.

The data limitation in the northern portion of the Basin is acknowledged but is not believed to limit MBGSA's ability to attain the monitoring objective because the numerical model can be used to estimate the potentiometric surface and storage change in areas without measured groundwater levels (Appendix I).

5.4.2 Data and Reporting Standards [§354.34(g)(2)]

§354.34 Monitoring Network.
(g) *Each Plan shall describe the following information about the monitoring network:*
(2) *Consistency with data and reporting standards described in Section 352.4. If a site is not consistent with those standards, the Plan shall explain the necessity of the site to the monitoring network, and how any variation from the standards will not affect the usefulness of the results obtained.*

The data and reporting standards for groundwater storage monitoring are identical to those for groundwater level monitoring because groundwater levels are used to estimate groundwater in storage.

5.4.3 Monitoring Protocols [§354.34(i)]

23 Cal. Code Regs. §354.34 Monitoring Network.
(i) *The monitoring protocols developed by each Agency shall include a description of technical standards, data collection methods, and other procedures or protocols pursuant to Water Code Section 10727.2(f) for monitoring sites or other data collection facilities to ensure that the monitoring network utilizes comparable data and methodologies.*

The monitoring protocols for groundwater storage monitoring are identical to those for groundwater levels monitoring (Section 5.3.2), because groundwater levels will be used to estimate aquifer storage.

5.4.4 Assessment and Improvement of Monitoring Network [§354.38(a),(b),(c)(1),(c)(2),(d),(e)(1),(e)(2),(e)(3), and (e)(4)]

§354.38 Assessment and Improvement of Monitoring Network.

(a) *Each Agency shall review the monitoring network and include an evaluation in the Plan and each five-year assessment, including a determination of uncertainty and whether there are data gaps that could affect the ability of the Plan to achieve the sustainability goal for the basin.*

(b) *Each Agency shall identify data gaps wherever the basin does not contain a sufficient number of monitoring sites, does not monitor sites at a sufficient frequency, or utilizes monitoring sites that are unreliable, including those that do not satisfy minimum standards of the monitoring network adopted by the Agency.*

(c) *If the monitoring network contains data gaps, the Plan shall include a description of the following:*

- ***(1)*** *The location and reason for data gaps in the monitoring network.*
- ***(2)*** *Local issues and circumstances that limit or prevent monitoring.*

(d) *Each Agency shall describe steps that will be taken to fill data gaps before the next five-year assessment, including the location and purpose of newly added or installed monitoring sites.*

(e) *Each Agency shall adjust the monitoring frequency and density of monitoring sites to provide an adequate level of detail about site-specific surface water and groundwater conditions and to assess the effectiveness of management actions under circumstances that include the following:*

- ***(1)*** *Minimum threshold exceedances.*
- ***(2)*** *Highly variable spatial or temporal conditions.*
- ***(3)*** *Adverse impacts to beneficial uses and users of groundwater.*
- ***(4)*** *The potential to adversely affect the ability of an adjacent basin to implement its Plan or impede achievement of sustainability goals in an adjacent basin.*

Assessment and potential improvements of the monitoring network for groundwater storage are identical to those for groundwater level monitoring (Section 5.3.4), because groundwater levels are used to estimate aquifer storage.

As noted above in Section 5.4.1, storage changes in the northern portion of the Basin will be addressed by using the numerical model.

A relationship between measured groundwater levels and storage (a.k.a. a “storage curve” approach) has been developed using the numerical model that addresses this data gap. This relationship will be used to calculate the annual storage change. More information about the storage curve approach to estimating annual change in storage is provide in Appendix K.

Groundwater extraction is reported to Untied for each active well on a semiannual basis per Water Code §75611. Thus, there are no spatial reporting gaps to address. It is noted that reporting is made for the periods January-June and July-December. MBGSA will use this reporting to estimate water year extractions.

5.5 Seawater Intrusion Monitoring Network [§354.34(e),(g)(3),(h), and (j)]

§354.34 Monitoring Network.
(e) *A Plan may utilize site information and monitoring data from existing sources as part of the monitoring network.*
(g) *Each Plan shall describe the following information about the monitoring network:*
(3) *For each sustainability indicator, the quantitative values for the minimum threshold, measurable objective, and interim milestones that will be measured at each monitoring site or representative monitoring sites established pursuant to Section 354.36.*
(h) *The location and type of each monitoring site within the basin displayed on a map, and reported in tabular format, including information regarding the monitoring site type, frequency of measurement, and the purposes for which the monitoring site is being used.*
(j) *An Agency that has demonstrated that undesirable results related to one or more sustainability indicators are not present and are not likely to occur in a basin, as described in Section 354.26, shall not be required to establish a monitoring network related to those sustainability indicators.*

A subset of the degraded water quality monitoring network consisting of cluster wells 02N23W15J01S/02S and planned monitoring well clusters at Sites A and B will be used to monitor for seawater intrusion (Figures 5.3-04 and 5.3-05). Cluster wells 02N23W15J01S/02S and the potential for planned cluster "early warning" wells at Site C will provide shoreline monitoring for early detection of any unexpected seawater intrusion. Planned cluster wells at Sites A and B will be used to monitor relative to the measurable objectives and minimum thresholds that are designed to protect beneficial uses of groundwater which exist at each of these locations (there are no groundwater beneficial uses in the Coastal Area west of planned cluster well Sites A & B). The aforementioned monitoring sites will be sampled and analyzed for chloride and other dissolved constituents and parameters no less frequently than annually as part of the degraded water quality monitoring network.

5.5.1 Attainment of Monitoring Objectives and Other Requirements [§354.34(c)(3) and (g)(1)]

§354.34 Monitoring Network.
(c) *Each monitoring network shall be designed to accomplish the following for each sustainability indicator:*
(3) *Seawater Intrusion. Monitor seawater intrusion using chloride concentrations, or other measurements convertible to chloride concentrations, so that the current and projected rate and extent of seawater intrusion for each applicable principal aquifer may be calculated.*
(g) *Each Plan shall describe the following information about the monitoring network:*
(1) *Scientific rationale for the monitoring site selection process.*

In accordance with GSP Emergency Regulations §354.34(b) and (d), the seawater intrusion monitoring network sites have been selected using MBGSA's scientific judgment to demonstrate progress toward (1) achieving measurable objectives described in the GSP, (2) monitor impacts to the beneficial uses and users of groundwater, (3) monitor changes in groundwater conditions relative to measurable objectives and minimum thresholds, and (4) provide adequate coverage of sustainability indicators. The seawater intrusion monitoring network focuses on the Coastal Area of the Basin where agricultural beneficial users are proximal to the Coast and would be at risk if unexpected seawater intrusion occurs (Figure 5.3-04 and 5.3-05).

Pursuant to GSP Emergency Regulations §354.34(c)(3), the seawater intrusion monitoring network sites have been selected to provide chloride concentrations to assess the projected rate and extent of seawater intrusion for each principal aquifer. The existing and planned groundwater quality monitoring wells screened in the Hueneme Aquifer and the Mugu Aquifer are considered to provide sufficient density for the following scientific and practical reasons, consistent with the key Basin-specific monitoring network design factors discussed in Section 5.2:

- The groundwater quality monitoring sites (existing and proposed) were selected to provide coverage across the Coastal Area where seawater intrusion could occur.
- The seawater intrusion monitoring sites (existing and proposed) were sited to provide both early warning of seawater intrusion and measurements relative to minimum thresholds and measurable objectives to protect groundwater beneficial uses.
- An annual sampling frequency is considered adequate because numerical modeling suggests that the average travel time between the shoreline wells and planned cluster wells A & B is more than the 50-year SGMA implementation timeframe, although it is possible that travel times could be shorter in the more permeable zones of an aquifer. If monitoring results suggest seawater may be present in any of the monitoring sites, the well will be resampled and, if confirmed, the sampling frequency will be increased to quarterly.

5.5.2 Data and Reporting Standards [§354.34(g)(2)]

§354.34 Monitoring Network.
(g) *Each Plan shall describe the following information about the monitoring network:*
(2) *Consistency with data and reporting standards described in Section 352.4. If a site is not consistent with those standards, the Plan shall explain the necessity of the site to the monitoring network, and how any variation from the standards will not affect the usefulness of the results obtained.*

The data and reporting standards for seawater intrusion monitoring are identical to those for the degraded water quality monitoring network, described in Section 5.6.2.

5.5.3 Monitoring Protocols [§354.34(i)]

23 Cal. Code Regs. §354.34 Monitoring Network.
(i) *The monitoring protocols developed by each Agency shall include a description of technical standards, data collection methods, and other procedures or protocols pursuant to Water Code Section 10727.2(f) for monitoring sites or other data collection facilities to ensure that the monitoring network utilizes comparable data and methodologies.*

The monitoring protocols for seawater intrusion monitoring are identical to those for the degraded water quality monitoring network (Section 5.6.2).

5.5.4 Assessment and Improvement of Monitoring Network [§354.38(a),(b),(c)(1),(c)(2),(d),(e)(1),(e)(2),(e)(3), and (e)(4)]

§354.38 Assessment and Improvement of Monitoring Network.

(a) *Each Agency shall review the monitoring network and include an evaluation in the Plan and each five-year assessment, including a determination of uncertainty and whether there are data gaps that could affect the ability of the Plan to achieve the sustainability goal for the basin.*

(b) *Each Agency shall identify data gaps wherever the basin does not contain a sufficient number of monitoring sites, does not monitor sites at a sufficient frequency, or utilizes monitoring sites that are unreliable, including those that do not satisfy minimum standards of the monitoring network adopted by the Agency.*

(c) *If the monitoring network contains data gaps, the Plan shall include a description of the following:*

- ***(1)*** *The location and reason for data gaps in the monitoring network.*
- ***(2)*** *Local issues and circumstances that limit or prevent monitoring.*

(d) *Each Agency shall describe steps that will be taken to fill data gaps before the next five-year assessment, including the location and purpose of newly added or installed monitoring sites.*

(e) *Each Agency shall adjust the monitoring frequency and density of monitoring sites to provide an adequate level of detail about site-specific surface water and groundwater conditions and to assess the effectiveness of management actions under circumstances that include the following:*

- ***(1)*** *Minimum threshold exceedances.*
- ***(2)*** *Highly variable spatial or temporal conditions.*
- ***(3)*** *Adverse impacts to beneficial uses and users of groundwater.*
- ***(4)*** *The potential to adversely affect the ability of an adjacent basin to implement its Plan or impede achievement of sustainability goals in an adjacent basin.*

Pursuant to GSP Emergency Regulations §354.38, MBGSA has assessed the existing seawater intrusion monitoring network and determined that certain data gaps exist. MBGSA concluded that additional wells are needed for measurements relative to minimum thresholds and measurable objectives. Planned monitoring well cluster Sites A and B were identified to address these gaps (Figure 5.3-04 and 5.3-05). An additional cluster wells at Site C will be considered to augment existing cluster well 02N23W15J01S/02S for early warning of seawater intrusion along the shoreline. Construction of Site C will be considered following the five-year GSP evaluation, based on monitoring results and funding availability.

DRAFT

5.6 Degraded Water Quality Monitoring Network [§354.34(e),(g)(3),(h), and (j)]

23 Cal. Code Regs. §354.34 Monitoring Network.

(e) *A Plan may utilize site information and monitoring data from existing sources as part of the monitoring network.*

(g) *Each Plan shall describe the following information about the monitoring network:*

(3) *For each sustainability indicator, the quantitative values for the minimum threshold, measurable objective, and interim milestones that will be measured at each monitoring site or representative monitoring sites established pursuant to Section 354.36.*

(h) *The location and type of each monitoring site within the basin displayed on a map, and reported in tabular format, including information regarding the monitoring site type, frequency of measurement, and the purposes for which the monitoring site is being used.*

(j) *An Agency that has demonstrated that undesirable results related to one or more sustainability indicators are not present and are not likely to occur in a basin, as described in Section 354.26, shall not be required to establish a monitoring network related to those sustainability indicators.*

Table 5.3-01 summarizes information regarding depth, sampling frequency, and purpose of the ten existing wells in Mound Basin that have been regularly sampled for water quality analysis. These wells are referred to as the "existing groundwater quality monitoring network." Locations of wells previously used to monitor groundwater quality in the Mugu and Hueneme aquifers are shown on Figures 5.3-04 and 5.3-05, respectively. Inspection of Table 5.3-01 indicates that most (six) existing groundwater quality monitoring sites are screened solely in the Hueneme Aquifer (one additional well is screened chiefly in the Hueneme Aquifer, but its screen may extend into the Mugu Aquifer), which is one of the two principal aquifers where most of the groundwater is extracted from Mound Basin (Table 3.1-02). Three groundwater quality monitoring sites are screened solely in the Mugu Aquifer, which is the other principal aquifer. In addition to these 10 groundwater quality monitoring sites, the existing monitoring wells screened in the fine-grained Pleistocene deposits overlying the Mugu Aquifer (02N22W07M03S and 02N23W07J03S) will be sampled occasionally to characterize the quality of the water that could leak into the Mugu Aquifer (Figure 5.3-03).

Two additional monitoring well clusters are planned in the Coastal Area to provide additional water quality monitoring sites for the seawater intrusion sustainability indicator (Sites A and B on Table 5.3-02 and Figures 5.3-04 and 5.3-05). These planned monitoring well clusters will include discrete screen intervals in each principal aquifer and will be incorporated into the groundwater quality monitoring network once constructed. Site C is a potential "early warning" shoreline well and the plans to install the well will be evaluated following the five-year review.

The aforementioned monitoring sites (existing and planned) will be sampled and analyzed annually for inorganic constituents (general mineral analysis) and common water quality parameters (Table 5.6-01). In addition to this annual sampling (in fall), United currently is conducting supplemental sampling at many of the monitoring wells for an abbreviated analyte list every spring; this spring sampling by United is expected to continue in the future as part of the GSP.

5.6.1 Attainment of Monitoring Objectives and Other Requirements [§354.34(c)(4) and (g)(1)]

§354.34 Monitoring Network.
(c) *Each monitoring network shall be designed to accomplish the following for each sustainability indicator:*
(4) *Degraded Water Quality. Collect sufficient spatial and temporal data from each applicable principal aquifer to determine groundwater quality trends for water quality indicators, as determined by the Agency, to address known water quality issues.*
(g) *Each Plan shall describe the following information about the monitoring network:*
(1) *Scientific rationale for the monitoring site selection process.*

In accordance with GSP Emergency Regulations §354.34(b) and (d), the groundwater quality monitoring network sites have been selected using MBGSA's scientific judgment to demonstrate progress toward (1) achieving measurable objectives described in the GSP, (2) monitor impacts to the beneficial uses and users of groundwater, (3) monitor changes in groundwater conditions relative to measurable objectives and minimum thresholds, and (4) provide adequate coverage of sustainability indicators. Importantly, there is no groundwater extraction in the northern portion of the Basin; thus, the sustainability indicators that rely on groundwater quality are necessarily focused on the southern portion of the Basin. The groundwater quality monitoring network has a special focus in areas of greatest risk for undesirable results: the western half of the Basin where agricultural beneficial users are proximal to the coast and would be at risk if unexpected seawater intrusion occurs. Additional monitoring well clusters are proposed in the western half of the Basin to address these concerns.

Pursuant to GSP Emergency Regulations §354.34(c)(4), the groundwater quality monitoring network sites have been selected to provide sufficient spatial and temporal data from each principal aquifer to determine groundwater quality trends. The existing and planned groundwater quality monitoring wells screened in the Hueneme and Mugu aquifers are considered to provide sufficient density for the following scientific and practical reasons consistent with the key Basin-specific monitoring network design factors discussed in Section 5.2:

- The groundwater quality monitoring sites (existing and proposed) were selected to provide focused monitoring of the western half of the Basin, where the greatest risk for undesirable results exists (i.e., seawater intrusion leading to increased chloride concentrations).
- The groundwater quality monitoring sites (existing and proposed) were selected to provide coverage across the southern portion of the Basin where current and projected groundwater beneficial uses exist.
- The lack of monitoring sites in the northern portion of the Basin is not believed to limit MBGSA's ability to sustainably manage the Basin because there are no groundwater beneficial uses in that area.
- A higher density of groundwater level monitoring sites has been selected in the Hueneme Aquifer commensurate with the fact that this aquifer supplies most of the water extracted from the Basin.
- The relatively limited number of groundwater level monitoring sites in the Mugu Aquifer is not believed to limit MBGSA's ability to sustainably manage the Basin; additional groundwater

quality monitoring sites would be helpful in the Mugu Aquifer, but the proposed network is considered adequate given the small amount of groundwater extraction from the aquifer.

- The annual sampling frequency is considered adequate. More frequent monitoring, when feasible, is desirable but not considered necessary for sustainable management of the Basin unless conditions change. The monitoring frequency will be increased if unexpected changes in water quality are observed. This will happen based on the Plan Manager's professional judgment and the changes will be reflected as described in the Annual Report and incorporated in the next GSP update.

Additional factors considered during selection of the groundwater quality monitoring sites include:

1. To the extent practicable, existing wells have been used as monitoring sites to avoid the cost and public nuisance associated with drilling new wells in a largely urban setting. However, in areas where groundwater quality monitoring would provide crucial information, but no existing wells are present (or are unsuitable for some reason, such as being screened at a depth that would not provide useful data), new wells have been installed in parks and other public spaces in Mound Basin in the past.
2. DWR's BMPs for developing monitoring networks (2016c) cites guidance stating that the density of monitoring wells should be 6.3 wells per 100 mi^2 (Sophocleous, 1983) to 4.0 wells per 100 mi^2 (Hopkins, 1994; applies to basins with groundwater extractions of more than 10,000 AF per 100 mi^2). In the principal aquifers of the Mound Basin (which has an area of approximately 23 mi^2), there are two existing groundwater quality monitoring wells (density of nine wells per 100 mi^2) screened solely in the Mugu Aquifer and six existing groundwater quality monitoring wells (density of 27 wells per 100 mi^2) screened solely in the Hueneme Aquifer. Therefore, the density of monitoring sites in the existing groundwater quality monitoring network exceeds the metrics recommended by DWR.

5.6.2 Data and Reporting Standards [§354.34(g)(2)]

§354.34 Monitoring Network.
(g) *Each Plan shall describe the following information about the monitoring network:*
(2) *Consistency with data and reporting standards described in Section 352.4. If a site is not consistent with those standards, the Plan shall explain the necessity of the site to the monitoring network, and how any variation from the standards will not affect the usefulness of the results obtained.*

The groundwater quality monitoring sites are generally consistent with applicable data and reporting standards set forth in GSP Emergency Regulations §352.4. Exceptions to the standards are described below:

- Well 02N23W13F02S is screened primarily in the Hueneme Aquifer, with a small length of screened interval in the Mugu Aquifer, as noted on Table 5.3-01. Results of water quality analyses for samples obtained from this well historically have been consistent with water quality at other wells screened in the Hueneme Aquifer in Mound Basin, suggesting it extracts groundwater primarily from the Hueneme Aquifer. Therefore, this well will remain in the GSP groundwater level monitoring network.

- Well 02N22W08G01S is believed to be screened in both the Mugu Aquifer and the upper part of the Hueneme Aquifer, as noted on Table 5.3-01. Additionally, water quality samples obtained from this well have been anomalous in the past, as described in Section 3.1.4.3, suggesting influence of shallow groundwater, possibly through a compromised well seal or well casing. This well is included in the GSP groundwater level monitoring network for completeness because it has been part of the existing monitoring program in the Basin; however, results of water quality analysis for samples from this well may not be consistent with groundwater chemistry in either the Mugu or Hueneme aquifers in the vicinity of this well and will not be a determining factor when analyzing concentrations relative to the minimum threshold and measurable objectives.

5.6.3 Monitoring Protocols [§354.34(i)]

23 Cal. Code Regs. §354.34 Monitoring Network.
(i) *The monitoring protocols developed by each Agency shall include a description of technical standards, data collection methods, and other procedures or protocols pursuant to Water Code Section 10727.2(f) for monitoring sites or other data collection facilities to ensure that the monitoring network utilizes comparable data and methodologies.*

United and VCWPD collect groundwater quality data from wells in Mound Basin (Table 5.3-01) in general conformance with the DWR's BMPs for monitoring protocols, standards, and sites (DWR, 2016b). The City of Ventura must additionally meet United States Environmental Protection Agency and California DDW standards for municipal water supply. Data and reporting standards for groundwater quality sampling at their municipal water supply wells typically exceed the recommended standards described in DWR's BMPs (2016b). The key DWR "standardized protocols" for groundwater quality sampling as described in Section 5.5.2 are followed by United, VCWPD, and the City of Ventura. More details are provided in the referenced guidance document (DWR, 2016b), and are not repeated in this GSP. It is presently anticipated that United, VCWPD, and the City of Ventura will continue collecting groundwater quality data from the existing monitoring network, including any improvements or modifications made in the future, and report those data to the MBGSA.

DRAFT

5.6.4 Assessment and Improvement of Monitoring Network [§354.38(a),(b),(c)(1),(c)(2),(d),(e)(1),(e)(2),(e)(3), and (e)(4)]

§354.38 Assessment and Improvement of Monitoring Network.

(a) *Each Agency shall review the monitoring network and include an evaluation in the Plan and each five-year assessment, including a determination of uncertainty and whether there are data gaps that could affect the ability of the Plan to achieve the sustainability goal for the basin.*

(b) *Each Agency shall identify data gaps wherever the basin does not contain a sufficient number of monitoring sites, does not monitor sites at a sufficient frequency, or utilizes monitoring sites that are unreliable, including those that do not satisfy minimum standards of the monitoring network adopted by the Agency.*

(c) *If the monitoring network contains data gaps, the Plan shall include a description of the following:*

- ***(1)*** *The location and reason for data gaps in the monitoring network.*
- ***(2)*** *Local issues and circumstances that limit or prevent monitoring.*

(d) *Each Agency shall describe steps that will be taken to fill data gaps before the next five-year assessment, including the location and purpose of newly added or installed monitoring sites.*

(e) *Each Agency shall adjust the monitoring frequency and density of monitoring sites to provide an adequate level of detail about site-specific surface water and groundwater conditions and to assess the effectiveness of management actions under circumstances that include the following:*

- ***(1)*** *Minimum threshold exceedances.*
- ***(2)*** *Highly variable spatial or temporal conditions.*
- ***(3)*** *Adverse impacts to beneficial uses and users of groundwater.*
- ***(4)*** *The potential to adversely affect the ability of an adjacent basin to implement its Plan or impede achievement of sustainability goals in an adjacent basin.*

The existing groundwater quality monitoring network, as described in Section 5.6, is considered generally suitable for groundwater sustainability planning relative to the criteria provided in DWR's GSP and CASGEM guidance (DWR, 2016a, 2010), and has met the needs of United and the City of Ventura in past decades.

Pursuant to GSP Emergency Regulations §354.38, MBGSA has assessed the existing groundwater quality monitoring network and determined that certain data gaps exist. Planned actions to address the data gaps before the next five-year assessment are discussed below.

Northern Portion of Mound Basin

As discussed in section 5.6.1, the northern portion of the Basin lacks groundwater quality monitoring sites. The lack of groundwater quality monitoring sites is due to the lack of groundwater extraction wells in the northern half of the Basin. Future groundwater beneficial uses are not anticipated in the northern part of the Basin due to the dominance of residential tract housing. Because there are no current or anticipated future beneficial uses, this data gap is not considered to a limiting factor for sustainable management of the Basin and will not be addressed unless changing conditions in the Basin warrant monitoring sites.

Mugu Aquifer

As discussed in section 5.6.1, there are a relatively limited number of groundwater quality monitoring sites in the Mugu Aquifer. This data gap is not believed to limit MBGSA's ability to sustainably manage the Basin because there is limited groundwater extraction from this aquifer. Additional groundwater quality monitoring sites would be helpful in the Mugu Aquifer, but the existing network is considered adequate given the small amount of groundwater extraction from the aquifer. However, it is noted that

the planned monitoring sites to address seawater intrusion (planned cluster sites A-C; section) will provide additional water quality data in the Mugu Aquifer.

5.7 Land Subsidence Monitoring Network [§354.34(e),(g)(3),(h), and (j)]

23 Cal. Code Regs. §354.34 Monitoring Network.

(e) *A Plan may utilize site information and monitoring data from existing sources as part of the monitoring network.*

(g) *Each Plan shall describe the following information about the monitoring network:*

(3) *For each sustainability indicator, the quantitative values for the minimum threshold, measurable objective, and interim milestones that will be measured at each monitoring site or representative monitoring sites established pursuant to Section 354.36.*

(h) *The location and type of each monitoring site within the basin displayed on a map, and reported in tabular format, including information regarding the monitoring site type, frequency of measurement, and the purposes for which the monitoring site is being used.*

(j) *An Agency that has demonstrated that undesirable results related to one or more sustainability indicators are not present and are not likely to occur in a basin, as described in Section 354.26, shall not be required to establish a monitoring network related to those sustainability indicators.*

As described in Section 4.8.2 of this GSP, InSAR is not considered a reliable method for measuring land subsidence in the western half of the Mound Basin due to multiple factors:

1. There is a significant lack of coverage in the western half of the Mound Basin (Figure 3.2-19), which causes the interpolated InSAR subsidence rates to be unreliable.
2. InSAR data provided by DWR are interpolated across the basin boundary between Mound and Oxnard basins. This is not appropriate because of the faults and folds that comprise the basin boundary. These structures likely impact the propagation of any subsidence between the basins (Figures 3.1-02, 3.1-06, and 3.2-19).
3. There is a subsidence "hotspot" that corresponds with a landfill located just south of the Mound Basin in the adjacent Oxnard Basin, which would be representing natural land compaction at the landfill. Careful inspection of the InSAR interpolation reveals that the hotpot greatly influences the subsidence values in the western portion of the Mound Basin, which lacks InSAR data (Figure 3.2-19).

For these reasons, groundwater elevations will be used as a proxy to detect and monitor the potential onset of inelastic land subsidence that may result from future groundwater extractions in Mound Basin (i.e., if groundwater elevations decline below historical low levels). Therefore, the land subsidence monitoring network utilizes the groundwater level monitoring network for the western half of the Basin, which is described above in Section 5.3. To ensure the best available data is used for monitoring, the eastern half of the Basin utilizes InSAR data to measure land surface elevation changes when groundwater levels are below historical lows (Section 4.8).

5.7.1 Attainment of Monitoring Objectives and Other Requirements [§354.34(c)(5) and (g)(1)]

§354.34 Monitoring Network.
(c) *Each monitoring network shall be designed to accomplish the following for each sustainability indicator:*
(5) *Land Subsidence. Identify the rate and extent of land subsidence, which may be measured by extensometers, surveying, remote sensing technology, or other appropriate method.*
(g) *Each Plan shall describe the following information about the monitoring network:*
(1) *Scientific rationale for the monitoring site selection process.*

The land subsidence monitoring network design criterion provided in GSP Emergency Regulations §354.34(c)(5) is to identify the rate and extent of land subsidence, which may be measured by extensometers, surveying, remote sensing technology, or other appropriate methods. Using groundwater levels as a proxy for inelastic land subsidence is an appropriate method because it is mentioned in the GSP Emergency Regulations (§354.36(b)) and because the sustainability goal of no measurable inelastic land subsidence due to groundwater extractions is directly correlated with maintaining groundwater levels above historical low levels. Declining groundwater levels (typically resulting from groundwater extractions) are one potential cause for land subsidence in California, especially when groundwater levels decline below historical lows (Sneed et al., 2013). However, after fine-grained sediments have been compacted during an episode of historically low groundwater levels, there is low probability of additional subsidence unless groundwater elevations decline further—specifically, below the previous historical lows (DWR, 2014). For these reasons, the groundwater level monitoring network will be used to attain the monitoring objectives for the land subsidence monitoring network.

5.7.2 Data and Reporting Standards [§354.34(g)(2)]

§354.34 Monitoring Network.
(g) *Each Plan shall describe the following information about the monitoring network:*
(2) *Consistency with data and reporting standards described in Section 352.4. If a site is not consistent with those standards, the Plan shall explain the necessity of the site to the monitoring network, and how any variation from the standards will not affect the usefulness of the results obtained.*

The data and reporting standards for land subsidence monitoring are identical to those for groundwater level monitoring since groundwater levels will be used as a proxy for indicating potential onset of land subsidence.

For the eastern half of the Basin, InSAR data acquired from DWR along with available GPS data will be reported in feet to an accuracy of at least 0.1 feet relative to North American Vertical Datum of 1988 (NAVD88). The InSAR and GPS data will be compared with groundwater level data to analyze the rate of ground position decline with variation in groundwater levels to determine subsidence in relation to groundwater levels or extraction rates. Results will be mapped, graphed, and reported consistent with standards described in GSP Emergency Regulations (§352.4 (d)), and provided with the GSP updates.

DRAFT

5.7.3 Monitoring Protocols [§354.34(i)]

23 Cal. Code Regs. §354.34 Monitoring Network.
(i) *The monitoring protocols developed by each Agency shall include a description of technical standards, data collection methods, and other procedures or protocols pursuant to Water Code Section 10727.2(f) for monitoring sites or other data collection facilities to ensure that the monitoring network utilizes comparable data and methodologies.*

The monitoring protocols for land subsidence monitoring are identical to those for groundwater level monitoring, as groundwater levels will be used as a proxy for indicating potential onset of land subsidence.

Subsidence data for the eastern half of the Basin will be acquired from DWR from their SGMA Data Viewer web-based GIS viewer (DWR, 2020), and reviewed. In addition to the InSAR results, data from a continuous GPS, VNCO, which is maintained by a non-profit university consortium, will be downloaded and reviewed (UNAVCO, 2020). GPS data will be compared with groundwater level data to analyze the rate of ground position decline with variation in groundwater levels to determine subsidence in relation to groundwater levels or extraction rates.

5.7.4 Assessment and Improvement of Monitoring Network [§354.38(a),(b),(c)(1),(c)(2),(d),(e)(1),(e)(2),(e)(3), and (e)(4)]

§354.38 Assessment and Improvement of Monitoring Network.
(a) *Each Agency shall review the monitoring network and include an evaluation in the Plan and each five-year assessment, including a determination of uncertainty and whether there are data gaps that could affect the ability of the Plan to achieve the sustainability goal for the basin.*
(b) *Each Agency shall identify data gaps wherever the basin does not contain a sufficient number of monitoring sites, does not monitor sites at a sufficient frequency, or utilizes monitoring sites that are unreliable, including those that do not satisfy minimum standards of the monitoring network adopted by the Agency.*
(c) *If the monitoring network contains data gaps, the Plan shall include a description of the following:*
- ***(1)*** *The location and reason for data gaps in the monitoring network.*
- ***(2)*** *Local issues and circumstances that limit or prevent monitoring.*

(d) *Each Agency shall describe steps that will be taken to fill data gaps before the next five-year assessment, including the location and purpose of newly added or installed monitoring sites.*
(e) *Each Agency shall adjust the monitoring frequency and density of monitoring sites to provide an adequate level of detail about site-specific surface water and groundwater conditions and to assess the effectiveness of management actions under circumstances that include the following:*
- ***(1)*** *Minimum threshold exceedances.*
- ***(2)*** *Highly variable spatial or temporal conditions.*
- ***(3)*** *Adverse impacts to beneficial uses and users of groundwater.*
- ***(4)*** *The potential to adversely affect the ability of an adjacent basin to implement its Plan or impede achievement of sustainability goals in an adjacent basin.*

Assessment and potential improvements of the monitoring network for land subsidence are identical to those for groundwater level monitoring since groundwater levels are used as a proxy for indicating potential onset of land subsidence.

MBGSA has assessed the available InSAR and GPS data for the eastern half of the Basin and has considered it generally suitable for estimating land subsidence in the case that groundwater levels are below the

historical low. There are some minor gaps in InSAR raster coverage in the eastern half of the Basin (see Figure 3.2-19) but will not significantly impact the interpolation of the InSAR land displacement.

5.8 Depletions of Interconnected Surface Water Monitoring Network [§354.34(e),(g)(3),(h), and (j)]

23 Cal. Code Regs. §354.34 Monitoring Network.
(e) *A Plan may utilize site information and monitoring data from existing sources as part of the monitoring network.*
(g) *Each Plan shall describe the following information about the monitoring network:*
(3) *For each sustainability indicator, the quantitative values for the minimum threshold, measurable objective, and interim milestones that will be measured at each monitoring site or representative monitoring sites established pursuant to Section 354.36.*
(h) *The location and type of each monitoring site within the basin displayed on a map, and reported in tabular format, including information regarding the monitoring site type, frequency of measurement, and the purposes for which the monitoring site is being used.*
(j) *An Agency that has demonstrated that undesirable results related to one or more sustainability indicators are not present and are not likely to occur in a basin, as described in Section 354.26, shall not be required to establish a monitoring network related to those sustainability indicators.*

As was described in Section 3.2.6 and 4.9 of this GSP, the depletions of interconnected surface water sustainability criterion was determined to be not applicable to Mound Basin. Therefore, a monitoring network for depletions of interconnected surface water is not required.

5.9 Representative Monitoring Sites [§354.36(a),(b)(1),(b)(2), and (c)]

§354.36 Representative Monitoring. *Each Agency may designate a subset of monitoring sites as representative of conditions in the basin or an area of the basin, as follows:*
(a) *Representative monitoring sites may be designated by the Agency as the point at which sustainability indicators are monitored, and for which quantitative values for minimum thresholds, measurable objectives, and interim milestones are defined.*
(b) *Groundwater elevations may be used as a proxy for monitoring other sustainability indicators if the Agency demonstrates the following:*
(1) *Significant correlation exists between groundwater elevations and the sustainability indicators for which groundwater elevation measurements serve as a proxy.*
(2) *Measurable objectives established for groundwater elevation shall include a reasonable margin of operational flexibility taking into consideration the basin setting to avoid undesirable results for the sustainability indicators for which groundwater elevation measurements serve as a proxy.*
(c) *The designation of a representative monitoring site shall be supported by adequate evidence demonstrating that the site reflects general conditions in the area.*

At present, the MBGSA plans to use data collected from all of the monitoring sites described in Sections 5.3, 5.5, and 5.6 to monitor relevant groundwater sustainability indicators in Mound Basin and is not currently designating a subset of monitoring sites as representative of conditions in the Basin.

5.10 Reporting Monitoring Data to the Department (Data Management System) [§354.40]

§354.40 Reporting Monitoring Data to the Department. *Monitoring data shall be stored in the data management system developed pursuant to Section 352.6. A copy of the monitoring data shall be included in the Annual Report and submitted electronically on forms provided by the Department.*

Pursuant to section §352.6, monitoring data will be stored in MBGSA's DMS. Data will be transmitted to DWR with the GSP, annual reports, and GSP updates electronically on the forms provided by DWR. Information concerning the MBGSA DMS is provided in Appendix L.

DRAFT

6.0 Projects and Management Actions
[Article 5, SubArticle 5]

6.1 Introduction [§354.42, 354.44(a),(b)(2),(b)(9),(c), and (d)]

§354.42 Introduction to Projects and Management Actions. *This Subarticle describes the criteria for projects and management actions to be included in a Plan to meet the sustainability goal for the basin in a manner that can be maintained over the planning and implementation horizon.*

§354.44 Projects and Management Actions

(a) *Each Plan shall include a description of the projects and management actions the Agency has determined will achieve the sustainability goal for the basin, including projects and management actions to respond to changing conditions in the basin.*

(b) *Each Plan shall include a description of the projects and management actions that include the following:*

(2) *If overdraft conditions are identified through the analysis required by Section 354.18, the Plan shall describe projects or management actions, including a quantification of demand reduction or other methods, for the mitigation of overdraft.*

(9) *A description of the management of groundwater extractions and recharge to ensure that chronic lowering of groundwater levels or depletion of supply during periods of drought is offset by increases in groundwater levels or storage during other periods.*

(c) *Projects and management actions shall be supported by best available information and best available science.*

(d) *An Agency shall take into account the level of uncertainty associated with the basin setting when developing projects or management actions.*

This section describes the projects and management actions included in the plan to ensure the sustainability goal is met and to address additional plan elements. Determination of the projects and management actions is based on the best available information and best available science and accounts for the level of uncertainty associated with the Basin setting.

The GSP Emergency Regulations specifically require the inclusion of projects or management actions to address the following:

- **Overdraft (§354.44(b)(2))**: A description of the projects or management actions, including a quantification of demand reduction or other methods, for the mitigation of overdraft, if and overdraft condition is identified through the analysis required by §354.18.
- **Drought Offset Measures §354.44(b)(9)**: A description of the management of groundwater extractions and recharge to ensure that chronic lowering of groundwater levels or depletion of supply during periods of drought is offset by increases in groundwater levels or storage during other periods.

As described in earlier sections, the 50-year modeling projections developed for the water budget suggest that the measurable objectives for the applicable sustainability indicators will be met without the need for overdraft mitigation or drought offset measures. However, several management actions are included to respond to potential changing conditions in the Basin and to help protect groundwater quality.

6.2 Seawater Intrusion Monitoring Wells for Sustainable Management Criteria Implementation [§354.44(b)(1) and (d)]

§354.44 Projects and Management Actions.
(b) *Each Plan shall include a description of the projects and management actions that include the following:*
(1) *A list of projects and management actions proposed in the Plan with a description of the measurable objective that is expected to benefit from the project or management action. The list shall include projects and management actions that may be utilized to meet interim milestones, the exceedance of minimum thresholds, or where undesirable results have occurred or are imminent.*
(d) *An Agency shall take into account the level of uncertainty associated with the basin setting when developing projects or management actions.*

As described in Sections 4.6.2.6 and 5.5.4, MBGSA has assessed the existing seawater intrusion monitoring network and determined that additional monitoring wells are needed between the shoreline and locations of water wells to implement minimum thresholds and measurable objectives designed to protect beneficial uses (monitoring well clusters at Sites A and B (Figure 5.3-04 and 5.3-05)). These wells are needed to meet the SGMA requirement for using a chloride concentration isocontour to delineate the seawater intrusion minimum thresholds and measurable objectives. At least two wells are needed along Harbor Boulevard to establish an isocontour between the coast and the beneficial users of groundwater located to the east. The Site A monitoring well is planned for construction in 2021 and will be funded by the DWR TSS program. The Site B monitoring well would be funded by MBGSA, unless a grant is obtained. Because monitoring wells are required for SMC implementation, they must be constructed before the first five-year GSP assessment (GSP Emergency Regulations §354.38(d)).

6.2.1 Relevant Measurable Objective(s) [§354.44(b)(1)]

§354.44 Projects and Management Actions.
(b) *Each Plan shall include a description of the projects and management actions that include the following:*
(1) *A list of projects and management actions proposed in the Plan with a description of the measurable objective that is expected to benefit from the project or management action. The list shall include projects and management actions that may be utilized to meet interim milestones, the exceedance of minimum thresholds, or where undesirable results have occurred or are imminent.*

The relevant measurable objective for the seawater intrusion monitoring wells project is the measurable objective for the seawater intrusion sustainability indicator. The planned Site A and B wells would also provide groundwater level and quality data that would be relevant to the measurable objectives for the other sustainability indicators.

DRAFT

6.2.2 Implementation Triggers [§354.44(b)(1)(A)]

§354.44 Projects and Management Actions.
(b) *Each Plan shall include a description of the projects and management actions that include the following:*
(1) *The Plan shall include the following:*
(A) *A description of the circumstances under which projects or management actions shall be implemented, the criteria that would trigger implementation and termination of projects or management, and the process by which the Agency shall determine that conditions requiring the implementation of particular projects or management actions have occurred.*

The implementation trigger for the seawater intrusion monitoring wells project is GSP Emergency Regulations §354.38(d), which requires GSAs to address data gaps before the first five-year GSP assessment. This project is already underway, with the Site A monitoring well scheduled for construction in 2021 with funding from the DWR TSS program. No known criteria would trigger the termination of this Project, and the conditions requiring the implementation of this project are discussed in Sections 4.6.2.6 and 5.5.4.

6.2.3 Public Notice Process [§354.44(b)(1)(B)]

§354.44 Projects and Management Actions.
(b) *Each Plan shall include a description of the projects and management actions that include the following:*
(1) *The Plan shall include the following:*
(B) *The process by which the Agency shall provide notice to the public and other agencies that the implementation of projects or management actions is being considered or has been implemented, including a description of the actions to be taken.*

MBGSA will continue to follow its adopted SEP to inform the public about progress implementing the seawater intrusion monitoring wells project.

6.2.4 Permitting and Regulatory Process [§354.44(b)(3)]

§354.44 Projects and Management Actions.
(b) *Each Plan shall include a description of the projects and management actions that include the following:*
(3) *A summary of the permitting and regulatory process required for each project and management action.*

The seawater intrusion monitoring wells project will require the following permits:

- CEQA compliance (most likely a categorical exemption).
- Administrative Coastal Development Permit (City of Ventura).
- Ventura County Well Permit.

6.2.5 Implementation Timeline [§354.44(b)(4)]

§354.44 Projects and Management Actions.
(b) *Each Plan shall include a description of the projects and management actions that include the following:*
(4) *The status of each project and management action, including a time-table for expected initiation and completion, and the accrual of expected benefits.*

This project is already underway and will be completed prior to the first five-year GSP assessment. The Site A monitoring well is scheduled for construction in 2021 with funding from the DWR TSS program. Site B monitoring wells are budgeted for construction in 2026 but would be completed sooner if grant funding is available.

6.2.6 Anticipated Benefits [§354.44(b)(5)]

§354.44 Projects and Management Actions.
(b) *Each Plan shall include a description of the projects and management actions that include the following:*
(5) *An explanation of the benefits that are expected to be realized from the project or management action, and how those benefits will be evaluated.*

The primary benefit of the seawater intrusion monitoring wells project is to provide monitoring sites to implement SMC for the seawater intrusion sustainability indicator.

6.2.7 Implementation Approach [§354.44(b)(6)]

§354.44 Projects and Management Actions.
(b) *Each Plan shall include a description of the projects and management actions that include the following:*
(6) *An explanation of how the project or management action will be accomplished. If the project or management actions rely on water from outside the jurisdiction of the Agency, an explanation of the source and reliability of that water shall be included.*

The Site A monitoring well is scheduled for construction in 2021 with funding from the DWR TSS program.

The Site B monitoring well will be completed by MBGSA. The project will be implemented as a typical design-bid-build project. MBGSA staff will obtain right-of-way, design, bid, and issue a construction contract with the assistance of legal counsel and consultants.

6.2.8 Legal Authority [§354.44(b)(7)]

§354.44 Projects and Management Actions.
(b) *Each Plan shall include a description of the projects and management actions that include the following:*
(7) *A description of the legal authority required for each project and management action, and the basis for that authority within the Agency.*

MBGSA will rely on the authority provided for under SGMA to contract for the construction of monitoring wells.

6.2.9 Cost & Funding [§354.44(b)(8)]

§354.44 Projects and Management Actions.
(b) *Each Plan shall include a description of the projects and management actions that include the following:*
(8) *A description of the estimated cost for each project and management action and a description of how the Agency plans to meet those costs.*

The Site A monitoring well cluster is funded by the DWR TSS program. Unreimbursed costs paid by MBGSA include Coastal Development permit application development and permit fees, well permit fees, and labor to obtain right-of-way and coordinate with DWR. MBGSA' estimated costs for the Site A monitoring wells are $50,000.

Site B monitoring well cluster is budgeted for construction in 2026. The total project costs (all-in) is estimated to be $884,000 (escalated from 2021 dollars assuming 3% per year inflation). The Site B monitoring wells will be funded using groundwater extraction fees, unless grant funding is available.

6.3 Seawater Intrusion Contingency Plan and Additional Shoreline Monitoring Well [§354.44(b)(1) and (d)]

§354.44 Projects and Management Actions.
(b) *Each Plan shall include a description of the projects and management actions that include the following:*
(1) *A list of projects and management actions proposed in the Plan with a description of the measurable objective that is expected to benefit from the project or management action. The list shall include projects and management actions that may be utilized to meet interim milestones, the exceedance of minimum thresholds, or where undesirable results have occurred or are imminent.*
(d) *An Agency shall take into account the level of uncertainty associated with the basin setting when developing projects or management actions.*

As described in Section 3.2.3 Seawater Intrusion, available data indicate that seawater has not been present in the onshore portions of the principal aquifers to date. Section 3.2.3 also explains that the Mound Basin principal aquifers may only be exposed to seawater where they crop out on the continental shelf edge, approximately 10 miles offshore, greatly reducing the likelihood that seawater can find a near-shore path for intrusion into the principal aquifers (Figure 3.1-10). As discussed in Section 4.6, particle tracking simulations indicated that GSP indicate that onshore migration of seawater is not anticipated during the 50-year SGMA planning and implementation horizon from the offshore aquifer subcrops. The possibility of nearshore short-circuit pathways that could allow seawater to enter the aquifer (for example along the Oak Ridge Fault) and migrate onshore during the SGMA planning horizon were also considered in the particle tracking analysis. The particle tracking results indicate that it is unlikely that beneficial users of groundwater would be impacted during the 50-year SGMA planning and implementation horizon by onshore migration of seawater via potential short-circuit pathways located near the coast.

Despite the very encouraging model results for seawater intrusion, MBGSA believes it would be prudent to develop a contingency plan to address any unexpected seawater intrusion. The contingency plan will be developed to identify measures that would be taken to address unexpected seawater intrusion. The contingency plan will be developed prior the first five-year GSP assessment. A related aspect of the contingency plan would be the construction of an additional shoreline monitoring well cluster (Site C on Figures 5.3-04 and 5.3-05) to provide early warning of any onshore flow of seawater. The Site C monitoring

wells would complement the existing shoreline monitoring wells located at Marina Park (02N23W15J01/2). Because the Site C monitoring wells are not required for SMC implementation, they can be constructed after the first five-year GSP assessment. Therefore, the GSP budget projections assume this well cluster would be constructed in 2032, just before the second five-year GSP assessment.

6.3.1 Relevant Measurable Objective(s) [§354.44(b)(1)]

§354.44 Projects and Management Actions.
(b) *Each Plan shall include a description of the projects and management actions that include the following:*
(1) *A list of projects and management actions proposed in the Plan with a description of the measurable objective that is expected to benefit from the project or management action. The list shall include projects and management actions that may be utilized to meet interim milestones, the exceedance of minimum thresholds, or where undesirable results have occurred or are imminent.*

The relevant measurable objective for the seawater intrusion contingency plan and additional shoreline monitoring well project is the measurable objective for the seawater intrusion sustainability indicator. The Site C monitoring well cluster would help ensure the measurable objective is met by providing early warning of unexpected seawater intrusion. The Site C wells would also provide groundwater level and quality data that would be relevant to the measurable objectives for the other sustainability indicators.

6.3.2 Implementation Triggers [§354.44(b)(1)(A)]

§354.44 Projects and Management Actions.
(b) *Each Plan shall include a description of the projects and management actions that include the following:*
(1) *The Plan shall include the following:*
(A) *A description of the circumstances under which projects or management actions shall be implemented, the criteria that would trigger implementation and termination of projects or management, and the process by which the Agency shall determine that conditions requiring the implementation of particular projects or management actions have occurred.*

The seawater intrusion contingency plan and additional shoreline monitoring well project is a voluntary measure that will be undertaken by the MBGSA at its discretion. As such, there is no definitive implementation trigger for developing the contingency plan or constructing the Site C wells.

6.3.3 Public Notice Process [§354.44(b)(1)(B)]

§354.44 Projects and Management Actions.
(b) *Each Plan shall include a description of the projects and management actions that include the following:*
(1) *The Plan shall include the following:*
(B) *The process by which the Agency shall provide notice to the public and other agencies that the implementation of projects or management actions is being considered or has been implemented, including a description of the actions to be taken.*

MBGSA will continue to follow its adopted SEP to inform the public about progress implementing the seawater intrusion contingency plan and additional shoreline monitoring well project.

6.3.4 Permitting and Regulatory Process [§354.44(b)(3)]

§354.44 Projects and Management Actions.
(b) *Each Plan shall include a description of the projects and management actions that include the following:*
(3) *A summary of the permitting and regulatory process required for each project and management action.*

No permits or regulatory approvals are required to develop the seawater intrusion contingency plan.

The additional shoreline monitoring well project will require the following permits:

- CEQA compliance (most likely a categorical exemption).
- Administrative Coastal Development Permit (City of Ventura).
- Ventura County Well Permit.

6.3.5 Implementation Timeline [§354.44(b)(4)]

§354.44 Projects and Management Actions.
(b) *Each Plan shall include a description of the projects and management actions that include the following:*
(4) *The status of each project and management action, including a time-table for expected initiation and completion, and the accrual of expected benefits.*

The seawater intrusion contingency plan and additional shoreline monitoring well project is a voluntary measure that will be undertaken by the MBGSA at its discretion. Contingency plan development is anticipated to be completed during the first five-year GSP assessment period (i.e., before 2027). Due to funding constraints, the additional shoreline monitoring well project is scheduled for construction in 2032 but would be completed sooner if grant funding is available.

6.3.6 Anticipated Benefits [§354.44(b)(5)]

§354.44 Projects and Management Actions.
(b) *Each Plan shall include a description of the projects and management actions that include the following:*
(5) *An explanation of the benefits that are expected to be realized from the project or management action, and how those benefits will be evaluated.*

The seawater intrusion contingency plan and additional shoreline monitoring well project will benefit beneficial users and property interests in the Basin by providing early warning of unexpected seawater intrusion and ensuring pre-planned measures are in place to address it before undesirable results could occur.

6.3.7 Implementation Approach [§354.44(b)(6)]

§354.44 Projects and Management Actions.
(b) *Each Plan shall include a description of the projects and management actions that include the following:*
(6) *An explanation of how the project or management action will be accomplished. If the project or management actions rely on water from outside the jurisdiction of the Agency, an explanation of the source and reliability of that water shall be included.*

DRAFT

The seawater intrusion contingency plan will be developed through a collaborative stakeholder driven process that identifies triggers, actions, and funding mechanisms to address unexpected seawater intrusion. Engineering assistance will be obtained from consultants as needed during the seawater intrusion contingency plan development process.

The Site C additional shoreline monitoring well will be completed by MBGSA. The project will be implemented as a typical design-bid-build project. MBGSA staff will obtain right-of-way, design, and bid, and issue a construction contract with the assistance of legal counsel and consultants.

6.3.8 Legal Authority [§354.44(b)(7)]

§354.44 Projects and Management Actions.
(b) *Each Plan shall include a description of the projects and management actions that include the following:*
(7) *A description of the legal authority required for each project and management action, and the basis for that authority within the Agency.*

MBGSA will rely on the authority provided for under SGMA to develop the seawater intrusion contingency plan or to contract for the construction of monitoring well.

6.3.9 Cost & Funding [§354.44(b)(8)]

§354.44 Projects and Management Actions.
(b) *Each Plan shall include a description of the projects and management actions that include the following:*
(8) *A description of the estimated cost for each project and management action and a description of how the Agency plans to meet those costs.*

The estimated cost for seawater intrusion contingency plan development is $85,000 (shared with the land subsidence contingency plan development). The estimated all-in cost for the new shoreline monitoring well is $1,052,000 (escalated form 2021 dollars assuming 3% per year inflation). The seawater intrusion contingency plan and monitoring wells will be funded using groundwater extraction fees, unless grant funding is available.

6.4 Land Subsidence Contingency Plan [§354.44(b)(1) and (d)]

§354.44 Projects and Management Actions.
(b) *Each Plan shall include a description of the projects and management actions that include the following:*
(1) *A list of projects and management actions proposed in the Plan with a description of the measurable objective that is expected to benefit from the project or management action. The list shall include projects and management actions that may be utilized to meet interim milestones, the exceedance of minimum thresholds, or where undesirable results have occurred or are imminent.*
(d) *An Agency shall take into account the level of uncertainty associated with the basin setting when developing projects or management actions.*

As described in Section 3.2.5 Land Subsidence, no land subsidence due to groundwater extraction has been documented historically in the Mound Basin. Section 3.2.5 also explains that the Mound Basin is considered to have a low estimated potential for inelastic land subsidence. Numerical modeling for the water budget suggests that future groundwater levels will remain above historical low levels, which would

prevent inelastic subsidence due to groundwater extraction (Appendix I). Despite these factors, sustainable management is prudent because groundwater levels could decline below historical levels and trigger inelastic land subsidence if actual future conditions differ significantly from those assumed in the projected water budget analysis.

As described in Section 4.8.1, the Coastal Area (Figure 4.1-01) located west of Harbor Boulevard would be particularly susceptible to impacts of land subsidence. Primary sewer lines to the City's WWTP run along Harbor Boulevard and have a low slope that could be impacted by relatively small amounts of land subsidence. Available studies indicate that the developed areas located west of Harbor Boulevard, including the Pierpont community and Ventura Harbor, will be impacted by sea level rise (Figure 4.8-01a) (VCWPD, 2018). Inelastic land subsidence in this area would unreasonably exacerbate the already significant impacts associated with sea level rise. For these reasons it was determined that any measurable inelastic land subsidence in the Coastal Area could potentially result in undesirable results, particularly as the effects of sea level rise act to increase coastal hazards in the Coastal Area during the planning and implementation horizons.

Despite the very encouraging model results that suggest that land subsidence is not expected during the 50-year GSP implementation period, MBGSA believes it would be prudent to develop a contingency plan to address unexpected conditions that could cause groundwater levels to decline below historical low levels in the western half of the Basin and potentially trigger inelastic land subsidence in the Coastal Area. The contingency plan will be developed to identify triggers and measures that would be taken to halt groundwater level declines before historical low levels are exceeded in the western half of the Basin.

6.4.1 Relevant Measurable Objective(s) [§354.44(b)(1)]

§354.44 Projects and Management Actions.
(b) *Each Plan shall include a description of the projects and management actions that include the following:*
(1) *A list of projects and management actions proposed in the Plan with a description of the measurable objective that is expected to benefit from the project or management action. The list shall include projects and management actions that may be utilized to meet interim milestones, the exceedance of minimum thresholds, or where undesirable results have occurred or are imminent.*

The relevant measurable objective for the land subsidence contingency plan is the measurable objective for the land subsidence sustainability indicator.

6.4.2 Implementation Triggers [§354.44(b)(1)(A)]

§354.44 Projects and Management Actions.
(b) *Each Plan shall include a description of the projects and management actions that include the following:*
(1) *The Plan shall include the following:*
(A) *A description of the circumstances under which projects or management actions shall be implemented, the criteria that would trigger implementation and termination of projects or management, and the process by which the Agency shall determine that conditions requiring the implementation of particular projects or management actions have occurred.*

The land subsidence contingency plan is a voluntary measure that will be undertaken by the MBGSA at its discretion. As such, there is no definitive implementation trigger for developing the contingency plan.

6.4.3 Public Notice Process [§354.44(b)(1)(B)]

§354.44 Projects and Management Actions.
(b) *Each Plan shall include a description of the projects and management actions that include the following:*
(1) *The Plan shall include the following:*
(B) *The process by which the Agency shall provide notice to the public and other agencies that the implementation of projects or management actions is being considered or has been implemented, including a description of the actions to be taken.*

MBGSA will continue to follow its adopted SEP to inform the public about progress developing the land subsidence contingency plan.

6.4.4 Permitting and Regulatory Process [§354.44(b)(3)]

§354.44 Projects and Management Actions.
(b) *Each Plan shall include a description of the projects and management actions that include the following:*
(3) *A summary of the permitting and regulatory process required for each project and management action.*

No permits or regulatory approvals are required to develop the land subsidence contingency plan.

6.4.5 Implementation Timeline [§354.44(b)(4)]

§354.44 Projects and Management Actions.
(b) *Each Plan shall include a description of the projects and management actions that include the following:*
(4) *The status of each project and management action, including a time-table for expected initiation and completion, and the accrual of expected benefits.*

The land subsidence contingency plan is a voluntary measure that will be undertaken by the MBGSA at its discretion. The land subsidence contingency plan development is anticipated to be completed during the first five-year GSP assessment period (i.e., before 2027).

6.4.6 Anticipated Benefits [§354.44(b)(5)]

§354.44 Projects and Management Actions.
(b) *Each Plan shall include a description of the projects and management actions that include the following:*
(5) *An explanation of the benefits that are expected to be realized from the project or management action, and how those benefits will be evaluated.*

the land subsidence contingency plan will benefit beneficial users and property interests in the Basin by providing early warning of groundwater levels declines that could lead to potential land subsidence in the Coastal Area and by ensuring pre-planned measures are to address it before undesirable results could occur.

6.4.7 Implementation Approach [§354.44(b)(6)]

§354.44 Projects and Management Actions.
(b) *Each Plan shall include a description of the projects and management actions that include the following:*
(6) *An explanation of how the project or management action will be accomplished. If the project or management actions rely on water from outside the jurisdiction of the Agency, an explanation of the source and reliability of that water shall be included.*

The land subsidence contingency plan will be developed through a collaborative stakeholder-driven process that identifies triggers, actions, and funding mechanisms to address unexpected groundwater level declines that could lead to potential land subsidence in the Coastal Area. Engineering assistance will be obtained from consultants as needed during the land subsidence contingency plan development process.

6.4.8 Legal Authority [§354.44(b)(7)]

§354.44 Projects and Management Actions.
(b) *Each Plan shall include a description of the projects and management actions that include the following:*
(7) *A description of the legal authority required for each project and management action, and the basis for that authority within the Agency.*

MBGSA will rely on the authority provided for under SGMA to develop the land subsidence contingency plan.

6.4.9 Cost & Funding [§354.44(b)(8)]

§354.44 Projects and Management Actions.
(b) *Each Plan shall include a description of the projects and management actions that include the following:*
(8) *A description of the estimated cost for each project and management action and a description of how the Agency plans to meet those costs.*

The estimated cost for land subsidence contingency plan development is $88,4000 (shared with the seawater intrusion contingency plan development).

6.5 Groundwater Quality Protection Measures [§354.44(b)(1) and (d)]

§354.44 Projects and Management Actions.
(b) *Each Plan shall include a description of the projects and management actions that include the following:*
(1) *A list of projects and management actions proposed in the Plan with a description of the measurable objective that is expected to benefit from the project or management action. The list shall include projects and management actions that may be utilized to meet interim milestones, the exceedance of minimum thresholds, or where undesirable results have occurred or are imminent.*
(d) *An Agency shall take into account the level of uncertainty associated with the basin setting when developing projects or management actions.*

MBGSA will coordinate with the County of Ventura to identify and address improperly constructed or abandoned wells that create conduits for migration of poor-quality water from the Shallow Alluvial

Deposits into the principal aquifers. MBGSA will also coordinate with County of Ventura to review the County well permit ordinance and modify, if necessary, to ensure the future wells are properly sealed to prevent migration of poor-quality water from the Shallow Alluvial Deposits into the principal aquifers.

6.5.1 Relevant Measurable Objective(s) [§354.44(b)(1)]

§354.44 Projects and Management Actions.
(b) *Each Plan shall include a description of the projects and management actions that include the following:*
(1) *A list of projects and management actions proposed in the Plan with a description of the measurable objective that is expected to benefit from the project or management action. The list shall include projects and management actions that may be utilized to meet interim milestones, the exceedance of minimum thresholds, or where undesirable results have occurred or are imminent.*

The relevant measurable objective for the groundwater quality protection measures management action is the measurable objective for the degraded water quality sustainability indicator.

6.5.2 Implementation Triggers [§354.44(b)(1)(A)]

§354.44 Projects and Management Actions.
(b) *Each Plan shall include a description of the projects and management actions that include the following:*
(1) *The Plan shall include the following:*
(A) *A description of the circumstances under which projects or management actions shall be implemented, the criteria that would trigger implementation and termination of projects or management, and the process by which the Agency shall determine that conditions requiring the implementation of particular projects or management actions have occurred.*

The groundwater quality protection measures management action is a voluntary measure that will be undertaken by the MBGSA at its discretion. As such, there is no definitive implementation trigger for developing the contingency plan.

6.5.3 Public Notice Process [§354.44(b)(1)(B)]

§354.44 Projects and Management Actions.
(b) *Each Plan shall include a description of the projects and management actions that include the following:*
(1) *The Plan shall include the following:*
(B) *The process by which the Agency shall provide notice to the public and other agencies that the implementation of projects or management actions is being considered or has been implemented, including a description of the actions to be taken.*

MBGSA will continue to follow its adopted SEP to inform the public about progress implementing the groundwater quality protection measures management action.

6.5.4 Permitting and Regulatory Process [§354.44(b)(3)]

§354.44 Projects and Management Actions.
(b) *Each Plan shall include a description of the projects and management actions that include the following:*
(3) *A summary of the permitting and regulatory process required for each project and management action.*

No permits or regulatory approvals are required to implement groundwater quality protection measures management action.

6.5.5 Implementation Timeline [§354.44(b)(4)]

§354.44 Projects and Management Actions.
(b) *Each Plan shall include a description of the projects and management actions that include the following:*
(4) *The status of each project and management action, including a time-table for expected initiation and completion, and the accrual of expected benefits.*

The groundwater quality protection measures management action is a voluntary measure that will be undertaken by the MBGSA at its discretion. However, it is anticipated that the Groundwater Quality Protection Measures management action will be initiated during the first five-year GSP assessment period (i.e., before 2027).

6.5.6 Anticipated Benefits [§354.44(b)(5)]

§354.44 Projects and Management Actions.
(b) *Each Plan shall include a description of the projects and management actions that include the following:*
(5) *An explanation of the benefits that are expected to be realized from the project or management action, and how those benefits will be evaluated.*

The groundwater quality protection measures management action will benefit beneficial users and property interests in the Basin by protecting groundwater quality from degradation.

6.5.7 Implementation Approach [§354.44(b)(6)]

§354.44 Projects and Management Actions.
(b) *Each Plan shall include a description of the projects and management actions that include the following:*
(6) *An explanation of how the project or management action will be accomplished. If the project or management actions rely on water from outside the jurisdiction of the Agency, an explanation of the source and reliability of that water shall be included.*

The groundwater quality protection measures management action will be developed through collaboration with the County of Ventura, the well permitting agency for the Basin.

6.5.8 Legal Authority [§354.44(b)(7)]

§354.44 Projects and Management Actions.
(b) *Each Plan shall include a description of the projects and management actions that include the following:*
(7) *A description of the legal authority required for each project and management action, and the basis for that authority within the Agency.*

MBGSA will rely on the County of Ventura's legal authority as the well permitting agency for the Basin.

6.5.9 Cost & Funding [§354.44(b)(8)]

§354.44 Projects and Management Actions.
(b) *Each Plan shall include a description of the projects and management actions that include the following:*
(8) *A description of the estimated cost for each project and management action and a description of how the Agency plans to meet those costs.*

The estimated costs for the groundwater quality protection measures management action are included in the groundwater management, coordination, and outreach budget. Grant funding will be pursued to address any improperly constructed or abandoned wells that are identified.

6.6 Interim Shallow Groundwater Data Collection and Analysis [§354.44(b)(1) and (d)]

§354.44 Projects and Management Actions.
(b) *Each Plan shall include a description of the projects and management actions that include the following:*
(1) *A list of projects and management actions proposed in the Plan with a description of the measurable objective that is expected to benefit from the project or management action. The list shall include projects and management actions that may be utilized to meet interim milestones, the exceedance of minimum thresholds, or where undesirable results have occurred or are imminent.*
(d) *An Agency shall take into account the level of uncertainty associated with the basin setting when developing projects or management actions.*

As described in Section 3.1.4.1.3, Section 3.2.6, and Appendix G, the current HCM, data, and modeling indicate that there is virtually no impact of principal aquifer groundwater extractions on groundwater levels in the Shallow Alluvial Deposits or surface flows in the Santa Clara River. In response to concerns communicated by several commenters on the draft GSP, MBGSA will partner with the City of Ventura and United to collect interim shallow groundwater levels and water quality data from existing shallow wells located near the Santa Clara River leading up to the first five-year GSP assessment to confirm the above-described conclusions. MBGSA is currently coordinating with the City of Ventura and United to perform the interim monitoring of shallow groundwater levels in several shallow wells located along the Santa Clara River (see Figure 6.6-01, Table 6.6-01). Note, these wells are not part of the Mound Basin GSP monitoring network, but data from these wells will be collected and analyzed on an interim basis. If data from the interim study confirm the existing conclusions, then no further monitoring will be necessary. If the data suggest a significant relationship exists between the Shallow Alluvial Deposits and Santa Clara River flows with the deeper, principal aquifers, the GSP will be updated to reflect those findings and an appropriate amount of monitoring will be continued.

Consistent with to GSP Emergency Regulations §354.34(c)(1)(B), static groundwater levels will be measured monthly (or more frequently, as feasible) at the shallow wells to represent seasonal-low and seasonal-high groundwater conditions. Groundwater elevations have been measured continuously by the City of Ventura with transducers, or manually on a monthly or bi-monthly basis at the shallow wells, exceeding the SGMA requirement for semiannual (fall and spring) measurements. The continuous data from the transducers is helpful for more accurately determining the precise timing of spring-high and fall-low groundwater elevations each year and for evaluating the interference effects of nearby groundwater extraction on static groundwater levels.

The City of Ventura collects and reports groundwater elevation data from the shallow wells in general conformance with the CASGEM program's "Procedures for Monitoring Entity Reporting" (DWR, 2010) and DWR's (2016b) BMPs for monitoring protocols, standards, and sites. Some key elements of DWR guidance include (but are not limited to) the following:

- Depth to groundwater must be measured relative to an established reference point on the well casing;
- Depth to groundwater must be measured to an accuracy of 0.1 ft below the reference point (it is preferable to measure depth to groundwater to an accuracy of 0.01 ft);
- Transducers must be able to record groundwater levels with an accuracy of 0.1 ft;
- Transducer data should periodically be checked against hand-measured groundwater levels to monitor electronic drift or cable movement.

More details are provided in the referenced guidance documents (DWR, 2010, 2016b), and are not repeated in this GSP. It is presently anticipated that MBGSA, United, and the City of Ventura will continue collecting groundwater level data from the existing shallow wells, including any improvements or modifications made in the future, and report those data to CASGEM and DWR.

6.6.1 Relevant Measurable Objective(s) [§354.44(b)(1)]

§354.44 Projects and Management Actions.
(b) *Each Plan shall include a description of the projects and management actions that include the following:*
(1) *A list of projects and management actions proposed in the Plan with a description of the measurable objective that is expected to benefit from the project or management action. The list shall include projects and management actions that may be utilized to meet interim milestones, the exceedance of minimum thresholds, or where undesirable results have occurred or are imminent.*

There is no relevant measurable objective for the interim shallow groundwater data collection and analysis management action.

6.6.2 Implementation Triggers [§354.44(b)(1)(A)]

§354.44 Projects and Management Actions.
(b) *Each Plan shall include a description of the projects and management actions that include the following:*
(1) *The Plan shall include the following:*
(A) *A description of the circumstances under which projects or management actions shall be implemented, the criteria that would trigger implementation and termination of projects or management, and the process by which the Agency shall determine that conditions requiring the implementation of particular projects or management actions have occurred.*

The interim shallow groundwater data collection and analysis management action is a voluntary measure that will be undertaken by the MBGSA at its discretion. As such, there is no definitive implementation trigger for developing this effort.

6.6.3 Public Notice Process [§354.44(b)(1)(B)]

§354.44 Projects and Management Actions.
(b) *Each Plan shall include a description of the projects and management actions that include the following:*
(1) *The Plan shall include the following:*
(B) *The process by which the Agency shall provide notice to the public and other agencies that the implementation of projects or management actions is being considered or has been implemented, including a description of the actions to be taken.*

MBGSA will continue to follow its adopted SEP to inform the public about progress implementing the interim shallow groundwater data collection and analysis management action.

6.6.4 Permitting and Regulatory Process [§354.44(b)(3)]

§354.44 Projects and Management Actions.
(b) *Each Plan shall include a description of the projects and management actions that include the following:*
(3) *A summary of the permitting and regulatory process required for each project and management action.*

No permits or regulatory approvals are required to implement the interim shallow groundwater data collection and analysis management action.

6.6.5 Implementation Timeline [§354.44(b)(4)]

§354.44 Projects and Management Actions.
(b) *Each Plan shall include a description of the projects and management actions that include the following:*
(4) *The status of each project and management action, including a time-table for expected initiation and completion, and the accrual of expected benefits.*

MBGSA is currently coordinating with the City and United to initiate the monitoring program and data management. The interim shallow groundwater data collection and analysis management action is anticipated to be initiated in 2022 and completed during the first five-year GSP assessment period (i.e., before 2027).

6.6.6 Anticipated Benefits [§354.44(b)(5)]

§354.44 Projects and Management Actions.
(b) *Each Plan shall include a description of the projects and management actions that include the following:*
(5) *An explanation of the benefits that are expected to be realized from the project or management action, and how those benefits will be evaluated.*

The interim shallow groundwater data collection and analysis management action will benefit beneficial users of the shallow groundwater (GDEs) and surface water (instream uses) within the Basin by providing additional data to ensure no impacts from groundwater extraction in the deeper principal aquifers is occurring. If the data indicate a hydraulic connection between the Shallow Alluvial Deposits and the deeper principal aquifers, then the data and analysis will provide the basis and data to update the HCM, SMC, and monitoring network to protect beneficial uses associated with the Shallow Alluvial Deposits and Santa Clara River from any groundwater extraction impacts.

6.6.7 Implementation Approach [§354.44(b)(6)]

§354.44 Projects and Management Actions.
(b) *Each Plan shall include a description of the projects and management actions that include the following:*
(6) *An explanation of how the project or management action will be accomplished. If the project or management actions rely on water from outside the jurisdiction of the Agency, an explanation of the source and reliability of that water shall be included.*

The interim shallow groundwater data collection and analysis management action is being developed through collaboration with the City of Ventura and United to collect and manage the data. MBGSA will develop a temporary monitoring plan and conduct the data analysis.

6.6.8 Legal Authority [§354.44(b)(7)]

§354.44 Projects and Management Actions.
(b) *Each Plan shall include a description of the projects and management actions that include the following:*
(7) *A description of the legal authority required for each project and management action, and the basis for that authority within the Agency.*

The legal authority for the interim shallow groundwater data collection and study are currently being assessed and will be updated in the next annual report.

6.6.9 Cost & Funding [§354.44(b)(8)]

§354.44 Projects and Management Actions.
(b) *Each Plan shall include a description of the projects and management actions that include the following:*
(8) *A description of the estimated cost for each project and management action and a description of how the Agency plans to meet those costs.*

The estimated costs for the interim shallow groundwater data collection and analysis management action are currently being assessed and will be updated in the next annual report.

DRAFT

7.0 GSP Implementation

This GSP section presents the anticipated GSP implementation costs and schedule. Please note that the costs and schedule are approximate estimates based on currently available information and will be updated annually as needed to satisfy GSP annual reporting requirements and for the Agency's annual budgeting process.

7.1 Estimate of GSP Implementation Costs [§354.6(e)]

§354.6 Agency Information. *When submitting an adopted Plan to the Department, the Agency shall include a copy of the information provided pursuant to Water Code Section 10723.8, with any updates, if necessary, along with the following information:*

(e) *An estimate of the cost of implementing the Plan and a general description of how the Agency plans to meet those costs.*

This subsection provides an estimate of the cost to implement the GSP and a general description of how the MBGSA plans to meet those costs. Implementation cost considerations include MBGSA administration, monitoring, data management, maintaining a prudent fiscal reserve, and other costs estimated over the GSP 20-year implementation horizon. The funding sources and mechanisms are also presented. The costs for projects and management actions are not included because none are anticipated to be required to meet the sustainability goal for the Mound Basin. However, costs to develop contingency plans to address unexpected land subsidence or seawater intrusion are included.

The following subsections present estimated costs for each major expense category. The estimated costs include annual costs for ongoing activities and estimated costs for one-time activities that are scheduled to occur within the first five-year GSP assessment period. This approach enables calculating the five-year total cost estimate, which is annualized to better inform MBGSA's general estimate of the costs by the major categories. Because costs are based on the best available estimates at the time of preparation, actual costs may vary from those used in the projections below.

The following subsections describe the scope of the various GSP implementation activities. Associated costs are presented in Table 7.1-01. In general, all costs were developed using 2021 dollars and escalated by 3% per year for the remainder of the 20-year GSP implementation period.

7.1.1 Agency Administration

This category includes the costs related to the administration of the MBGSA, including administrative staff support, finance staff support and related expenses, insurance, organizational memberships and conferences, miscellaneous supplies, and materials. The estimated costs are presented in Table 7.1-01. The MBGSA uses a collaborative staffing model to accomplish its work. Executive management is provided under contract with an independent consultant, Bondy Groundwater Consulting, Inc. (Bryan Bondy). Mr. Bondy serves as the Agency's Executive Director and the GSP Plan Manager. Administrative and accounting support is provided under contract with member agency United. This budget category includes finance-related costs for routine accounts payable and receivable functions, extraction fee billing, budgeting, financial reporting, and financial audits. Administrative costs also include annual liability

insurance costs, IT services (website, email, and cloud storage), and incidentals (postage, copies, etc.). MBGSA does not own or lease any office space or office equipment.

7.1.2 Legal Counsel

Legal services are provided under contract with Klein Denatale Goldner on an as-needed basis. The budget assumes legal review of contracts and access agreements as well as consultation on other matters, such as Brown Act matters and groundwater extraction fee issues.

7.1.3 Groundwater Management, Coordination, and Outreach

GSP implementation will require certain management and coordination activities. The Executive Director will monitor activities of the Member Agencies, land use planning efforts, the Santa Paula Technical Advisory Committee (management of the adjacent adjudicated Santa Paula Basin), and FCGMA (GSP implementation for the adjacent Oxnard Basin), and the Santa Clara River Watershed Committee (Integrated Regional Water Management program). The Executive Director will also stay abreast of DWR updates concerning the SGMA and related programs. This task also includes ongoing outreach required by the SGMA concerning GSP implementation in accordance with the MBGSA Board-approved SEP (Appendix D).

This cost category also includes miscellaneous technical support that may be needed to implement the GSP that is not captured in other cost categories. The specific needs and costs are yet to be identified but it is expected as the initial GSP implementation efforts proceed that these needs will become evident. Examples of technical support are potential tasks such as ongoing data review (outside of annual reporting and GSP evaluation); day-to-day data management, review of funding mechanisms; development of alternative funding mechanisms (grants), and other technical issues that may arise during GSP implementation. It is envisioned that much of the work will be completed by the Executive Director with support from United staff and other consultants, as needed.

Lastly, the year one (Fiscal Year 2022) included $25,000 for the application for a GSP Implementation Grant.

7.1.4 Data Collection

The MBGSA's proposed monitoring program is presented in the monitoring section (Section 5). The initial monitoring networks for the GSP consist of the existing monitoring programs implemented by United and to a lesser extent the VCWPD and City of Ventura. The existing monitoring networks will be supplemented with monitoring well clusters to be constructed by MBGSA (see Section 6) and perhaps several existing wells where opportunities arise.

7.1.4.1 Monitoring Well Construction

Sections 5.3.4, 5.5.4, and 5.6.4 describe monitoring network gaps. In summary, MBGSA concluded that two monitoring wells are needed between the shoreline and locations of water wells to implement minimum thresholds and measurable objectives designed to protect beneficial uses. Two multi-level monitoring wells (clusters) will be constructed to address these needs. The wells were also sited to address

monitoring needs for the land subsidence sustainability indicator and, more generally, to better define the potentiometric surface near the coast and provide additional vertical gradient data.

Pursuant to GSP Emergency Regulations § 354.38(d), the multi-level monitoring wells will be installed in a phased approach at prioritized locations within the next five years. One well is planned for construction in 2021 under DWR's TSS program (Site A on Figures 5.3-01 through 5.3-04). The fiscal year 2022 budget includes $30,000 for coordination with the DWR TSS. MBGSA will budget for and seek to install the other multi-level monitoring well (Site B on Figures 5.3-01 through 5.3-04) before the five-year GSP assessment. The MBGSA's cost to construct the multi-level monitoring wells in 2026 is estimated to be approximately $750,000 per site in 2021 dollars. The estimated costs include access agreements, permitting, project management, and construction costs. These approximate costs are estimates as there are uncertainties such as site-specific considerations and construction bid environment, as well as a variety of other factors that will ultimately determine the all-in construction costs.

In addition to the monitoring wells described above, another monitoring well is proposed to provide early detection of seawater at the shoreline (Site C on Figures 5.3-01 through 5.3-04). However, because this well is not needed for establishing minimum thresholds and measurable objectives, this well does not need to be constructed before first five-year GSP assessment. It is assumed that the well would be constructed before the second five-year GSP assessment, if funding is available.

7.1.4.2 Groundwater Elevation Monitoring

There is a combined network of 24 wells in the Basin monitored at least quarterly. Monitoring is performed by United and to a lesser extent the VCWPD and City of Ventura (Table 5.3-01). Monitoring is described in detail in Section 5.3. The costs for ongoing monitoring of the existing monitoring network are included in the budgets of the current monitoring entities. United staff have indicated a willingness to incorporate the above-described new monitoring sites into its existing network, but that MBGSA would need to cover the costs for pressure transducers. Therefore, costs are included for pressure transducers.

7.1.4.3 Groundwater Quality Monitoring

There is a combined network of 10 wells in the Basin monitored at least quarterly. Monitoring is performed by United and to a lesser extent the VCWPD and City of Ventura (Table 5.3-01). Monitoring is described in detail in Section 5.3. The costs for ongoing monitoring of the existing monitoring network are included in the budgets of the current monitoring entities. United staff have indicated a willingness to incorporate the above-described new monitoring sites into its existing network, but that MBGSA would need to cover the laboratory fees for water quality testing. Therefore, costs are included for water quality testing.

7.1.4.4 Groundwater Extraction Monitoring

Groundwater extractions are reported semiannually to United pursuant to the Water Code §75611. The reported extractions are shared with MBGSA. There is no cost to MBGSA to obtain the extraction volume data.

7.1.5 Annual Reporting

SGMA regulations require submittal of annual reports to DWR on the status of GSP implementation and basin conditions. The reporting requirements are presented in GSP Emergency Regulations §356.2. In general, the annual report must include an executive summary, description, and graphical presentation basin conditions (groundwater levels and storage), reporting of groundwater extractions, reporting of surface water supplies to the Basin, reporting of total water use in the Basin, and discussion of GSP implementation progress relative to the SMC. It is anticipated the annual reports will be prepared by the Executive Director in coordination with United staff and with consultant support. Additional consultant support will be obtained, as needed, to complete the reports. The cost for the first annual report is anticipated to be greater than the cost for subsequent reports because the first report must be developed from scratch and will include several years of data to bridge the gap between data presented in the GSP and water year 2020/2021. The first annual report is due in April 2022.

Ongoing maintenance for the SMGA-required DMS is included in the annual reporting costs. Please see Section 5.10 and Appendix L for more information concerning the DMS.

7.1.6 Projects and Management Actions

Costs to develop a contingency plan for unexpected land subsidence or seawater intrusion are included. Further information about the contingency plans can be found in Section 6. In addition, MBGSA developed a groundwater protection measures management action to identify and address improperly constructed or abandoned wells that create conduits for migration of poor-quality water from the Shallow Alluvial Deposits into the principal aquifers. This management action will also include coordination with the County of Ventura to review the County well permit ordinance and modify, if necessary, to ensure the future wells are properly sealed to prevent migration of poor-quality water from the Shallow Alluvial Deposits into the principal aquifers. Grant funding will be pursued to address any improperly constructed or abandoned wells that are identified.

7.1.7 GSP Evaluations and Amendments

GSP Emergency Regulations § 356.4 require MBGSA to evaluate the GSP at least every five years and in conjunction with any GSP amendments. The initial five-year GSP evaluation is due to DWR in 2027. It is assumed that any Plan amendments will be timed such that only one GSP assessment will be performed per five-year period. GSP evaluations will require the activities described in the following subsections.

7.1.7.1 Numerical Model Updates and Simulations

Prior to performing each five-year GSP evaluation, the numerical flow model used to support GSP development will be updated. The updated model will help inform ongoing performance assessment of the SMC. Periodic updates to the groundwater model will be required to continue to refine and improve its capabilities and maintain ongoing functionality. This includes incorporating new model tools and features, updates to data, and updates to calibration. The model will be an important tool to inform the evaluation of GSP implementation over time. Numerical model updates will be performed by United as part of the activities undertaken to achieve its mission. Therefore, there are no anticipated costs to MBGSA for model updates. Model simulations requested by MBGSA will be performed by United (for a

fee) or a consultant. Therefore, estimated costs for model simulations are included in the GSP implementation budget.

7.1.7.2 GSP Evaluation

SGMA regulations require submittal of written evaluation of the GSP to DWR at least once every five years. The GSP evaluation requirements are presented in GSP Emergency Regulations §356.4. In general, the GSP evaluation must include a description of groundwater conditions relative to each sustainability indicator, discussion of GSP implementation, proposed revisions to the Basin setting, SMC in light of new information or changes in water use, assessment of the monitoring networks, regulatory actions taken by MBGSA, summary of coordination with agencies located within the Basin and in adjacent basins, and a description of any proposed or adopted GSP amendments. It is anticipated the GSP evaluation will be prepared by the Executive Director in coordination with United staff and with consultant support. The cost of the first GSP evaluation is anticipated to be greater than the cost for subsequent reports because the first evaluation must be developed from scratch.

7.1.7.3 GSP Amendments

To control costs, MBGSA will seek to perform any Plan amendments in conjunction with the required five-year evaluations. Pertinent sections of the GSP will be amended, as appropriate, based on new information, groundwater conditions and monitoring results, water use, land use changes, land use plan updates, and groundwater conditions and management status of adjacent basins. It is anticipated the GSP evaluation will be prepared by the Executive Director in coordination with United staff and with consultant support.

7.1.8 Respond to DWR GSP Evaluations and Assessments

MBGSA will respond to DWR comments on the initial GSP and requests for additional information following its review of the adopted GSP. It is assumed that DWR comments on the initial GSP will be received and addressed during fiscal year 2024. MBGSA will respond to DWR comments and requests for information associated with its subsequent five-year GSP assessments. It is anticipated the GSP evaluation will be prepared by the Executive Director in coordination with United staff and with consultant support.

7.1.9 Contingencies

Contingency is included in the budget in recognition that the GSP implementation is new and there is potential for unanticipated expenses. For the purposes of conservatively estimating the cost to implement the GSP, the budget estimate includes a 10% contingency based upon the annual fiscal year budget estimate. The actual need for contingency will be reviewed during each annual budgeting process. It is anticipated the contingency needs will be reduced over time as MBGSA becomes more certain about ongoing GSP implementation costs.

7.1.10 Financial Reserves

Prudent financial management requires that MBGSA carry a general reserve in order to manage cash flow. General reserves have no restrictions on the types of expenses they can be used to fund. Current Board Direction policy on reserve level is $25,000.

DRAFT

7.2 Total Estimated Implementation Costs Through 2042 [§354.6(e)]

§354.6 Agency Information. *When submitting an adopted Plan to the Department, the Agency shall include a copy of the information provided pursuant to Water Code Section 10723.8, with any updates, if necessary, along with the following information:*

(e) *An estimate of the cost of implementing the Plan and a general description of how the Agency plans to meet those costs.*

GSP implementation costs are presented in Table 7.1-01. The estimated cost is presented by budget categories discussed in Section 7.1. The estimated total cost of the GSP implementation over the 20-year planning horizon is [$7,002,188]. Costs through the first five-year assessment periods are also provided as subtotal, and are estimated to be [1,937,618]. The annual costs include an annual rate of inflation of 3.0% factored into the cost projections. These estimated costs are based on the best available information at the time of Plan preparation and submittal. It represents the MBGSA's current understanding of Basin conditions and the current roles and responsibilities of the MBGSA under SGMA.

7.3 Funding Sources and Mechanisms [§354.6(e)]

§354.6 Agency Information. *When submitting an adopted Plan to the Department, the Agency shall include a copy of the information provided pursuant to Water Code Section 10723.8, with any updates, if necessary, along with the following information:*

(e) *An estimate of the cost of implementing the Plan and a general description of how the Agency plans to meet those costs.*

Funding for GSP implementation will be obtained from groundwater extraction fees charged to groundwater users in the Basin. This funding approach has been used since the MBGSA's formation. This funding approach will be reevaluated over time as the GSP implementation progresses. The MBGSA obtained a $760,000 Proposition 1 Sustainable Groundwater Planning Grant from DWR to fund, in part, the development of the GSP. In addition, the Site A monitoring wells planned for construction in 2021 is being funded by DWR's TSS program. MBGSA will continue to pursue funding from state and federal sources to support GSP planning and implementation.

7.4 Implementation Schedule [§354.44(b)(4)]

§354.44 Projects and Management Actions.

(b) *Each Plan shall include a description of the projects and management actions that include the following:*

(4) *The status of each project and management action, including a time-table for expected initiation and completion, and the accrual of expected benefits.*

The GSP is anticipated to be presented to the MBGSA Board for adoption in December 2021 and will be submitted to DWR no later than January 31, 2022. Many of the budget categories consist of ongoing tasks and efforts that will be conducted throughout GSP implementation. GSP reporting will occur on an annual basis, with reports for the preceding water year due to DWR by April 1. Periodic evaluations (every five

years) and associated GSP amendments will be submitted to DWR by April 1 at least every five years (2027, 2032, 2037, and 2042).

The proposed monitoring well clusters are scheduled for construction in 2021, 2026, and 2032, but it is noted that site identification, access agreements, and permitting will take place in the years immediately preceding construction. Then first well scheduled for 2021 construction will be paid for by DWR's TSS program (Site A on Figures 5.3-01 through 5.3-04). Due to the significant construction costs for the remaining monitoring wells, it is anticipated that the second well (Site B) will be constructed during fiscal year 2026 to provide time to accumulate funding. If necessary, the third well (Site C) would be constructed in 2032 to provide time to accumulate funding after completing the second well[2].

DRAFT

2 Because this well is not needed for establishing minimum thresholds and measurable objectives, this well does not need to be constructed before first five-year GSP assessment.

8.0 References and Technical Studies [§354.4(b)]

§354.4 General Information.

(b) *Each Plan shall include the following general information: A list of references and technical studies relied upon by the Agency in developing the Plan. Each Agency shall provide to the Department electronic copies of reports and other documents and materials cited as references that are not generally available to the public.*

3-1 Introduction

This chapter will describe the responsibilities of the District Biologist, the definition of waters of the United States (U.S.) and State, including wetlands, how and why these resources are regulated, and the general procedures that should be implemented by the Biologist when dealing with effects to these resources. For purposes of clarity, the term “waters” will be used in this document to describe all waters of the U.S. and State as defined below in Section 3.3. For additional guidance concerning federal and state laws, regulations, Executive Orders, Caltrans procedures, and supplemental information regarding wetland and waters, refer to Volume 1, Chapter 15, Waters of the U.S. and the State.

3-2 Biologist's Role

The District Biologist acts as the liaison between Caltrans and resource and regulatory agencies, such as the U.S. Army Corps of Engineers (USACE), who are responsible for approving actions that affect waters. The District Biologist is responsible for being aware of the regulatory procedures required for identifying

these resources. In addition, the Biologist must have a basic understanding of wetland/waters ecology in order to determine the extent of potential effects and to design appropriate mitigation or compensation activities.

The District Biologist is a member of the Project Development Team (PDT) with varied responsibilities that frequently go beyond the environmental analysis process. With regard to waters, the overall processes that involve the Biologist are listed below.

- Perform field reviews of the project, as needed, to determine whether waters are present.
- Map or delineate these resources and submit a report to the USACE documenting results and requesting verification of the determination.
- Submit the report to the Natural Resources Conservation Service (NRCS) documenting results and requesting verification of the determination when agricultural lands are being converted to other land uses such as development, roads, and utility lines.
- Provide mapping to the Project Manager and discuss methods to avoid, minimize, or mitigate (compensate for) potential effects to these resources.
- Coordinate with resource and regulatory agency staff to discuss potential project effects and methods to avoid, minimize, or mitigate potential effects to these resources. Where possible, written agreement is obtained from agency staff regarding proposed methods.
- Confirm implementation of avoidance, minimization, and mitigation activities during and/or prior to construction of the transportation project.
- Where required, monitor or provide monitoring oversight for habitat mitigation activities.
- Report monitoring results to resource and regulatory staff as required.

3-3 Waters of the U.S. and the State Defined

3-3.1 Waters of the U.S.

The term "waters of the U.S." (PDF) has broad meaning and incorporates both deep-water aquatic habitats and special aquatic sites, including wetlands. This section defines the term “waters of the U.S.” as it applies to the jurisdictional limits of the authority of the USACE under the Clean Water Act (CWA). It prescribes the policy, practice, and procedures to be used in determining the extent of jurisdiction of the USACE concerning “waters of the U.S.”

The lateral limits of jurisdiction of waters may be divided into three categories. The categories include the territorial seas, tidal waters, and nontidal waters (see 33 CFR 328.4 (PDF), (a), (b), and (c), respectively). More specifically, 33 CFR 328.3(a) (PDF) provides the following clear definition of Waters of the U.S.

The term waters of the U.S. means (1) All waters which are currently used, or were used in the past, or may be susceptible to use in interstate or foreign commerce, including all water which are subject to the ebb and flow of the tide; (2) All interstate waters including interstate wetlands; (3) All other waters such as intrastate lakes, rivers, streams (including intermittent streams), mudflats, sandflats, wetlands, sloughs, prairie potholes, wet meadows, playa lakes, or natural ponds, the use, degradation or destruction of which could affect interstate or foreign commerce including any such waters: (i) Which are or could be used by interstate or foreign travelers for recreational or other purposes; or (ii) From which fish or shellfish are or could be taken and sold in interstate or foreign commerce; or (iii) Which are used or could be used for industrial purposes by industries in interstate commerce; (4) All impoundments of waters otherwise defined as waters of the U.S. under this definition; (5) Tributaries of waters identified in paragraphs (1)-(4); (6) The territorial seas; (7) Wetlands adjacent to waters (other than waters that are themselves wetland) identified in paragraphs (1)-(6).

Waste treatment systems, including treatment ponds or lagoons designed to meet the requirements of the CWA (other than cooling ponds as defined in 40 CFR § 123.11(m) which also meet the criteria of this definition) are not waters of the U.S. 33 CFR § 328.3(a) (PDF); 40 CFR § 230.3(s) (PDF).

Adjacent wetlands subject to CWA Section 404 jurisdictions are those that are bordering, contiguous, or neighboring to other waters of the U.S. Frequently, the term "wetlands and other waters of the U.S." is used when describing areas under USACE jurisdiction.

Waters of the U.S. includes essentially all surface waters such as all navigable waters and their tributaries, all interstate waters and their tributaries, all wetlands adjacent to these waters, and all impoundments of these waters.

3-3.2 Wetlands Defined

Wetlands are driven by hydrology and occur where water is present near the soil surface resulting in soil and plant characteristics that are not found in upland (mostly dry) or aquatic (almost always wet and un-vegetated) habitats. Wetlands are generally found in transition zones between upland and aquatic habitats.

For the regulatory process, the USACE and U.S. Environmental Protection Agency (EPA) jointly define wetlands as follows:

"Those areas that are inundated or saturated by surface or ground water at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions. Wetlands generally include swamps, marshes, bogs, and similar areas (EPA, 40 CFR 230.3 and USACE, 33 CFR 328.3)."

For addressing federal permit issues, Caltrans recognizes this definition and uses it in the assessment of biological effects of transportation projects. The USACE, U.S. Fish and Wildlife Service (FWS), California Coastal Commission (CCC), and Regional Water Quality Control Board (RWQCB) review and approve the permits most frequently required for projects which will affect these resources.

Regulatory changes and/or litigation may result in modification of the definition of waters of the U.S. and State, including wetlands; therefore, the District Biologist or other users of the Standard Environmental Reference (SER), Volume 1 and Volume 3, must use the latest guidance from the USACE.

3-3.3 Waters of the State

The number of wetland definitions contained in state law for planning and regulatory purposes has expanded significantly over the years. The term “Waters of the State” is an attempt to capture all the various aquatic resources regulated by numerous state agencies. It includes rivers, streams, lakes, wetlands, mudflats, vernal pools, and other aquatic sites.

There have been attempts to codify a single State of California definition of “wetlands” that could be used by all state agencies; however, this has not been achieved to date. Each agency is bound by their laws, regulations and policy. Each maintains their own definition of a “wetland.”

For example, the California Department of Fish and Wildlife (CDFW) found the FWS wetland definition and classification system to be the most biologically valid. The FWS definition includes swamps; freshwater, brackish water, and saltwater marshes; bogs; vernal pools; periodically inundated saltflats; intertidal mudflats; wet meadows and pastures; springs and seeps; and portions of lakes, ponds, rivers and streams. CDFW staff use this definition as a guide in identifying wetlands while conducting on-site inspections for implementing the Fish and Game Commission’s wetlands policy.

Waters found in the “coastal zone” are regulated under the California Coastal Act of 1976 and the federal Coastal Zone Management Act of 1972 (CZMA), and are within the jurisdiction of the California Coastal Commission (CCC). Under the Coastal Act, wetlands are defined as “land within the coastal zone which may be covered periodically or permanently with shallow water and include saltwater marshes, freshwater marshes, open or closed brackish water marshes, swamps, mudflats, and fens.” This statutory definition has been expanded upon in the Coastal Commission’s regulations as: “...land where the water table is at, near, or above the land surface long enough to promote the formation of hydric soils or to support the growth of hydrophytes, and shall also include types of wetlands where vegetation is lacking and soil is poorly developed or absent as a result of frequent drastic fluctuations of surface water levels, wave action, water flow, turbidity or high concentration of salts or other substances in the substrate. Such wetlands can be recognized by the presence of surface water or saturated substrate at some time during each year and their location within, or adjacent to vegetated wetland or deep water habitats.” (14 CCR 13577)

Waters in the San Francisco Bay, however, do not lie within the Coastal Commissions jurisdiction and are managed by the San Francisco Bay Conservation and Development Commission (BCDC). The primary law governing the BCDC, the McAteer-Petris Act, does not define wetlands, but does outline the BCDC’s geographical jurisdiction respective to wetlands. BCDC defines jurisdictional wetlands as “managed wetlands consisting of all areas which have been diked off from the bay and have been maintained during the three years immediately preceding the effective date of the amendment of this section during the 1969 Regular Session of the Legislature as a duck hunting preserve, game refuge or for agriculture. (Government Code Section 66610(b)).

As previously stated, regulatory changes and/or litigation may result in modification of the definition of waters of state; therefore, the District Biologist, or other users of the SER, must use the latest guidance from USACE.

3-3.4 CWA Jurisdiction Under Rapanos

The definition of Waters of the U.S. and the State, have been controversial due to conflicting court decisions. In 2008, the EPA and USACE issued revised joint guidance interpreting the bounds of CWA jurisdictions following the 2006 Supreme Court case, Rapanos v. United States. The revised guidance replaces a previous policy issued in June 2007 and clarifies the 2006 Supreme Court decision in Rapanos. In the Rapanos case, the Supreme Court considered where the Federal government can apply the CWA, specifically by determining whether a wetland or tributary is a "water of the U.S." The Court was divided on these issues, creating two vastly different tests for CWA jurisdiction.

Four justices, in a plurality opinion authored by Justice Scalia, rejected the argument that the term "waters of the U.S. is limited to only those waters that are navigable in the traditional sense and their abutting wetlands. However, the plurality concluded that the agencies' regulatory authority should extend only to "relatively permanent, standing or continuously flowing bodies of water" connected to traditional navigable waters, and to "wetlands with a continuous surface connection to" such relatively permanent waters. Justice Kennedy did not join the plurality's opinion but instead authored an opinion concurring in the judgment vacating and remanding the cases to the Sixth Circuit Court of Appeals. Justice Kennedy agreed with the plurality that the statutory term "waters of the U.S." extends beyond water bodies that are traditionally considered navigable. Justice Kennedy, however, found the plurality's interpretation of the scope of the CWA to be "inconsistent with the Act's text, structure, and purpose" and he instead presented a different standard for evaluating CWA jurisdiction over wetlands and other water bodies. Justice Kennedy concluded that wetlands are "waters of the U.S." "if the wetlands, either alone or in combination with similarly situated lands in the region, significantly affect the chemical, physical, and biological integrity of other covered waters more readily understood as 'navigable.' When, in contrast, wetlands' effects on water quality are speculative or insubstantial, they fall outside the zone fairly encompassed by the statutory term 'navigable waters.'
Despite the substantial differences between the two Rapanos opinions, the joint guidance instructs the EPA and USACE to assert CWA jurisdiction when either opinion is met. Due to the Rapanos case, wetland/waters delineation reports should document hydrologic connections between the wetland and waters of the U.S. Special aquatic sites that receive special protection during the Section 404 permitting process should also be identified in delineations. In addition to wetlands, special aquatic sites include sanctuaries and refuges, mudflats, vegetated shallows, coral reefs, and riffle and pool complexes (40 CFR 230.40 et seq.).

3-3.5 Commonly Found Waters of California

In California, wetlands are commonly classified according to the length of time that an area is inundated or saturated by water, or by the types of plants and animals an area supports. For example, if an area is only saturated or inundated for part of the year, it can be classified as a seasonal or perennial wetland. Likewise, areas that are inundated or saturated throughout the entire year may be referred to as a permanent wetland.

The following are common types of waters found in California:

Freshwater: These areas may be permanent or seasonal, inland or coastal. This category includes riparian, or streamside areas, marshes, seeps, montane mountain meadows, and vernal pools. In some cases, wetlands may also occur within riparian settings above the wettest portions of the streambed areas subject to saltwater influence in coastal settings support vegetation adapted to brackish conditions. Alkaline conditions may support vegetation similar to that found in areas influenced by saltwater.

Saltwater: Coastal marsh, subject to full tidal action, occurs along the coast of California. Tidal marshes can be found along protected coastlines in middle and high latitudes worldwide. Some are freshwater marshes, others are brackish (somewhat salty), and still others are saline (salty), but they are all influenced by the motion of ocean tides. Tidal marshes are normally categorized into two distinct zones, the lower or intertidal marsh and the upper or high marsh. In saline tidal marshes, the lower marsh is normally covered and exposed daily by the tide.

Non-tidal marshes also exist, and are the most prevalent and widely distributed wetland/waters in North America. They are mostly freshwater marshes, although some are brackish or alkaline. They frequently occur along streams in poorly drained depressions, and in the shallow water along the boundaries of lakes, ponds, and rivers. Water levels in these wetland/waters generally vary from a few inches to two or three feet, and some marshes, like prairie potholes, may periodically dry out completely.

Vernal Pools/Seasonal Wetlands: Vernal pools are seasonal depressional wetlands that occur under the Mediterranean climate conditions of the West Coast. They are covered by shallow water for variable periods from winter to spring, but may be completely dry for most of the summer and fall. These

wetlands range in size from small puddles to shallow lakes and are usually found in a gently sloping plain of grassland. Although generally isolated, they are sometimes connected to each other by small drainages known as vernal swales. Beneath vernal pools lies either bedrock or a hard clay layer in the soil that helps keep water in the pool.

3-4 Federal Agencies

The following table provides a summary of the Federal agencies that regulate activities in waters of the U.S.

Agency	Regulation	Authority
U.S. Army Corps of Engineers (USACE)	Clean Water Act (CWA), Section 404	Regulates placement of dredged or fill material into waters of the U.S.
	Rivers and Harbors Act of 1899, Section 10	Regulates work in navigable waters of the U.S. and authorizes construction, dumping, and dredging permits
	National Environmental Policy Act (NEPA)	Cooperating Agency
U.S. Environmental Protection Agency (EPA)	CWA	Enforcement of regulations; may enforce violations of USACE 404 permits
	NEPA	Cooperating Agency
U.S. Fish and Wildlife Service (FWS)	Fish and Wildlife Coordination Act	Reviews/comments on Federal actions that affect waters, including Section 404 permit applications
	Federal Endangered Species Act (FESA)	USACE must consult with FWS if listed species or habitat is present on site
	NEPA	Cooperating Agency
National Marine Fisheries Service (NMFS)	Fish and Wildlife Coordination Act	Reviews/comments on Federal actions that affect waters, including Section 404 permit applications
	Federal Endangered Species Act (FESA)	USACE must consult with NMFS if listed marine species or habitat are present on site
	NEPA	Cooperating Agency
U.S. Coast Guard (USCG)	Rivers and Harbors Act of 1899, Section 9	Approves the location and plans of bridges and causeways across navigable waters by authorizing a Bridge Permit
Natural Resources Conservation Service (NRCS)	Food Security Act of 1985 (Swampbuster)	Approves wetland/waters determinations on agricultural land
	CWA, Section 404	Regulates placement of dredged or fill material into waters of the U.S. and State, including agricultural lands

Federal Regulatory Agencies

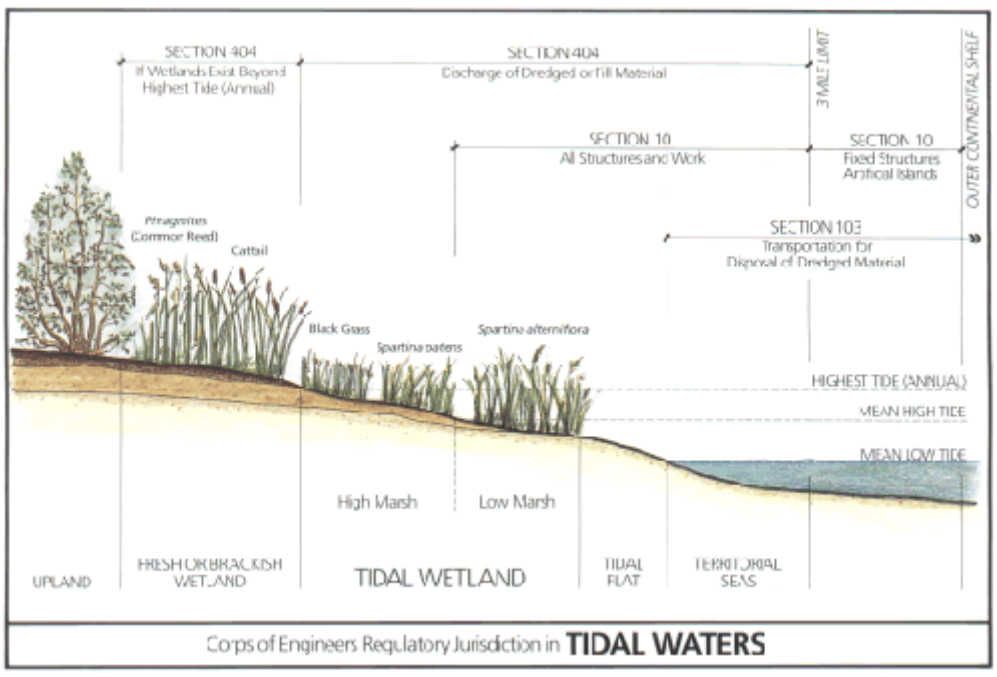
3-4.1 U.S. Army Corps of Engineers (USACE)

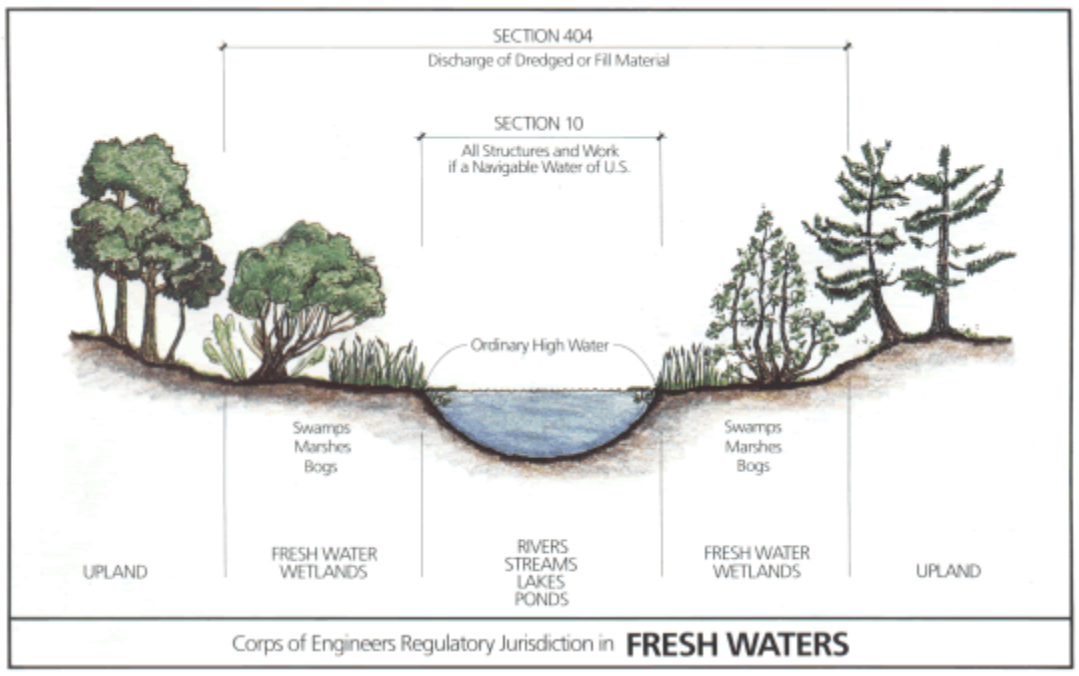
USACE is primarily responsible for implementing the CWA Section 404 program. Section 404 of the CWA establishes a permit program administered by USACE which regulates the discharge of dredged or fill material into waters of the U.S. Section 404(b)(1) guidelines allow the discharge of dredged or fill material into the aquatic system only if there is no practicable alternative which would have less adverse effects. Implementing regulations by USACE are found at 33 CFR Parts 320-330.

The purpose of the USACE and Section 404 program is to ensure that the physical, biological, and chemical quality of our nation's water is protected from irresponsible and unregulated discharges of dredged or fill material that could permanently alter or destroy these valuable resources. The USACE Regulatory Program administers and enforces Section 10 of the Rivers and Harbors Act of 1899 and Section 404 of the CWA. Under the Rivers and Harbors Act, Section 10, a permit is required for work or structures in, over or under navigable waters of the U.S. Under CWA, Section 404, a permit is required for the discharge of dredged or fill material into waters of the U.S. Many water bodies in the nation are waters of the U.S, as described in section 3-3, and are subject to the USACE regulatory authority.

The USACE regulatory authority under the Rivers and Harbors Act of 1899 is limited to traditional "navigable waters". Traditional navigable waters regulated by Section 10 are waters that are, could be, or were once used to transport interstate or foreign commerce. In contrast,"waters of the U.S." regulated under Section 404 also include "other waters" such as wetlands that have a sufficient nexus to interstate commerce. In practice, USACE regulatory authority under the Rivers and Harbors Act has been integrated with regulatory authority under the CWA, and USACE uses one permit application for both types of permits.

The diagram below illustrates the USACE lateral extent of jurisdiction under Section 10 and Section 404.





The District Biologist is typically responsible for delineation of jurisdictional waters. USACE is then responsible for verifying the Biologist's delineation. The permit process is typically initiated by a jurisdictional determination (JD) that the proposed project would occur in waters. The District Biologist prepares a wetland/waters delineation report to USACE requesting verification. USACE will review JD reports and either verifies the conclusions in the report or request changes to the report based on the review. Once the USACE agrees with the conclusions presented in the JD report, USACE will make a JD. The USACE may then proceed with the evaluation of a permit application submittal from the District Biologist (individual permit application, general permit, pre-construction notification or general permit

verification request). The USACE may also send a letter affirming a preliminary or approved JD. Upon verification, these areas are referred to as "jurisdictional areas." A graphical depiction of the overall permit review process (PDF) is provided from USACE.

USACE RGL 08-02, issued June 26, 2008, entitled "Jurisdictional Determinations," (JD) explains the differences between JDs and preliminary JDs. Approved JDs and preliminary JDs are tools used by the USACE to help implement Section 404 of the CWA and Sections 9 and 10 of the Rivers and Harbors Act of 1899. RGL 08-02 provides guidance on when an approved JD is required and when the District Biologist can decline to request and obtain an approved JD and elect to use a preliminary JD instead.

Approved JDs are an official USACE determination that jurisdictional "waters of the U.S." or "navigable waters of the U.S., or both, are either present or absent on a particular site. An approved JD precisely identifies the limits of those waters on the project site determined to be jurisdictional under the CWA and Rivers and Harbors Act (33 CFR 331.2). Preliminary JDs are not binding, but written indications that there may be wetland/waters of the U.S. on a project site. Preliminary JDs are advisory in nature and may not be appealed (33 CFR 331.2).

A Section 404 permit is required from the USACE when a project requires fill or other modification of waters. There are two types of permits issued by the USACE: Standard and General permits.

Standard Permits

There are two types of Standard permits: Individual permits and Letters of Permission

Individual Permits are complex, covering projects with more than minimal affects to waters. Processing time usually takes 60 to 120 days unless a public hearing is required or an environmental statement must be prepared. Special conditions of the permit may include mitigation activities that need to be monitored for a five to ten year period for the most complex and/or controversial projects. To apply for an individual permit, an application form must be completed.

A Letter of Permission may be issued for work that is routine or with minimal effects to the aquatic ecosystem, and objections are unlikely. If the proposed project meets these criteria, it may qualify for a Letter of Permission (LOP). An LOP is another type of individual permit used for projects with very minor effects, that do not meet any of the Nationwide permit (NWP's) conditions. An LOP is only for those projects where the District Biologist provides evidence of thorough pre-application coordination among the regulatory and resource agencies. The Biologist must submit an application that addresses programmatic concerns to support a determination that full public notice review would not result in a substantive change in the proposed project or mitigation. An LOP can be issued more quickly than a Standard permit since public notice is not required. USACE will not notify you if your proposed activity qualifies for an LOP.

General Permits

There are two types of General permits: Nationwide permits (NWP) and Regional permits (GPs).

- Nationwide Permits are issued on a nationwide basis to authorize and cover a wide variety of minor activities with no more than minimal effects.
- Regional Permits are issued by the District Engineer for a general category of activities when:
  1. The activities are similar in nature and cause minimal environmental effect (both individually and cumulatively), and
  2. The Regional permit reduces duplication of regulatory control by state and federal agencies. Compensatory mitigation is required for all effects to waters.

Initiation of a request for a USACE permit to affect waters involves other resource and regulatory agencies as a part of the interagency review process. The USACE submits permit applications to the EPA, CDFW, NMFS, and FWS for review and comment. Time periods and extent of commenting required by these agencies varies depending upon the permit type. Individual permits are the most lengthy and involved.

Applications for USACE permits may be prepared and submitted by the Project Engineer, the District Biologist, or others, using information on delineated waters as prepared by the Biologist. The Project Engineer provides information on the extent of the construction effects responsible for proposed fill. The District Biologist is the key liaison with resource and regulatory agency staff regarding the wetland/waters habitat effects and potential mitigation required.

For Standard permits, the USACE permit decision is based on whether the proposed project complies with EPA's Section 404 (b) (1) Guidelines, and whether issuance of a permit is in the public interest. The Guidelines (40 CFR 230 et seq.) state that the USACE may not issue a permit if there is a less environmentally damaging practicable alternative (LEDPA) to the proposed discharge that would have

less effects on the waters, and not have other significant adverse environmental consequences. This means that the District Biologist must document that a sequence of avoidance, minimization, and compensation has been followed, in that order. This sequence is required under the Section 404(b)(1) Guidelines (40 CFR Part 230).

The Guidelines also restrict permitting activities that:

- Violate water quality or toxic effluent standards
- Jeopardize the continued existence of listed species
- Violate marine sanctuary protections
- Cause “significant degradation” to waters of the U.S

To review the requirements for the use of Nationwide, Regional or General permits, and to determine which permit applies to your project, please visit the USACE Regulatory website in your region.

3-4.2 USACE Regulatory Guidance Letters (RGL)

USACE RGLs were developed by the USACE as a system to organize and track written guidance issued to its field agencies. RGLs are normally issued as a result of evolving policy, judicial decisions, and changes to USACE regulations or another agency’s regulations which affect the permit program. RGLs are used only to interpret or clarify existing Regulatory Program policy, but do provide mandatory guidance to the USACE district offices. Below is a list of RGLs related to wetland and waters of the U.S. The RGLs are described in further detail in this chapter.

- RGL 08-03 (PDF) - Minimum Monitoring Requirements for Compensatory Mitigation Projects Involving the Restoration, Establishment, and/or Enhancement of Aquatic Resources
- RGL 08-02 (PDF) - Jurisdictional Determinations
- RGL 02-02 (PDF) - Guidance on Compensatory Mitigation Projects for Aquatic Resource Impacts Under the Corps Regulatory Program Pursuant to Section 404 of the Clean Water Act and Section 10 of the Rivers and Harbors Act of 1899
- RGL 02-01 (PDF) - Inclusion of Disclaimer Statements in Jurisdictional Letters Indicating that the Clean Water Act (CWA) Jurisdictional Determinations/Delineations May Not Meet the Requirements of the Food Security Act (FSA) of 1985

3-4.3 U.S. Environmental Protection Agency (EPA)

EPA activities which affect waters include, but are not limited to, developing rules to regulate municipal and industrial wastewater discharge, stormwater discharge; overseeing drinking water quality; overseeing USACE regulatory activities pertaining to protection of waters of the U.S., and dredge and fill activities. The mission of the EPA includes protection of human health and safeguarding the natural environment. The EPA has the right to challenge a USACE permit approval. Section 404 (b) (1) of the EPA and USACE guidelines involve assurance that the proposed activity does not violate water quality standards (USACE, EPA 1993). It requires that the District Biologist, along with the PDT, to provide an alternative’s analysis to illustrate that the alternative least damaging to waters of the U.S. has been selected (LEDPA). The EPA also has jurisdiction over violations. The EPA and USACE have issued several memoranda of agreement (MOA’s), including one that defines each agency’s roles more specifically.

3-4.4 U.S. Fish and Wildlife Service (FWS)

The FWS jurisdiction is nationwide and operates under a host of federal legal mandates that explicitly and implicitly refer to waters of the U.S. The mission of the FWS includes working to conserve, protect, and enhance fish and wildlife and their habitats for the continuing benefit of the American people. According to the Fish and Wildlife Coordination Act, all federal agencies are required to contact the FWS, NMFS, and California's wildlife agency, CDFW, regarding activities that affect, control, or modify waters of any stream or other bodies of water. These consulted agencies review applications for permits issued under Section 404 and provide comments to the USACE about the environmental effects of the proposed project. Regulations pertaining to wetland/waters overlap with FESA requirements because wetland/waters could be habitat for federally listed plants and animals. The granting of a permit is a “federal action” for purposes of FESA; thus, if a listed species may be affected, a 404 permit request triggers the need for a consultation with FWS under FESA. FWS retains jurisdiction over terrestrial species and freshwater aquatic species.

3-4.5 National Marine Fisheries Service (NMFS)

NMFS comments on all NEPA and Section 404 documents for projects that could affect marine, estuarine, or anadromous fish, or their habitat. This includes intertidal wetlands, sub tidal areas, eelgrass habitat for marine and estuarine species, as well as riparian habitat for salmonids. NMFS is also responsible for designating critical habitat for species it lists under FESA. The critical habitat designation may include specific areas within the geographical area occupied by the species at the time of listing, if they contain physical or biological features essential to conservation, those features that may require special management considerations or protection; and specific areas outside the geographical area occupied by the species if the agency determines that the area itself is essential for conservation. Regulations pertaining to wetland/waters overlap with FESA requirements because wetland/waters could be habitat for federally listed plants and animals. As with FWS, if a listed species may be affected, a 404 permit request triggers the need for consultation with NMFS under FESA. NMFS retains jurisdiction over marine species and most anadromous fish.

3-4.6 United States Coast Guard (USCG)

The USCG administers the various bridge statutes, environmental laws of the U.S., and pertinent regulations and policies. The USCG is responsible for approval of the location and plans of bridges and causeways constructed across navigable waters of U.S. In addition, the Coast Guard is responsible for approval of the location and plans of international bridges and the alteration of bridges found to be unreasonable obstructions to navigation. Section 9 of the Rivers and Harbors Appropriations Act is administered by the U.S. Coast Guard and requires Caltrans to obtain a Bridge Permit (PDF). A Bridge permit is required by the USCG when there is construction of a new bridge or causeway or reconstruction or modification of an existing bridge or causeway across navigable waters. When Caltrans applies for a Bridge permit, they must submit an application package (PDF) to the USCG. The Bridge Application must be sent to the Coast Guard District office with jurisdiction in the vicinity of the proposed bridge site. Remember to include any approvals or other permits that you have already received.

3-4.7 Natural Resources Conservation Service (NRCS)

Caltrans may be required to coordinate with the NRCS, formerly the Soil Conservation Service, when a proposed transportation project may affect agricultural lands where farmers have been growing commodity crops in areas that were drained, filled, or otherwise altered wetlands prior to 1985. The Food Security Act of 1985 (referred to as "Swampbuster") ended the NRCS approval of the draining of wetlands for commodity crops. The NRCS administers the Act, as amended by the Food, Agriculture, Conservation, and Trade Act of 1990 and the Federal Agriculture Improvement and Reform Act of 1996.

In 1994, the NRCS signed a Memorandum of Agreement (MOA) with USACE which makes the NRCS responsible for wetland/waters delineations on prior converted croplands and farmed wetlands that receive agricultural subsidies through the federal government. The NRCS may use the procedures for delineating wetland/waters as described in the National Food Security Act Manual, Third Edition (PDF). The NFSAM 4th Edition contains only the common provisions and the Highly Erodible Land Conservation compliance parts. The National Food Security Act Manual (NFSAM) 5th Edition will be out soon. It is comprised of 12 parts, covering both the highly erodible land conservation and wetland/waters conservation compliance provisions. This edition will be available online in its entirety. Please refer to the latest guidance from NRCS. Linear projects such as roadway improvements may be excluded from the NRCS involvement.

When the NRCS is involved, the District Biologist is responsible for contacting the NRCS, submitting the wetland/waters delineation report to the appropriate NRCS field office, and requesting verification. In some cases, the USACE may take the responsibility for the NRCS verification, or provide evaluation of an "other waters" determination. It is best to obtain guidance from the NRCS regarding responsibility of all aspects of the determination.

3-5 State Agencies

The following table provides a summary list of the State agencies that regulate activities in waters of the U.S. and the State.

Agency	Regulation	Authority
California Department of Fish and Wildlife (CDFW)	California Fish and Game Code, Sections 1600-1607	Regulates activities resulting in alteration of streams and lakes including stream banks (Streambed Alteration Agreement)
	CEQA	Responsible or Trustee Agency
Regional Water Quality Control Board (RWQCB)	Clean Water Act, Section 401	Proposed fill in waters requires coordination with the appropriate RWQCB that administers Section 401 and provides certification
	Clean Water Act, Section 402	Issues National Pollutant Discharge Elimination System (NPDES) permit
	CEQA	Responsible or Trustee Agency
California Coastal Commission (CCC)	California Coastal Act of 1976	Issues all coastal development permits
	Coastal Zone Management Act of 1972 as amended through the Coastal Zone Protection Act of 1996	Issues notice that work is consistent with state Coastal Management Plan (PDF)
	CEQA	Responsible or Trustee Agency
San Francisco Bay Conservation and Development Commission (BCDC)	McAteer-Petris Act of 1965	Regulates work within the bay, certain creeks, and a shoreline band of 100 feet inland from line of highest tidal action; projects that require BCDC permits often must receive authorization from the RWQCB and USACE
	Coastal Zone Management Act of 1972 as amended through the Coastal Zone Protection Act of 1996	Issues federal consistency determinations under the Coastal Zone Management Act
	CEQA	Responsible or Trustee Agency
State Lands Commission (SLC)	Public Trust Doctrine	Protects publically owned property rights in the navigable waters of the state; the Commission manages the use of the state owned wetland/waters through lease to other public agencies and private parties
	CEQA	Responsible or Trustee Agency

State Regulatory Agencies

3-5.1 California Department of Fish and Wildlife (CDFW)

Waters may also be subject to jurisdiction of the CDFW in accordance with Fish and Game Code Sections 1600-1607. The CDFW regulates activities that would alter the flow, bed, channel or bank of streams and lakes by issuing Lake or Streambed Alteration Agreements. In riparian areas, CDFW jurisdictional limits are usually delineated by the top of the stream or lake banks, or the outer edge of riparian vegetation; whichever is wider. Waters under jurisdiction of the USACE may or may not be included in the area covered by a Lake or Streambed Alteration Agreement obtained from the CDFW.

Caltrans must contact the CDFW regarding any potential Section 1600-1607 effects independent of their role as reviewer on USACE Section 404 permits. The CDFW contacts for Section 1600 are best facilitated by coordination with the District Biologist.

3-5.2 Regional Water Quality Control Board (RWQCB)

SWRCB and the nine (9) Regional Water Quality Control Boards (RWQCB) work together to protect California's water resources. The SWRCB is generally responsible for setting statewide water quality policy and considering petitions contesting RWQCB actions. The State Board is also solely responsible for allocation of surface water rights. Section 401 of the CWA (33 U.S.C. 1341) requires any applicant of a federal license or permit conducting any activity that may result in a discharge of a pollutant into waters of the U.S. to obtain certification from the state in which the discharge originates. As a result, proposed fill in waters requires coordination with the appropriate RWQCB that administers Section 401 and provides certification. The RWQCB also plays a role in review of water quality and wetland/waters issues, including avoidance and minimization of effects. Section 401 certification is required prior to issuance of a Section 404 permit.

3-5.3 California Coastal Commission (CCC)

When a project will require fill in waters within the coastal zone, Caltrans must obtain a permit from the CCC or the city or county with coastal permit jurisdiction. The CCC oversees implementation of the California Coastal Act (CCA) and the nationwide Coastal Zone Management Act (CZMA). The coastal zone extends three miles seaward and generally about 1,000 yards inland. In particularly important and generally undeveloped areas where there can be considerable effects on the coastline from inland development, the coastal zone extends to a maximum of 5 miles inland from mean high tide line. In developed urban areas, the coastal zone extends substantially less than 1,000 yards inland. The Coastal Commission's jurisdiction does not extend into or around San Francisco Bay, where development is regulated by the San Francisco Bay Conservation and Development Commission. The District Biologist and the Project Engineer may share coordination with the CCC, when needed.

3-5.4 San Francisco Bay Conservation and Development Commission (BCDC)

Projects affecting waters within the limits of San Francisco Bay may require a permit from the BCDC. The BCDC has jurisdiction over all areas of San Francisco Bay subject to tidal action up to the mean high tide line, or a line five feet above mean sea level in marshlands. The area 100 feet inland from the mean high tide is also within jurisdiction. All projects proposed in tidal wetland/waters within the BCDC's jurisdiction require an approved BCDC permit before proceeding. Projects that require BCDC permits often must receive authorization from the RWQCB and USACE. Under state and federal law the BCDC is required to set conditions for these permits in order to minimize effects on waters and to offset those effects that are unavoidable. The BCDC is responsible for federal implementation of the CZMA within the limits of San Francisco Bay, rather than the CCC. The Project Engineer is usually the key contact for this agency. The District Biologist provides analysis of wetland/waters effects and may work directly with agency staff on mitigation requirements unique to the BCDC.

3-5.5 State Lands Commission (SLC)

The California SLC manages some 4.5 million acres of land held in trust for the people of California. The State holds these lands for all people of the State for the public trust purposes of water related commerce, navigation, fisheries, recreation, and open space. The Commission manages the use of the State owned waters through leases to other public agencies and private parties. The Commission staff reviews permit applications submitted to the CCC, the San Francisco BCDC, and the USACE. The Commission has jurisdiction and control over State owned lands pursuant to PRC 6000 et seq. These lands include: a three mile-wide section of tidal and submerged land adjacent to the coast and offshore islands, including bays, estuaries, and lagoons; the waters and underlying beds of more than 120 rivers, lakes, streams, and sloughs; and 585,000 acres of school lands granted to the state by the federal government to support public education.

3-6 Early Coordination And Agreements

3-6.1 Early Coordination

It is important to identify potential effects to waters as early in the environmental process as possible. Complex wetlands/waters delineation and assessment reports require extensive involvement from the District Biologist. Early coordination is an informal process where the Biologist meets with project managers (PM), the developed PDT, and regulatory agencies, to discuss the project in its early planning stages. These early coordination meetings allow time to review your proposed plans and discuss permit requirements, potential problems, timeframes, and ways to change the project to reduce or further minimize effects. Early involvement will also help to avoid potential delays in project delivery and minimize potential changes in the project scope that may result in project cost increases. You are encouraged to contact the USACE for proposed work in waters in your project area. Exemptions, nationwide, regional and individual requirements will be reviewed. By discussing all information prior to application submittal, your application will be processed more efficiently. Click here for more information on USACE pre-application consultation.

Early notification to the PM, PDT, and resource and regulatory agencies also allows time for investigation of design modifications to avoid or minimize potential effects to waters. If effects cannot be avoided, and have been reduced to the minimum level practicable, wetland/waters mitigation proposals to compensate for those effects must be developed by the District Biologist and others on the PDT, and evaluated as part of the environmental impact analysis process.

3-6.2 NEPA/404 Memorandum of Understanding

Caltrans has implemented early coordination with the state and federal agencies involved in the wetland/waters regulation process. In 1993, Caltrans signed a Memorandum of Understanding (MOU) with the Federal Highway Administration (FHWA), Federal Transit Administration (FTA), EPA, USACE, FWS, NMFS, and the Arizona and Nevada Departments of Transportation. The objective of the MOU is to integrate the National Environmental Policy Act (NEPA) and the CWA, Section 404. Referred to as the NEPA/404 integration process, the MOU commits these agencies to ensuring the earliest possible consideration and identification of environmental concerns pertaining to waters of the U.S. This is accomplished in conjunction with land use and transportation planning.

3-6.3 Wetlands Only Practicable Alternative Finding

Early stage planning meetings allow for full discussion of project alternatives to avoid wetland/waters. These alternatives may need to be discussed in the environmental document as a “Wetlands Only Practicable Alternative Finding” (WOPAF). Executive Order 11990 , Protection of Wetlands (1977), calls for no net loss of habitats referred to as wetlands and established a national policy to avoid adverse effects on wetlands wherever there is a practicable alternative. The Federal Department of Transportation promulgated DOT Order 5660.1A in 1978 to comply with this direction. On Federally funded projects, effects to wetland/waters must be identified in the environmental document. Alternatives that avoid wetland/waters must be considered. If wetland/waters effects cannot be avoided, then all practicable measures to minimize harm must be included. If the preferred alternative is located in wetlands/waters, the final EIS needs to contain the finding required by Executive Order 11990. The finding will document compliance with the Executive Order 11990 requirements (23 CFR 771.125(a)(1)). The finding should be included in a separate subsection entitled "Wetlands Only Practicable Alternative Finding" and should be supported by the following information:

1. A reference to Executive Order 11990;
2. An explanation why there are no practicable alternatives to the proposed action;
3. An explanation why the proposed action includes all practicable measures to minimize harm to wetland/waters; and
4. A concluding statement that: "Based upon the above considerations, it is determined that there is no practicable alternative to the proposed construction in wetland and that the proposed action includes all practicable measures to minimize harm to wetlands which may result from such use."

An additional requirement is the opportunity for early public involvement in projects affecting waters. The Federal Highway Administration provides technical assistance in meeting these criteria (FHWA Technical Advisory 6640.8A) and reviews environmental documents for compliance. Section 404 Individual Permit applications also require a Section 404(b)(1) alternatives analysis (LEDPA), as discussed above in section 3-4.1.

3-7 Wetland/Waters Delineation

As stated in Section 3-3, Caltrans follows the wetland/waters definition agreed to by the EPA and USACE. Although CDFW and FWS have their own definitions that may play a role in the wetland/waters delineation and assessment process, this discussion focuses on the USACE process.

In 1994, the EPA, NRCS, and USACE agreed to use the 1987 USACE Wetland Delineation Manual, together with applicable regional supplements, for non-agricultural lands (CFR Vol. 59, No. 12, pp. 2920-2924 Jan. 19, 1994). The procedure describes a three-parameter approach that includes presence of hydrophytic vegetation, wetland hydrology, and hydric soils. All three parameters must be present, under normal circumstances, for an area to be designated as wetland under jurisdiction of the USACE. Such wetlands are referred to as jurisdictional wetlands. In order to obtain a Section 404 permit, the District Biologist must provide USACE with a delineation of potential jurisdictional areas.

A large portion of California occurs within the Arid West Region. This region is characterized by low rainfall and hot, dry summers. The Arid West Region has a slightly different set of wetland/waters indicator criteria. In 2008, USACE published the Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region (Version 2.0) (USACE 2008) to be used in areas defined as the Arid West. This supplement allows for delineation in areas which the arid climate may not distinctly show one of the three parameters. USACE also offers the Arid West Data Form (PDF) and the Western Arid Regional Jurisdictional Determinations Checklist (PDF) (Interstate Nexus Worksheet).

In 2008, USACE published the Field Guide to the Ordinary High Water Mark (OHWM) in the Arid West Region of the Western United States (PDF) (USACE 2008). This supplement is an approach for identifying the lateral limits of non-wetland/waters. The western mountains, valleys, and coastal range have a slightly different set of wetland/waters indicator criteria.

The Interim Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Western Mountains, Valleys, and Coast Region (PDF) is one of a series of Regional Supplements to the Corps of Engineers Wetland Delineation Manual, which provides technical guidance and procedures for identifying and delineating wetland/waters that may be subject to regulatory jurisdiction under Section 404 of the CWA or Section 10 of the Rivers and Harbors Act. The development of Regional Supplements is part of a nationwide effort to address regional wetland/waters characteristics and improve the accuracy and efficiency of wetland/waters delineation procedures. This supplement is applicable to the Western Mountains, Valleys, and Coast Region, which consists of portions of 12 states, including Arizona, California, Colorado, Idaho, Montana, Nevada, New Mexico, Oregon, South Dakota, Utah, Washington, and Wyoming.

Wetland/waters must be delineated by a qualified Biologist, who is trained in soils, hydrology, local vegetation, as well as the USACE Wetlands Delineation Manual. Biologist's who do not have the appropriate training need to be supervised by a qualified Biologist when delineating wetland/waters. The Biologist takes site information and background materials to prepare a Wetland/Waters Delineation and Assessment Report. The Wetlands/Waters Delineation and Assessment Report is submitted to the USACE as a part of the Section 404 permit application package.

The Wetlands/Waters Delineation and Assessment Report also serves as a technical report for the environmental document, in conjunction with the Natural Environment Study (NES). The NES describes the existing biological environment and how the project alternatives affect that environment. The NES is the technical backup for statements made in the environmental document concerning plants, animals, and natural communities occurring in the biological study area. If the wetland/waters effects of a project are very small, the discussion may be included as a part of the NES. If included as a discussion in the NES, a separate Wetland/Waters Delineation Report would be prepared and submitted to the USACE for the permitting process. Materials to include in these reports will be discussed in the following section. If the wetland/waters effects are large or controversial, it is more convenient to prepare a report separate from the NES. The NES covers non-wetland/waters effects that would not necessarily be of interest to the USACE in review of a Section 404 permit application and does not need to be sent to the USACE.

3-8 Wetland/Waters Assessment

Delineation of waters is only the first phase of determining potential effects. USACE and EPA have a national goal of no net loss of wetlands to be applied to each permit decision. In measuring no net loss, USACE primarily will consider loss of wetlands functions and values. The Biologist must analyze the effects of the proposed loss of function and values. Proposed mitigation or compensation actions must also be developed. In order to do this, the functions and values of the wetlands habitat must be evaluated to determine the degree of effects resulting from the proposed transportation project. In this manner, appropriate mitigation plans may be developed to replace those functions and values.

Functions: Functions are the physical, chemical, and biological attributes of wetlands without regard to their importance to society. Examples of functions include flood flow alteration, wildlife habitat, and groundwater discharge.

Values: The term values may be used to describe those functions that are generally regarded as beneficial to society. Recreation and uniqueness are examples of values. All or part of society may not value some functions. Nutrient removal and transformation, for example, may not be considered a value if that function leads to algal blooms and noxious odors.

Caltrans uses the functions and values described by USACE and the EPA. Although the complex methodology described by USACE and the EPA may be used, experience has shown that informed professional judgment, applied to the identified functions and values, accomplishes the same result in California waters. These results are obtained in significantly less time than implementing the full methodology. The District Biologist is responsible for interpreting and understanding the functions and values and using their best professional judgment to determine potential effects.

3-9 Wetland/Waters Delineation And Assessment Report Format

To improve the quality and consistency of wetland/waters delineations, the USACE Districts have specific requirements for delineation reports. USACE District requirements vary by area and are updated frequently. There are three USACE District locations within the South Pacific Division in California. These include the Sacramento District, the San Francisco District, and the Los Angeles District.

- The USACE Sacramento District provides specific requirements necessary for accepting delineation in its "Minimum Standards for Acceptance of Preliminary Wetlands Delineation (PDF)".
- The San Francisco District provides its own requirements in its "San Francisco District Information Requested for Verification of Corps Jurisdiction (PDF)" to ensure rapid and accurate evaluation of materials prepared by the applicant.
- The Los Angeles District wetland/waters delineation requirements provide a "List of Information Required for Complete Application" which would assist the USACE in reviewing your application for a permit.

Applicants providing supportive documentation in other formats could encounter delays from the increased time it takes to evaluate non-standard materials submitted to the USACE. Accurate delineations by qualified individuals have resulted in a quicker review and response from the appropriate USACE District; substandard or inaccurate delineations have resulted in unnecessary time delays for Biologists. These delays are due to insufficient, incomplete, or conflicting data, which prevent the USACE District from verifying the proposed wetlands/waters boundaries. Such delineations must be returned by the USACE District to the Biologist for revision.

The following outline represents a suggested example of how to present information in a report format. This outline may be adapted to meet the needs of a particular project.

Format and Content of the Delineation Report

- No set format
  - Typical example:
    - Introduction
    - Setting
    - Methods
    - Results
  - Include a summary and table of contents only it is a lengthy report
  - Useful near the beginning of long reports is a list of acronyms and abbreviations
- Contents: Review USACE's minimum standards for reports
- Is Rapanos required?

The Delineation Report: Introduction

Typically Includes:

- Project location
- Directions to the site
- Property ownership (including any property to be acquired)
- How the study limits were determined
- Total area within the study limits

- Name(s) of the preparer(s) of the delineation report and/or applicant, together with contact information

The Delineation Report: Setting

Typically includes:

- Physical setting of the project area
  - Topography
  - Watershed(s)
  - Climate, in particular, mean annual rainfall and snowfall
- Hydrology
  - Where does the water come from?
  - Where does it go?
  - Keep the Rapanos requirements in mind
- Soils
- Vegetation

3-10 Wetland/Waters Migration

In accordance with state and federal permit requirements, unavoidable effects to wetland/waters shall be compensated. The District Biologist works closely with the PDT to design a suitable creation or restoration project that will replace the wetland/waters functions and values affected by the transportation project. A combination of onsite and offsite mitigation may best compensate for damage or destruction of functions and values. Onsite mitigation may focus on flood storage, flood conveyance, erosion control, and water quality protection. Offsite mitigation at some distance from project effects may help restore regional wildlife.

The District Biologist is usually responsible for monitoring and preparation of the mitigation report and submitting annual monitoring reports to the USACE. The processes involved are described in detail in Volume 3, Chapter 5, Mitigation and Monitoring (PDF).

Mitigation guidance may also be found in the USACE and EPA 1990 Memorandum of Agreement (USACE and EPA, 1990), USACE Regulatory Guidance Letter 02-2 (PDF) (USACE, 2002), and more recently in Regulatory Guidance Letter 08-03 (PDF) (73 Fed. Reg. 19594).

The USACE and EPA 1990 MOA establishes the basic mitigation sequencing framework. Wetland/waters effects can be mitigated through avoidance, minimization, or compensation. Avoidance through selecting a non-wetland/waters site, and minimization of effects through project modifications and permit conditions should be implemented prior to compensation.

RGL 02-2 (PDF), “Guidance on Compensatory Mitigation Projects for Aquatic Resource Impacts Under the Corps Regulatory Program Pursuant to Section 404 of the Clean Water Act and Section 10 of the Rivers and Harbors Act of 1899,” requires appropriate and practicable mitigation for authorized effects to aquatic resources by requiring the use of watershed and ecosystem approaches when determining compensatory mitigation requirements. The District Biologist must consider the resource needs of the watersheds where effects will occur, and also consider the resources needs of neighboring watersheds.

RGL 08-03 (PDF), “Minimum Monitoring Requirements for Compensatory Mitigation Projects Involving the Restoration, Establishment, and/or Enhancement of Aquatic Resources (PDF),” provides guidance on minimum monitoring requirements for compensatory mitigation projects, including the required minimum content for monitoring reports. The final Mitigation Rule published on April 10, 2008, states that the submission of monitoring reports to assess the development and condition of compensatory mitigation projects is required, but the content and level of detail for those reports must be commensurate with the scale and scope of the compensatory mitigation projects as well as the compensatory mitigation project type (33 CFR 333.6(a)(1)).

Specifically, the rule:

- emphasizes that the process of selecting a location for compensation sites should be driven by assessments of watershed needs and how specific wetland restoration and protection projects can best address those needs;
- requires measurable and enforceable ecological performance standards for all types of compensation so that project success can be evaluated;
- requires regular monitoring to document that compensation sites achieve ecological performance standards;
- clearly specifies the components of a complete compensation plan based on the principles of aquatic ecosystem science; and,

- emphasizes the use of science-based assessment procedures to evaluate the extent of potential water resource effects and the success of compensation measures.

Compensatory mitigation is to create, restore, or enhance wetlands to replace or “compensate” for the wetland area and functions lost through the permitted alteration. Constructing a wetland in an area that never supported wetlands historically is called creation. Wetland creation is often difficult because the upland soils are not good at retaining water. Restoration means re-establishing wetland hydrology and vegetation to a site that was historically a wetland by correcting the conditions that cause it to be degraded. This may include providing more water to the site and reestablishing native plant communities. The enhancement goal is to measurably improve the condition and functions of the wetland.

3-11 Quality Control and Assurance for Biological Technical Documents

The Quality Control and Assurance for Biological Technical Documents provide document preparation requirements, quality control and assurance procedures, criteria of what is to be included in a final draft, along with independent peer review and correspondence procedures.

The District Biologist is responsible for following quality control (QC) and assurance (QA) procedures when writing technical documents such as a Wetlands/Waters Delineation/Assessment Report. Caltrans biological technical documents, and those authorized under the Federal Aid Local Assistance Program, provide natural resource information and analysis for PDT decisions, environmental document preparation, public input, as well as permits, licenses, agreements or certifications. Careful, consistent and concise quality control and assurance procedures allow the Department to effectively provide information and respond to public or agency inquiries regarding compliance with policies and regulations, as well as federal environmental responsibilities and consultations assumed pursuant to SAFETEA-LU Sections 6004 and 6005.

SER Chapter 1, Federal Requirements offers the Federal Highway Administration (FHWA) California Division Environmental Checklist "Draft" and the FHWA California Division "Final" NEPA Document Checklist. These checklists offer an environmental document preparation and review tool that provides the Biologist with the major required content of wetland/waters considerations.

The FHWA California Division "Draft" NEPA Document Checklist is a dynamic working document to be used as a tool to develop an adequate document for approval. It should be used in conjunction with other appropriate guidance and does not include all applicable federal laws or regulations nor is it intended to address the requirements of state and local laws.

The Wetlands/Waters Delineation /Assessment Report will include the name of the Biologist(s) preparing the documents and the manager overseeing the work. These people should be prepared to answer questions regarding document content, quality, and preparation. At management’s discretion, District Biologists may use specific checklists, worksheets or other tools to assist preparation and/or when verifying the documents were prepared by qualified experts, meet regulatory and professional standards, and reflect the actions and commitments of the lead agency.

Currently there is no standard template for a Wetlands/Waters Delineation/Assessment Report on the SER Forms and Templates page. As discussed in Section 3-9, each USACE District has their own requirements.

CITY OF SAN BUENAVENTURA

2005 VENTURA GENERAL PLAN

ADOPTED AUGUST 8, 2005

RESOLUTION NOS.2005-072 AND 2005-073

The following people contributed to the preparation of the 2005 Ventura General Plan:

CITY COUNCIL
Brian Brennan, Mayor
Carl E. Morehouse, Deputy Mayor
Neal Andrews, Council Member
Bill Fulton, Council Member
James L. Monahan, Council Member
Sandy E. Smith, Council Member
Christy Weir, Council Member

PLANNING COMMISSION
Carolyn Briggs, Chair
Curt Stiles, Vice Chair
Ronald Allen, Commissioner
Michael Faulconer, Commissioner
Martel Fraser, Commissioner
Bill Growdon, Commissioner
John Hecht, Commissioner

GENERAL PLAN COMMITTEE
Carolyn Briggs, Planning Commission Chair
Michael Faulconer, Commissioner
Bill Fulton, Council Member
John Hecht, Commissioner
Sandy E. Smith, Council Member
Christy Weir, Council Member

ventura's general plan

OVERVIEW

"The building of cities is one of man's greatest achievements. The form of his city always has been and always will be a pitiless indicator of the state of his civilization. This form is determined by the multiplicity of decisions made by the people who live in it."

— Edmund N. Bacon
Design of Cities, 1967

CITY OF
VENTURA

We, the people of Ventura, in order to ensure that our City remains a great place for us to live ...

. . . establish these goals for our community's future:

OUR NATURAL COMMUNITY

Our goal is to be a model for other communities of environmental responsibility, living in balance with our natural setting of coastline, rivers, and hillside ecosystems.

OUR PROSPEROUS COMMUNITY

Our goal is to attract and retain enterprises that provide high-value, high wage jobs; to diversity the local economy; to increase the local tax base; and to anticipate our economic future in order to strengthen our economy and help fund vital public services.

OUR WELL-PLANNED COMMUNITY

Our goal is to protect our hillsides, farmlands, and open spaces; enhance Ventura's historic and cultural resources; respect our diverse neighborhoods; reinvest in older areas of our community; and make great places by insisting on the highest standards of quality in architecture, landscaping and urban design.

OUR ACCESSIBLE COMMUNITY

Our goal is to provide residents with more transportation choices by strengthening and balancing bicycle, pedestrian and transit connections in the City and surrounding region.

OUR SUSTAINABLE INFRASTRUCTURE

Our goal is to safeguard public health, well being and prosperity by providing and maintaining facilities that enable the community to live in balance with natural systems.

OUR ACTIVE COMMUNITY

Our goal is to add to and enhance our parks and open spaces to provide enriching recreation options for the entire community.

OUR HEALTHY AND SAFE COMMUNITY

Our goal is to build effective community partnerships that protect and improve the social well being and security of all our citizens.

OUR EDUCATED COMMUNITY

Our goal is to encourage academic excellence and life-long learning resources to promote a highly-educated citizenry.

OUR CREATIVE COMMUNITY

Our goal is to become a vibrant cultural center by weaving the arts and local heritage into everyday life.

OUR INVOLVED COMMUNITY

Our goal is to strive to work together as a community to achieve the Ventura Vision through civic engagement, partnerships, and volunteer service.

State law requires each California city to adopt a comprehensive, long-term General Plan for the physical development of the community that guides local decision-making by expressing community goals about the future distribution and character of land uses and activities. The plan should be comprehensive by both covering the City's entire planning area and addressing the broad range of issues facing the community, including physical, social, aesthetic and economic concerns. The plan must be internally consistent and serve as a long-term guide, establishing policies for day-to-day land use decisions over an approximately 20-year period.

Introduction and Background

"To remain successful, Ventura must periodically renew itself, re-examine its goals and create a shared vision to guide the community into the future."

With these opening words, the citizens of our community proclaimed the **Ventura Vision,** which was unanimously accepted by the City Council in March 2000. That landmark report captured the results of "a partnership encompassing city government, non-profit organizations, community groups, businesses, schools and individual residents to chart the community's future through a process of visioning."

Building on that shared vision, the City embarked on an effort to revise the 1989 Comprehensive Plan that served as the General Plan that all cities are required by State law to use to guide land use, transportation and other important policy decisions. This new General Plan is the culmination of that effort to translate the Ventura Vision into a coherent and comprehensive implementation plan to guide future development and preservation.

Throughout the visioning process and at the ballot box, Ventura residents have made clear we want a well-planned approach to managing growth. We don't want continued suburban sprawl paving over farm land and sensitive hillside areas. Instead, we want vacant or run-down properties to be improved with high quality "infill" to provide new jobs, new homes and new stores and services.

Managing growth to improve our quality of life and standard of living is the smart thing to do. Ventura residents don't want uncontrolled growth and suburban sprawl. We also don't want traffic gridlock, more "cookie cutter" tract houses or housing prices that make Ventura unaffordable for working families. By targeting new development to areas that would benefit from reinvestment – and by respecting our historic character and sense of place – "smart growth" is a better alternative.

Our vision is for a prosperous and well-planned community. Smart Growth emphasizes reusing existing buildings and land, revitalizing our historic downtown and neighborhoods, and protecting the environment for future generations. Smart Growth channels new businesses and homes into appropriate areas. It also provides options for public transportation, creates neighborhoods where homes are in walking distance of local services and ensures green space for public use.

We seek to protect and enhance our unique "sense of place" that builds on our pride in Ventura's history and natural setting. Instead of new development that looks like everywhere else, our vision is for interesting, unique neighborhoods and districts, which reflect our values and heritage. The policies for pursuing these goals are spelled out in this new General Plan.

The Ventura General Plan

The *2005 Ventura General Plan* is the second in a series of three connected documents that will guide future conservation and change in the city. The *Ventura Vision* set the stage for this plan and enumerated four overarching principles that were affirmed by the community to guide Ventura into the future:

- Reach broadly and deeply into the community.
- Build on existing cultural, natural, and economic assets.
- Emphasize and encourage connections within the community.
- Work proactively and collaboratively to achieve the community's shared vision.

The final piece of the trilogy is a form-based *Development Code*. This code represents a new approach to zoning that prioritizes the appearance of development, while still ensuring that neighboring land uses are compatible and appropriate.

The *General Plan* will be put into action through the Development Code and a variety of other mechanisms, such as a mobility plan, specific plans, community plans, and capital improvement projects that will together shape the future of Ventura. The *General Plan* purposefully anticipates the *Code* focusing on the districts, corridors, and neighborhood centers where future change will be most pronounced.

The following vision statements reflect a high level of community consensus about a desired future for Ventura.

In the future, Ventura is a community that…

Environment

- Seeks sustainability by simultaneously promoting ecological health, economic vitality, and social well-being for current and future generations.
- Acts as an environmentally responsible model for other coastal areas.
- Protects and restores the natural character of its beaches, ocean views, hillsides, barrancas, and rivers as a scenic backdrop for its high quality urban environment.

Economy

- Develops a flourishing and balanced economy by encouraging a broad range of high quality employment and entrepreneurial opportunities.
- Encourages private economic development that supports public services and amenities associated with high quality of life.
- Has a vital, prosperous, and stable economy while maintaining its small-town feel.
- Is noted for private and public sector cooperation that enhances economic vitality.
- Actively participates in regional economic development efforts.

Planning, Design, and Circulation

- Retains its character as an attractive coastal town by growing slowly and sustainably, and by emphasizing its history, diversity, and natural environment.
- Cherishes its distinctive, diverse, and eclectic neighborhoods, and preserves their character.
- Has safe, accessible, and balanced transportation that promotes multiple modes of travel to local and regional destinations.

Social Activity

- Is known as an inclusive, diverse, and tolerant place that welcomes and celebrates all people.
- Provides all residents access to quality and affordable health and social services.
- Recognizes the importance of children and seniors by providing exceptional cultural, educational, and social support programs.
- Offers a diverse range of active and passive recreation for residents and visitors of all ages and abilities.
- Is dedicated to educational excellence and an emphasis on lifelong learning.
- Celebrates and is enriched by the arts and diverse cultural opportunities.

Collaboration

- Encourages residents to collaborate with each other and City government in an informed, active, and constructive manner to assess and resolve common issues.

ventura
seize
the future

Building on the Vision

Following adoption of the *Ventura Vision*, the City Council established a 19-member Comprehensive Plan Advisory Committee (CPAC) to shape the *Vision* concepts into issues and priorities for revision of the 1989 Comprehensive Plan. The CPAC included representatives of varied interests, including neighborhoods, agriculture, seniors and schools, as well as one member from the Planning Commission and one from the City Council. The committee met more than 30 times over almost three years. During that effort, the City published the August 2002 *Comprehensive Plan Update Background Report*, which provides a highly detailed account and analysis of opportunities and constraints that affect planning and land use in Ventura. This ultimately led to their findings, contained in the September 2003 *CPAC Issues & Alternatives Report*.

CPAC endeavored to create strategies to resolve planning and land use issues in Ventura utilizing the smart growth principles formulated by the U.S. Environmental Protection Agency:

- Mix land uses.
- Achieve compact building design.
- Provide a range of housing opportunities.
- Create walkable neighborhoods.
- Foster distinctive, attractive communities with a strong sense of place.
- Preserve open space, farmland, natural beauty, and critical environmental areas.
- Strengthen and direct development toward existing communities.
- Provide a variety of transportation choices.
- Make development decisions predictable, fair, and cost effective.
- Encourage community collaboration in planning decisions.

The recommendations of the CPAC were presented to the Planning Commission and City Council. After several months of reviewing the CPAC recommendations, the Planning Commission in December 2003 made some modifications to the CPAC's recommended land use scenario.

The City Council met 11 times from February through August 2004 to consider the CPAC and Planning Commission recommendations, review relevant data, and formulate broad goals, policies, and a diagram to guide growth and change in the City until 2025. In September 2004, the City Council established an ad-hoc General Plan Committee consisting of three Planning Commissioners and three City Council members to work with City staff and consultants to ensure that the *General Plan* would be completed expeditiously and with ample public participation, and to ensure open communication, transparency, and coordination among all parties interested in the creation of the *Plan*. All of the CPAC, Planning Commission, City Council, and General Plan Committee workshops, meetings, and hearings were open to the public and included significant, meaningful, and often extensive citizen input and participation.

Goals *summarize how conservation, development, and future growth should occur by identifying physical, economic and social ends that the community wishes to achieve.*

Policies *establish basic courses of action for the Planning Commission and City Council to follow in working to achieve community goals, by directly guiding the response of elected and appointed officials to development proposals and related community actions.*

Actions *need to be undertaken by the City to implement policies.*

Plan Format

The comprehensive and involved process of creating what is really a totally new (not just updated) *General Plan* – based on a new community vision and smart growth principles – resulted in a new set of goals, policies, and actions to guide future decision-making in Ventura that truly reflect the planning objectives of the community. These policy directives are organized by subject area in *General Plan* Chapters 1 through 10, which follow the organizational framework established in the *Ventura Vision* (see Table 1). Each topic is introduced with an overarching goal that carries forward the *Vision*, a description of issues needing resolution and methods for remedying them, and finally measurable policies and actions to achieve those solutions. Each of the policies contained within the Plan are intended to be understood and read with the following preface: "It is the intent of the City of San Buenaventura to...". All of the actions are summarized in table form in Appendix A, along with the City department or division responsible for implementing each action and timeframe for completion. Also included in the Plan are the legally binding Appendices B through E. Attachment A is provided as a reference, while Attachment B is provided to serve as guidelines for future development until an update to the Zoning Ordinance is completed.

Table 1
General Plan Organization

Vision/General Plan Chapter	Required/*Optional* Elements	Examples of Topics Covered
1. Our Natural Community	Conservation Open Space	Open space, hillsides, watersheds, riparian areas, sensitive plants and animals
2. Our Prosperous Community	*Economic Development*	Commercial and industrial growth, economic diversification, job opportunities, tourism
3. Our Well-Planned and Designed Community	Land Use/*Design* Housing *Park & Recreation*	Development patterns, neighborhoods, visual character, urban design, streetscapes, demographics, housing needs, affordability, constraints on production
4. Our Accessible Community	Circulation	Traffic, street network, parking, transit services, bike routes
5. Our Sustainable Infrastructure	Land Use	Water supply, wastewater treatment, drainage
6. Our Active Community	Land Use *Park & Recreation*	Park and recreation facilities, youth and senior programs
7. Our Healthy and Safe Community	Safety Noise Land Use	Development in hazardous areas, hazardous waste management, seismicity, flood control, water quality, brownfields, noise, police, fire, air quality
8. Our Educated Community	Land Use	Schools and libraries
9. Our Creative Community	*Culture*	Arts, events, community programs, cultural and historic resources
10. Our Involved Community	*Citizen Input*	Participation in governance

The format of the *General Plan* satisfies the State requirement that every general plan include policies for seven "elements," as follows:

Land use – establishes the general distribution and intensity of land uses, including housing, commerce, industry, open space, education, and public facilities.

Circulation – identifies the location and type of existing and proposed highways, arterial and collector roadways, bicycle routes, and other transportation facilities.

Conservation – addresses treatment of natural and cultural resources, including watersheds, wetlands, trees, rivers and barrancas, and cultural and historic landmarks.

Housing – assesses current and projected housing needs of all segments of the community and identifies land to provide adequate housing to meet those needs. Although the City's Housing Element and Technical Report is contained in a separate document to facilitate the frequent updating required by the State, the goals, policies and programs of the Housing Element must be and are consistent with the goals, policies, and actions of the *2005 Ventura General Plan.* (See Chapter 3, page 3-28, for 2004 Housing Element Goals and Policies.)

Noise – appraises noise sources in the community and develops means to mitigate nuisances.

Open Space – details techniques for preserving open space areas for natural resources, outdoor recreation, public health and safety, and agricultural activities.

Safety – establishes policies to protect the community from risks associated with seismic, geologic, flood, fire, and other hazards.

The *General Plan* also contains a number of special elements that aren't required by State law but are integral to the unique identity of Ventura. These cover a range of topics including education, recreation, arts and culture, and community involvement in local government. Another chapter treats the very important subject of the local economy, providing guidance to citizens, City staff and policy makers regarding strategies and priorities for economic development in Ventura.

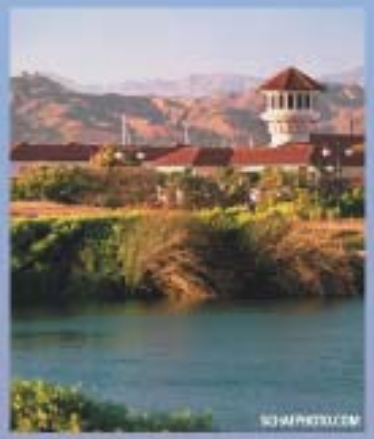
California Coastal Act

The *General Plan* also satisfies State requirements for the City's **Local Coastal Program** in accordance with the California Coastal Act (*Public Resources Code § 30000 et seq.)*. Actions in the *General Plan* that affect coastal resources are intended to become part of the Land Use Plan of the Local Coastal Program, which will be accomplished through specific or community plans for those areas. These actions are identified with the logo of the California Coastal Commission (which oversees all Local Coastal Programs). The basic goals of the State for the coastal zone are to:

- Protect, maintain, and where feasible, enhance and restore the overall quality of the coastal zone environment and its natural and artificial resources.
- Assure orderly, balanced utilization and conservation of coastal zone resources taking into account the social and economic needs of the people of the state.
- Maximize public access to and along the coast and maximize public recreational opportunities in the coastal zone consistent with sound resources conservation principles and constitutionally protected rights of the private property owners.
- Assure priority for coastal-dependent and coastal-related development over other development on the coast.
- Encourage state and local initiatives and cooperation in preparing procedures to implement coordinated planning and development for mutually beneficial uses, including educational uses, in the coastal zone.
  (Public Resources Code § 30001.5)

ventura's general plan

OUR NATURAL COMMUNITY



"As age comes on, one source of enjoyment after another is closed, but Nature's sources never fail. Like a generous host, she offers her brimming cups in endless variety, served in a grand hall, the sky its ceiling, the mountains its walls, decorated with glorious paintings and enlivened with bands of music ever playing."

— John Muir
20th Century Naturalist

CITY OF
VENTURA

1. OUR NATURAL COMMUNITY

Our goal is to be a model for other communities of environmental responsibility, living in balance with our natural setting of coastline, rivers, and hillside ecosystems.

Natural Context

Ventura's natural setting is one if its greatest assets, and preserving the environment is a top community priority. Situated between the ocean, hills, and two rivers, the city affords its residents and visitors with a significant amount of accessible, beautiful, and biologically diverse open space. Although a number of programs are in place to protect coastal and watershed ecosystems and to maintain and preserve existing open lands, some natural features in and around the city have been compromised by the impacts of human activity.

As in many communities across the nation, concern is growing in Ventura about human impacts on natural resources. The historic spread of local development has given rise to grassroots efforts aimed at preserving Ventura's viable agricultural land, open space, and hillsides. The 1995 Save Our Agricultural Resources initiative (see Appendix B) and the 2001 Hillside Voter Participation Area (Appendix C) measure require voter approval before the city can expand into open space areas. The Ventura Hillsides Conservancy formed in 2003 seeks to preserve local hillsides, canyons, and open space.

Ventura, Oxnard, Ventura County, and the County Local Agency Formation Commission have adopted agreements to preserve agricultural and open space land located between the cities. A change that amends these greenbelts requires the approval of all signatories.

Protecting Ventura's fragile natural resources is a fundamental focus of the *2005 Ventura General Plan*. Policies and actions in this chapter intend to ensure that coastal, hillside, and watershed features are preserved, remain visible and accessible, and demarcate boundaries for urban development to define and enhance the city's identity.

The community cherishes the shoreline as one of Ventura's best features. Coastal facilities in the city include:

- Emma Wood State Beach
- Ventura Seaside Park and Fairgrounds
- Surfers Point at Seaside Park
- Beachfront Promenade Park
- San Buenaventura State Beach
- Pierpont Community Beach
- Marina Beach/Cove Port District Beach
- Channel Islands National Park Headquarters
- Surfers Knoll
- Santa Clara River Mouth

Coastal Resources

Ventura boasts seven miles of beautiful sand beaches and valuable shoreline habitat. This "string of pearls" has long been identified by the community as one of the city's most prized features. At its eastern end, the Ventura Harbor offers opportunities for residents and visitors to explore the local marine environment, including the Channel Islands National Park and Marine Sanctuary. Elsewhere along the coast, shoreline and dune habitat provide nesting, feeding, and mating grounds for a wide variety of wildlife, including threatened or endangered species such as the western snowy plover and the least tern.

Shoreline conservation programs underway include the Surfers Point Managed Shoreline Retreat, San Buenaventura State Beach restoration, Ventura Harbor wetland rehabilitation, and coastline water quality monitoring. The City will continue to invest in restoration to enhance the shoreline ecosystem, with the actions in this chapter augmenting current efforts.

Hillsides

The hills of the Transverse Range rise 1,200 feet above Ventura, providing an important visual backdrop that frames the City. Not only do these hills provide residents and visitors with scenic vistas, they are also part of a larger integrated ecosystem comprised by the hillsides, coastal areas, rivers and barrancas that together provide a rich habitat for many species. It is vital to the community that these hillsides that lie outside the city limits (with a County land use designation of either Open Space or Agriculture), are protected and preserved.

These hillsides, by definition, are coterminous with the Hillside Voter Participation Area, and comprise the Hillside Open Space community as depicted on the General Plan Diagram (page 3-22). Because the Hillside Voter Participation Area measure prohibits the extension of City urban services to the hillsides through 2030 without voter approval, the General Plan Diagram identifies the hillsides affected by the measure with a Planning Designation of Open Space. The full text and map of the Hillside Voter Participation Area appears in Appendix C (as required by the act). This chapter calls working with land conservation organizations to establish a Ventura hillsides preserve, and Chapter 6, *Our Active Community*, contains actions to work with the County to create public trails in the hillsides.

Definitions for “Hillside Open Space,” “Hillside Area,” “hillsides,” and “Hillside Voter Participation Area” can be found in the Glossary (Attachment A).

Rivers and Barrancas

The Ventura River flows south to the Pacific Ocean along the western edge of the city, and the Santa Clara River bisects the Oxnard coastal plain south of Ventura. A series of seasonal watercourses called barrancas traverse the city in narrow incised drainage channels running down from the hillsides. The rivers and barrancas and their larger watersheds provide undeveloped open space, riparian vegetation, wildlife habitat and corridors, recreational opportunities, and aesthetic beauty.

Where local watercourses have not been channelized, riparian trees and shrubs grow in fringing woodlands and thickets. Several sensitive bird species breed in these areas, including the least Bell's vireo, willow flycatcher, yellow warbler, and yellow-breasted chat. Steelhead and rainbow trout seasonally inhabit both the Ventura and Santa Clara Rivers.

Riparian and freshwater marsh areas in Ventura represent only a remnant of pre-human coverage, but the City has initiated conservation and restoration efforts such as the Ventura River Estuary Program to help reverse this trend. The estuaries at the mouths of the Ventura and Santa Clara Rivers serve as breeding grounds and feeding areas for migratory and resident shorebirds and waterfowl, as well as home to many terrestrial animals, fish, and free-swimming invertebrates.

Actions in this chapter – such as maintaining adequate buffers from watercourses, requiring restoration of natural drainage features, and prohibiting the placement of manmade materials in drainages – can protect and improve water and habitat quality in local watersheds. The bolder action of removing concrete channel structures would further enhance natural functions and aesthetics.

Resource Conservation

As Ventura continues to grow, conserving resources, increasing energy efficiency, and achieving environmental sustainability become ever more important. The City desires to incorporate green building measures into the design, construction, and maintenance of public and private buildings which can result in significant cost savings and promote overall health and productivity of residents, workers, and visitors to the city. Raising conservation awareness can help minimize waste and pollution released into the natural environment. Improving energy efficiency in buildings, expanding recycling programs, and reducing transportation-related energy consumption will make the city a greener place. The policies and actions in this chapter provide clear direction to guide conservation, green practices, and responsible use of resources.

Policy 1A: Reduce beach and hillside erosion and threats to coastal ecosystem health.

Action 1.1: Adhere to the policies and directives of the California Coastal Act in reviewing and permitting any proposed development in the Coastal Zone.

Action 1.2: Prohibit non-coastal-dependent energy facilities within the Coastal Zone, and require any coastal-dependent facilities including pipelines and public utility structures to avoid coastal resources (including recreation, habitat, and archaeological areas) to the extent feasible, or to minimize any impacts if development in such areas is unavoidable.

Action 1.3: Work with the State Department of Parks and Recreation, Ventura County Watershed Protection Agency, and the Ventura Port District to determine and carry out appropriate methods for protecting and restoring coastal resources, including by supplying sand at beaches under the Beach Erosion Authority for Control Operations and Nourishment (BEACON) South Central Coast Beach Enhancement program.

Action 1.4: Require new coastal development to provide non-structural shoreline protection that avoids adverse impacts to coastal processes and nearby beaches.

Action 1.5: Collect suitable material from dredging and development, and add it to beaches as needed and feasible.

Action 1.6: Support continued efforts to decommission Matilija Dam to improve the sand supply to local beaches.

Action 1.7: Update the Hillside Management Program to address and be consistent with the Planning Designations as defined and depicted on the General Plan Diagram.

Policy 1B: Increase the area of open space protected from development impacts.

Action 1.8: Buffer barrancas and creeks that retain natural soil slopes from development according to State and Federal guidelines.

Action 1.9: Prohibit placement of material in watercourses other than native plants and required flood control structures, and remove debris periodically.

Action 1.10: Remove concrete channel structures as funding allows, and where doing so will fit the context of the surrounding area and not create unacceptable flood or erosion potential.

Action 1.11: Require that sensitive wetland and coastal areas be preserved as undeveloped open space wherever feasible and that future developments result in no net loss of wetlands or "natural" coastal areas.

Action 1.12: Update the provisions of the Hillside Management Program as necessary to ensure protection of open space lands.

Action 1.13: Recommend that the City's Sphere of Influence boundary be coterminous with the existing City limits in the hillsides in order to preserve the hillsides as open space.

Action 1.14: Work with established land conservation organizations toward establishing a Ventura hillsides preserve.

Action 1.15: Actively seek local, State, and federal funding sources to achieve preservation of the hillsides.

Policy 1C: Improve protection for native plants and animals.

Action 1.16: Comply with directives from regulatory authorities to update and enforce stormwater quality and watershed protection measures that limit impacts to aquatic ecosystems and that preserve and restore the beneficial uses of natural watercourses and wetlands in the city.

Action 1.17: Require development to mitigate its impacts on wildlife through the development review process.

Action 1.18: Require new development adjacent to rivers, creeks, and barrancas to use native or non-invasive plant species, preferably drought tolerant, for landscaping.

Action 1.19: Require projects near watercourses, shoreline areas, and other sensitive habitat areas to include surveys for State and/or federally listed sensitive species and to provide appropriate buffers and other mitigation necessary to protect habitat for listed species.

Action 1.20: Conduct coastal dredging in accordance with the U.S. Army Corps of Engineers and California Department of Fish and Game requirements in order to avoid impacts to sensitive fish and bird species.

Action 1.21: Work with State Parks on restoring the Alessandro Lagoon and pursue funding cooperatively.

Action 1.22: Adopt development code provisions to protect mature trees, as defined by minimum height, canopy, and/or trunk diameter.

Action 1.23: Require, where appropriate, the preservation of healthy tree windrows associated with current and former agricultural uses, and incorporate trees into the design of new developments.

Action 1.24: Require new development to maintain all indigenous tree species or provide adequately sized replacement native trees on a 3:1 basis.

Policy 1D: Expand the use of green practices.

Action 1.25: Purchase and use recycled materials and alternative and renewable energy sources as feasible in City operations.

Action 1.26: Reduce pesticide use in City operations.

Action 1.27: Utilize green waste as biomass/compost in City operations.

Action 1.28: Purchase low-emission City vehicles, and convert existing gasoline-powered fleet vehicles to cleaner fuels as technology becomes available.

Action 1.29: Require all City funded projects that enter design and construction after January 1, 2006 to meet a design construction standard equivalent to the minimum U.S. Green Building Council LEED™ Certified rating in accordance with the City's Green Building Standards for Private and Municipal Construction Projects.

Action 1.30: Provide information to businesses about how to reduce waste and pollution and conserve resources.

Action 1.31: Provide incentives for green building projects in both the public and private sectors to comply with either the LEED™ Rating System, California Green Builder, or the Residential Built Green program and to pursue registration and certification; incentives include "Head-of-the-Line" discretionary processing and "Head-of-the-Line" building permit processing.

Action 1.32: Apply for grants, rebates, and other funding to install solar panels on all City-owned structures to provide at least half of their electric energy requirements.

Action 1.33: Publicly acknowledge individuals and businesses that implement green construction and building practices.

OUR PROSPEROUS COMMUNITY

ventura's general plan

"Every increment of construction should be done in such a way as to heal the city."

— Christopher Alexander
Author of *A Pattern Language*, 1977

CITY OF
VENTURA

2. OUR PROSPEROUS COMMUNITY

Our goal is to attract and retain enterprises that provide high-value, high wage jobs; to diversify the local economy; to increase the local tax base; and to anticipate our economic future in order to strengthen our economy and help fund vital public services.

Adapting in the 21st Century

Great communities are prosperous communities. A successful city brings people, institutions, ideas, and capital together in creative ways that enrich the lives of those who live and work there. In today's global economy, high-wage high-value jobs are the foundation of the prosperity that instills a city with the financial resources necessary to provide high quality of life and excellent community amenities.

Ventura has been blessed with a history of prosperity, thanks in large part to success in harnessing the area's natural assets for economic benefit. For most of the 20th Century, Ventura was sustained largely by its role as the hub of the region's oil and agriculture industries. These two sectors not only provided a stable source of jobs and business opportunities, but also helped to shape Ventura's role as the legal, governmental, and cultural center of the County.

In the 21st Century, however, Venturans can't take continued prosperity for granted. Competition occurs regionally, nationally, and globally for innovative businesses, top talent, and good jobs. The community must build on its resources and constantly be on the lookout for new economic opportunities.

County government will likely remain the city's largest employer, providing an important element of economic stability, but government employment is not likely to grow significantly. Oil and agriculture will continue to be important, but their roles are diminishing. While Ventura is a regional center for healthcare, that industry will continue to face intense pressures to reduce costs. Still, the City of Ventura is positioned to move into an era dominated by innovation and reliant on emerging technologies. Cities and regions that excel in the "New Economy" promote high tech industries and boast a high quality of life. Likewise, to remain competitive, Ventura must continue to support economic development, but also create a more attractive living environment, including by providing appropriate housing for all segments of the local workforce. Efforts to boost economic development must be supported by a high quality of life, including a thriving cultural arts scene, award winning schools, and an engaged community. Tourism is also a strong market for Ventura. The beaches, museums, downtown, harbor and the nearby Channel Islands National Park attract more than 1.5 million visitors a year.

The policies and actions in this chapter seek to identify business niches that can thrive locally to diversify the economic base and ensure future community prosperity.

Economic Challenges

Ventura faces a variety of interrelated challenges to continued economic vitality, including:

1. Capturing a share of high-value job markets, such as biotechnology, computer software, communications, entertainment, multimedia, education, and business and financial services.

2. Diversifying the local economy to reduce dependence on the service, retail, and government sectors.

3. Building on the success of the tourism, manufacturing, business, and financial services sectors through marketing and job training programs that will ensure retention and attraction of these enterprises.

4. Finding appropriate locations for commercial and industrial land, including through revitalization opportunities in the Westside and Downtown and possibly via annexations of sites in the North Ventura Avenue and 101 Business Corridor areas.

5. Expanding the retail base, because sales tax represents a major City revenue source.

6. Providing housing for the full range of workforce households at all income levels.

7. Providing adequate infrastructure and financing resources.

Meeting all of these challenges in an integrated, strategic manner will be necessary to achieve long-term economic stability and success. The City must endeavor to identify the businesses most likely to remain and grow in an area that has very high costs – especially for housing – but also has outstanding community amenities, including good weather, a spectacular natural setting, and a safe and desirable community fabric.

The *Ventura Vision* calls for targeting industries that demonstrate the greatest promise for long-term community prosperity by:

- Providing high-wage, high skilled jobs,
- Possessing a local competitive advantage in the global economy,
- Being committed to local responsibility,
- Growing from local ownership, control or management,
- Practicing environmental leadership in their markets, and
- Strengthening the community's creative, cultural identity.

The *Vision* also offers principles for the City to pursue in charting future strategies for economic development:

- Encourage a broad range of high-quality employment and entrepreneurial opportunities.
- Encourage private economic prosperity that can support public services and quality-of-life amenities.

- Develop a vital, prosperous, and stable economy while maintaining a "small-town" flavor.
- Encourage the public and private sectors to work together to achieve prosperity.
- Participate constructively in regional economic development efforts.

Implementing these strategies will not be simple or easy. For one reason, California's current tax system contains provisions that result in some of the lowest-paying economic sectors providing the city with the most tax revenue, and vice versa.

Pillars for Prosperity

Community prosperity is not something that a city government can create by itself. Any successful economic development effort requires the participation of many partners, including community-based business organizations, educational and training institutions, venture capitalists, individual entrepreneurs and business owners, networks of suppliers, and other government agencies that have a mission to enhance prosperity.

Together, the City and its economic partners must ensure that the building blocks for community prosperity are in place. These foundations include organizations and institutions that can coordinate local economic development efforts, as well as land and other economic infrastructure required to make Ventura an attractive business location.

This organizational infrastructure is evolving in Ventura. Business groups such as the Chamber of Commerce and the Ventura County Economic Development Association (a countywide group) are already active, but a wider network is needed to assemble the resources and capacity of entrepreneurs, venture capitalists, educators, and other stakeholders in building a healthy business climate. Greater synergy is needed among the area's higher education institutions – including California State University Channel Islands, Ventura College, Brooks Institute, and satellite campuses of other colleges and universities.

Appropriate and sufficient land will also be necessary to ensure continued economic prosperity over the next 20 years, even as we seek to protect open space and combat sprawl. Demand for land to support retail and office development is likely to outstrip current supply unless allowable building intensities are significantly increased. While some increased density is likely, and some older industrial land may be recycled for new business uses, the City must take care to reserve sufficient land for these purposes – especially in an environment where short-term pressure is likely to encourage conversion of land to commuter housing.

Thus, the strategy for community prosperity must be coordinated with area-specific planning efforts, especially on the Westside (where industrial land is likely to be recycled), Downtown (which must stress office, studio, and retail business growth as well as an emerging residential component), and in the 101 Corridor between Mills Road and

Johnson Drive (where most of the city's business activity now takes place). The City will advance on a set of defined focused areas:

Auto Center – efforts over the short term will focus on making the area a regional retail destination. The City will strengthen its partnership with Auto Center dealers to realize beautification projects and facilitate land use entitlements for additional dealerships.

McGrath Property – the 76-acre site provides Ventura with the very best opportunity to attract new industry with high-value, high-wage jobs. The City and property owners will work on securing project entitlement approvals and recruiting desired tenants. The objective is to attract targeted industries and provide the impetus for initial site development over the short-term.

Westside – the feasibility of establishing a redevelopment project area will be considered by the City and Westside citizens. Such legal designation would provide the resources needed to leverage and implement planned initiatives in various Westside plans. Brownfield reuse efforts will also continue to secure funding for much needed site assessment and remediation activities.

Upper North Avenue – the objective is to transform this area from an oilfield industrial area to a dynamic economic engine. Development efforts will address reuse of the former USA Petroleum site, including and evaluation of the site's potential to emerge as a component of a campus expansion opportunity for Brooks Institute. Keys to this effort are site remediation, compatibility issues, and future annexation to the City.

Downtown – proposed initiatives include well defined design standards in the updated Downtown Specific Plan, enhanced efforts to market the Downtown Cultural District, formation of a downtown management entity, and attracting uses that create "around–the-clock" activity.

Anticipating Our Economic Future – Ventura's economic growth is built on a foundation of concerted efforts that fuel innovation, collaboration, and continuous learning. The focus will be on attracting high technology and knowledge-based businesses including biotechnology, non-durable manufacturing, and business and financial services. Continuous learning opportunities for job seekers, workers, and employers will acknowledge demographic pressures and rapidly changing skill needs. Through specific strategies, the community will develop leaders for tomorrow, and attract and retain new graduates and skilled employees. Critical players will include the Workforce Investment Board, Ventura College, California State Channel Islands, and the Brooks Institute.

The policies and actions in this chapter attempt to provide the means to support these targeted efforts to achieve a stable and balanced economic base.

Policy 2A: Establish a clear economic strategy.

Action 2.1: Track economic indicators for changes that may affect City land resources, tax base, or employment base, such as terms and conditions of sale or lease of available office, retail, and manufacturing space.

Action 2.2: Prepare an economic base analysis that identifies opportunities to capture retail sales in sectors where resident purchasing has leaked to other jurisdictions.

Action 2.3: Maintain and update an Economic Development Strategy to implement City economic goals and objectives.

Policy 2B: Make the local economic climate more supportive of businesses investment.

Action 2.4: Map priority locations for commercial and industrial development and revitalization, including a range of parcel sizes targeted for high-technology, non-durables manufacturing, finance, business services, tourism, and retail uses.

Action 2.5: Share economic and demographic information with organizations that may refer businesses to Ventura.

Action 2.6: Encourage intensification and diversification of uses and properties in districts, corridors, and neighborhood centers, including through assembly of vacant and underutilized parcels.

Action 2.7: Partner with local commerce groups to recruit companies and pursue funding for business development and land re-utilization.

Action 2.8: Carry out Housing Element programs that provide housing to all segments of the local workforce.

Action 2.9: Expedite review for childcare facilities that will provide support to local employees.

Policy 2C: Encourage niche industries.

Action 2.10: Expedite review of the entitlement process for installation of infrastructure necessary to support high technology and multimedia companies.

Action 2.11: Allow mixed-use development in commercial and industrial districts as appropriate.

Action 2.12: Allow uses such as conference centers with resort amenities on appropriately sized and located parcels.

Action 2.13: Market the city to businesses that link agriculture with high technology, such as biotechnology enterprises.

Action 2.14: Partner with local farms to promote farmers markets and high quality locally grown food.

Policy 2D: Expand tourism opportunities.

Action 2.15: Provide incentives for use of waterfront parcels for recreation, visitor-serving commerce, restaurant, marina, and fishing uses.

Action 2.16: Work with the State to create year-round commercial opportunities at the fairgrounds.

Action 2.17: Partner with the Harbor District and National Park Service to promote Channel Islands tours and develop a marine learning center.

Action 2.18: Prioritize uses within the Harbor master plan area as follows: (1) coastal dependent, (2) commercial fishing, (3) coastal access, and (4) visitor serving commercial and recreational uses.

Action 2.19: Partner with hotels and the Chamber of Commerce to promote city golf courses.

Action 2.20: Promote outdoor recreation as part of an enhanced visitor opportunities strategy.

ventura's general plan

OUR WELL PLANNED COMMUNITY

"Communities should be designed to serve the cycle of the day and the cycle of the lifetime."

— Andres Duany
Architect & Town Planner

CITY OF
VENTURA

3. OUR WELL PLANNED & DESIGNED COMMUNITY

Our goal is to protect our hillsides, farmlands and open spaces; enhance Ventura's historic and cultural resources; respect our diverse neighborhoods; reinvest in older areas of our community; and make great places by insisting on the highest standards of quality in architecture, landscaping and urban design.

Our City

Ventura is a unique coastal community, proud of our heritage and dedicated to being a national model for effectively managing growth to protect our natural environment and continue to be a great place for us to live.

It is our public responsibility to plan and shape the physical realm to achieve these goals. Past policies, particularly the 1989 Comprehensive Plan, reined in rapid outward suburban sprawl. The 1992 Downtown Specific Plan set the direction for revitalization of the historic heart of our community. Voter-approved measures clearly underscored a mandate to protect agricultural resources and open space, particularly in our hillsides.

Guided by the Ventura Vision of 2000, the centerpiece for this General Plan is creating a "well-planned and designed community." The policies build on the foundation of the past. This plan also represents an historic commitment to *smart* growth:

1. Mix land uses
2. Take advantage of compact building design
3. Create a range of housing opportunities and choices
4. Create walkable communities
5. Foster distinctive, attractive communities with a strong sense of place
6. Preserve open space, farmland, natural beauty, and critical environmental areas
7. Strengthen and direct development toward existing communities
8. Provide a variety of transportation choices
9. Make development decisions predictable, fair, and cost effective
10. Encourage community and stakeholder collaboration in development decisions

Source: U.S. Environmental Protection Agency

"**Smart growth** is about being good stewards of our communities and of our rural lands, parks, and forests. It is about ensuring that the best of the past is preserved, while creating new communities that are attractive, vital, and enduring."
--Michael Leavitt, EPA Administrator

Infill First

Ventura today is the product of decades of earlier growth and development. These patterns have largely established our community's character and will continue to do so in the future. The passage of SOAR, the Hillside Voter Protection Area, and other land-use constraints, along with natural boundaries, such as the ocean and the rivers, make it abundantly clear that before we expand outward any further, we must pursue an "Infill First" strategy. Such a strategy will help avoid sacrificing farmland and sensitive areas in our hillsides and along our rivers.

Our “Infill First” strategy for Ventura means avoiding suburban sprawl by directing new development to vacant land in the City and Sphere of Influence (with the exception of SOAR land), and by focusing new public and private investment in carefully selected districts, corridors, and neighborhood centers where concentrated development and adaptive reuse will improve the standard of living and quality of life for the entire community.

Recognizing that the rate of future population growth is not subject to City control, this plan has been analyzed (in the accompanying Environmental Impact Report) on the basis of estimates of what new homes and other development might be expected to take place over the next twenty years (see Table 3-2). Looking at the rate of growth over the past decade and recognizing the challenges to "infill" development compared to "greenfield" expansion, a projection of roughly 8,300 additional housing units and approximately 5 million square feet of non-residential development has been used for the plan's 20 year planning horizon. Table 3-2 provides estimates of the amount of development that could reasonably be expected to occur in the City and Sphere of Influence.

The actual distribution of future growth in the City may vary based on market forces and other factors. The districts, corridors, and neighborhood center areas, shown on Figure 3-1 Infill Areas, could accommodate more development and/or a different mix of development than shown in Table 3-2. To demonstrate this, Table 3-1 shows the potential development based on the overall carrying capacity of the land.

Distribution of growth in the districts and corridors is based on the following general assumptions:

- Development in the Downtown and Harbor Districts will conform to the plans for those areas,
- The Downtown area and, to a lesser extent, the Ventura Avenue corridor will be the focus of future residential and commercial growth, and
- The Arundell, North Avenue, and Upper North Avenue areas will be the focus of future economic growth, potential expansion of the Brooks Institute, with some residential uses.

Table 3-1. Potential Development Based on Carrying Capacity of Land Area

Planning Designation	Allowed Density (du/acre)	Existing Development 2004					General Plan Capacity			
		Single Family Units	Multi Family Units	Comm./Ind. Sq. Ft.	Parcels	Acres	Vacant Parcels	Vacant Acres	Additional Potential[3] Units	Additional Potential[3] Sq. Ft.

Total		**22,034**	**17,142**	**15,923,154**	**32,630**	**27,884**	**378**	**1099**	**29,910**	**57,869,859**

1. Commerce residential unit capacity is for property within a Corridor, District, or Neighborhood Center and assumes buildout to the maximum FAR and that 25% of floor area would be commercial (with the remainder residential).
2. Industry residential unit capacity is for property within a Corridor, District, or Neighborhood Center and assumes buildout to the maximum FAR and that 75% of floor area would be industrial (with the remainder residential).
3. "Additional Potential" assumes a historic buildout rate of 70% for both residential and non-residential.

Figure 3-1
Infill Areas

Footnotes for Table 3-2:
Growth estimates for the Arundell community consider the likely development of the 75-acre McGrath property with a mix of uses and development of other vacant lands. Growth estimates for the North Bank area consider the possibility of a large retailer in that area. Estimates of growth in the SOI/Other Infill sites are based on the following general assumptions: (a) 101/126 Orchard site will develop similarly to a project recently proposed for that site; (b) Wells/Saticoy sites will develop in accordance with ongoing planning efforts for those areas; (c) the Pierpont area will develop generally in accordance with a conceptual project recently considered by the City; (d) Second Units will be added at a rate of 15/year; (e) roughly half of underutilized lands identified in the Housing Element will be re-developed over the next 20 years; (f) all vacant lands outside the districts and corridors will be developed in accordance with the proposed planning designations. Planned and Pending Developments based upon the City's 2004 Pending Projects list. Building areas do not include self storage facilities.
The following potential projects not included in the 2004 Planned and Pending Developments list have been included in the future development totals: (1) 150,000 square feet of industrial development in the North Bank area; (2) 165,000 square feet of retail development along Wells Road in the Saticoy area; (3) 50,000 square feet of office development on a 3.5-acre site along Ralston Drive. The Auto Center industrial project is included in the North Bank district; the other two projects are included in the "vacant" category. The square footage associated with these projects has been added to the projections of future growth to provide a conservative analysis of possible future impacts.

Together Table 3-2 and Figure 3-1, Infill Areas, offer a sense of how much growth Ventura might experience by 2025, and a picture of where such change is likely to occur. Precisely how and when development happens and what resources are conserved will be determined by the actions presented in the ten chapters of the *General Plan*, and by the specific land development standards. This plan is one of many tools the City will use to control where and how any future development takes place.

21st Century Tool Kit

The City has a wide array of tools at its disposal to achieve our "Infill First" strategy in ways that respect Ventura's heritage and result in beautiful buildings, blocks, streetscapes, and public places that enhance and enrich quality of life for the entire community. Shaping the City's physical form in the 21st Century will be achieved most effectively and aesthetically by combining Planning Designations with a transect-based approach, and with a new form-based Development Code. Together these can strongly influence the design and functioning of Ventura's distinct and unique neighborhoods, districts, and corridors.

The policies and actions in this chapter seek to enrich Ventura's urban fabric through appropriate design that showcases the attractive features of neighborhoods, districts, and corridors. To promote high-quality infill, the policies and actions encourage neighborhood centers, pedestrian access, established and desirable building types, and dynamic, neighborhood-serving nodes of mixed-use development along primary streets and corridors. This chapter specifically calls for detailed attention to community design through a form-based approach.

Neighborhoods: The Basic Building Blocks of Community

Like any great city, Ventura has grown around the basic unit of the neighborhood. A true neighborhood is not a subdivision of similar houses disconnected from surrounding places. Instead it is an identifiable area containing a neighborhood center with a pedestrian-friendly mix of uses and a palette of housing types for people in all stages of their lives. Neighborhoods are often defined by a quarter-mile "pedestrian shed" (see Figure 3-2), in which most residents' daily needs can be met within a five-minute walk. The organic nature of neighborhoods and their interdependency is what makes them viable for generations. Neighborhoods are not static places that resist change, but rather evolve naturally through periods of transformation to accommodate new residents' needs and desires.

> "In a neighborhood, everything that is needed is there and everything that is there is needed."

Pedestrian Shed, Theoretical versus Actual

This map is a product of the City of San Buenaventura, California. Although reasonable efforts have been made to ensure the accuracy of this map, the City of San Buenaventura cannot guarantee its accuracy.

The City is rich in a variety of neighborhoods, most of which are within one of Ventura's distinct communities. A total of 17 communities were identified in the 1989 Comprehensive Plan and have been carried forward, with some modifications to allow for a more detailed approach to describe Ventura's geography. Figure 3-3 illustrates 19 distinct communities, some of which are composed of a group of neighborhoods, each boasting their own unique attractions and potential. The oldest settled area is nearest the ocean, with newer areas found eastward, with the exception of Saticoy. Some of Ventura's communities have neighborhood centers established around parks, community gathering places, or civic buildings, and contain or are near services they share with surrounding areas, such as schools, libraries, post offices, and specialty shopping.

Ventura also has residential subdivisions and commercial and industrial districts that could evolve into true neighborhoods. A long-term strategy should be developed to gradually transform these areas that do not yet follow the neighborhood pattern. Existing subdivisions could be linked by pedestrian routes to new small-scale retail and service centers. Congested commercial areas could be redesigned as mixed-use centers on a grid of streets with walkable blocks that connect with surrounding neighborhoods and central plazas. These streets could be lined with buildings containing upper level housing and lower level commercial, office, and civic spaces that hide internal parking structures. Industrial sites that are fast converting to light industry, high tech manufacturing, and assembly could become factory villages with green space, multiple types of housing, small-scale retail to serve workers, and spin-off businesses.

Ventura's 19 communities (Figure 3-3) can each be enriched by using the *transect* (see discussion page 3-10) as a lens to understanding the ways in which it functions and by applying form-based development controls to respect and enhance its character to ensure that, where appropriate, each community provides one, if not more, walkable neighborhoods.

Planning Communities

Figure 3-3
Planning Communities

This map is a product of the City of San Buenaventura, California. Although reasonable efforts have been made to ensure the accuracy of this map, the City of San Buenaventura cannot guarantee its accuracy.

Taylor Ranch
This area is essentially undeveloped, with agriculture as the primary activity. Taylor Ranch is within the City's Planning Area, including a portion within the Coastal Zone Boundary.

Ventura River
This area includes the Ventura River Basin, is within the Coastal Zone Boundary, and with Emma Wood State Beach Park, its major activity is recreation offering day use and overnight camping. Opportunities exist for passive recreation and nature study.

Hillside Open Space
Within the City's Planning Area, is undeveloped, and designated Open Space. Plant communities include chaparral, riparian willow forest, and oak woodland. This area has tremendous potential for passive recreation including scenic trails with panoramic views. This area is coterminous with the Hillside Voter Participation Area or "HVPA" (see Chapter 1 and Appendix C).

North Avenue
Within the City's Planning Area. Historically, largely oilfield industrial. Includes both the Upper North Avenue and North Avenue districts, and is home to the Brooks Institute, which is world renown for its professional photographic and motion picture education. Opportunities exist to strengthen the economy of this area and provide for the expansion of the Brooks Institute into a campus-village including spin-off businesses with a mix of housing types and transit options for all ages.

Westside
Includes the Ventura Avenue corridor and is home to several neighborhood centers that are surrounded by well-connected neighborhood blocks. Opportunities exist to realize the potential of neighborhood improvements initiated in ongoing and past grassroots efforts, such as the Westside Revitalization Plan. This community includes "Hillside Areas" (see definition in Attachment A), which are subject to the Hillside Management Program that provides necessary development criteria in order to retain the natural qualities and minimize potential hazards.

Downtown
The area is regulated by the Downtown Specific Plan. This community is both an urban core with opportunity to grow economically stronger, and the historic center of the City. Civic uses include City Hall, Seaside Park, Grant Park, the Ventura County Museum, San Buenaventura Mission, and is home to a number of historic sites and landmarks. Additional opportunity to enhance the area's already strong cultural climate, including art, cookery, music, performance, and entertainment. Tremendous potential to create "around-the-clock activity" leading to increased vitality. This community includes "Hillside Areas".

Midtown
Includes the Main, Thompson, and Loma Vista corridors, a portion of the Telegraph corridor, as well as the Seaward/Alessandro neighborhood center. Home to the Pacific View Mall, the City's Bus Transfer Center, Ventura High School. Blanche Reynolds Park, Ocean Avenue Park,

and Memorial Park. Includes a small amount of agriculture. Opportunities exist to realize potential improvements initiated in ongoing and past grassroots efforts, such as Midtown by Design, and more recently the Midtown Urban Design Charrette. This community includes "Hillside Areas".

Pierpont
Within the Coastal Zone Boundary, a unique-beach oriented predominantly residential community, with high-quality beachfront homes. Includes the Harbor district and the Pierpont neighborhood center. Home to the Ventura Harbor, Seaward Elementary School, a mobile home park, and Marina Park. Currently offers highway retail such as motels, hotels, and fast food, but opportunity exists to offer residents and visitors with more attractive and improved neighborhood and coastal oriented services and to develop a specific plan for the Harbor district.

College
Includes a portion of the Telegraph corridor, and the College/Day neighborhood center. Major civic uses are Arroyo Verde and Camino Real Park, Ventura Community College and Buena High School. This community includes "Hillside Areas".

Thille
Includes the Gateway neighborhood center and shares the Victoria corridor with Montalvo to the east. Contains mix of housing types built mostly between 1960 and 1980, with some newer development in the 1990's and early 2000's. Its primary civic use is the County Square Linear Park

Arundell
This community contains the main industrial and warehouse district of Ventura, but also has mixed-use areas with retail, restaurants, and offices within walking distance of many workers. Callens Road, the historic center of this community, has great potential to expand and increase the mix of uses it contains, including residential. A significant vacant parcel, the 75-acre McGrath property, offers great economic opportunity to attract new industry that provides high value, high wage jobs to the City.

Olivas
Predominantly agricultural. Its major civic use is the Olivas Park Golf Course and is home to the Olivas Adobe. Contains some commercial and industrial.

North Bank
This community contains a portion regulated by the Auto Center Specific Plan. Its major civic use the Buenaventura Golf Course. Predominantly industrial, with some agriculture. Opportunity to enhance the area as a regional retail destination, while providing workforce serving retail uses.

Poinsettia
Includes the Victoria Plaza neighborhood center. Its primary civic uses include elementary and middle schools. Predominantly residential, with some housing in the Hillside Area, and a significant amount of agricultural operations.

Montalvo
Includes the Johnson Drive corridor, Bristol neighborhood center, and shares the Victoria corridor with Thille to the west. Its major civic use is the County Government Center (equal size to 12 downtown blocks), but also the Rancho Ventura Linear Park and the Barranca Vista Park. Contains mix of housing types and is home to the Metrolink Station.

Serra
Includes the Telephone/Petit neighborhood center, and is home to the City's newest civic use – the Community Park, set to open Fall 2005. Also includes the Chumash Park, Junipero Serra Park, North Bank Linear Park, and Bristol Bay Linear Park. Contains a significant amount of agricultural land.

Juanamaria
Includes the Kimball/Telegraph neighborhood center. Primary civic use is Hobert Park; this community contains some agricultural land.

Wells
Includes the Wells corridor. The Brown Barranca runs through the northerly portion of this area. Contains agricultural land.

Saticoy
Includes the Telephone/Cachuma and Saticoy neighborhood centers and the Saticoy district. Developed originally as a rural town in the late 1800s, Saticoy has the full range of transect characteristics: from the Santa Clara river and the rural eastern edge, to its neighborhood centers, and a mix of housing types at various intensities. Its major civic uses are the Fritz Huntsinger Youth Sports Complex, Saticoy Regional Golf Course and the Saticoy neighborhood park.

Planning Designations and Transect Zones

Land in the City's Planning Area is divided into eight basic Planning Designations on the General Plan Diagram (page 3-22). Each acknowledges a particular predominant development pattern that exhibits certain desirable characteristics, such as building types and functions that can be measured and described.

The wide range of building forms in Ventura offers great potential for compatible infill and viable mixed-use projects in existing neighborhoods, districts, corridors, and neighborhood centers. The wealth of building types includes attached and detached housing, duplexes, courtyard bungalows, second units (often over garages), lofts (some live-work), urban villas, neighborhood shopfronts, concentrated retail developments, and civic buildings. Public buildings retain special importance by serving as prominent landmarks that shape the visual character of the city.

Streetscapes set the tone for quality of life in Ventura by providing the shared outdoor living space of the community. Although the city's distinct neighborhoods, commercial and industrial districts, and agricultural areas are linked by corridors that have evolved primarily to accommodate motor vehicles, opportunities abound to make those streets more livable and to focus activities in neighborhood centers that emphasize walking, biking, and public gathering, and thereby ease traffic and reinforce community vitality. Accordingly, new development needs to be high quality, compact, and walkable, and it should incorporate design diversity that increases lifestyle choices and bolsters commerce and industry.

Determining which building types are most appropriate in specific locations requires shifting away from conventional zoning that emphasizes use toward a form-based approach that prioritizes function, appearance, and compatibility with surrounding context. A powerful tool for understanding this context is the *Transect*, which depicts the continuum from rural to urban conditions (see Figure 3-4).

The transect is a tool that can be used by the community to understand and describe the full range of unique environmental and built characteristics within each of Ventura's neighborhoods. Using the six parenthetical transect zones to better understand the broad Planning Designations of the General Plan Diagram, a finer-grained (site specific) set of development standards can be created to ensure that new development is in keeping with local preferences for building.

This new Development Code will better accommodate the diversity of lifestyles Ventura desires – from the *rural* farm to the *sub-urban* house and yard to the *urban core* with apartments above shops – and will contribute to the identity and character desired by the community. Common elements that the transect will help measure and describe, and that the Development Code will prescribe, include the types and

arrangements of buildings, their "intensity" of lot coverage, height and mass, the details of streets, public and private frontages and the requirements for and character of open spaces. In general it will prescribe individual neighborhood preferences for urban design and building characteristics, including standards.

In many cases, area specific codes, applying the Planning Designations including districts, corridors, and neighborhood centers, will be developed as part of community or specific plans that establish a detailed strategy for public and private investment and policies to promote the appropriate preservation and development of community desired character.

The following descriptions of the Planning Designations include a parenthetical reference to the transect zones they encompass that will be used as guidance in interpreting the planning designations while drafting detailed plans and codes:

"A **transect** is a geographical cross-section of a region used to reveal a sequence of environments. For human environments, this cross-section can be used to identify a set of habitats that vary by their level and intensity of urban character, a continuum that ranges from rural to urban. In transect planning, this range of environments is the basis for organizing the components of the built world: building, lot, land use, street, and all of the other physical elements of the human habitat."
--SmartCode, Volume 6.5, 2005

"All architecture should be beautiful. All towns should be beautiful. Beauty nurtures the soul and the spirit. It makes life worth living."
-Camillo Sitte

- Neighborhood Low – *(T3 Sub-Urban and T4 General Urban)*
emphasizes detached houses with some attached units in a small mix of building types from 0 up to 8 dwelling units per acre. Predominantly residential, with opportunity for limited home occupation and neighborhood services sensitively located along corridors and at intersections.

- Neighborhood Medium – *(T3 Sub-Urban, T4 General Urban and T5 Urban Center)*
anticipates a mixture of detached and attached dwellings and higher building types at approximately 9 to 20 dwelling units per acre. Predominantly residential with small scale commercial at key locations, primarily at intersections and adjacent to corridors.

- Neighborhood High – *(T3 Sub-Urban through T6 Urban Core)*
accommodates a broader mix of building types, primarily attached, from 21 to 54 dwelling units per acre; A mix of residential, commercial, office, and entertainment that includes mixed-use buildings.

- Commerce – *(T4 General Urban through T6 Urban Core, neighborhood center downtown, regional center, town center or village center)*
encourages a wide range of building types of anywhere from two to six stories (depending on neighborhood characteristics) that house a mix of functions, including commercial, entertainment, office and housing.

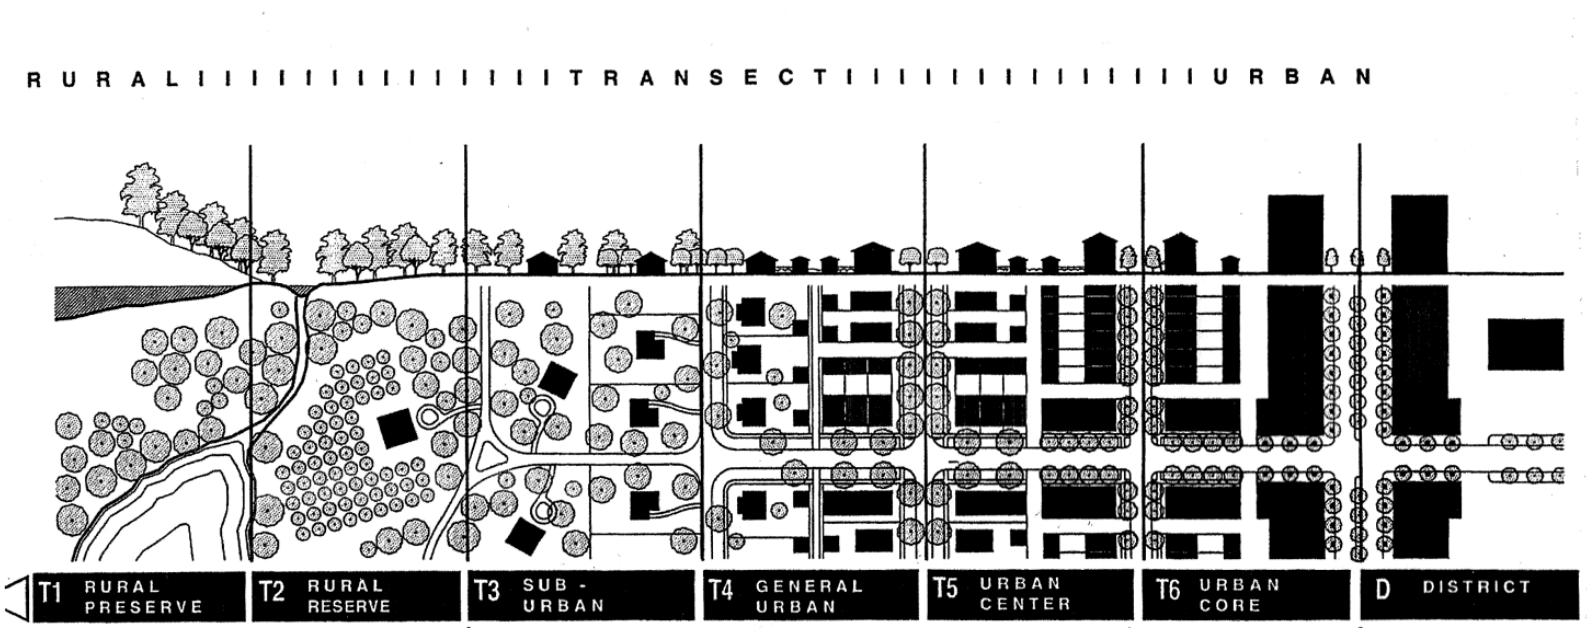
- Industry – *(T2 Rural through T6 Urban Core)*
encourages intensive manufacturing, processing, warehousing and similar uses, as well as light, clean industries and support offices; also encourages workplace-serving retail functions and work-live residences where such secondary functions would complement and be compatible with industrial uses. Primarily large-scale buildings. Also can be developed as Transit Oriented Development, employment center or working village with a mix of uses.

- Public and Institutional – *(T1 Preserve through T6 Urban Core)*
accommodates civic functions such as government offices, hospitals, libraries, schools and public green space.

- Agriculture – *(T2 Rural)*
predominantly commercial cultivation of food and plants and raising of animals.
Pursuant to SOAR: The Agricultural use (not to be considered until after the Year 2030) category identifies those lands that are designated for agricultural use on the General Plan Diagram. The target date of 2030 associated with the Agricultural Use designation indicates a review date after which agriculturally designated lands may be reconsidered for urban uses. However, during the life of this Plan as amended by initiative, it is intended that only agricultural uses are permitted on these lands, except as such lands may be appropriate to public open space and recreational usage. Furthermore, any updates to this Plan are not intended to imply that development would necessarily be appropriate at that time.

- Parks and Open Space – (*T1 Preserve through T6 Urban Core)*
designate lands to public recreation and leisure and visual resources, and can range from neighborhood tot lots and pocket parks to urban squares and plazas and playgrounds to large regional parks and natural preserves.

Figure 3-4. The Transect



Transect: a system of ordering human habitats in a range from the most natural to the most urban. For convenience, the Transect is divided into six zones which describe the physical character of place at any scale, according to the intensity of land use and urbanism. The T-Zones are T1 Natural, T2 Rural, T3 Sub-Urban, T4 General Urban, T5 Urban Center, and T6 Urban Core.

Natural Zone (T1): consists of lands approximating or reverting to a wilderness condition, includes lands unsuitable for settlement due to topography, hydrology, or vegetation.

Rural Zone (T2): consists of lands in open or cultivated state or sparsely settled. These may include woodlands, agricultural lands, grasslands and irrigable deserts.

Sub-Urban Zone (T3): though similar in density to conventional suburban residential areas, differs by its superior connectivity and by allowing home occupations. It is typically adjacent to other urban T-zones. This zone is naturalistic in its planting. Blocks may be large and the roads irregular to accommodate site conditions.

General Urban (T4): has a denser and primary residential urban fabric. Mixed-use is usually confined to certain corner locations. This zone has a wide range of building types: singles, side yard and rowhouses. Setbacks and street tree settings are variable.

Urban Center (T5): is the equivalent of the main street area. This zone includes mixed-use building types that accommodate retail, offices and dwellings, including rowhouses and apartments. This zone is a tight network of streets and blocks with wide sidewalks, steady street tree planting and buildings set close to the frontages.

Urban Core (T6): is the equivalent of a downtown. It contains the densest urbanism – the tallest buildings and the greatest variety of uses, particularly unique ones such as financial districts and important civic buildings. This zone is the least naturalistic of all the zones; street trees are formally arranged or non-existent.

Source: Duany, Plater Zyberk & Company's SmartCode, Volume 6.5, Spring 2005

The General Plan Diagram (page 3-22) also depicts the Downtown, Auto Center, and Saticoy Village Specific Plan areas, which are subject to detailed standards for form and use. In addition, the Diagram identifies Districts, Corridors, and Neighborhood Centers – where the development of housing alongside commercial uses is specifically encouraged. These Districts, Corridors, and Neighborhood Centers make up the growth priority areas as the City's "Infill First" strategy (See Figure 3-1 Infill Areas).

Districts, Corridors, and Neighborhood Centers

One of the primary objectives for infill in Ventura is to produce mixed-use development that places most people's daily needs within walking distance of their dwellings. This may include encouraging "flex space" where a single building functions as both living and working area for the owner, combining housing and commercial uses in the same structures, or sensitively integrating small-scale retail, service, and entertainment within convenient distance of residential areas. Mixed-use places inherently reduce automobile trips and improve the pedestrian experience, resulting in safer neighborhoods, healthier citizens, and better access to everyday needs. The City's corridors and districts already encompass significant mixed-use development. Opportunities exist to augment those areas in ways that complement and enhance existing urban form and streetscapes to better serve Ventura's residents.

Districts

Districts consist of streets or areas emphasizing specific types of activities and exhibiting distinct characteristics. A neighborhood or parts of neighborhoods can form a district. A thoroughfare may also be a district, such as when a major shopping avenue runs between adjoining neighborhoods. The following nine districts are depicted on the General Plan Diagram:

1. Upper North Avenue – home to a mix of industrial uses, including an abandoned oil refinery and Brooks Institute. Tremendous opportunities exist for the remediation and reuse of the former USA Petroleum site, as well as for the expansion of the Brooks Institute as a campus village, surrounded by a green edge to define the upper limits of Ventura.

2. North Avenue – an area with oilfield, industrial, and residential development, which has potential to fully develop into a more balanced mix of building types and uses with unique character, to serve as a major neighborhood anchor for northwest Ventura.

3. Downtown – the most intensely developed area of the city and its urban core. The Downtown Specific Plan regulates this area. Proposed initiatives include well-defined design standards via the Downtown Specific Plan update; enhanced efforts to market the Downtown Cultural District; formation of a

downtown management entity; and attracting uses that create "around–the-clock" activity.

4. Pacific View Mall – an enclosed shopping center and adjacent commercial uses. Large expanses of surface parking paired with significant building mass offer opportunity for the reintroduction of the block pattern and a reinvention of single-use retail into a much more sustainable mix of high intensity uses.

5. Harbor – an area with visitor serving uses, marine facilities, boating and commercial and recreational fishing activities, as well mixed-use places. A specific plan (based on the draft Harbor Master Plan) is being prepared for the Harbor District that will ensure a mix of uses, including residential, and highly defined public frontages and shared civic space for increased accessibility to ocean-front amenities.

6. Arundell – is currently an industrial center with a mix of small-scale industrial uses, business park development, and limited retail services. The McGrath Property – is a 76-acre site of undeveloped land that could provide the catalyst for Ventura's redefinition of 21st Century light industry, manufacturing, research and development, and technological innovation. It is centrally located in the Arundell area, which is ripe for redevelopment into a new form of community plan and building that incorporates large-scale employment, workforce housing and neighborhood commercial in an economically diverse setting.

7. North Bank – a combination of automobile retail, regulated by the Auto Center Specific Plan, and industrial/business park uses. Auto Center – efforts over the short tem will focus on making the area a regional retail destination. The City will strengthen its partnership with Auto Center dealers to realize beautification projects and facilitate land use entitlements for additional dealerships, as well as nurture creative partnerships to discover potential for unique attractions of regional interest.

8. Montalvo – an area of industrial and heavier commercial uses, and currently home to the Metrolink Station. Because of the strategic location of this area between east and west Ventura and it's transportation-rich infrastructure, it needs a strong plan for connectivity and a strategic mix of uses for evolution that is economically sustainable.

9. Saticoy – a mix of homes, older industrial and agricultural operations, and the planned site for the County maintenance yard. The Saticoy Village Specific Plan governs a small portion of this area. A larger effort should ensure Saticoy's seamless connection with adjacent areas, including a greenspace and circulation plan.

Corridors

Corridors, which can be natural or urban, often form boundaries, as well as connections, between neighborhoods and/or districts. Natural corridors can be those such as streams, barrancas, canyons, or green parkways. Urban corridors can be transportation thoroughfares that frequently encompass major access routes, especially ones with commercial destinations, including transit routes and rail lines. The following eight urban corridors are depicted on the General Plan Diagram. Each has the potential to evolve into a vibrant mixed-use City street with a distinct character borrowed from the neighborhoods that share it:

A. Ventura Avenue – a mix of older, small-scale commercial, industrial, and residential uses, with potential to grow even more vibrant by building on existing strengths, including its historic role as a major "working center." Using the warehouse model and diversity of building materials as a cue, "The Avenue" could harness cultural expression and become an eclectic center for the emerging arts and manufacturing crafts.

B. Main Street – currently a commerce-oriented area with a limited amount of mixed use development, this corridor displays the broadest range of architectural types and styles in the city, as well as the widest spectrum of transect characteristics. It has the most potential for increased mixed use and housing with improved streetscape and pedestrian enhancement to slow traffic.

C. Thompson Boulevard – a commercial thoroughfare in need of streetscape improvements and pedestrian amenities, this corridor is much like Main Street in that it boasts tremendous history as a "gateway to Ventura" and epitomizes a beach town character. It is a natural for a major transit or streetcar corridor, where nodes of mixed-use development and pedestrian and bike enhancement could support parallel neighborhoods and increase access to the ocean.

D. Loma Vista Road – a mix of commercial and residential development at varying scales, with a high concentration of medical facilities, this is the ideal place for Ventura to focus on creating a concentration of medical and research-centered business, with a high intensity of workforce housing and services housed in large-scale mixed-use buildings of high-tech character and serviced by increased transit.

E. Telegraph Road – a sub-urban-scale commercial area with some detached homes and multifamily buildings. The City's bus transfer station is located along this corridor, creating the perfect opportunity for a multi-modal connection with an intense node of housing and employment. The streetscape could change character along its length, with a mixture of intensities of development.

F. Victoria Avenue – currently a wide artery with high traffic volumes and shopping centers, Victoria needs effective traffic management

and pedestrian and streetscape improvements with strong attention to additional mobility options. Actions in this General Plan, along with the new Development Code, will call for revitalizing this corridor by redesigning the current array of single-use shopping centers and retail parcels with a mix of building types, uses, and public and private frontages. By eliminating "big box", mega-block, auto-oriented strip development, and the traffic patterns it generates, Victoria Avenue could create tremendous opportunity for healthy economic investment in walkable blocks, connected to better serve surrounding neighborhoods. Creative solutions, including dedicating transit or streetcar lanes, wider sidewalks, and bike lanes could transform Victoria's image into a regional thoroughfare of great and sophisticated diversity. All new commercial development within the Victoria Avenue corridor must follow this approach.

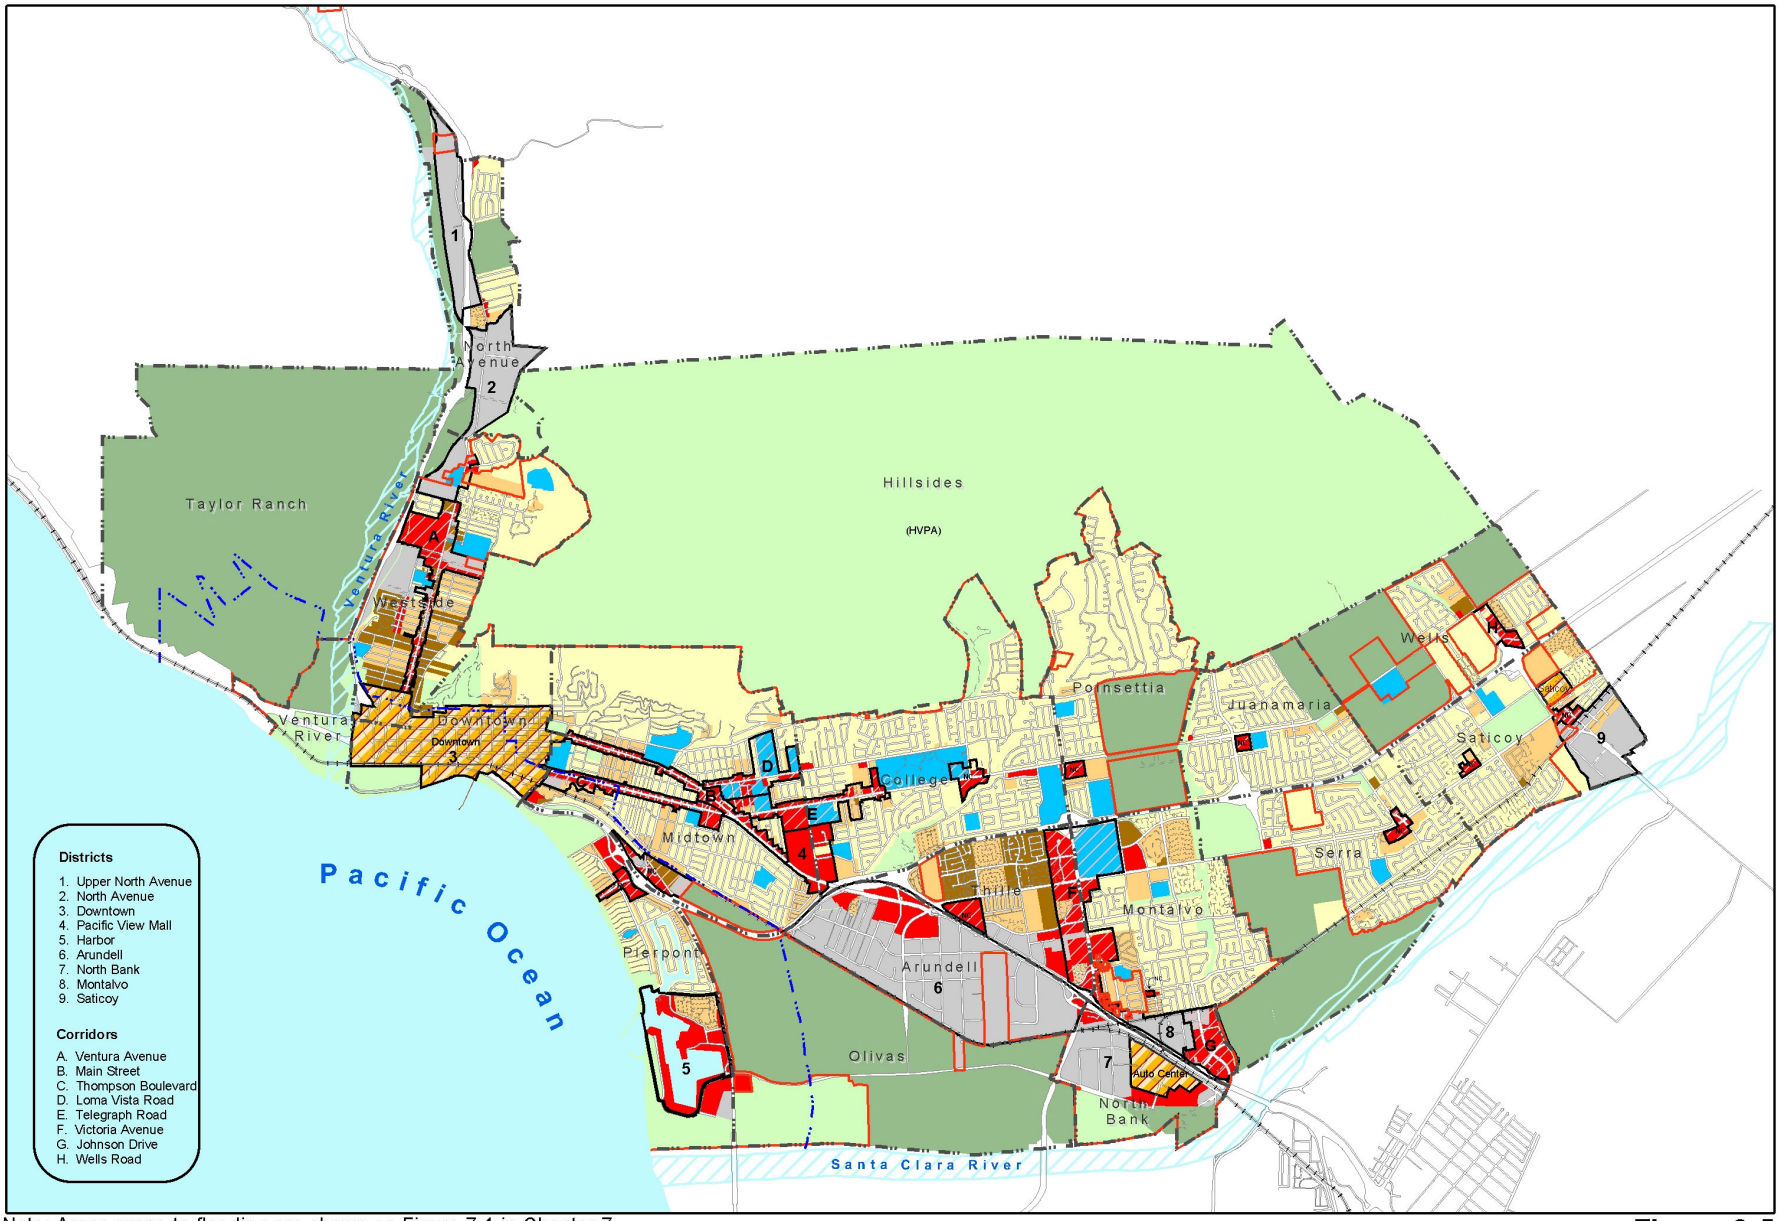
G. Johnson Drive – a connector between eastern Ventura and Highway 101 with sub-urban scale retail. Opportunities exist for high-quality, mixed-uses (such as child-care, restaurants, offices, light industrial, and housing) with ground floor commercial space to strengthen its economic presence and provide a visual gateway.

H. Wells Road – a mix of older industrial uses and newer sub-urban commercial and residential development. Well's Road should be returned to the neighborhoods it serves, so that new development can emulate the country charm that existed prior to its widening. Traffic calming in appropriate locations would encourage neighborhood connectivity, and end the current trend toward walls and buildings that turn their back to the street. This would also encourage redevelopment of the old neighborhood centers.

Neighborhood Centers

Community evolves from individual conversations and the best places to grow community are in individual neighborhoods. Every neighborhood should have at least one center where people can meet by chance at a local coffee shop, market, bookstore, diner, or even hardware store. *Our Involved Community* needs places to gather to have meaningful conversations and share civic information. Ventura's existing neighborhood centers have the opportunity to become such places. The General Plan Diagram identifies 10 neighborhood centers – where the development of housing alongside commercial uses is specifically encouraged. These centers include:

(1) Pierpont, (2) Seaward/Alessandro, (3) College/Day, (4) Gateway Plaza, (5) Victoria Plaza, (6) Bristol, (7) Kimball/Telegraph, (8) Petit/Telephone, (9) Telephone/Cachuma, and (10) Saticoy.



Note: Areas prone to flooding are shown on Figure 7-1 in Chapter 7.

Special Topics

Agricultural Lands

During the 20th Century, the value of agricultural land in Ventura became secondary to that for development. However, this pattern is not irreversible, and protecting green land to save the aesthetic beauty of open space, preserve the cultural landscape of the community's heritage, and conserve land for environmental quality are high priorities in Ventura. In fact, the land's historic role for food production may soon be more highly valued once again, as prime agricultural areas continue to disappear to development at an astounding rate.

Ventura is fortunate to retain much of its rural landscape. Agriculture still plays an important role in the economy of the City and County of Ventura. Significant yields are made possible by the presence of high quality soils, adequate water supply, favorable climate, long growing season, and level topography. Mechanisms such as the California Land Conservation Act (more popularly known as the Williamson Act), the Save Our Agricultural Resources (SOAR) initiative (see Appendix B), and greenbelt agreements with neighboring jurisdictions continue to help maintain a balance between urban growth and agricultural preservation. The SOAR initiative that was adopted by the voters in 1995, and that, by its own terms, remains in full legal effect until 2030, refers to specific policies from the 1989 Comprehensive Plan that are still in effect and, as such, have been carried forward into this Plan under Policy 3D and Action 3.20 in addition to being incorporated in this General Plan as set forth in Appendix B.

A primary agricultural concern is the potential conflict with adjacent urban uses over pesticides, dust, odors, noise, and the visual impact of large greenhouses. Other issues of importance to agricultural producers include restrictions on farm-related activities, access to water, and provision of farmworker housing. Paralleling these concerns is a community interest in sustainability, the ability to provide for the needs of future generations. The policies and actions in this chapter intend to sustain viable farm operations in areas designated for agricultural use.

Growth Management

Growth management seeks to preserve public good, improve social equity, and minimize adverse impacts of development while still accommodating new housing and business attraction. The effects of growth management policies on housing prices are complex due to the idiosyncrasies of local real estate markets. Properly designed, growth management programs can plan for all development needs, such as open space, access to public transportation, and walkable neighborhoods.

The City's Residential Growth Management Program (originally established in 1979 to ensure that housing development would not outpace needed infrastructure) has not always contributed to housing affordability or quality design. This General Plan calls for revising the Residential

Subsequent to the adoption of the **SOAR** initiative, there have been two general plan amendments, which redesignated individual agricultural properties through a vote of the electorate as required by SOAR. These remain in full legal effect and have been carried forward into this Plan. These include the new Community Park at Kimball Road and the southeast corner of Montgomery and Bristol (see Appendix E and F).

Growth Management Program with an integrated set of growth management tools. Such tools not only include the adoption of a new form-based Development Code, but also community or specific plans based on availability of infrastructure and resources.

Long Term Potential Expansion Strategy

Indeed, the community has indicated that before the City expands any further, the first priority for achieving planning goals should be in the vacant and underutilized areas of the City. Yet, even the most successful effort to achieve community planning goals through infill may need to be supplemented at some point by expanding into areas outside the city limits. Such expansion may not only be necessary to fulfill development objectives; it also may be needed to provide open space, parklands, and natural areas to be preserved and restored. To address this, citizens discussed during the preparation of this General Plan which areas, if any, should be possible expansion areas. These areas were identified because they embody opportunities for achieving a variety of community vision objectives that may not be feasible within existing city limits. The community further went on to agree upon a set of rules about how these areas should be planned. These areas were analyzed in the environmental impact report prepared for this General Plan, and a "long term potential expansion strategy" will be formulated to guide the process of prioritizing any potential future expansion areas to fulfill General Plan objectives that may not be able to be achieved by our "Infill First" approach. Should any areas be selected for future planning, a specific plan, a public vote (if required pursuant to SOAR), and an amendment with the regulatory planning framework would have to occur.

The policies and actions in this chapter call for measured and appropriate growth in Ventura by prioritizing areas appropriate for additional development based on community values and infrastructure potential.

Policy 3A: Sustain and complement cherished community characteristics.

Action 3.1: Preserve the stock of existing homes by carrying out Housing Element programs.

Action 3.2: Enhance the appearance of districts, corridors, and gateways (including views from highways) through controls on building placement, design elements, and signage.

Action 3.3: Require preservation of public view sheds and solar access.

Action: 3.4 Require all shoreline development (including anti-erosion or other protective structures) to provide public access to and along the coast, unless it would duplicate adequate access existing nearby, adversely affect agriculture, or be inconsistent with public safety, military security, or protection of fragile coastal resources.

Action 3.5: Establish land development incentives to upgrade the appearance of poorly maintained or otherwise unattractive sites, and enforce existing land maintenance regulations.

Action 3.6: Expand and maintain the City's urban forest and thoroughfare landscaping, using native species, in accordance with the City's Park and Development Guidelines and Irrigation and Landscape Guidelines.

Action 3.7: Evaluate whether lot coverage standards should be changed based on neighborhood characteristics.

Policy 3B: Integrate uses in building forms that increase choice and encourage community vitality.

Action 3.8: Adopt new development code provisions that designate neighborhood centers, as depicted on the General Plan Diagram, for a mixture of residences and small-scale, local-serving businesses.

Action 3.9: Adopt new development code provisions that designate areas within districts and corridors for mixed-use development that combines businesses with housing, and focuses on the redesign of single-use shopping centers and retails parcels into walkable, well connected blocks, with a mix of building types, uses, and public and private frontages.

Action 3.10: Allow intensification of commercial areas through conversion of surface parking to building area under a district-wide parking management strategy in the Downtown Specific Plan.

Action 3.11: Expand the downtown redevelopment area to include parcels around future transit areas and along freeway frontage.

Action 3.12: The City will work with the hospitals on the new Development Code treatment for the Loma Vista corridor, which includes both hospitals.

Action 3.13: Assess whether the City's Affordable Housing Programs respond to current needs, and modify them as necessary within State mandated Housing Element updates.

Specific Plan Requirements

Specific Plans must include a statement of its relationship to the General Plan and specify all of the following:

1. distribution, location, and extent of uses
2. distribution, location, extent, and intensity of public and private transportation, sewage, water, drainage, solid waste disposal, energy
3. standards and criteria by which development will proceed and standards for conservation, development, and utilization of natural resources
4. program of implementation measures, including regulations, programs, public works projects, and financing
5. any other subjects that are necessary

(§65450-65452)

Policy 3C: Maximize use of land in the city before considering expansion.

Action 3.14: Utilize infill, to the extent possible, development to accommodate the targeted number and type of housing units described in the Housing Element.

Action 3.15: Adopt new development code provisions that ensure compliance with Housing Element objectives.

Action 3.16: Renew and modify greenbelt agreements as necessary to direct development to already urbanized areas.

Action 3.17: Continue to support the Guidelines for Orderly Development as a means of implementing the General Plan, and encourage adherence to these Guidelines by all the cities, the County of Ventura, and the Local Agency Formation Commission (LAFCO); and work with other nearby cities and agencies to avoid urban sprawl and preserve the rural character in areas outside the urban edge.

Action 3.18: Complete community or specific plans, subject to funding, for areas such as Westside, Midtown, Downtown, Wells, Saticoy, Pierpont, Harbor, Loma Vista/Medical District, Victoria Corridor, and others as appropriate. These plans will set clear development standards for public and private investments, foster neighborhood partnerships, and be updated as needed.

Action 3.19: Preparation of the new Development Code will take into account existing or proposed community or specific plans to ensure efficient use of City resources and ample citizen input.

Policy 3D: Continue to preserve agricultural and other open space lands within the City's Planning Area.

Action 3.20: Pursuant to SOAR, adopt development code provisions to "preserve agricultural and open space lands as a desirable means of shaping the City's internal and external form and size, and of serving the needs of the residents.

Action 3.21: Adopt performance standards for non-farm activities in agricultural areas that protect and support farm operations, including requiring non-farm uses to provide all appropriate buffers as determined by the Agriculture Commissioner's Office.

Action 3.22: Offer incentives for agricultural production operations to develop systems of raw product and product processing locally.

Policy 3E: Ensure the appropriateness of urban form through modified development review.

Action 3.23: Develop and adopt a form-based Development Code that emphasizes pedestrian orientation, integration of land uses, treatment of streetscapes as community living space, and environmentally sensitive building design and operation.

Action 3.24: Revise the Residential Growth Management Program (RGMP) with an integrated set of growth management tools including:

- community or specific plans and development codes based on availability of infrastructure and transit that regulate community form and character by directing new residential development to appropriate locations and in ways that integrate with and enhance existing neighborhoods, districts and corridors;
- appropriate mechanisms to ensure that new residential development produces high-quality designs and a range of housing types across all income levels; and,
- numeric limitations linked to the implementation of community or specific plans and development codes and the availability of appropriate infrastructure and resources; within those limitations, the RGMP should provide greater flexibility for timing new residential development.

Action 3.25: Establish first priority growth areas to include the districts, corridors, and neighborhood centers as identified on the General Plan Diagram; and second priority areas to include vacant undeveloped land when a community plan has been prepared for such (within the City limits).

Action 3.26: Establish and administer a system for the gradual growth of the City through identification of areas set aside for long-term preservation, for controlled growth, and for encouraged growth.

Action 3.27: Require the use of techniques such as digital simulation and modeling to assist in project review.

Action 3.28: Revise the planning processes to be more user-friendly to both applicants and neighborhood residents in order to implement City policies more efficiently.

Policies and actions related to the preservation of **historic architecture and resources** are contained in Chapter 9.

2000-2006 HOUSING ELEMENT GOALS AND POLICIES, City Council Adopted Resolution 2004-014. Adopted April 12, 2004

Goal 1

Maintain and improve the quality of existing housing and residential neighborhoods in Ventura.

Policy 1.1 Encourage citizen involvement in addressing the maintenance and improvement of the housing stock and neighborhood quality.

Policy 1.2 Continue to preserve and maintain the City's historical and architecturally significant buildings and neighborhoods.

Policy 1.3 Encourage homeowners and landlords to maintain properties in sound condition through the City's residential rehabilitation assistance programs and code enforcement efforts.

Policy 1.4 Cooperate with housing providers in the acquisition, rehabilitation, and maintenance of older residential properties as long-term affordable housing.

Policy 1.5 Permit the conversion of apartments to condominiums only when such conversion would not adversely affect the overall supply and availability of rental units, particularly units occupied by lower- and moderate-income households.

Policy 1.6 Continue to support the provision of rental assistance to lower-income households, and encourage property owners to list units with the Housing Authority.

Policy 1.7 Continue to preserve the affordability of mobile homes through the Rent Stabilization Ordinance. Support the acquisition and ownership of mobile home parks by non-profit housing providers and resident organizations.

Policy 1.8 Preserve the existing stock of affordable housing, including mobilehomes, through City regulations, as well as financial and other forms of assistance.

Goal 2

Facilitate the provision of a range of housing types to meet the diverse needs of the community.

Policy 2.1 Provide high quality housing for current and future residents with a diverse range of income levels.

Promote housing that is developed under modern sustainable community standards.

Policy 2.2 Provide expanded housing opportunities for the City's workforce. Promote the City's affordable housing programs with employers in Ventura.

Policy 2.3 Continue to offer and promote homeownership assistance programs to lower- and moderate-income households to purchase both new and existing housing. Pursue participation in other homeownership programs available in the private market.

Policy 2.4 Continue to provide financial and regulatory incentives to non-profits, private housing developers, and public agencies for the construction of the types of housing required to meet identified needs.

Policy 2.5 Support the provision of quality rental housing with three or more bedrooms to accommodate large families, and encourage room additions in the existing housing stock to address household overcrowding.

Policy 2.6 Support a variety of housing types to address the needs of agricultural workers, including affordable rentals, mobilehome parks, single room occupancy hotels (SROs), and group housing for migrant laborers.

Policy 2.7 Facilitate the provision of housing to address Ventura's growing senior population, including senior housing with supportive services, assisted living facilities, and second units.

Policy 2.8 Encourage the provision of housing adaptable to the physically disabled through integration of universal design features in new development, and compliance with Title 24 of the California Health and Safety Code.

Policy 2.9 Encourage the provision of supportive housing for persons with mental illness to address the severe shortage of housing for this special needs population.

Policy 2.10 Support efforts by non-profits to expand transitional and emergency housing in Ventura, including support of grant applications and assistance in identification of suitable sites.

Policy 2.11 Evaluate adoption of an inclusionary housing ordinance as a means of integrating affordable units within new residential development: 1) Require affordable units to be provided on or off-site, with allowance for payment of an in-lieu fee at the discretion of the City; 2) Evaluate the financial impact of inclusionary requirements on development, and assess incentive-based alternative strategies for provision of affordable housing.

Policy 2.12 Facilitate the provision of second units as a means of providing affordable rental housing in existing neighborhoods. Ensure compatibility with the primary unit and surrounding neighborhood.

Policy 2.13 Encourage the production of housing that meets the needs of all economic segments, including lower, moderate, and above moderate-income households, to achieve a balanced community.

Policy 2.14 Promote and facilitate non-traditional housing types and options, including co-housing, assisted living facilities, live-work spaces, and artist lofts.

Policy 2.15 Direct City-controlled housing funds towards programs that address the needs of very low- and low-income households.

Policy 2.16 Prioritize affordable housing opportunities and assistance for public service employees.

Policy 2.17 Annually monitor the City's progress in meeting its housing needs for all income levels.

Goal 3

Provide adequate housing sites through appropriate land use and zoning designations to accommodate the City's share of the regional housing needs.

Policy 3.1 Maintain an up-to-date inventory of vacant and underutilized parcels and provide to interested developers in conjunction with information on available development incentives. Within redevelopment project areas, provide assistance in land assembly in support of affordable housing.

Policy 3.2 Implement smart growth principles by rewarding quality infill projects that utilize existing infrastructure.

Policy 3.3 Encourage efficient utilization of the City's limited land resources by encouraging development at the upper end of the permitted Zoning Code/Comprehensive Plan density.

Policy 3.4 Utilize the Urban Infill Overlay Zone and Downtown Specific Plan as a tool to facilitate higher density residential and mixed-use development.

Policy 3.5 Explore residential reuse opportunities on obsolete commercial properties, such as older motels and underutilized historic structures.

Policy 3.6 Pursue use of publicly owned land, such as public parking lots, for development of affordable housing.

Policy 3.7 Identify opportunities for housing development that achieves other community goals such as neighborhood improvement, recreation opportunities, and the preservation of sensitive lands and neighborhood character.

Policy 3.8 Facilitate the development of mixed-use projects in appropriate commercial areas, including stand-alone residential developments (horizontal mixed-use) and housing above ground floor commercial uses (vertical mixed-use).

Policy 3.9 Promote higher density housing as part of mixed-use developments along parts of Thompson Boulevard and Main Street in Midtown Ventura, as well as other areas such as Westside, Downtown and East Ventura.

Policy 3.10 Promote mixed-use developments on the Westside of Ventura.

Policy 3.11 Ensure that the updated Land Use Element designates adequate sites for housing for executives to enhance the City's ability to attract businesses with higher paying jobs.

Goal 4

Mitigate or remove any potential governmental constraints to housing production and affordability.

Policy 4.1 Provide regulatory and/or financial incentives, where appropriate, to offset or reduce the costs of affordable housing development, including density bonuses and flexibility in site development standards.

Policy 4.2 Utilize the Affordable Housing Program to provide incentives for production of affordable units, including streamlined permit processing, reduced fees and exemption from the required competition for RGMP allocations.

Policy 4.3 Amend the City's Residential Growth Management Plan (RGMP) to better facilitate housing production, while discouraging sprawl and maintaining quality of life goals.

Policy 4.4 Undertake a comprehensive review of the City's residential development project review procedures and establish modified procedures as appropriate to streamline processing times, while maintaining adequate levels of public review.

Policy 4.5 Provide flexibility in development standards to accommodate new models and approaches to providing affordable housing, such as co-housing, live/work units and assisted living facilities.

Goal 5

Promote equal opportunity for all residents to reside in the housing of their choice.

Policy 5.1 Continue to enforce fair housing laws prohibiting arbitrary discrimination in the building, financing, selling or renting of housing on the basis of race, religion, family status, national origin, physical or mental disability, or other such factors.

Policy 5.2 Continue to support organizations that offer fair housing and mediation services to Ventura residents.

Policy 5.3 Promote housing that meets the special needs of large families, elderly persons, agricultural workers, and the disabled.

Policy 5.4 Continue to enforce notification and provide relocation assistance for lower-income persons displaced due to demolition, reuse, condominium conversion, or rehabilitation as a result of code enforcement.

ventura's general plan

OUR ACCESSIBLE COMMUNITY

"Restore human legs as a means of travel. Pedestrians rely on food for fuel and need no special parking facilities."

— Lewis Mumford
Author of *The City in History*, 1961

CITY OF
VENTURA

4. OUR ACCESSIBLE COMMUNITY

Our goal is to provide residents with more transportation choices by strengthening and balancing bicycle, pedestrian and transit opportunities in the City and surrounding region.

An Integrated Mobility System

Central to the well-being of Ventura's citizens and visitors is *mobility*, the ability to get from one place to another. Mobility depends on the range, efficiency, and connectivity of the various components that comprise the transportation network – sidewalks, bicycle routes, and thoroughfares, as well as transit services – and that enable people to access the things they need, from the most basic to the extraordinary (See Figures 4-1 Bicycle Facilities, 4-2 Bus and Rail Routes, and 4-3 Roadway Classification Plan). Ventura is a community that recognizes that thoroughfares serve a variety of functions and are not simply conduits for automobile traffic.

Balancing automobile use with other means of travel is essential to maintaining social and physical health. Safe and enjoyable routes for pedestrians and bicyclists should connect every part of the city, and neighborhoods need to be linked by ample and convenient transit service along corridors. Ventura also must be connected to the larger region by a variety of transportation modes.

Thoroughfares have a tremendous effect on neighborhood character and therefore quality of life for both residents and visitors.

Thoroughfares are essentially the stage of public life where a diversity of citizens interact. They can create places of remembrance, chance encounters, and discovery. Ensuring that Ventura thoroughfares are *great places* requires improving design and quality as well as connectivity. In some cases, city thoroughfares are over-engineered to accommodate the worst-case scenario.

Slowing down automobiles, especially in residential neighborhoods, is a desire shared by many residents. Vehicle travel should be directed toward routes that minimize congestion, avoid conflicts with walkers and bicyclists, and keep residential neighborhoods free of excessive cut-through traffic. Additionally, in some areas of the city, suburban patterns have resulted in less connectivity than is desired by the community. Transportation modes and land uses in the city need to be distributed so that residents have close and easy access to meet their basic needs and travel destinations.

Traffic congestion is a major concern among Ventura residents. Although traffic on local roads is generally free-flowing, a few key intersections and road segments experience congestion during peak traffic hours. Simply widening roads to add lanes will not solve traffic congestion. Instead, the system needs integrated solutions that improve mobility for all

The essential qualities of a properly functioning mobility system are:

1. Well connected, interesting components
2. Convenient accessibility
3. Integrated linkage of all modes
4. Comfort and safety
5. Design reflecting natural and urban context

means of travel. While walking, biking, and transit use are already popular, these alternative modes need to be enhanced and better linked. For example, bus and rail systems serve Ventura, but not thoroughly enough to provide a reasonable alternative to auto use for most travelers. And while pedestrian access exists in most areas of Ventura, the network lacks continuous routes in some key locations.

As expressed in the *Ventura Vision,* a top community priority is to minimize automobile use through a fully integrated multi-modal transportation system. The policies and actions in this chapter aim to achieve this objective.

Travel Modes

Walking

Sidewalks are arguably the most important component of the city's mobility system. As with circulation in general, the utility of pedestrian systems is inextricably linked to land use patterns. Combined with urban design elements, land use patterns influence how much walking can safely and effectively occur in the community. Circulation systems that are designed with pedestrians in mind tend to increase outdoor activity and community interaction, while those oriented toward motor vehicles tend to create disincentives to walking.

Ventura's pedestrian system consists of sidewalks, access ramps, crosswalks, linear park paths, and overpasses and tunnels. Special corridors such as the Beachfront Promenade, California Plaza, and Figueroa Plaza have been designated especially for pedestrians. The pedestrian system also includes neighborhood and park path systems, and dedicated trail facilities that are shared with bicyclists and other users.

Pedestrian paths need to be interesting, enjoyable, and lead to a destination, from the most simple – such as a pocket park – to more grand points of arrival, such as major civic spaces. Creating a network of paths that connect key features such as parks, schools, civic facilities, shops, and services is vital to the success of reducing dependence on the automobile. Those most in need of pedestrian access include children, teenagers, and the elderly, as well as those who cannot afford a car or choose not to drive.

The main deficiency of Ventura's pedestrian system is its discontinuity. Some sections of thoroughfares lack sidewalks, and pedestrian connections between some key use areas are in need of repair. Crosswalks are prohibited along some corridors, and pedestrian signal phases are not always long enough for all walkers. Traffic-calming measures also are needed to improve walkability in many neighborhoods. Citizens have placed a high emphasis on improving the pedestrian network, recommending specific improvements such as:

- narrowing selected thoroughfare segments,
- improving sidewalks and road crossings,
- lengthening pedestrian signal phases,
- adding marked crossings at key intersections,
- developing safe and attractive walkways from Downtown and Midtown to the beach,
- ensuring that new development provides ample pedestrian access,
- creating trails along watercourses and through the hillsides, and
- improving pedestrian facilities near schools.

Figure 4-1 illustrates the three State defined classes of bikeway facilities:

- Bike Path (Class I) – Class I bike paths are separated from roads by distance or barriers, and cross-traffic by motor vehicles is minimized.
- Bike Lane (Class II) – Class II bikeways are roadway lanes reserved for bicycles. These lanes are painted with pavement lines and markings and are signed.
- Bike Route (Class III) – Class III bike routes share existing roads and provide continuity to other bikeways or designated preferred routes through high traffic areas. There are no separate lanes, and bike routes are established by placing signs that direct cyclists and warn drivers of the presence of bicyclists.

Policies and actions in this chapter intend to improve pedestrian access through this range of methods.

Biking

Because bicycles are an integral component of the city's mobility system, they are allowed on *all* city thoroughfares. The City has adopted a General Bikeway Plan intended to create a safe, accessible, and interconnected network of bike paths, lanes, and routes that will ensure Ventura becomes and remains a truly bicycle-friendly community. The General Bikeway Plan is a flexible, comprehensive, and long-range guide for bicycle transportation and recreation planning, design, and budget decision-making. Accordingly, it is designed to:

- refine and implement City bicycle-related policies,
- establish bikeway design standards,
- enhance bicycle safety and education programs,
- set priorities and phasing for improvements and amenities depicted on the Select System of Bikeways map, and
- identify funding means and opportunities for interagency cooperation.

The City places high emphasis on improving the local bicycle network by following the recommendations of the General Bikeway Plan, which include:

- connecting schools, parks, activity areas, housing areas, and employment centers with bike paths and lanes, particularly in areas without thoroughfares,
- constructing additional Class I or Class II bikeways in a number of locations, including along the Santa Clara River and the coast to connect to the Ventura River Trail,
- installing bicycle racks,
- updating bicycle facility standards to ensure proper design and maintenance,
- constructing improvements to resolve bicycle/automobile conflicts,
- establishing a highly visible route identification and signage program that fits the character of the community, and
- mitigating impacts on bicyclists from new development and during and following construction of roadway projects.

Policies and actions in this chapter seek to improve bicycle access and safety by carrying out these recommendations.

Public Transit – Bus & Rail

Transit service in Ventura includes bus and rail operations (see Figure 4-2). South Coast Area Transit (SCAT) provides local bus service, Ventura Intercity Transit Authority (VISTA) runs regional routes, and Greyhound offers statewide and national connections. Metrolink provides rail service to and from Los Angeles – although on a very limited schedule, while Amtrak trains that stop in Ventura run between San Luis Obispo and San Diego.

Although local bus routes connect most activity centers, the East End is not well served, and more frequent service is needed to key destinations such as the beach and downtown. Metrolink and Amtrak need to be linked to each other and accessed by local bus routes. An agreement between the City and the Ventura County Transportation Commission calls for identifying a permanent Metrolink site, and the best way to integrate all of these services is with a major multi-modal transit center that also accommodates potential additional future alternative transportation modes.

SCAT buses are equipped with wheelchair lifts and adjustable steps to ensure access for all riders. SCAT also offers discounted fares for seniors and disabled riders, as well as dial-a-ride service. However, seniors and mobility-impaired persons also desire frequent fixed-route service in smaller vehicles, and all riders need upgraded amenities at a number of stops. Bus routes also need increased frequency and stops to make transit a viable alternative to driving.

Other transit system needs include:

- reduced-emission vehicles,
- continued use of schedule synchronization to accommodate route transfers, and
- service to regional destinations such as California State University Channel Islands and airports.

Policies and actions in this Chapter aim to improve transit efficiency, encourage ridesharing, and preserve long-term transit options.

The Automobile and Types of Roadways

The most basic component of the mobility system is the *thoroughfare*, used not only by people who drive, but also by people who ride the bus, bike and walk. Thoroughfares encompass sidewalks, bicycle lanes, travel lanes, and are the most utilized means of travel in Ventura. This system is organized into the following classifications: local thoroughfares, collectors, and arterials (see Figure 4-3, Roadway Classification Plan – also known as "Circulation Plan").

Local Thoroughfares

Local thoroughfares provide mobility within neighborhoods and are generally not shown on the Roadway Classification Plan. Local thoroughfares include *alleys, lanes,* and *"yield" streets*.

Collectors

Collectors serve as links between local thoroughfares. Collectors may front residential and neighborhood-serving commercial uses. Collectors can be configured as *boulevards, avenues, streets,* and *main streets*.

Arterials

Arterials are the primary mechanism for cross-town travel and serve the major centers of activity. These roads typically carry a high proportion of the total urban area travel. Arterials can be configured as *boulevards, avenues,* and *streets*.

Collector and arterial thoroughfare segments in the City are characterized in two ways that describe their physical features: *design* classification and *functional* classification. Design Classification defines the number of travel *lanes* using the following categories: Primary Arterial (6 lanes or more), Secondary Arterial (4 lanes), and Collector (2 lanes), as shown on the Roadway Classification Plan, Figure 4-3. Functional Classification describes how a thoroughfare is used: essentially as a *boulevard*, *avenue*, *street*, or *main street*.

Functional Classification also identifies whether roadways have medians, parking, bike lanes, and other streetscape attributes needed to achieve objectives other than just moving traffic, such as accommodating pedestrians, bicycles, and adjoining land uses and public spaces. Table 4-1 shows the design and functional classifications for thoroughfares in the City.

Ventura is mainly connected by 2-lane and 4-lane thoroughfares. The classification for each type of road segment represents a balance between vehicle capacity, pedestrian and bicycle access, parking requirements, streetscape character, and right-of-way limitations.

Boulevard
A multi-lane and generally urban corridor with a central, planted median.

Avenue
Avenues are typically multi-lane, short distance connectors, with a painted median, used in both residential and commercial areas, and often terminate at prominent buildings or plazas.

Table 4-1 Thoroughfare Sizes and Types

	Street Sizes (Engineering Design Classification)		
	Primary Arterial (6 or more lane roadway)	Secondary Arterial (4 lane roadway)	Collector (2 lane roadway)
Existing			
Future Widening			
Future Extension			
	Thoroughfare Types (Functional Classification)		
	Boulevard	Boulevard	Boulevard
	Avenue	Avenue	Avenue
		Street	Street
			Main Street

Source: Definitions for Design Classifications are the City's modifications to the American Association of State Highway and Transportation Officials (AASHTO) standards. Definitions for Functional Classifications are the City's modifications to the Traditional Neighborhood Development Street Design Guidelines.

Street
Street typically allows two way travel and may be multi-lane and does not have a central median and generally provides access to predominantly residential areas.

Main Street

Main streets have 2 vehicle lanes. Their main purpose is to provide low-speed access to commercial, mixed-uses, and higher density neighborhoods.

Consistency between the design and functional classifications is determined based on the number of through lanes. Temporary improvements, such as restriping to change the number of lanes are allowed, however a permanent improvement that moves the curbs and changes the number of lanes would require an amendment to this plan.

The *Ventura Vision* offers several key recommendations to improve the city thoroughfare system:

- add or enhance north-south arterials;
- consider an additional Santa Clara River bridge, Portola Avenue overcrossing of U.S. 101, and Johnson Drive overcrossing of Route 126; and
- soften the barrier impact of U.S. 101 by working with Caltrans to improve signage, aesthetics, undercrossings, and overcrossings.

Policies, actions, and the Roadway Classification Plan work together to address these recommendations. To improve the safety and functioning of the thoroughfare network and to maintain its compatibility with the character of the community, the policies and actions in this chapter also call for upgrading problem thoroughfares and intersections, improving and constructing freeway ramps, and connecting unfinished roadways. Additional actions intend to protect views from scenic routes, including State-designated scenic highways.

Policy 4A: Ensure that the transportation system is safe and easily accessible to all travelers.

Action 4.1: Direct city transportation investment to efforts that improve user safety and keep the circulation system structurally sound and adequately maintained. First priority for capital funding will go to our pavement management program to return Ventura streets to excellent condition.

Action 4.2: Develop a prioritized list of projects needed to improve safety for all travel modes and provide needed connections and multiple route options.

Action 4.3: Provide transportation services that meet the special mobility needs of the community including youth, elderly, and disabled persons.

Action 4.4: Combine education with enforcement to instill safe and courteous use of the shared public roadway.

Action 4.5: Utilize existing roadways to meet mobility needs, and only consider additional travel lanes when other alternatives are not feasible.

Action 4.6: Require new development to be designed with interconnected transportation modes and routes to complete a grid network.

Action 4.7: Update the traffic mitigation fee program to fund necessary citywide circulation system and mobility improvements needed in conjunction with new development.

Action 4.8: Implement the City's Neighborhood Traffic Management Program and update as necessary to improve livability in residential areas.

Action 4.9: Identify, designate, and enforce truck routes to minimize the impact of truck traffic on residential neighborhoods.

Action 4.10: Modify traffic signal timing to ensure safety and minimize delay for all users.

Action 4.11: Refine level of service standards to encourage use of alternative modes of transportation while meeting state and regional mandates.

Action 4.12: Design roadway improvements and facility modifications to minimize the potential for conflict between pedestrians, bicycles, and automobiles.

Action 4.13: Require project proponents to analyze traffic impacts and provide adequate mitigation in the form of needed improvements, in-lieu fee, or a combination thereof.

Policy 4B: Help reduce dependence on the automobile.

Action 4.14: Provide development incentives to encourage projects that reduce automobile trips.

Action 4.15: Encourage the placement of facilities that house or serve elderly, disabled, or socioeconomically disadvantaged persons in areas with existing public transportation services and pedestrian and bicycle amenities.

Action 4.16: Install roadway, transit, and alternative transportation improvements along existing or planned multi-modal corridors, including primary bike and transit routes, and at land use intensity nodes.

Action 4.17: Prepare and periodically update a Mobility Plan that integrates a variety of travel alternatives to minimize reliance on any single mode.

Action 4.18: Promote the development and use of recreational trails as transportation routes to connect housing with services, entertainment, and employment.

Action 4.19: Adopt new development code provisions that establish vehicle trip reduction requirements for all development.

Action 4.20: Develop a transportation demand management program to shift travel behavior toward alternative modes and services.

Action 4.21: Require new development to provide pedestrian and bicycle access and facilities as appropriate, including connected paths along the shoreline and watercourses.

Action 4.22: Update the General Bikeway Plan as needed to encourage bicycle use as a viable transportation alternative to the automobile and include the bikeway plan as part of a new Mobility Plan.

Action 4.23: Upgrade and add bicycle lanes when conducting roadway maintenance as feasible.

Action 4.24: Require sidewalks wide enough to encourage walking that include ramps and other features needed to ensure access for mobility-impaired persons.

Action 4:25: Adopt new development code provisions that require the construction of sidewalks in all future projects.

Action 4.26: Establish a parking management program to protect the livability of residential neighborhoods, as needed.

Action 4.27: Extend stubbed-end streets through future developments, where appropriate, to provide necessary circulation within a developing area and for adequate internal circulation within and between neighborhoods. Require new developments in the North Avenue area, where applicable, to extend Norway Drive and Floral Drive to connect to Canada Larga Road; and connect the existing segments of Floral Drive. Designate

the extension of Cedar Street between Warner Street and south of Franklin Lane and the linking of the Cameron Street segments in the Westside community as high priority projects.

Policy 4C: Increase transit efficiency and options.

Action 4.28: Require all new development to provide for citywide improvements to transit stops that have sufficient quality and amenities, including shelters and benches, to encourage ridership.

Action 4.29: Develop incentives to encourage City employees and local employers to use transit, rideshare, walk, or bike.

Action 4.30: Work with public transit agencies to provide information to riders at transit stops, libraries, lodging, and event facilities.

Action 4.31: Work with public and private transit providers to enhance public transit service.

Action 4.32: Coordinate with public transit systems for the provision of additional routes as demand and funding allow.

Action 4.33: Work with Amtrak, Metrolink, and Union Pacific to maximize efficiency of passenger and freight rail service to the City and to integrate and coordinate passenger rail service with other transportation modes.

Action 4.34: Lobby for additional transportation funding and changes to Federal, State, and regional transportation policy that support local decision-making.

Action 4.35: The City shall pursue funding and site location for a multi-modal transit facility in coordination with VCTC, SCAT, U.P.R.R., Metrolink, Greyhound Bus Lines, and other forms of transportation.

Policy 4D: Protect views along scenic routes.

Action 4.36: Require development along the following roadways – including noise mitigation, landscaping, and advertising – to respect and preserve views of the community and its natural context.

- State Route 33
- U.S. HWY 101
- Anchors Way
- Brakey Road
- Fairgrounds Loop
- Ferro Drive
- Figueroa Street
- Harbor Boulevard
- Main Street
- Navigator Drive
- North Bank Drive
- Poli Street/Foothill Road
- Olivas Park Drive
- Schooner Drive
- Spinnaker Drive
- Summit Drive

- Telegraph Road – east of Victoria Avenue
- Victoria Avenue – south of U.S. 101
- Wells Road

Action 4.37: Request that State Route 126 and 33, and U.S. HWY 101 be designated as State Scenic Highways.

Action 4.38: Continue to work with Caltrans to soften the barrier impact of U.S. HWY 101 by improving signage, aesthetics and undercrossings and overcrossings.

Action 4.39: Maintain street trees along scenic thoroughfares, and replace unhealthy or missing trees along arterials and collectors throughout the City.

Note: Bike facilities shown on this figure are taken from the 1999 General Bikeway Plan and may change as updates to the General Bikeway Plan are completed.

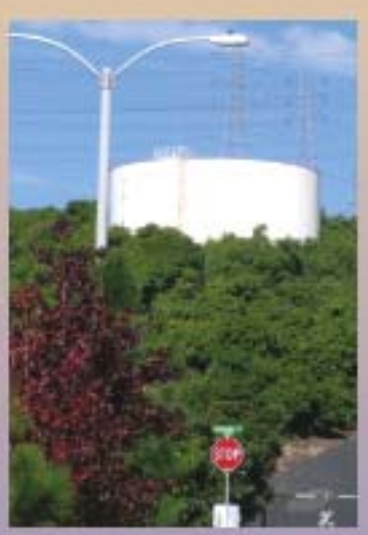
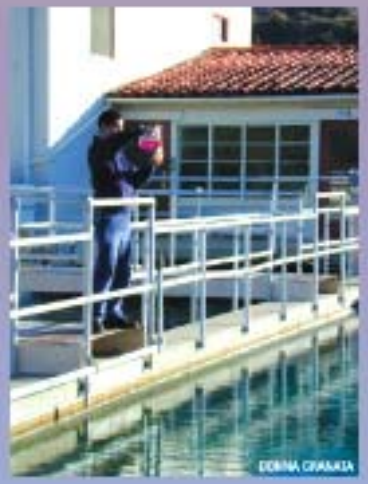
ventura's general plan

OUR SUSTAINABLE INFRASTRUCTURE





"Now, I truly believe, that we in this generation, must come to terms with nature, and I think we're challenged as mankind has never been challenged before to prove our maturity and our mastery, not of nature, but of ourselves."

— Rachel Carson
Biologist, Writer; Ecologist 1907-1964

CITY OF
VENTURA

5. OUR SUSTAINABLE INFRASTRUCTURE

Our goal is to safeguard public health, well-being and prosperity by providing and maintaining facilities that enable the community to live in balance with natural systems.

Essential Support Systems

Infrastructure is an extremely important though largely unnoticed foundation of quality of life in Ventura. Efficient water supply, wastewater treatment, and drainage systems are vital to most daily activities. These facilities on which the community depends need regular maintenance, and they frequently require upgrading both to meet the demands of a growing population and to be sensitive to environmental resources.

To ensure that citizens get high-quality drinking water, the City owns and operates a State-certified laboratory where water quality is tested continuously. Each City treatment plant is also run by State-certified operators who monitor water quality. As a result, City water exceeds State and federal water quality requirements.

The City employs conservation measures and emerging technology in its effort to achieve a high standard for wastewater treatment while protecting natural systems. As a result, treatment capability historically has outpaced community needs, with even peak flows typically reaching only 75 percent of plant capacity. Even so, further expanding the use of reclaimed water and reducing water consumption will be vital to maintaining long-term water supplies.

Much of the storm drain system is aging and in need of repair or replacement, especially corrugated metal pipes in some of the older areas of Ventura. Collecting adequate fees that truly reflect the cost of serving development can help support City efforts to preclude additional deficiencies, and relying on and complementing natural drainage features can both help avoid the need for expensive and environmentally damaging channelization and improve the functioning of the overall drainage system.

Water Supply

The City provides drinking water, and water for fire protection, to households and businesses in Ventura through a complex system with more than 500 miles of distribution mains, 3 water treatment plants, 22 booster pump stations, 25 treated water reservoirs, and 13 wells. Five distinct sources provide surface and ground water to the City supply system:

- Casitas Municipal Water District
- Ventura River surface water intake, subsurface water and wells (Foster Park)
- Mound groundwater basin
- Oxnard Plain groundwater basin (Fox Canyon Aquifer)
- Santa Paula groundwater basin

The City also holds a State Water Project entitlement of 10,000 acre-feet per year;

however, new facilities would need to be constructed to transport this water to the City. The City updates its Urban Water Management Plan every two years (instead of every five years as required by State law) as part of its ongoing effort to ensure that City-managed water supplies will continue to accommodate demand in Ventura.

Meeting future water demands requires saving and reusing every drop possible. The City utilizes recycled water from its reclamation facility (a tertiary wastewater treatment plant) near the Harbor to augment the municipal water supply. Recycled water is used to irrigate City and private landscaping in the area and the Buenaventura and Olivas Park municipal golf courses. The remaining effluent is discharged to the Santa Clara River Estuary.

Largely as a result of conservation efforts, water consumption per city resident has generally declined (see Table 5-1). Projections anticipate that the City will continue to be able to meet consumer needs. Policies and actions in this chapter seek to refine demand management practices and conservation programs to further reduce per capita water use so that Ventura can sustain water resources for many more generations.

Table 5-1
Historic and Projected Water Production (Acre Feet)

Year	Estimated Population Served	Per Capita Use[1]	Treated Water Production	Raw Water Production	Total Water Production

2015	122,447	0.179	21,918	1,000	22,918
2020	129,504	0.179	23,181	1,000	24,181

Sources: City of Ventura Urban Water Management Plan, Dec. 2000, City of Ventura 2004 Biennial Water Supply Report, as amended, September 2004.

[1] Per Capita use excludes raw water.

Wastewater Treatment

Ventura residents generate millions of gallons of wastewater each day, which is carried by more than 450 miles of sewer mains and 12 lift stations to the water reclamation facility in the Harbor area near the mouth of the Santa Clara River. While most residents receive sewer service directly from the City, three other sanitary sewer agencies with their own treatment facilities provide service to some citizens in the Montalvo, Saticoy, and North Ventura Avenue areas. As shown in Table 5-2, all local treatment facilities operate well below capacity.

Table 5-2 Treatment Facilities

Treatment Facilities	Treatment Type	Capacity	Average Daily Flow
Ventura Water Reclamation Facility	Tertiary	14 MGD	9.0 MGD (68% capacity)
Montalvo Municipal Improvement District Treatment Plant	Secondary	0.36 MGD	0.242 MGD (67% capacity)
Saticoy Sanitary District Treatment Plant	Secondary[2]	0.25 MGD	0.16 MGD (64% capacity)
Ojai Valley Sanitary District Treatment Plant	Tertiary	3 MGD	2.0 MGD (71% capacity)

[2] Includes nutrient removal prior to percolation.
Source: Individual agencies listed

About two-thirds of the wastewater treated locally is discharged to the Santa Clara River Estuary, as allowed by the Regional Water Quality Control Board. The remaining effluent is either transferred to recycling ponds, where some is delivered as reclaimed water, or it percolates to underground aquifers or evaporates. The policies and actions in this chapter call for improving treatment system efficiency to reclaim and reuse as much water as possible.

Storm Drainage

Storm runoff travels from the hills above Ventura through the City until it is absorbed into the ground or reaches the Ventura River, the Santa Clara River, or the Pacific Ocean. To convey the occasional high flows associated with storms, the Ventura County Flood Control District oversees about 20 natural or concrete lined barrancas that serve as the major drainage courses for local watersheds. The City has about 20 miles of off-street drain system designed to convey runoff from all but the most severe of storms, in which case water also runs off via city streets.

Maintaining the barrancas and other watercourses that are not already lined with concrete as natural flood channels can help reduce peak flows by limiting water velocity. Incorporating natural features into drainage systems rather than hard treatment devices also can improve water quality and reduce maintenance costs. The policies and actions in this chapter seek to prevent increases in future storm water impacts by incorporating natural drainage and flood control features such as wildlife ponds and wetlands – instead of cement retention basins – into the storm drain system where possible. Such less intensive approaches not only cost less, but they also preserve environmental resources and protect water quality.

Policy 5A: Follow an approach that contributes to resource conservation.

Action 5.1: Require low flow fixtures, leak repair, and drought tolerant landscaping (native species if possible), plus emerging water conservation techniques, such as reclamation, as they become available.

Action 5.2: Use natural features such as bioswales, wildlife ponds, and wetlands for flood control and water quality treatment when feasible.

Action 5.3: Demonstrate low water use techniques at community gardens and city-owned facilities.

Action 5.4: Update the Urban Water Management plan as necessary in compliance with the State 1983 Urban Water Management Planning Act.

Action 5.5: Provide incentives for new residences and businesses to incorporate recycling and waste diversion practices, pursuant to guidelines provided by the Environmental Services Office.

Policy 5B: Improve services in ways that respect and even benefit the environment.

Action 5.6: Require project proponents to conduct sewer collection system analyses to determine if downstream facilities are adequate to handle the proposed development.

Action 5.7: Require project proponents to conduct evaluations of the existing water distribution system, pump station, and storage requirements in order to determine if there are any system deficiencies or needed improvements for the proposed development.

Action 5.8: Locate new development in or close to developed areas with adequate public services, where it will not have significant adverse effects, either individually or cumulatively, on coastal resources.

Action 5.9: Update development fee and assessment district requirements as appropriate to cover the true costs associated with development.

Action 5.10: Utilize existing waste source reduction requirements, and continue to expand and improve composting and recycling options.

Action 5.11: Increase emergency water supply capacity through cooperative tie-ins with neighboring suppliers.

Action 5.12: Apply new technologies to increase the efficiency of the wastewater treatment system.

Action 5.13: Increase frequency of city street sweeping, and post schedules at key points within each neighborhood.

Action 5.14: Develop a financing program for the replacement of failing corrugated metal storm drain pipes in the City.

Action 5.15: Establish assessment districts or other financing mechanisms to address storm drain system deficiencies in areas where new development is anticipated and deficiencies exist.

Action 5.16: Require new developments to incorporate stormwater treatment practices that allow percolation to the underlying aquifer and minimize offsite surface runoff utilizing methods such as pervious paving material for parking and other paved areas to facilitate rainwater percolation and retention/detention basins that limit runoff to pre-development levels.

Action 5.17: Require stormwater treatment measures within new development to reduce the amount of urban pollutant runoff in the Ventura and Santa Clara Rivers and other watercourses.

Action 5.18: Work with the Ventura Regional Sanitation District and the County to expand the capacity of existing landfills, site new landfills, and/or develop alternative means of disposal that will provide sufficient capacity for solid waste generated in the City.

"Leave all the afternoon for exercise and recreation, which are as necessary as reading. I will rather say more necessary because health is worth more than learning."

— Thomas Jefferson
3rd President of the United States
1801-1809

CITY OF
VENTURA

OUR ACTIVE COMMUNITY

ventura's general plan

6. OUR ACTIVE COMMUNITY

Our goal is to add to and enhance our parks and open spaces to provide enriching recreation options for the entire community.

Higher Standards

For many people, spending time outdoors and participating in recreational activities represent some of life's most cherished rewards. Ventura's superb public park, open space, and recreation system offers a myriad of ways to partake in these privileges. The city offers 34 developed parks, 45 miles of linear park and trail network, stellar beaches, specialized play and sports facilities and programs, communitywide events, senior and youth activities, and two 18-hole tournament class public golf courses. Figure 6-1 at the end of this chapter shows the locations of various public facilities in the city.

The City is committed to ensuring that its citizens have ample access to high quality spaces for leisure and active recreation. The City's adopted standard of 10 acres per 1,000 residents has created far more park area than would be possible under the basic State level of 3 acres per 1,000, and also tops the more ambitious National Park and Recreation Association benchmarks for specific park types (see Table 6-1). The City continues to create customized facilities like the Community Park (approved by the voters pursuant to SOAR) to expand opportunities for local residents to enjoy healthy, active lifestyles.

Table 6-1 Park Acreage per 1,000 Population

Park Type	Standards	
	City of Ventura	National Park & Recreation Association
Neighborhood	2 acres	1.5 acres
Community	3 acres	2.5 acres
Citywide	5 acres	5 acres
Total	10 acres	9 acres

Sources: City of Ventura, www.nrpa.org.

City Parks and Open Space

The public park and open space system in Ventura includes neighborhood, community, citywide, and linear parks. As shown in Table 6-2, the City oversees nearly 600 acres of developed park facilities, plus the linear park network, which provides important connections among watersheds for both people and wildlife.

As the City continually strives to improve the quality of leisure and recreation opportunities for everyone in the community, it must address a number of challenges such as:

- modernizing existing facilities,
- finding appropriate land for new facilities,
- developing useful and enjoyable public spaces, such as plazas and mini-parks in urban settings,
- formalizing shared use arrangements for non-City facilities like school playfields,
- meeting increasing demand for athletic courts, fields and pools,
- provide opportunities for passive recreation, and
- providing services needed by youth, seniors, and residents with special needs.

Neighborhood Parks
Typically less than 8 acres each, these smaller parks primarily serve specific residential areas in the community. The 18 neighborhood parks in Ventura cover about 73 total acres. Any future development outside the current city limits will have to provide new neighborhood parks to serve the added population.

Community Parks
These parks are designed to offer specialized opportunities and facilities to residents of more than one neighborhood. Amenities in community parks may include formal athletic fields, courts, recreation buildings, preschool and youth play structures, group and individual picnic areas, and landscaped areas for informal activity or leisure.

Citywide Parks
These parks feature recreational opportunities that draw a wide range of age and interest groups from throughout the city. They offer a variety of attractive amenities, such as large open spaces, unique natural resources, interpretive centers, cultural amenities, group picnic areas, sports facilities, and equestrian, bicycling, and hiking trails. The Ventura Community Park also serves some citywide park functions and attracts visitors from outside the city with its high-quality playing fields and aquatic center.

Linear Parks
Ventura's unique linear park network intersperses trails and picnic areas among a mostly undeveloped web of barranca and riverbanks that provide valuable wildlife habitat and migration corridors. The linear parks also merge with a number of neighborhood and community parks, complementing developed recreation areas with natural riparian qualities. Extending trails through the linear park network can create additional opportunities for low-impact contact with nature, and in some cases even provide pleasant non-automobile commuting options.

Table 6-2 City Park Facilities

Total	**60.8**	**142.7**	**275.8**	**97.8**	**577.1**

Sources: City of Ventura, 2004. Note: several parks serve functions in more than one category.
[1] Acreage varies with ocean high levels.
[2] Acreage varies with fluctuations in Ventura River level.

As with most parks in the city, resources for linear park system improvements typically come through conditions placed on adjacent development. City regulations establish standards for park width, landscaping, fencing, lighting, and tree rows that apply specifically along barrancas, freeways, rivers, the shoreline, harbor, hillsides, and utility rights-of-way.

Recreation Programs

The City operates four neighborhood centers where recreation programs and senior services are available: the Ventura Avenue Adult Center, Senior Recreation Center, Barranca Vista Center, and Westpark Community Center. The City also offers a wide range of sports programs, including youth and adult sports programs, classes, aquatics, and corporate games. Other City-sponsored recreational activities include arts and environmental education, community gardening, recreation programs for special needs residents, and after-school activities and summer camps.

A variety of other recreation opportunities are available in Ventura in addition to City programs. Foremost among these are all of the activities possible at State beaches and developed waterfront areas. Other local non-City facilities include the County Fairgrounds and local golf courses. In addition, joint-use agreements allow city residents to use sports fields, pools, and gymnasiums during certain times at public schools and Ventura College.

The policies and actions in this chapter seek to further expand local park and recreation choices by:

- identifying sites for new parks,
- increasing public access to open space, including via linear park trails,
- collaborating with schools and other local agencies and organizations,
- ensuring universal and equal access to parks and recreation facilities, and
- allowing appropriate revenue-generating activities at City parks.

Policy 6A: Expand the park and trail network to link shoreline, hillside, and watershed areas.

Action 6.1: Develop new neighborhood parks, pocket parks, and community gardens as feasible and appropriate to meet citizen needs, and require them in new development.

Action 6.2: Require higher density development to provide pocket parks, tot lots, seating plazas, and other aesthetic green spaces.

Action 6.3: Work with the County to plan and develop trails that link the City with surrounding open space and natural areas, and require development projects to include trails when appropriate.

Action 6.4: Request Flood Control District approval of public access along unchannelized watercourses for hiking.

Action 6.5: Seek landowner permission to allow public access on properties adjacent to open space where needed to connect trails.

Action 6.6: Update plans for and complete the linear park system as resources allow.

Action 6.7: Work with the County of Ventura to initiate efforts to create public trails in the hillsides.

Action 6.8: Update and require periodic reviews of the Park and Recreation Workbook as necessary to reflect City objectives and community needs.

Action 6.9: Require dedication of land identified as part of the City's Linear Park System in conjunction with new development.

Action 6.10: Evaluate and incorporate, as feasible, linear park segments in the General Bikeway Plan.

Action 6.11: Update standards for citywide public parks and open space to include an expanded menu of shared park types, and identify locations and potential funding sources for acquiring new facilities in existing neighborhoods.

Action 6.12: Update and carry out the Grant Park Master Plan.

Action 6.13: Foster the partnership between the City and Fair Board to improve Seaside Park.

Policy 6B: Ensure equal access to facilities and programs.

Action 6.14: Improve facilities at City parks to respond to the requirements of special needs groups.

Action 6.15: Adjust and subsidize fees to ensure that all residents have the opportunity to participate in recreation programs.

Action 6.16: Update the project fee schedule as necessary to ensure that development provides its fair share of park and recreation facilities.

Policy 6C: Provide additional gathering spaces and recreation opportunities.

Action 6.17: Update and create new agreements for joint use of school and City recreational and park facilities.

Action 6.18: Offer programs that highlight natural assets, such as surfing, sailing, kayaking, climbing, gardening, and bird watching.

Action 6.19: Provide additional boating and swimming access as feasible.

Action 6.20: Earmark funds for adequate maintenance and rehabilitation of existing skatepark facilities, and identify locations and funding for new development of advanced level skatepark facilities.

Policy 6D: Increase funding and support for park and recreation programs.

Action 6.21: Promote the use of City facilities for special events, such as festivals, tournaments, and races.

Action 6.22: Enter into concession or service agreements where appropriate to supplement City services.

Figure 6-1
Public Faciities

ventura's general plan

OUR HEALTHY & SAFE COMMUNITY

"A city, like a living thing, is a united and continuous whole."

— Plutarch
ca. 50-120 AD, author of *Moralia*

CITY OF
VENTURA

7. OUR HEALTHY AND SAFE COMMUNITY

Our goal is to build effective community partnerships that protect and improve the social well-being and security of all our citizens.

Community Wellness

Keeping the small town feel of Ventura depends on working together as a community to look out for the well being of all residents, especially those most at risk. Community wellness requires comprehensive preventative care, as well as careful preparation for and response to dangers within the built environment and to risks posed by natural processes (see Figure 7-1).

Adequate shelter, sufficient medical services, walkable neighborhoods, and proper nutrition create an essential foundation for a healthy community. Reducing as much as possible the threat to people and property from earthquakes, landslides, floods, and fires further enhance the collective wellness of the city. In addition, a healthy Ventura community requires thorough protection from crime, and freedom from pollution, unwanted noise, and the threat of hazardous materials.

***Alquist-Priolo** designation requires a geologic investigation prior to the approval of a development permit to determine if a specific site within the zone is threatened by surface displacement from future fault movement.*

Geologic and Flood Hazards

Ventura lies in an active geologic region and is therefore subject to a variety of seismic hazards, including ground shaking, liquefaction, and slope failure. State law requires the City to regulate development in mapped seismic hazard zones. Major faults in the city include the Ventura-Foothill (a State-designated Alquist-Priolo Earthquake Fault Zone), Oak Ridge, McGrath, Red Mountain and Country Club Faults. Areas closest to these faults are most likely to experience ground shaking or rupture in the event of an earthquake. Liquefaction during an earthquake is most likely to occur in areas with loose, granular soils where the water table lies within 50 feet of the surface. As the soil liquefies, buildings and other objects may tilt or sink.

Hillside stability varies based on slope, soil, rock type and groundwater depth. The hills north of Poli Street/Foothill Road have experienced many historic landslides and are prone to future movement. The City Hillside Management Program limits development in the area to minimize dangers from landsliding, erosion, flooding, and fire, and to retain natural and scenic character.

The Federal Emergency Management Agency regulates development along watercourses based on the likelihood of flooding: the basic benchmark – the 100-year flood – has a one percent chance of occurring in any given year. Although the mapped 100-year flood hazard areas for local rivers and barrancas are fairly limited in size, the largest recorded flood events along the Ventura and Santa Clara Rivers, both following heavy rains in 1969, exceeded the 100-year flood zone. The policies and actions in this Chapter intend to limit harm from geologic and flood events by requiring detailed risk analyses and mitigation prior to development of sites in hazard prone areas.

Fire and Emergency Response

The Ventura Fire Department responds to fire, medical, and disaster calls from six stations in the city. The Department's goal is to reach the scene within 4 minutes 90% of the time. The Department has a reciprocal agreement with the County Fire Protection District to ensure that Ventura residents receive the swiftest service possible. The Department also has a responsibility to provide disaster preparedness for the City. Particular fire department concerns in the City include:

- the need for reliable and sustainable source of fire service revenue,
- lengthy response times to areas farthest from existing stations (See Figure 7-2),
- firefighter and support staffing levels that are far below the .98 firefighter per 1,000 population averages of other municipal fire departments with comparable city size, age, and population,
- the threat of wildland fire entering urban area, and
- the lack of fire protection systems in older structures.

The policies and actions in this Chapter aim to optimize firefighting and emergency response capabilities through oversight of new development, improved facilities, and added staff.

Police Protection

Ventura Police response to crimes in progress or alarm soundings averages less than six minutes, and less than sixteen minutes for most other calls. While the local crime rate is slightly higher than State average, the Department hopes to better engage the community in policing efforts to lower crime levels. As part of a Strategic Planning Process, the Department has established the following goals:

- reduce crime and the fear of crime
- improve the quality of life in neighborhoods
- enhance community and police partnerships
- develop personnel
- continued accountability

One-time grant funding has helped add officers dedicated to community crime prevention, gang control, and youth mentoring programs. As these grants end the City must face the challenge of funding these services. Actions in this Chapter seek to improve the full range of police services to maximize community safety by increasing staffing, outreach efforts, and public access to police services.

Noise

Noise is generally defined as unwanted sound. Its effects can range from annoyance to nuisances to health problems. State law requires the City to identify and address noise sources and establish projected noise levels for roadways, railroads, industrial uses, and other significant generators. The Noise Contours map (Figure 7-3) is used to help guide land use in a way that minimizes exposure of residents to excessive noise.

Vehicle traffic is by far the greatest source of noise affecting Ventura residents. Other sources include the Seaside Park raceway, the Grant Park shooting range, and railroad, commercial, and industrial activity. Homes, schools, hotels, and hospitals are considered sensitive receptors where excessive noise can interfere with normal activities.

Noise intensity is customarily measured on the decibel scale, an index of loudness. Sounds as faint as 10 decibels (dB) are barely audible, while noise over 120 dB can be painful or damaging to hearing (Table 7-1 shows some typical noise levels). A sound 10 dB higher than another is perceived as about twice as loud. A 5 dB change is readily noticeable, but a 3 dB difference is barely perceptible.

As shown in Table 7-2, normally acceptable outdoor noise in residential areas may reach 65 decibels. The Ldn label in the table indicates that sound is averaged over time to account for the fact that sources like traffic or aircraft may cause fluctuations of more than 20 dB over a few seconds. CNEL refers to the fact that 5 dB is added to noise after 7 p.m. and 10 dB added from 10 p.m. to 7 a.m., when quieter conditions make sound more noticeable.

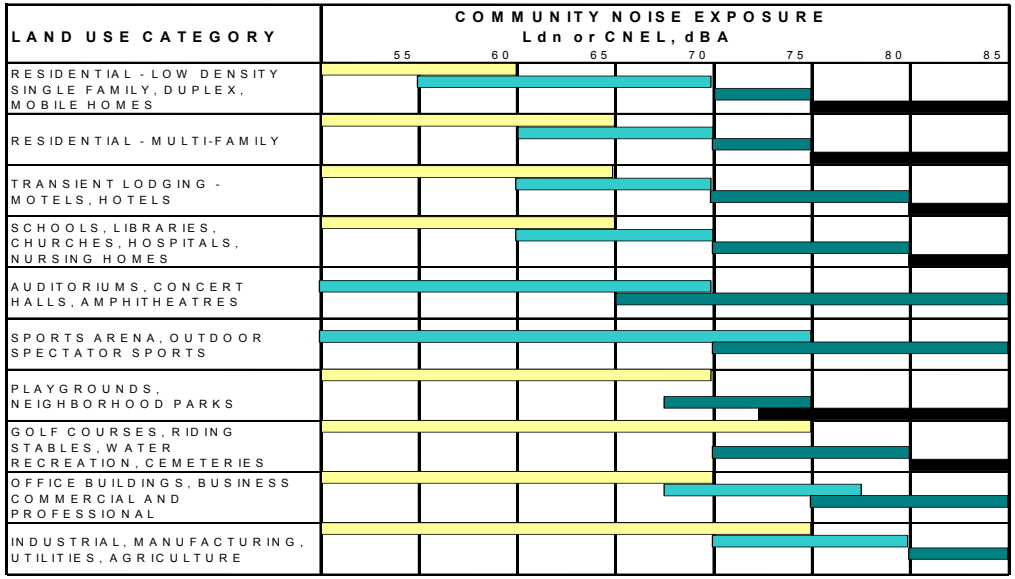
The State Building Code requires an acoustical study whenever outdoor noise would exceed 60 decibels at a proposed duplex, multifamily residence, hotel, motel or other attached dwelling. The study must show that the proposed project design would result in interior noise levels of 45 dB or less.

Although future increases in traffic are not expected to produce a significant change in perceived noise levels, other specific sound generators have been identified as problems in the community. The policies and actions in this chapter look to reduce the exposure of people in Ventura to these noise sources.

Table 7-1. Typical Noise Levels

Type of Noise or Environment	Decibels
Recording Studio	20
Soft Whisper; Quiet Bedroom	30
Busy Open-plan Office	55
Normal Conversation	60-65
Automobile *at 20 mph 25 ft. away*	65
Vacuum Cleaner *10 ft. away*	70
Dump Truck *at 50 mph 50 ft. away*	90
Train Horn *100 ft. away*	105
Claw Hammer; Jet Takeoff *200 ft. away*	120
Shotgun *at shooter's ear*	140

Table 7-2
Acceptable Noise Levels



NORMALLY ACCEPTABLE
Specified land use is satisfactory, based upon the assumption that any buildings involved are of normal conventional construction, without any special noise insulation requirements.

CONDITIONALLY ACCEPTABLE
New construction or development should be undertaken only after a detailed analysis of the noise reduction requirements is made and needed noise insulation features included in the design. Conventional construction, but with closed windows and fresh air supply systems or air conditioning will normally suffice.

NORMALLY UNACCEPTABLE
New construction or development should generally be discouraged. If new construction or development does proceed, a detailed analysis of the noise reduction requirements must be made and needed noise insulation features included in the design

CLEARLY UNACCEPTABLE
New construction or development should generally not be undertaken.

Source: General Plan Guidelines, California Office of Planning and Research

Hazardous Materials

Hazardous materials include medical and industrial wastes, pesticides, herbicides, radioactive materials, and combustible fuels. Improper use, storage, transport, or disposal of these materials may result in harm to humans, surface or ground water degradation, air pollution, fire, or explosion. Most of the several hundred facilities in Ventura that use or store hazardous materials lie along Ventura Avenue or in the Arundell industrial district.

The Fire Department maintains a team specially trained and equipped to respond to hazardous materials emergencies. Additional equipment and personnel for large-scale hazardous materials incidents is available from the County Fire Protection District, the City of Oxnard, and the U.S. Naval Construction Battalion Center in Port Hueneme.

The Westside and North Avenue neighborhoods include about 30 brownfields: sites that may possess contaminated soils but also have potential for reuse. Cleanup of these sites will make them more attractive for redevelopment that can improve the neighborhoods and generate employment and tax revenue. The City has established a Brownfield Assessment Demonstration Pilot Program to fund site assessments and initiate remediation. The policies and actions in this chapter intend to minimize the risk of adverse health effects of hazardous materials by regulating their location and seeking funding for cleanup of brownfield sites to encourage their reuse.

Policy 7A: Encourage wellness through care and prevention.

Action 7.1: Work with interested parties to identify appropriate locations for assisted-living, hospice, and other care-provision facilities.

Action 7.2: Provide technical assistance to local organizations that deliver health and social services to seniors, homeless persons, low-income citizens, and other groups with special needs.

Action 7.3: Participate in school and agency programs to:

- provide healthy meals,
- combat tobacco, alcohol, and drug dependency,
- distribute city park and recreation materials through the schools, and
- distribute information about the benefits of proper nutrition and exercise.

Action 7.4: Enhance or create ordinances which increase control over ABC licensed premises.

Action 7.5: Investigate the creation of new land use fees to enhance funding of alcohol related enforcement, prevention and training efforts.

Policy 7B: Minimize risks from geologic and flood hazards.

Action 7.6: Adopt updated editions of the California Construction Codes and International Codes as published by the State of California and the International Code Council respectively.

Action 7.7: Require project proponents to perform geotechnical evaluations and implement mitigation prior to development of any site:

- with slopes greater than 10 percent or that otherwise have potential for landsliding,
- along bluffs, dunes, beaches, or other coastal features
- in an Alquist-Priolo earthquake fault zone or within 100 feet of an identified active or potentially active fault,
- in areas mapped as having moderate or high risk of liquefaction, subsidence, or expansive soils,
- in areas within 100-year flood zones, in conformance with all Federal Emergency Management Agency regulations.

Action 7.8: To the extent feasible, require new critical facilities (hospital, police, fire, and emergency service facilities, and utility "lifeline" facilities) to be located outside of fault and tsunami hazard zones, and require critical facilities within hazard zones to incorporate construction principles that resist damage and facilitate evacuation on short notice.

Action 7.9: Maintain and implement the Standardized Emergency Management System (SEMS) Multihazard Functional Response Plan.

Action 7.10: Require proponents of any new developments within the 100-year floodplain to implement measures, as identified in the Flood Plain Ordinance, to protect structures from 100-year flood hazards (e.g., by raising the finished floor elevation outside the floodplain).

Action 7.11: Prohibit grading for vehicle access and parking or operation of vehicles within any floodway.

Policy 7C: Optimize firefighting and emergency response capabilities.

Action 7.12: Refer development plans to the Fire Department to assure adequacy of structural fire protection, access for firefighting, water supply, and vegetation clearance.

Action 7.13: Resolve extended response time problems by:

- adding a fire station at the Pierpont/Harbor area,
- relocating Fire Station #4 to the Community Park site,
- increasing firefighting and support staff resources,
- reviewing and conditioning annexations and development applications, and
- require the funding of new services from fees, assessments, or taxes as new subdivisions are developed.

Action 7.14: Educate and reinforce City staff understanding of the Standardized Emergency Management System for the State of California.

Policy 7D: Improve community safety through enhanced police service.

Action 7.15: Increase public access to police services by:

- increasing police staffing to coincide with increasing population, development, and calls for service,
- increasing community participation by creating a Volunteers in Policing Program, and,
- require the funding of new services from fees, assessments, or taxes as new subdivisions are developed.

Action 7.16: Provide education about specific safety concerns such as gang activity, senior-targeted fraud, and property crimes.

Action: 7.17: Establish a nexus between police department resources and increased demands associated with new development.

Action 7.18: Continue to operate the Downtown police storefront.

Action 7.19: Expand Police Department headquarters as necessary to accommodate staff growth.

Policy 7D: Minimize exposure to air pollution and hazardous substances.

Action 7.20: Require air pollution point sources to be located at safe distances from sensitive sites such as homes and schools.

Action 7.21: Require analysis of individual development projects in accordance with the most current version of the Ventura County Air Pollution Control District Air Quality Assessment Guidelines and, when significant impacts are

identified, require implementation of air pollutant mitigation measures determined to be feasible at the time of project approval.

Action 7.22: In accordance with Ordinance 93-37, require payment of fees to fund regional transportation demand management (TDM) programs for all projects generating emissions in excess of Ventura County Air Pollution Control District adopted levels.

Action 7.23: Require individual contractors to implement the construction mitigation measures included in the most recent version of the Ventura County Air Pollution Control District Air Quality Assessment Guidelines.

Action 7.24: Only approve projects involving sensitive land uses (such as residences, schools, daycare centers, playgrounds, medical facilities) within or adjacent to industrially designated areas if an analysis provided by the proponent demonstrates that the health risk will not be significant.

Action 7.25: Adopt new development code provisions that ensure uses in mixed-use projects do not pose significant health effects.

Action 7.26: Seek funding for cleanup of sites within the Brownfield Assessment Demonstration Pilot Program and other contaminated areas in West Ventura.

Action 7.27: Require proponents of projects on or immediately adjacent to lands in industrial, commercial, or agricultural use to perform soil and groundwater contamination assessments in accordance with American Society for Testing and Materials standards, and if contamination exceeds regulatory action levels, require the proponent to undertake remediation procedures prior to grading and development under the supervision of the County Environmental Health Division, County Department of Toxic Substances Control, or Regional Water Quality Control Board (depending upon the nature of any identified contamination).

Action 7.28: Educate residents and businesses about how to reduce or eliminate the use of hazardous materials, including by using safer non-toxic equivalents.

Action 7.29: Require non-agricultural development to provide all necessary buffers, as determined by the Agriculture Commissioner's Office, from agricultural operations to minimize the potential for pesticide drift.

Action 7.30: Require all users, producers, and transporters of hazardous materials and wastes to clearly identify the materials that they store, use, or transport, and to notify the appropriate City, County, State and Federal agencies in the event of a violation.

Action 7.31: Work toward voluntary reduction or elimination of aerial and synthetic chemical application in cooperation with local agricultural interests and the Ventura County agricultural commissioner.

Policy 7E: Minimize the harmful effects of noise.

Action 7.32: Require acoustical analyses for new residential developments within the mapped 60 decibel (dBA) CNEL contour, or within any area designated for commercial or industrial use, and require mitigation necessary to ensure that:

- Exterior noise in exterior spaces of new residences and other noise sensitive uses that are used for recreation (such as patios and gardens) does not exceed 65 dBA CNEL, and
- Interior noise in habitable rooms of new residences does not exceed 45 dBA CNEL with all windows closed.

Action 7.33: As funding becomes available, construct sound walls along U.S. 101, SR 126, and SR 33 in areas where existing residences are exposed to exterior noise exceeding 65 dBA CNEL.

Action 7.34: Request that sound levels associated with concerts at the County Fairgrounds be limited to 70 dBA at the eastern edge of that property.

Action 7.35: Request the termination of auto racing at the County fairgrounds.

Action 7.36: Amend the noise ordinance to restrict leaf blowing, amplified music, trash collection, and other activities that generate complaints.

Action 7.37: Use rubberized asphalt or other sound reducing material for paving and re-paving of City streets.

Action 7.38: Update the Noise Ordinance to provide standards for residential projects and residential components of mixed-use projects within commercial and industrial districts.

ventura's general plan

OUR EDUCATED COMMUNITY

"A vigorous culture capable of making corrective, stabilizing changes depends heavily on its educated people, and especially upon their critical capacities and depth of understanding."

— Jane Jacobs
Dark Age Ahead

CITY OF
VENTURA

8. OUR EDUCATED COMMUNITY

Our goal is to encourage academic excellence and life-long learning resources to promote a highly-educated citizenry.

Lifelong Learning

Education is more important than ever before as the foundation for the vitality of informed community participation in Ventura. The *Ventura Vision* calls for the city to be "a community dedicated to educational excellence and an emphasis on lifelong learning." A truly educated community is key to achieving most of the goals in this General Plan because:

- In the 21st Century information economy a highly educated and skilled workforce is vital to community prosperity,
- Education and the institutions that provide it are critical to achieving environmental and cultural leadership, and
- An educated and informed citizenry is essential to sound planning and decision-making.

While Ventura has a comparatively well-educated population (see Table 8-1), the high costs of doing business and finding housing in the city will force even greater emphasis on businesses and jobs that require ever-higher levels of skill. The need and desire for lifelong learning will require relentlessly expanding educational resources and access to them in the years ahead. Plus, the assets that strong educational institutions provide are necessary to bring a rich cultural life to the community as well.

Ventura can build on an impressive base of well-regarded public schools, array of private alternatives, major community college, satellite university campuses, expanding media-training institute, law school, and three branch libraries, among other educational resources. The key to becoming renowned as a local "learning community" lies in creating stronger linkages between these existing resources and integrating them into the physical and social landscape of our community.

Leveraging our Assets

Excellence in public education is the top priority for the Ventura Unified School District (whose boundaries extend beyond the city). In Ventura, the District manages 16 elementary schools, four middle schools, three high schools, and one continuation high school, plus independent study and adult education programs.

In addition to District schools, the city also is home to more than a dozen private schools (see Table 8-2), serving 13 percent of elementary and high school students living in Ventura, according to the 2000 Census. Figure 6-1 shows school locations in the city.

Table 8-1
Education Level

Schooling Completed	Percent of Population
High School	21.7
Some College	28.2
Associate Degree only	9.6
Bachelors Degree only	15.4
Graduate Degree	9.3
High School Diploma & Above	***84.1***
Associate Degree & Above	***34.2***

Table 8-2
Private Schools

School	Grades
First Baptist Day	K-5
St. Augustine Academy	4-12
Sacred Heart	K-8
Ventura Missionary Christian Day	K-8
College Heights Christian	K-8
St. Bonaventure High School	9-12
Holy Cross	K-8
Our Lady of The Assumption	K-8
St. Paul's Parish Day	K-8
Grace Lutheran Christian Day	K-6
Jameson	K-12
Ventura County Christian	K-12
Hill Road Montessori Preschool	K-3
Wells Road Baptist Academy	K-12

Most public schools operate at or near capacity (see Table 8-3), and continuing growth in Ventura requires the District to search for sites for new schools (see Table 8-4). Developers of new projects are required to dedicate land or pay fees for school purposes, and any major annexation of land outside the city is likely to have to provide a school site to serve new resident children. Still, the scarcity and cost of suitable sites means that greater thought will need to be given to shared facility use and other non-traditional approaches to expanding capacity.

Table 8-3. Ventura Unified School District Enrollment

Schools – No.	Students	Capacity
Elementary – 17	8,093	95%
Middle – 4	4,304	93%
High - 3	4,820	85%
TOTAL	**17,217**	**92%**

Middle	1,000	1	20
High	2,000	1	40
TOTAL		**6**	**100**

1. Assumes 10 acres for elementary schools, 20 acres for middle schools, and 40 acres for high schools.

Source: Ventura Unified School District, 2003

Ventura is increasingly becoming recognized as a center for higher education. Ventura College is a highly respected two-year school with more than 12,000 students, providing everything from a distinguished transfer opportunity for the University of California to certificates and associates degrees in important fields such as manufacturing and nursing. Students also can obtain four-year degrees in certain fields at the UCSB Ventura Center. Brooks Institute of Photography provides education in photojournalism, filmmaking, and related fields, providing the city with a significant cultural asset. Residents can earn graduate degrees in law, public policy, and education at the Ventura campuses of California Lutheran University, Azusa Pacific University, the Ventura College of Law, and the Southern California Institute of Law. The opening of the nearby California State University Channel Islands has drawn many students and faculty to live in Ventura, especially those in creative fields.

Combined, these institutions of higher learning provide Ventura with tremendous educational assets. Through the policies and actions in this chapter, the City is committed to nurturing these institutions, creating synergy among them, and instilling both cultural and economic opportunities.

Libraries of the Future

The County public library system in Ventura currently operates three branch libraries that serve about 200,000 visits annually (see Table 8-5). But in a digital age where more and more content is available online, the traditional book borrowing function is becoming outmoded. Library administrators and staff, the City's Library Advisory Commission, and patrons have all pointed to needs for adding library space, extending operating hours, and updating and expanding learning resources.

At a more fundamental level, the ideas of what constitutes a library and how it fits the patterns of a learning community need to be reexamined. Integration with school libraries, including the Ventura College Learning Center, is a top priority for this reevaluation, as embodied in the policies and actions in this chapter.

City and Community Programs

Traditional classroom settings alone cannot provide the complete set of educational skills and experience needed by people of all ages. The City provides a variety of learning opportunities, including youth and adult art programs, environmental education, adaptive recreation programs, youth after-school activities, and summer camps. Community organizations also provide a range of classes and experiences, including tours, museums, lectures, and hands-on activities. Expanding venues for such activities and promoting participation in them are key challenges.

Policies and actions in this chapter seek to expand lifelong learning opportunities for everyone in the community.

Table 8-5. Local Libraries

Library	Card-Holders	2003-2004 Patronage	Hours Open Weekly	Facility Size (sq. ft.)
E. P. Foster	48,195	366,134	54	31,000
H. P. Wright			39	12,000
Avenue			25	3,000

Source: Ventura County Library Administration, 2005

Policy 8A: Reach out to institutions and educators to advance lifelong learning.

Action 8.1: Work closely with schools, colleges, and libraries to provide input into site and facility planning.

Action 8.2: Organize a regional education summit to generate interest in and ideas about learning opportunities.

Action 8.3: Adopt joint-use agreements with libraries, schools, and other institutions to maximize use of educational facilities.

Action 8.4: Distribute information about local educational programs.

Policy 8B: Increase the availability and diversity of learning resources.

Action 8.5: Install infrastructure for wireless technology and computer networking in City facilities.

Action 8.6: Establish educational centers at City parks.

Action 8.7: Work with the State Parks Department to establish a marine learning center at the Harbor.

Action 8.8: Work with the Ventura Unified School District to ensure that school facilities can be provided to serve new development.

Policy 8C: Reshape public libraries as 21st Century learning centers.

Action 8.9: Complete a new analysis of community needs, rethinking the role of public libraries in light of the ongoing advances in information technology and the changing ways that individuals and families seek out information and life-long learning opportunities.

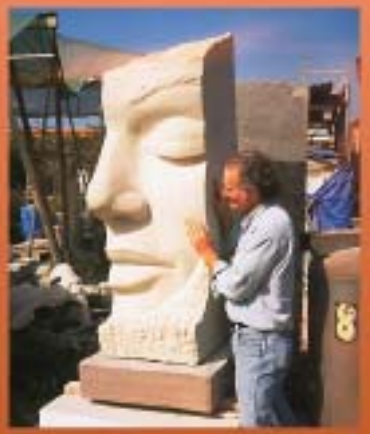
Action 8.10: Reassess the formal and informal relationships between our current three branch public libraries and school libraries – including the new Ventura College Learning Resource Center – as well as joint use of facilities for a broader range or compatible public, cultural, and educational uses.

Action 8.11: Develop a Master Plan for Facilities, Programs, and Partnerships to create an accessible, robust, and vibrant library for the 21st Century system, taking into consideration that circulation of books is no longer the dominant function but will continue to be an important part of a linked network of learning centers.

Action 8.12: Develop formal partnerships, funding, capital strategies, and joint use agreements to implement the new libraries Master Plan.

ventura's general plan

OUR CREATIVE COMMUNITY



"Whatever you can do, or dream you can, begin it. Boldness has genius, power and magic in it."

— Johann Wolfgang von Goethe

CITY OF
VENTURA

9. OUR CREATIVE COMMUNITY

Our goal is to become a vibrant cultural center by weaving the arts and local heritage into everyday life.

A Rich Foundation

Local history, artistic expression, and cultural diversity play vital roles in making Ventura a vibrant and interesting place. The heritage of Chumash civilization, which developed over the course of about 9,000 years, and influences of Mexican settlement establish a rich tableau for the modern development of the city. Art in museums, galleries, and public places, as well as space and energy devoted to the creation of artwork and crafts connect the community in complex and fundamental ways. Cultural expression in the form of festivals and informal gatherings provide additional and essential bonds that strengthen the community.

Historic Context

Abundant food and water, temperate climate, and ample material for tool manufacturing attracted early local inhabitants. Chumash peoples were living in a string of coastal villages when Spanish explorers arrived in 1542. Shisholop village (at the south end of present-day Figueroa Street) was a thriving Chumash provincial capital at the time of the Spanish arrival. Other Chumash villages and burial sites have been found in what are now the North Avenue and Saticoy neighborhoods, as well as north of the Ventura River. Mexican settlers began to arrive in earnest after the founding of Mission San Buenaventura in 1782.

Table 9-1
Key Historical and Cultural Sites

Site	Description
Albinger Museum	Artifacts spanning 3,500 years excavated from a site next to the Mission are on display in this former adobe at 113 East Main Street.
Downtown	Downtown Ventura is home to a variety of 19th Century buildings that house restaurants and retail establishments in a small-town setting with a variety of cultural amenities.
Olivas Adobe Park	Completed in 1849 for the Raymundo ranching family, the well-preserved hacienda at 4200 Olivas Park Road is utilized as concert and banquet facility.
Ortega Adobe	Built in 1857, the adobe is only remaining example of the middle class homes that once lined West Main Street. The building has since been used as a police station and restaurant.
San Buenaventura Mission	Built in 1782, the Mission anchors the western part of the downtown area and is still used for regular Catholic services.
Santa Gertrudis Chapel	The Chapel was originally completed around 1809. The site is located along Highway 33 near Foster Park.
San Miguel Chapel	The site is located at Thompson Boulevard and Palm Street. The original chapel dated back to the early 1800s.
Ventura County Museum of History and Art	The museum at 100 East Main Street houses exhibits featuring local artists and historical artifacts. Expansion plans include a 200-seat auditorium and a gallery with touring exhibits.

Source: City of Ventura

More than 90 historic sites have been identified in the planning area (which includes areas outside the city). Notable ones include the Mission, the Ortega and Olivas Adobes, and the locations of the Santa Gertrudis and San Miguel Chapels (See Table 9-1 and Figure 9-1). Many of the existing buildings in Ventura were constructed between 1880 and 1940, a period that coincided with development of the railroads and harbor. City

Hall (formerly the County Courthouse) and the Mission aqueduct are listed as landmarks on the National Register of Historic Places, and structures in the following historic districts are protected by City architectural controls:

- the grounds within the Mission District,
- the Mitchell block (south of Thompson Boulevard between Chestnut and Fir Streets),
- the Selwyn Shaw block (north of Poli Street between Ann and Hemlock Streets), and
- the Simpson Tract (west of Ventura Avenue between Simpson and Prospect Streets).

Arts and Culture

When the City first adopted a Community Cultural Plan in 1992, Ventura's creative community was in its fledgling stage. Few of the now-thriving professional art and cultural organizations existed (see Table 9-2). A burgeoning visual artist community had made the city its home, but was fairly invisible except to the more intrepid arts supporters and collectors.

Since completion of that plan, the City has either implemented or initiated all of its recommendations, which were developed through extensive public involvement. As a result, the growth of the cultural community has been extraordinary. Now Ventura is home to a wealth of active artists and arts organizations. From 1994-2004, the budgets of arts organizations in Downtown Ventura alone increased from $500,000 to more than $4 million.

Ventura also now has a complement of major cultural institutions unique for a city of its size, including the Ventura Music Festival, the Rubicon Theatre Company, the Ventura County Museum of History and Art, and Focus on the Masters. The individual artists who live and work in the city continue to comprise a major part of its cultural fabric, and are highlighted in popular cultural events like the Downtown ArtWalks.

A strong focus of the City's general is to build the arts infrastructure of Ventura. A strong cultural infrastructure is the foundation of a healthy arts ecosystem: this includes *places* (for arts creation, sales, exhibition, performance, rehearsal, living), *people* (artists, audiences, patrons), and *organizations* (production, support, and presentation).

In keeping with the community's respect for its roots, the Ventura arts scene remains authentic, no small feat in today's competitive environment. While many communities focus on importing Broadway shows or big-name art exhibits to increase their profile, Ventura successfully continues to highlight local artists, architecture, culture, history, and the environment – the unique threads that together comprise the rich tapestry of the Ventura community. Policies and actions in this chapter call for continuing to build the cultural foundations of the community by involving everyone in the production, support, and presentation of art and cultural programs, installing art in public places, providing working and display space for local artists, and identifying a site for an arts and cultural center.

Table 9-2
Art and Cultural Institutions

Name	Description	Years in Operation	Annual Patronage
Buenaventura Arts Association	Fine art gallery in downtown Ventura.	50	5,000
Channelaire Chorus	Women's chorus	42	2,500
City of Ventura Cultural Affairs Division	Supports local arts organizations; produces cultural programs (ArtWalks, Street Fairs, Music Under the Stars, Arts Education classes, grants, public art, etc.)	13	132,000
Focus on the Masters	Documentation of extraordinary artists (photographs, audio and video interviews)	10	15,000
Kids' Art	Ongoing, free kids' creative arts programs	12	350
Music 4 Kids	After school music instruction at Boys & Girls Clubs	4	800
Plexus Dance Theater	Professional modern dance performances	20	1,400
Rubicon Theater	Regional theater – classic and contemporary	6	37,000
San Buenaventura Foundation for the Arts	Arts umbrella organization - supports development of the Cultural Center and produces Arts Explosion	5	5,900
Ventura Area Theater Sports	Live improvisational theater in downtown Ventura	15	5,000
Ventura Artists' Union	Art gallery and weekly arts shows on California Plaza	15	17,000
Ventura College Opera Workshop	Opera and theater company at Ventura College	21	4,500
Ventura County Ballet	Ballet school with twice annual performances	6	11,000
Ventura County Master Chorale	Professional vocal music ensemble	23	6,000
Ventura County Museum of History and Art	Museum featuring exhibits on the history and art of Ventura County	26	55,000
Ventura Music Festival	Annual concert festival presenting international and local performers	11	9,000

Policy 9A: Increase public art and cultural expression throughout the community.

Action 9.1: Require works of art in public spaces per the City's Public Art Program Ordinance.

Action 9.2: Sponsor and organize local art exhibits, performances, festivals, cultural events, and forums for local arts organizations and artists.

Action 9.3: Expand outreach and publicity by:

- promoting locally produced art and local cultural programs
- publishing a monthly calendar of local art and cultural features,
- distributing the *State of the Arts* quarterly report, and
- offering free or subsidized tickets to events.

Action 9.4: Support the creative sector through training and other professional development opportunities.

Action 9.5: Work with the schools to integrate arts education into the core curriculum.

Action 9.6: Promote the cultural and artistic expressions of Ventura's underrepresented cultural groups.

Action 9.7: Offer ticket subsidy and distribution programs and facilitate transportation to cultural offerings.

Policy 9B: Meet diverse needs for performance, exhibition, and workspace.

Action 9.8: Increase the amount of live-work development, and allow its use for production, display, and sale of art.

Action 9.9: Work with community groups to locate sites for venues for theater, dance, music, and children's programming.

Policy 9C: Integrate local history and heritage into urban form and daily life.

Action 9.10: Provide incentives for preserving structures and sites that are representative of the various periods of the city's social and physical development.

Action 9.11: Organize and promote multi-cultural programs and events that celebrate local history and diversity.

Action 9.12: Allow adaptive reuse of historic buildings.

Action 9.13: Work with community groups to identify locations for facilities that celebrate local cultural heritage, such as a living history Chumash village and an agricultural history museum.

Policy 9D: Ensure proper treatment of archeological and historic resources.

Action 9.14: Require archaeological assessments for projects proposed in the Coastal Zone and other areas where cultural resources are likely to be located.

Action 9.15: Suspend development activity when archaeological resources are discovered, and require the developer to retain a qualified archaeologist to oversee handling of the resources in coordination with the Ventura County Archaeological Society and local Native American organizations as appropriate.

Action 9.16: Pursue funding to preserve historic resources.

Action 9.17: Provide incentives to owners of eligible structures to seek historic landmark status and invest in restoration efforts.

Action 9.18: Require that modifications to historically-designated buildings maintain their character.

Action 9.19: For any project in a historic district or that would affect any potential historic resource or structure more than 40 years old, require an assessment of eligibility for State and federal register and landmark status and appropriate mitigation to protect the resource.

Action 9.20: Seek input from the City's Historic Preservation Commission on any proposed development that may affect any designated or potential landmark.

Action 9.21: Update the inventory of historic properties.

Action 9.22: Create a set of guidelines and/or policies directing staff, private property owners, developers, and the public regarding treatment of historic resources that will be readily available at the counter.

Action 9.23: Complete and maintain historic resource surveys containing all the present and future components of the historic fabric within the built, natural, and cultural environments.

Action 9.24: Create a historic preservation element.

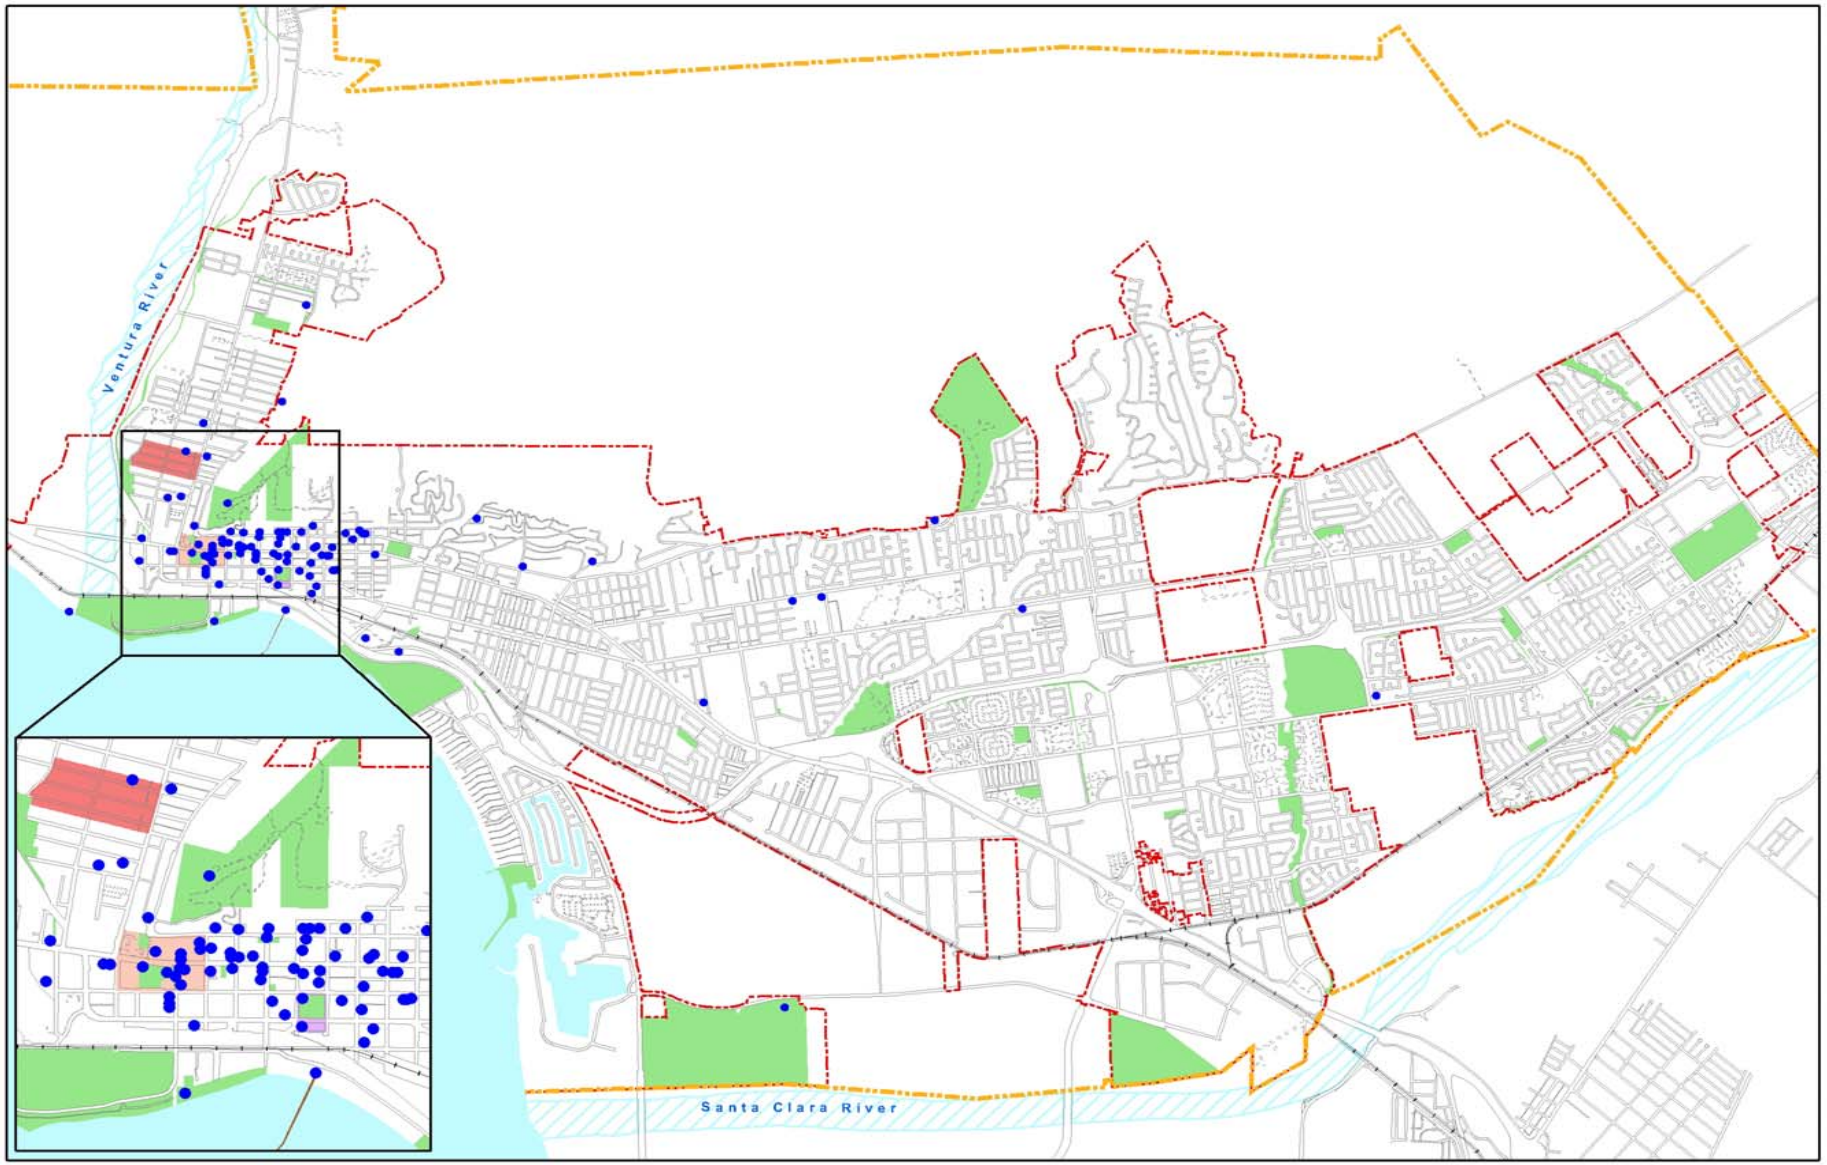


Figure 9-1
Historic Districts and Sites

CITY OF
VENTURA

OUR INVOLVED COMMUNITY

ventura's general plan

10. OUR INVOLVED COMMUNITY

Our goal is to strive to work together as a community to achieve the Ventura Vision through civic engagement, partnerships, and volunteer service.

Civic Engagement

It is not enough to have a vision of smart growth for Ventura. Achieving that vision requires the active and ongoing participation of an engaged and active community. Fortunately, Ventura builds on a strong foundation: thousands of Ventura citizens are involved in their schools and places of worship and give their time to civic, cultural, and charitable organizations. City Commissions, the Community Councils, the Chamber of Commerce and other well-established avenues provide opportunities for community leadership.

This is what Alexis De Toqueville celebrated in his famous book, *Democracy in America*, calling our nation, "the one country in the world, day in and day out, that makes use of an unlimited freedom of association." Yet today in Ventura, as all across America, there is concern about the health of our democracy. Sociologist Robert Putnam gained national attention with his research showing that "by almost every measure, Americans' direct engagement in politics and government has fallen steadily and sharply over the last generation."

Among the symptoms in Ventura have been a decline in voter turnout in recent local elections – (a 36% drop from 1995 through 2003.) Over those years, the ability to build consensus about future development has been undermined by sharply polarized divisions, showdowns at the ballot box, and often rancorous public hearings. The complaint often recurs that planning decisions are made without adequate notice or consideration of the views of those affected. Many citizens criticize the City decision-making process as convoluted and counterproductive.

Moreover, ongoing participation of an engaged community requires civic places where citizens can come together. It is not insignificant that a decline in public participation and the quality of civic discourse has paralleled the loss of civic places in our cities. Historically, governments provided open spaces and buildings that were at the center of a community, physically and symbolically. Town squares and plazas, often faced by a hall for formal gathering and civic engagement, have all but disappeared. The poverty of American public places was apparent after the Columbine High School shooting in Colorado, when citizens gathered to mourn, not in a shared place for people, but in a parking lot.

Nearly everyone agrees we can and should do better. The best model for doing this was the citywide effort to craft the *Ventura Vision*. Thousands participated in a year-long partnership encompassing City government, non-profit organizations, community groups, business,

schools and individual residents to chart the community's future.

The vision of an "involved community" was described in the *Ventura Vision* report as: seeking "broad community collaboration; more widely publicizing city government services, planning processes and policies; better involvement of typically under-represented groups such as youth, seniors and ethnic minorities in community planning; and developing public parks, plazas, neighborhood greenways and other spaces that promote civic interaction and events."

Since that vision was adopted by the City Council in 2000, the City has worked to implement it, building on existing community assets and strengthening the linkages and interconnections that already exist among people, organizations, and shared community goals. A remarkable example of broad community collaboration earned attention throughout Southern California in late 2004. Facing the prospect of winter flooding, the City undertook to evacuate homeless people living in the channel of the Ventura River. This was accomplished by a partnership involving non-profit social service agencies, faith-based organizations, City staff, business leaders, community volunteers and the affected homeless population.

There are many more models of successful community collaboration in Ventura, including: the restoration of the pier, the community's rich array of after-school programs, the implementation of the 1992 Cultural Plan, the 2004 Downtown Charrette, the 2005 Midtown Design Charrette and the establishment of conservancies to preserve the Grant Park cross and Ventura's cherished hillsides.

City government has learned from these efforts to reach broadly and deeply into the community. Civic engagement and trust are built when City representatives actively seek to involve everyone in positive and transparent partnerships. That goal requires a continually evolving effort to promote participation:

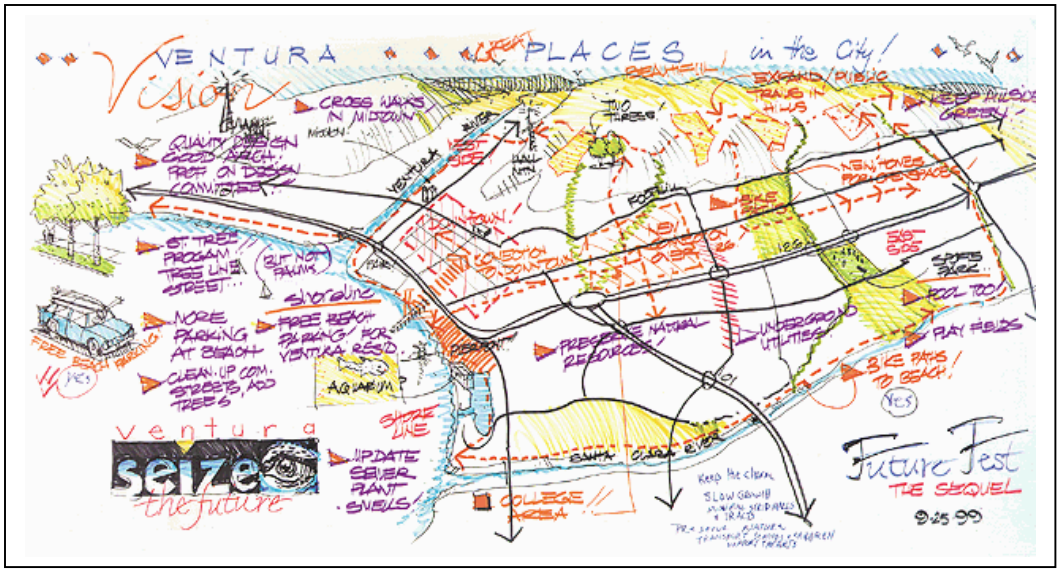
- through proactive and interactive media outreach in the press, on the web, on radio and television,
- by striving to include everyone in decision making and making it convenient for them to participate by seeking them out in their neighborhoods and gathering places like schools, houses of worship and public spaces, and
- through community dialogues, workshops, charrettes, town hall forums, and community councils, in addition to formal public hearings.

More effort needs to be put into building consensus about future growth and change upfront through community planning, rather than waiting until specific development projects are proposed. That effort will continue with the work to craft a citywide "form-based code" and concentrated planning efforts for specific neighborhoods and districts.

Focused attention should be paid to making our public decision-making processes easier to understand and participate in. Citizens have little time or patience for complicated planning and entitlement processes that drag on for years. By establishing clearer rules and public processes for applying them, the policies and actions in this chapter will enable more citizens to feel that they will be heard and their contributions valued. By involving a wider range of the community in clearly setting Ventura's planning goals and standards of quality, we can devote more time to achieving those goals and less time wrangling over specific proposals.

Ventura also needs to reestablish places for civic discourse. While the City will continue to encourage the use of our beautiful City Hall for its historic role of government by and for the people, we also need a hierarchy of civic spaces citywide that are strategically located in neighborhood centers and accessible by pedestrians (see Chapter Three, Action 3.8). Every neighborhood should have access to a physical location designated for public gathering and civic purposes.

Our long-range vision is to build an ethic and a fabric of robust civic engagement – what De Toqueville called "the habits of the heart." His phrase evokes what the Ventura Vision called "direct engagement in public affairs" through "participation, hard work and collaboration . . . sustaining Ventura as an exceptional place." The policies and actions in this chapter aim to do just that.



Policy 10A: Work collaboratively to increase citizen participation in public affairs.

Action 10.1: Conduct focused outreach efforts to encourage all members of the community – including youth, seniors, special needs groups, and non-English speakers – to participate in City activities.

Action 10.2: Obtain public participation by seeking out citizens in their neighborhoods and gathering places such as schools, houses of worship and public spaces.

Action 10.3: Invite civic, neighborhood, and non-profit groups to assist with City project and program planning and implementation.

Action 10.4: Provide incentives for City staff to participate in community and volunteer activities.

Action 10.5: Invite seniors to mentor youth and serve as guides at historical sites.

Action 10.6: Offer internships in City governance, and include youth representatives on public bodies.

Action 10.7: Continue to offer the Ambassadors program to obtain citizens assistance with City projects.

Policy 10B: Raise awareness of City operations and be clear about City objectives.

Action 10.8: Utilize the City website as a key source of information and expand it to serve as a tool for civic engagement.

Action 10.9: Publish an annual report that evaluates City performance in such areas as conservation, housing, and economic development.

Action 10.10: Continue to improve the user-friendliness of the media that communicate information about the City, including the website, cable channels, newsletters, kiosks, and water billing statements.

Policy 10 C: Work at the neighborhood level to promote citizen engagement.

Action 10.11: Establish a clear policy toward the scope, role, boundaries, and jurisdiction of neighborhood Community Councils citywide, with the objectives of strengthening their roles in decision-making.

Action 10.12: Establish stronger partnerships with neighborhood Community Councils to set area priorities for capital investment, community policing, City services, commercial investment, physical planning, education, and other concerns, to guide both City policies and day-to-day cooperation and problem-solving.

Action 10.13: Recognizing that neighborhood empowerment must be balanced and sustained by overall City policies and citywide vision and resources – establish a citywide Neighborhood Community Congress where local neighborhood Community Councils can collaborate and learn from each other.

Action 10.14: Establish clear liaison relationships to foster communication, training, and involvement efforts between the City, neighborhood Community Councils and other community partners, including the Ventura Unified School District and business, civic, cultural and religious groups.

ventura's general plan

APPENDICES

"Individual commitment to a group effort, that is what makes a team work, a company work, a society work, a civilization work."

— Vince Lombardi

ORDINANCE NO. 95-33

AN ORDINANCE OF THE PEOPLE OF THE CITY OF SAN BUENAVENTURA ADOPTING AN ORDINANCE AMENDING THE COMPREHENSIVE PLAN WITH RESPECT TO THE PRESERVATION OF AGRICULTURAL LANDS.

The people of the City of San Buenaventura do hereby ordain as follows:

Section 1. Findings and Purpose.

A. The protection of existing agricultural and watershed lands is of critical importance to present and future residents of the City of San Buenaventura (City of Ventura). Agriculture has been and remains the major contributor to the economy of the City and County of Ventura, creating employment for many people, directly and indirectly, and generating substantial tax revenues for the City.

B. In particular, the City of Ventura and surrounding area, with its unique combination of soils, micro-climate and hydrology, has become one of the finest growing regions in the world. Vegetable and fruit production from the County of Ventura and in particular production from the soils and silt from the Santa Clara and Ventura rivers have achieved international acclaim, enhancing the City's economy and reputation.

C. Uncontrolled urban encroachment into agricultural and watershed areas will impair agriculture and threaten the public health, safety and welfare by causing increased traffic congestion, associated air pollution, and potentially serious water problems, such as pollution, depletion, and sedimentation of available water resources. Such urban encroachment would eventually result in both the unnecessary, expensive extension of public services and facilities and inevitable conflicts between urban and agricultural uses.

D. The unique character of the City of Ventura and quality of life of City residents depend on the protection of a substantial amount of open space lands. The protection of such lands not only ensures the continued viability of agriculture, but also protects the available water supply and contributes to flood control and the protection of wildlife, environmentally sensitive areas, and irreplaceable natural resources.

E. The Resolution by which the City of Ventura adopted its Comprehensive Plan on August 28, 1989, Resolution No. 89-103, at page 4, contains in part the following "mitigation measures" in recognition of the importance of preserving agriculture resources:

> "Any potential significant adverse impacts are mitigated by substantially limiting the amount of agricultural land converted from an agricultural land use designation limiting the amount of prime farmland converted, and by making the various agricultural land areas designated for potential development subject to conditions which narrowly limit the possible land use."

F. The Comprehensive Plan sets out as Objective 4 (at II-9) the desire to:

"Continue to preserve agricultural and other open space lands within the City's Planning Area."

And, the Comprehensive Plan describes as the first Goal of its Resource Element (at II-3) the objective to:

> "Preserve agricultural and open space lands as a desirable means of shaping the City's internal and external form and size, and of serving the needs of residents."

G. The purpose of this initiative is to ensure that the Goals and Objectives of the Comprehensive Plan are inviolable by transitory short-term political decisions and that agricultural, watershed and open space lands are not prematurely or unnecessarily converted to other non-agricultural or non-open space uses without public debate and a vote of the people. Accordingly, the initiative ensures that until December 31, 2030, the general plan provisions governing agricultural land use designation and intent may not be change except by vote of the people. In addition, the initiative provides that any lands designated as "Agriculture Use", referring to both "Agricultural Use (not to be reconsidered until after the Year 2010" and Agricultural/Institutional" on the City of Ventura's General Plan "Land Use Plan Map" adopted by the City Council by Resolution 89-103 on August 28, 1989, as amended through February 1, 1995, will remain designated as Agricultural Use until December 31, 2030, unless the land is redesignated to another land use category by vote of the people, or redesignated by the City Council for the City of San Buenaventura pursuant to the procedures set forth in this initiative.

H. This initiative allows the City Council to redesignate agriculture lands only if certain if certain findings can be made, including (among other things) that the land is proven to be unsuitable for any form of agriculture and redesignation is necessary to avoid an unconstitutional taking of property without just compensation.

Section 2. General Plan Amendment.

The Agricultural Lands Preservation Initiative hereby reaffirms and readopts until December 31, 2030, The "Agricultural Use" designations as defined in the City of San Buenaventura Comprehensive Plan adopted August 28, 1989, as amended through February 1, 1995, at pages III-25 and III-26, with the modification that the "target date" is extended from 2010 until after December 31, 2030.

The following terminology shall replace the current "Agricultural Use" designation defined at page III-25 of The Plan:

Agricultural Use

The Agricultural Use (not to be reconsidered until after the Year 2030) category identifies those lands that are designated for agricultural use on the Land Use Plan Map.

The target date of 2030 associated with the Agricultural Use designation indicates a review date after which agriculturally designated lands may be reconsidered for urban uses. However, during the life of this plan as amended by initiative, it is intended that only agricultural uses are permitted on these lands, except as such lands may be appropriate to public open space and recreational usage. Furthermore, any updates to this Plan are not intended to imply that development would necessarily be appropriate at hat time.

In addition, the initiative hereby reaffirms and readopts until December 31, 2030, the "Agricultural" designations set forth on the of the City of Ventura Comprehensive Plan "Land Use Plan Map" adopted by the City Council on August 28, 1989, as amended through February 1, 1995, which map is incorporated herein by reference, modified, as appropriate, to delete the reference year 2010 and replace it with the reference year 2030.

Finally, the text of the Amendment Procedures of the City of Ventura Comprehensive Plan adopted August 28, 1989, as amended through February 1, 1995, (at XI-I) shall be amended to add a new subsection which provides:

Limitation on General Plan Amendments Relating to "Agricultural Use"

a) Until December 31, 2030, the provisions and designations governing the intent for lands designated "Agricultural Use" of the Land Use Element and Resource Element adopted on August 28, 1989, as amended through February 1, 1995, shall not be amended unless such amendment is approved by vote of the people.

b) All those lands designated as "Agricultural Use" in the City of Ventura Comprehensive Plan "Land Use Plan Map" adopted by the City Council on August 28, 1989 as amended through February 1, 1995, shall remain so designated until December 31, 2030 unless redesignated to another general plan land use category by vote of the people, or redesignated by the City Council pursuant to the procedures set forth in subsections c) or d), below.

c) Except as provided in subsection d), below, land designated as "Agricultural Use" may be redesignated by the City Council to a land use other than "Agricultural Use" as defined by the Comprehensive Plan adopted by the City Council on August 28, 1989, as amended through February 1, 1995, only if the City Council makes all of the following findings supported by the evidence:

   i) The land is immediately adjacent to areas developed in a manner comparable to the proposed use;

   ii) Adequate public services and facilities are available and have the capacity and capability to accommodate the proposed use;

   iii) The proposed use is compatible with agricultural uses, does not interfere with accepted agricultural practices, and does not adversely affect the stability of land use patterns in the area;

   iv) The land proposed for redesignation has not been used for agricultural purposes in the past 2 years and is unusable for agriculture due to its topography, drainage, flooding, adverse soil conditions or other physical reasons; and

v) The land proposed for redesignation pursuant to this subsection (c) does not exceed 40 acres for any one landowner in any calendar year, and one landowner may not obtain redesignation in the Comprehensive Plan of "Agricultural Use" land pursuant to this subsection (c) more often than every other year. Landowners with any unity of interest are considered one landowner for purposes of this limitation.

d) Land designated as "Agricultural Use" on the Land Use Plan Map may be redesignated to another land use category by the City Council if each of the following conditions are satisfied:

i) The City Council makes a finding that the application of the provisions of Section 2 (a) would constitute an unconstitutional taking of the landowners' property; and

ii) In permitting the redesignation, the City Council allows additional land uses only to the extent necessary to avoid said unconstitutional taking of the landowner's property.

e) Approval by a vote of the people is accomplished when a Comprehensive Plan amendment is placed on the ballot through any procedure provided for in the Election Code, and a majority of the voters vote in favor of it. Whenever the City Council adopts an amendment requiring approval by a vote of the people pursuant to the provisions of this subsection, the City Council's action shall have no effect until after such a vote is held and a majority of the voters vote in favor of it. The City Council shall follow the provisions of the Election Code in all matters pertaining to such an election.

Section 3. Implementation.

A. Upon the effective date of this initiative, the initiative shall be deemed inserted in the City of Ventura's Comprehensive Plan as an amendment thereof; except, that if the four amendments of the mandatory elements of the general plan permitted by state law for any given calendar year have already been utilized in 1995, prior to the effective date of this initiative, this Comprehensive Plan amendment shall be deemed inserted in the City's General Plan on January 1, 1996. At such time as this Comprehensive Plan amendment is deemed inserted in the City's Comprehensive Plan (hereinafter, the "insertion date") any provisions of the City's Zoning Ordinance inconsistent with that amendment shall not be enforced to the extent of the inconsistency. Within 180 days of the insertion date, the City shall complete

such revisions of its Comprehensive Plan, including, but not limited to, the Comprehensive Plan Land Use Plan Map adopted by the City Council on August 28, 1989, (as amended through February 1, 1995) and accompanying test, as are necessary to achieve consistency with all provisions of this initiative. Also, within 180 days of the insertion date, the City Council shall complete such revisions of its Zoning Ordinance and other land use regulations as are necessary to conform to and be consistent with all provisions of this initiative.

B. The provisions of this initiative shall prevail over any revisions to the City of Ventura's Comprehensive Plan as amended through February 1, 1995, or to the City of Ventura's Land Use Plan Map as amended through February 1, 1995 which conflict with the initiative. Except as provided in Section 4 below, upon the specific plans, tentative or final subdivision maps, parcel maps, conditional use permits, building permits or other ministerial or discretionary entitlements for use not yet approved or issued shall not be approved or issued unless consistent with the policies and provisions of this initiative.

Section 4. Exemptions for Certain Projects.

This initiative shall not apply to or affect any property owner whose property has acquired any of the following prior to its effective date:

A. A vested right pursuant to state law;

B. A validly approved and fully executed development agreement with the City; or

C. Approval of a vesting tentative map.

Section 5. Severability.

If any portion of this initiative is declared invalid by a court, the remaining portions are to be considered valid.

Section 6. Amendment or Repeal.

This initiative may be amended or repealed only by the voters at a general election.

STATE OF CALIFORNIA)
COUNTY OF VENTURA) ss
CITY OF SAN BUENAVENTURA)

I, BARBARA J. KAM, City Clerk of the City of San Buenaventura, California, do hereby certify that the foregoing Ordinance was adopted by the voters of the City of San Buenaventura at the General Municipal Election held on November 7, 1995 and subsequently declared adopted by the City Council of the City of San Buenaventura on November 27, 1995. The Ordinance shall take effect December 7, 1995. This ordinance shall not be repealed or amended except by a vote of the people, unless provision is otherwise made in the original ordinance.

Dated this 30th day of November, 1995.

Barbara J. Kam, CMC
City Clerk

Ventura Hillside Voter Participation Measure

The people of the City of San Buenaventura do ordain as follows:

Section 1. Title

This measure shall be known as the Ventura Hillside Voter Participation Measure.

Section 2. Purpose

The overall purpose of this measure is to allow City voters to participate in the review process relating to non-exempt development projects that may be proposed in a certain portion of the "Hillside Area" of the City as defined in the City's Comprehensive Plan Update to the Year 2010 (hereafter the "Comprehensive Plan"). The portion of the Hillside Area under consideration lies generally north of the City, constitutes an area approximately 9108 acres in size, and is further depicted as the "Hillside Voter Participation Area" indicated in Exhibit "A" attached hereto and made a part hereof. The proposed Hillside Voter Participation Area (also referred to from time to time hereafter as "HVP Area" or "HVPA") is outside the Ventura City limits, but it is within the "Planning Area" of the City of San Buenaventura as further indicated on Exhibit "A." The Comprehensive Plan Land Use Map currently designates the properties within the proposed Hillside Voter Participation Area as "Hillside Planned Residential" or "HPR" rather than "Agricultural" and, therefore, these properties are not subject to the Save Our Agricultural Resources ("SOAR") Initiative adopted by the voters in 1995.

In the recent past, some property owners within the proposed Hillside Voter Participation Area have publicly presented initial proposals to develop those properties with a combination of residential uses and open space and recreational areas proposed to include, among other things, hiking and equestrian trails for use by the public. In the course of public meetings and informational workshops discussing these proposals, it has become apparent that there is a high level of public concern over potential issues of scenic resource protection, open space and recreational opportunities, infrastructure needs, traffic circulation, and other development-related issues arising from any proposed changes in the use of this important part of the City's Planning Area. This measure, in recognition of this heightened public concern, is intended to provide the electorate of the City of San Buenaventura with an opportunity to vote on the approval of any such development proposals or any similar proposals to extend urban services to the Hillside Voter Participation Area or develop property in the Hillside Voter Participation Area with urbanized land uses.

More particularly, this measure proposes to amend the Comprehensive Plan of the City of San Buenaventura by adding a requirement that approvals for extensions of "urban services" (defined in the City's Hillside Management Program as the provision of domestic water and sewers) or any proposed "urbanized uses of land" (as defined herein) in the Hillside Voter Participation Area cannot be granted without prior approval by a majority vote of the electorate.

Section 3. Comprehensive Plan Amendment

The following text shall be inserted into the Land Use Element of the Comprehensive Plan at page 111-8 thereof:

Hillside Voter Participation Area

The electorate of the City of Ventura has adopted a Hillside Voter Participation Area (Ventura HVP Area). Its purpose, principles, implementation procedures, and methodologies for amendment are set forth in this Comprehensive Plan amendment.

A. PURPOSE

The City of Ventura Hillside Area, with its unique topography, viewsheds, watershed lands; its unique microclimate and hydrology, and its diversity of plant and wildlife resources, is one of the finest scenic resources in the Southern California region. The Comprehensive Plan recognizes the unique and important qualities and potential of the Hillside Area in, among other provisions, the declaration of specialized Objectives and Policies for the Hillside Area in the Resources Element of the Plan and the Plan's requirements for continuing operation of, and compliance with, the City's Hillside Management Program.

This Comprehensive Plan amendment is intended to provide for an increased level of public awareness and participation in the development review process applicable to that portion of the Hillside Area described and depicted in Exhibit "A" as the "Hillside Voter Participation Area." It is further intended to provide assurance to the public that any proposed development in the Hillside Voter Participation Area appropriately takes into account the Area's unique combination of viewshed, watershed, open space, scenic area, and environmentally sensitive habitat, and that agricultural, viewshed, watershed, and open space lands in the Hillside Voter Participation Area are not converted to urban or other non-open space uses without public discussion and a vote of the people. Increasing citizen participation in the development review process through the establishment of a Hillside Voter Participation Area enhances the City's sense of community, allows for development unique to the City of Ventura, and promotes the efficient use of the City's infrastructure.

More specifically, this Comprehensive Plan amendment is intended to provide an opportunity for the public to be involved in insuring that any development projects proposed in the Hillside Voter Participation Area, shall, at a minimum:

1. Maintain the scenic character of the hillsides in areas of future development, by preserving significant natural landmarks and scenic ridgelines and slopes.

2. Provide increased recreational opportunities for existing and future hillside and other City residents, by improving access to existing parks and establishing additional parks or open, non-developed areas in conjunction with future hillside development.

3. Maximize public access to hillside open space and recreation areas, by establishing a system of linear parks and hiking trails along scenic ridges and barrancas.

4. Minimize the impact of hillside development on sensitive natural habitats and historical or archaeological resources.

B. PRINCIPLES

Inappropriate urban encroachment into Hillside open space, viewshed, watershed, scenic areas, and biological resource areas would have the potential to impact sensitive environmental areas, unwarrantedly intrude on open space, diminish the quality of life and threaten the public health, safety and welfare by leading to increased traffic congestion, associated air pollution, erosion, alteration of sensitive lands in watershed areas and causing potentially serious water problems, such as pollution, depletion and sedimentation of available water resources not only for the City of Ventura, but for its jurisdictional neighbors. Inappropriate urban encroachment could further result in the unwarranted extension of public services and facilities into sensitive areas.

The unique character of the City of Ventura and quality of life of City residents depends on the appropriate protection of the Hillside Area's substantial amount of open space, viewshed, watershed, scenic resources, and biological resources. The increased public awareness and involvement in the fate of such lands through the implementation of this Comprehensive Plan amendment will provide the public a special opportunity to assure that future generations of Ventura citizens will not be deprived of the benefits of access to a viable water supply, flood and erosion control, protection of viewsheds, wildlife, environmentally sensitive areas, open space and recreational areas, and irreplaceable natural resources.

C. IMPLEMENTATION

(1) There is hereby established a Ventura Hillside Voter Participation Area (Ventura HVP Area). The Ventura HVP Area is that portion of the Hillside Area delineated and depicted in Exhibit "A" of this Comprehensive Plan amendment (hereafter, the "HVP Area Map"). As shown on the HVP Area Map, the southern boundary of the HVP Area generally follows the northern segment of the City's incorporated limit as established by the Local Agency Formation Commission for the City of Ventura, except as the HVP boundary line runs northerly of some small residential lots on or near Foothill Road west of Arroyo Verde Park as further depicted on Exhibit "A." East of Harmon Barranca, the HVP Area boundary generally follows the alignment of Foothill Road eastward to the boundary of the City's Planning Area. The northerly boundary of the HVP Area continues, generally, as the northern boundary of the City's Planning Area. The westerly boundary of the HVP Area alternately follows the City limit boundary or Sphere of Influence boundary easterly of the North Avenue area. The foregoing narrative description is intended to be general in nature and all of the foregoing is more particularly depicted and described in Exhibit "A'

Insofar as the HVP Area boundary described and depicted in this Comprehensive Plan amendment, including Exhibit "A" hereto, is said or shown to be coterminous with either the City's incorporated limit or the City's Sphere of Influence boundary, or with the boundary of the City's Planning Area, such references are intended to be, and shall be construed to be, the location of the City limit boundary or Sphere of Influence boundary or boundary of the City's Planning Area. as applicable, as each of those boundaries are established for the City of Ventura as of January 1, 2001. Although the HVP Area boundary is established, in part, in generally the same location as the City limit boundary, or in some instances, the Sphere of Influence boundary, the establishment of the HVP Area boundary is not intended to and shall in no way inhibit the Local Agency Formation Commission from changing or altering the City limit boundary or Sphere of Influence boundary in accordance with State law. The boundary of the HVP Area, although incidentally coterminous as of one point in time with the City limit boundary or Sphere of Influence boundary or boundary of the City's Planning Area, is independent from these boundaries in legal significance and purpose. While the City limit boundary or Sphere of Influence boundary may be, from time to time, altered by the Local Agency Formation Commission, or the boundary of the City's Planning Area may be changed, the HVP Area boundary shall not be changed except as provided herein.

(2) Until December 31, 2030, the City of Ventura shall not extend urban services into, and shall not authorize urbanized uses of land within, the Ventura Hillside Voter Participation Area unless otherwise authorized by a vote of the people, except for the purpose of construction of public potable water facilities, public parks or other city government facilities or as otherwise provided or excepted herein. Upon the effective date of this Hillside Voter Participation Area Comprehensive

Plan amendment, the City and its departments, boards, commissions, officers and employees shall not grant, or by inaction allow to be approved by operation of law, any Comprehensive Plan amendment, rezoning, specific plan, subdivision map, conditional use permit, building permit or any other ministerial or discretionary entitlement, which is inconsistent with the purposes of this Comprehensive Plan amendment, unless in accordance with the amendment procedures of Section 4 of this Comprehensive Plan amendment.

(3) "Urbanized uses of land" shall mean any development that would require the establishment of new community sewer systems or the significant expansion of existing community sewer systems; or, would result in the creation of residential densities greater than one primary residential unit per 40 acres in area; or, would result in the establishment of commercial or industrial uses that are neither agriculturally-related nor related to the production of mineral resources.

(4) The Land Use Map is amended to reflect the existence of the Ventura Hillside Voter Participation Area as generally described in paragraph (1) above and as depicted in Exhibit "A," attached hereto.

(5) The Hillside Voter Participation Area, as defined herein, may not be amended, altered, revoked or otherwise changed prior to December 31, 2030, except by vote of the people or by the City Council pursuant to the procedures set forth in Section 4 of this Comprehensive Plan amendment. For purposes of this Ordinance, approval by a vote of the people is accomplished when a Comprehensive Plan amendment is placed on the ballot through any procedure provided for in the Election Code, and a majority of the voters vote in favor of it. Whenever the City Council adopts an amendment requiring approval by a vote of the people pursuant to the provisions of this subsection, the City Council's action shall have no effect until after such a vote is held and a majority of the voters vote in favor of it. The City Council shall follow the provisions of the Election Code in all matters pertaining to such an election.

Section 4. Changes to Area: Procedures.

Until December 31, 2030, the foregoing Purposes, Principles and Implementation provisions of this Comprehensive Plan amendment, and the Hillside Voter Participation Area may be amended only by a vote of the people commenced pursuant to the initiative process by the public, or pursuant to the procedures set forth below:

A. The City Council may amend the boundary of the Hillside Voter Participation Area depicted on Exhibit "A" if it finds such amendment to be in the public interest, provided that the amended boundary enlarges said Hillside Voter Participation Area established by this Comprehensive Plan amendment.

B. The City Council, following at least one public hearing for presentation by an applicant and the public, and after compliance with the California Environmental Quality Act, may amend the Hillside Voter Participation Area described herein, based on substantial evidence in the record, if the City Council makes each of the following findings:

(1) Application of the provisions of subsections (A) or (B) of the amendment procedures set forth in this Section 4 are unworkable and failure to amend the Hillside Voter Participation Area would constitute an unconstitutional taking of a landowner's property for which compensation would be required or would deprive the landowner of a vested right; and

(2) The amendment and associated land use designations will allow additional land uses only to the minimum extent necessary to avoid said
unconstitutional taking of the landowner's property or to give effect to the vested right.

C. The City Council, following at least one public hearing for presentations by an applicant and the public, and after compliance with the California Environmental Quality Act, may place any amendment to the Hillside Voter Participation Area or the provisions of this Comprehensive Plan amendment on the ballot pursuant to the mechanisms provided by state law.

D. The Comprehensive Plan may be reorganized and individual provisions, including the provisions of this ordinance, maybe renumbered or reordered in the course of ongoing updates of the Comprehensive Plan in accordance with the requirements of state law.

Section 5. No Changes to Save Our Agricultural Resources Initiative

Any restrictions imposed upon the City of San Buenaventura limiting the City's ability to redesignate, or allow development of, property designated "Agricultural" that are in effect as a result of the "SOAR" initiative approved by the voters in 1995 and adopted by the City Council as Ordinance No. 95-33 shall remain in full force and effect and shall not be amended, modified, altered, or abridged by the adoption of this ordinance.

Section 6. Exemptions:

The provisions of this ordinance do not apply to:

A. Construction or reconstruction of, or related to, public potable water facilities, public: parks or other city government facilities; or

B. Construction or reconstruction of no more than one residential dwelling unit, and incidental uses or structures related thereto, on an individual parcel of land that is lawfully established of record as of the effective date of this Comprehensive Plan amendment and that is contiguous to the City's incorporation boundary but only to the extent that such a legally established parcel is developed with, or proposed to be developed with, no more than one residential dwelling unit; or

C. Any development that would result in the creation of residential densities equal to or less than one primary residential unit per 40 acres in area; or, would result in the establishment of commercial or industrial uses that are agriculturally-related or related to the production of mineral resources; or

D. Any development project that has obtained, as of the effective date of this Comprehensive Plan amendment, a vested right pursuant to state or local law; or

E. Uses that are "incidental' (as the City's Zoning Ordinance defines "incidental uses") to uses lawfully established as of the effective date of this Comprehensive Plan amendment.

Section 7. Interpretation

This ordinance shall be broadly construed in order to achieve the purposes stated in this ordinance. It is the intent of the voters that the provisions of this measure shall be interpreted by the City and others in a manner that promotes public participation in decision-making relating to future development proposals within in the Hillside Voter Participation Area.

Section 8. Insertion Date

A. Upon the effective date of this ordinance, Sections 3, 4, 5, 6, and 7 of this ordinance shall be deemed inserted in the Comprehensive Plan and the Land Use Map referred to in Part C of Section 3 shall be deemed amended even though the reprinting may not occur until it can be carried out by the staff of the City of San Buenaventura.

B. The Comprehensive Plan in effect at the time the City Council decided to place this measure on the ballot, and the Comprehensive Plan as amended by this ordinance, comprise an integrated, internally consistent and compatible statement of policies for the City of San Buenaventura. In order to ensure that the Comprehensive Plan remains an integrated, internally consistent and compatible statement of policies and to ensure that the actions of the voters in enacting this ordinance are given effect, any provision of the Comprehensive Plan that is adopted between July 23, 2001 and the effective date of this ordinance, to the extent that such provision is inconsistent with this ordinance, shall be amended as soon as possible and in the manner and time required by state law to ensure consistency between such provision and Section 3 of this ordinance. In the alternative, such interim-enacted inconsistent provisions shall be repealed.

Section 9. Amendment or Repeal

This ordinance may be amended or repealed only by the voters of the City of San Buenaventura at an election held in accordance with state law, except as expressly provided by Section 4 herein.

The people of the City of San Buenaventura do ordain as follows:

Section 1. Title

This measure shall be known as the Ventura Community Park SOAR Amendment.

Section 2. Purpose

The purpose of this measure is to allow the City to develop a Community Park on a parcel of property located at the northwest corner of the intersection of Kimball Road and Telephone Road. The subject property, which is approximately 100 acres in size, is further described in Exhibit "A," attached hereto and made a part hereof, and is hereafter referred to as the "Property." Most of the Property is outside the Ventura City limits but within the "Planning Area" of the City of San Buenaventura and therefore covered by the City's Comprehensive Plan Update to the Year 2010 (hereafter the "Comprehensive Plan"). The Property is currently designated "Agricultural" under the Comprehensive Plan and, therefore, also subject to the 1995 Save Our Agricultural Resources ("SOAR") Initiative.

The City is proposing to develop the Property with community-oriented public park facilities that may include, among other things, athletic fields, an aquatic facility, a community center and other related buildings and structures for use by the public. If this measure is approved, the City may also construct and operate a fire station on a portion of the Property.

This initiative proposes to amend the Comprehensive Plan of the City of San Buenaventura, by changing the designation of the Property in the Comprehensive Plan Land Use Plan Map from "Agricultural" (or "A") to "Parks" (or "P"). This will allow the City of San Buenaventura to potentially develop the Property with a Community Park without being restricted by the SOAR Initiative.

Section 3. Comprehensive Plan Amendment

Part A.

The following paragraph titled “Parks Uses” is hereby added to the Land Use Element of the Comprehensive Plan, more particularly, to the provisions of the Serra Community Intent and Rationale Statement on page III-96, to read as follows:

“Parks Uses: The Parks Land Use Plan designation is applied to an approximately 100-acre site at the northwest corner of Kimball Road and Telephone Road for the purpose of developing a multi-purpose community-oriented public park on this site. It is further intended that this site should be zoned to the “P” (Parks) zone if and when it is annexed to the City. Design Review should be carried out by the City's Planning Commission prior to the development of any Recreation Services use types on the site to assure that the range of community park uses potentially permitted on the site by the "P" zone are well integrated on the site and compatible with adjacent land uses.”

Part B.

The Property is deleted from the discussion of “Agricultural Uses” in the Serra Community provisions of the Land Use Element of the Comprehensive Plan. To that end, the final paragraph with the heading “Agricultural Use” beginning at the bottom of page III-95 and ending at the top of page III-96 is hereby revised to read as follows:

“Agricultural Use: A 297-acre area between Telephone Road and the Southern Pacific Railroad and a 172-acre area between Bristol Road and the Santa Clara River are designated Agricultural Use, not to be reconsidered until after the Year 2010, to preserve their existing agricultural character.”

Part C.

The Land Use Plan Map incorporated in the Comprehensive Plan is hereby amended, and official copies thereof shall be revised by City staff, to reflect the foregoing amendments to the text of the Land Use Element.

Section 4. Zoning

Upon annexation to the City of San Buenaventura, the zoning classification for the Property shall be "P" (Parks) and the Official Zoning District Map incorporated in the Zoning Ordinance shall, by this Measure, be amended, and official copies thereof shall be revised by City staff, to reflect the foregoing zone change to the Property.

Section 5. Save Open-Space and Agricultural Resources

Any restrictions imposed upon the City of San Buenaventura limiting the City's ability to redesignate, or allow development of, property designated "Agricultural" that are in effect on the day that this Initiative is approved by the voters shall remain in full force and effect except as to the Property. The City of San Buenaventura may allow development of a community park on the Property in accordance with this ordinance.

Section 6. Interpretation

This ordinance shall be broadly construed in order to achieve the purposes stated in this ordinance. It is the intent of the voters that the provisions of this ordinance shall be interpreted by the City of San Buenaventura and others in a manner that facilitates the development of a community park on the Property in accordance with the purposes of this ordinance.

Section 7. Insertion Date

Part A. Upon the effective date of this ordinance, Part A and Part B of Section 3 of this ordinance shall be deemed inserted in the Comprehensive Plan and the Land Use Map referred to in Part C of Section 3 shall be deemed amended even though the reprinting may not occur until it can be carried out by the staff of the City of San Buenaventura.

Part B. The Comprehensive Plan in effect at the time the City Council decided to place this measure on the ballot, and the Comprehensive Plan as amended by this ordinance, comprise an integrated, internally consistent and compatible statement of policies for the City of San Buenaventura.

In order to ensure that the Comprehensive Plan remains an integrated, internally consistent and compatible statement of policies and to ensure that the actions of the voters in enacting this ordinance are given effect, any provision of the Comprehensive Plan that is adopted between [the date the City Council decided to place this measure on the ballot] and the effective date of this ordinance, to the extent that such provision is inconsistent with this ordinance, shall be amended as soon as possible and in the manner and time required by state law to ensure consistency between such provision and Section 3 of this ordinance. In the alternative, such interim-enacted inconsistent provisions shall be repealed.

Section 8. Amendment or Repeal

Section 3 and Section 4 of this ordinance may be amended or repealed only by the voters of the City of San Buenaventura at an election held in accordance with state law.

The people of the City of San Buenaventura do ordain as follows:

Section 1. Title

This ordinance shall be known as the First Assembly of God Land Initiative.

Section 2. Purpose

The purpose of this ordinance is to allow the First Assembly of God (hereafter "Church") to develop a property located at the northwest corner of the intersection of Montgomery Avenue and Northbank Drive. Such property is 25.59 acres and is further described in Exhibit A, attached hereto and made a part hereof, and is hereafter referred to as "Property". The Church wishes to develop the Property in accordance with City of San Buenaventura Ordinance No 95-33 (commonly known as "SOAR") guidelines for a sanctuary, related Church buildings, and athletic fields for use by the community of San Buenaventura.

Since the Property is within the sphere of influence of the City of San Buenaventura, this ordinance (1) amends the Comprehensive Plan Update to the Year 2010 (hereafter the "General Plan") of the City of San Buenaventura, and (2) prezones the Property to the R-1 Single Family zone with a subzone of R-1-1AC. This will allow the City of San Buenaventura to annex the Property with a restricted land use that is compatible with the Church's development of the Property.

Section 3. General Plan Amendment

Part A.

The second paragraph under the heading "Residential Uses" appearing on page III-94 of the General Plan describes the areas that may be used for low-density, single family homes in the Serra Community area of the City of San Buenaventura. The single family use (designated as SF in the General Plan) is the most restrictive land use that will allow the Church to build a sanctuary, related church buildings, and athletic fields. Section 4 of this initiative will further restrict the Property by pre-zoning the Property and requiring a minimum of one acre for each parcel. This will make the Property unattractive for single family development but still acceptable for the Church sanctuary, related Church buildings, and athletic fields. This ordinance adds the Church's 25.59 acre parcel to the SF land use.

The second paragraph under the heading "Residential Uses" appearing on page III-94 of the General Plan is hereby amended to read as follows:

"The SF category is applied to an approximately 3-acre site at the southeast corner of Henderson and Petit Avenue, a 1.7-acre site southerly of Darling Road extended, and a 25.59-acre site located at the northwest corner of Montgomery Avenue and Northbank Drive."

Part B.

The final paragraph with the heading "Agricultural Use" beginning at the bottom of page III-95 and ending at the top of page III-96 of the General Plan describes that portion of the Serra Community area of the City of San Buenaventura which may only be used for agricultural uses. This ordinance deletes the Church's 25.59 acre parcel from the agricultural use category.

The final paragraph with the heading "Agricultural Use" beginning at the bottom of page III-95 and ending at the top of page III-96 of the General Plan is hereby amended to read as follows:

"Agricultural Use: A 100-acre site at the northwest corner of Kimball Road and Telephone, a 297-acre area between Telephone Road and the Southern Pacific Railroad except for the 25.59-acre site located at the northwest corner of Montgomery Avenue and Northbank Drive, and a 172-acre area between Bristol Road and the Santa Clara River are designated Agricultural Use, not to be reconsidered until after the Year 2010, to preserve their existing agricultural character."

Part C.

The map of the Land Use Plan contained in the General Plan shall be redrafted to reflect the foregoing amendments.

Section 4. Zoning

The most restrictive zoning in the City of San Buenaventura which will allow the Church to build a sanctuary, related Church buildings, and athletic fields on the Property is an R-1 Single Family zone with a subzone of R-1-1AC. The R-1-1AC subzone restricts the Property by requiring a minimum of one acre for each parcel. This will make the Property unattractive for single family development but still acceptable for the Church's sanctuary, related Church buildings, and athletic fields.

Therefore, upon annexation of the Property to the City of San Buenaventura the zoning designation for the Property shall be the R-1 Single Family zone with a subzone of R-1-1AC.

Section 5. Save Open-Space and Agricultural Resources

Any restrictions imposed upon he City of San Buenaventura limiting the City's ability to annex property and allow development of such property shall remain in full force and effect except as to the 25.59-acres of the Property.

Section 6. Construction

This ordinance shall be broadly construed in order to achieve the purposes stated in this ordinance. It is the intent of the voters that the provisions of this ordinance shall be interpreted by the City of San Buenaventura and others in a manner that facilitates the development of the Property in accordance with the purposes of this ordinance.

Section 7. Insertion Date

Part A. Upon the effective date of this ordinance, Part A and Part B of Section 3 of this ordinance shall be deemed inserted in the General Plan and the Land Use Map referred to in Part C of Section 3 shall be deemed amended even though the reprinting may not occur until deemed convenient by the City of San Buenaventura.

Part B. The General Plan in effect at the time the Notice of Intention to circulate this initiative was submitted to the City Clerk of the City of San Buenaventura, and the General Plan as amended by this ordinance, comprise an integrated, internally consistent and compatible statement of policies for the City of San Buenaventura. In order to ensure that the General Plan remains an integrated, internally consistent and compatible statement of policies and to ensure that the actions of the voters in enacting this ordinance are given effect, any provision of the General Plan that is adopted between the Notice of Intention and the effective date of this ordinance, to the extent that such provision is inconsistent with this ordinance, shall be amended as soon as possible and in the manner and time required by state law to ensure consistency between such provision and Section 3 of this ordinance. In the alternative, such interim-enacted inconsistent provisions shall be repealed.

Section 8. Amendment or Repeal

Section 3 and Section 4 of this ordinance may be amended or repealed only by the voters of the City of San Buenaventura at an election held in accordance with state law.

EXHIBIT "A"

PARCEL 1:

That portion of Subdivision 98 of Rancho Santa Paula y Saticoy, in the county of Ventura, state of California, as per map recorded in book "A" pag3 290 of Miscellaneous Records (Transcribed Records from Santa Barbara County), in the office of the county recorder of said county, described as follows:

Beginning at the point of intersection of the centerline of the right of way of the Southern Pacific Railroad and the boundary line between Subdivisions 98 and 99 of said Rancho Santa Paula y Saticoy; thence from said point of beginning,

1st: - North 10° 30' West 9.482 chains, more or less, to the southeast corner of that certain Parcel of land conveyed to Charles H. Fowler, by deed dated March 18, 1892, recorded in book 36 page 86 of Deeds; thence,

2nd: - South 79º 30' West 19.25 chains, along the south line of said lands of Charles H. Fowler, to the northeast corner of that certain Parcel of land as conveyed to Emma J. Tyler, by deed dated June 20, 1894, recorded in book 43 page 90 of Deeds; thence,

3rd: - South 10º 30' East 18.982 chains, more or less, along the east line of said lands of Emma J. Tyler, to a point in the centerline of the right of way of the Southern Pacific Railroad; thence along same,

4th: - North 53º 15' East 22.57 chains, more or less, to the point of beginning.

EXCEPT a strip of parcel of land 50 feet wide lying adjoining and immediately west of the east line of the above described land, conveyed to the County of Ventura, as a public highway, by deed recorded July 12, 1889, in book 28 page 338 of Deeds.

ALSO EXCEPT that portion thereof conveyed to the Southern Pacific Railroad Company by deed recorded January 27, 1887 in book 18 page 146 of Deeds.

RESERVING unto the grantor herein, all oil, gas and mineral rights in and to said land, without however, any right of surface entry in and to a depth of 500 feet.

PARCEL 3:

That certain parcel in Lot 99 of the Rancho Santa Paula y Saticoy, marked “not a part of this subdivision” on the map of Tract No. 1333-1, in the City of San Buenaventura, county of Ventura, state of California, as per map recorded in book 30 page 51 of Maps, in the office of the county recorder of said county, and lying northwesterly of the Southern Pacific Railroad right of way, easterly of Bristol Road and southwesterly of Montgomery Avenue, as shown on said map.

RESERVING unto the grantor herein, all oil, gas and mineral rights in and to said land, without however, any right of surface entry in and to a depth of 500 feet from the surface thereof.

CITY OF
VENTURA

21ST CENTURY TOOL KIT

Prelude

The 2005 Ventura General Plan envisions a new direction to protect and preserve its citizens' quality of life. This direction is based on the recognition that zoning and land development, as practiced for the past several decades, has not served our citizens, our city, or our environment as well as it should.

Currently, the two most successful movements created to alleviate this situation are "Smart Growth" and "New Urbanism." Smart Growth is a government initiated approach against sprawl that addresses underlying policy from the top-down, and is primarily marketed by government and similar agencies. New Urbanism is a grass roots, market response to outdated zoning and land use policy as it impacts development and the physical properties of the public realm. Its chief advocates are architects and town designers.

Smart Growth grew out of early New Urbanist work, and both are concerned with the real outcomes of the built environment and how it affects communities environmentally, economically, culturally, and socially.

The Ahwahnee Principles and the Charter for the New Urbanism, listed below, were created early on as "constitutions" that governed these movements. Both are valuable tools that Ventura would be wise to include in it's 21st Century Tool Kit to understand and solve long-standing problems associated with growth and change.

AHWAHNEE PRINCIPLES

Preamble:

Existing patterns of urban and suburban development seriously impair our quality of life. The symptoms are: more congestion and air pollution resulting from our increased dependence on automobiles, the loss of precious open space, the need for costly improvements to roads and public services, the inequitable distribution of economic resources, and the loss of a sense of community. By drawing upon the best from the past and the present, we can plan communities that will more successfully serve the needs of those who live and work within them. Such planning should adhere to certain fundamental principles.

Community Principles

1. All planning should be in the form of complete and integrated communities containing housing, shops, work places, schools, parks and civic facilities essential to the daily life of the residents.

2. Community size should be designed so that housing, jobs, daily needs and other activities are within easy walking distance of each other.
3. As many activities as possible should be located within easy walking distance of transit stops.
4. A community should contain a diversity of housing types to enable citizens from a wide range of economic levels and age groups to live within its boundaries.
5. Businesses within the community should provide a range of job types for the community's residents.
6. The location and character of the community should be consistent with a larger transit network.
7. The community should have a center focus that combines commercial, civic, cultural and recreational uses.
8. The community should contain an ample supply of specialized open space in the form of squares, greens and parks whose frequent use is encouraged through placement and design.
9. Public spaces should be designed to encourage the attention and presence of people at all hours of the day and night.
10. Each community or cluster of communities should have a well-defined edge, such as agricultural greenbelts or wildlife corridors, permanently protected from development.
11. Streets, pedestrian paths and bike paths should contribute to a system of fully-connected and interesting routes to all destinations. Their design should encourage pedestrian and bicycle use by being small and spatially defined by buildings, trees and lighting; and by discouraging high speed traffic.
12. Wherever possible, the natural terrain, drainage and vegetation of the community should be preserved with superior examples contained within parks or greenbelts.
13. The community design should help conserve resources and minimize waste.
14. Communities should provide for the efficient use of water through the use of natural drainage, drought tolerant landscaping and recycling.
15. The street orientation, the placement of buildings and the use of shading should contribute to the energy efficiency of the community.

Regional Principles

1. The regional land-use planning structure should be integrated within a larger transportation network built around transit rather than freeways.
2. Regions should be bounded by and provide a continuous system of greenbelt/wildlife corridors to be determined by natural conditions.
3. Regional institutions and services (government, stadiums, museums, etc.) should be located in the urban core.
4. Materials and methods of construction should be specific to the region, exhibiting a continuity of history and culture and compatibility with the climate to encourage the development of local character and community identity.

Implementation Principles

1. The general plan should be updated to incorporate the above principles.
2. Rather than allowing developer-initiated, piecemeal development, local governments should take charge of the planning process. General plans should designate where new growth, infill or redevelopment will be allowed to occur.

3. Prior to any development, a specific plan should be prepared based on these planning principles.
4. Plans should be developed through an open process and participants in the process should be provided visual models of all planning proposals.

CONGRESS FOR THE NEW URBANISM

THE CONGRESS FOR THE NEW URBANISM views disinvestment in central cities, the spread of placeless sprawl, increasing separation by race and income, environmental deterioration, loss of agricultural lands and wilderness, and the erosion of society's built heritage as one interrelated community building challenge.

WE STAND for the restoration of existing urban centers and towns within coherent metropolitan regions, the reconfiguration of sprawling suburbs into communities of real neighborhoods and diverse districts, the conservation of natural environments, and the preservation of our built legacy.

WE RECOGNIZE that physical solutions by themselves will not solve social and economic problems, but neither can economic vitality, community stability, and environmental health be sustained without a coherent supportive physical framework.

WE ADVOCATE the restructuring of public policy and development practices to support the following principles: neighborhoods should be diverse in use and population; communities should be designed for the pedestrian and transit as well as the car; cities and towns should be shaped by physically defined and universally accessible public spaces and community institutions; urban places should be framed by architecture and landscape design that celebrate local history, climate, ecology, and building practice.

WE REPRESENT a broad-based citizenry, composed of public and private sector leaders, community activists, and multidisciplinary professionals. We are committed to reestablishing the relationship between the art of building and the making of community, through citizen-based participatory planning and design.

WE DEDICATE ourselves to reclaiming our homes, blocks, streets, parks, neighborhoods, districts, towns, cities, regions, and environment.

We assert the following principles to guide public policy, development practice, urban planning, and design:

The region: Metropolis, city, and town

1. Metropolitan regions are finite places with geographic boundaries derived from topography, watersheds, coastlines, farmlands, regional parks, and river basins. The metropolis is made of multiple centers that are cities, towns, and villages, each with its own identifiable center and edges.

2. The metropolitan region is a fundamental economic unit of the contemporary world. Governmental cooperation, public policy, physical planning, and economic strategies must reflect this new reality.

3. The metropolis has a necessary and fragile relationship to its agrarian hinterland and natural landscapes. The relationship is environmental, economic, and cultural. Farmland and nature are as important to the metropolis as the garden is to the house.

4. Development patterns should not blur or eradicate the edges of the metropolis. Infill development within existing urban areas conserves environmental resources, economic investment, and social fabric, while reclaiming marginal and abandoned areas. Metropolitan regions should develop strategies to encourage such infill development over peripheral expansion.

5. Where appropriate, new development contiguous to urban boundaries should be organized as neighborhoods and districts, and be integrated with the existing urban pattern. Noncontiguous development should be organized as towns and villages with their own urban edges, and planned for a jobs/housing balance, not as bedroom suburbs.

6. The development and redevelopment of towns and cities should respect historical patterns, precedents, and boundaries.

7. Cities and towns should bring into proximity a broad spectrum of public and private uses to support a regional economy that benefits people of all incomes. Affordable housing should be distributed throughout the region to match job opportunities and to avoid concentrations of poverty.

8. The physical organization of the region should be supported by a framework of transportation alternatives. Transit, pedestrian, and bicycle systems should maximize access and mobility throughout the region while reducing dependence upon the automobile.

9. Revenues and resources can be shared more cooperatively among the municipalities and centers within regions to avoid destructive competition for tax base and to promote rational coordination of transportation, recreation, public services, housing, and community institutions.

The neighborhood, the district, and the corridor

1. The neighborhood, the district, and the corridor are the essential elements of development and redevelopment in the metropolis. They form identifiable areas that encourage citizens to take responsibility for their maintenance and evolution.

2. Neighborhoods should be compact, pedestrian-friendly, and mixed-use. Districts generally emphasize a special single use, and should follow the principles of neighborhood design when possible. Corridors are regional connectors of neighborhoods and districts; they range from boulevards and rail lines to rivers and parkways.

3. Many activities of daily living should occur within walking distance, allowing independence to those who do not drive, especially the elderly and the young. Interconnected networks of streets should be designed to encourage walking, reduce the number and length of automobile trips, and conserve energy.

4. Within neighborhoods, a broad range of housing types and price levels can bring people of diverse ages, races, and incomes into daily interaction, strengthening the personal and civic bonds essential to an authentic community.

5. Transit corridors, when properly planned and coordinated, can help organize metropolitan structure and revitalize urban centers. In contrast, highway corridors should not displace investment from existing centers.

6. Appropriate building densities and land uses should be within walking distance of transit stops, permitting public transit to become a viable alternative to the automobile.

7. Concentrations of civic, institutional, and commercial activity should be embedded in neighborhoods, and districts, not isolated in remote, single-use complexes. Schools should be sized and located to enable children to walk or bicycle to them.

8. The economic health and harmonious evolution of neighborhoods, districts, and corridors can be improved through graphic urban design codes that serve as predictable guides for change.

9. A range of parks, from tot-lots and village greens to ball fields and community gardens, should be distributed within neighborhoods. Conservation areas and open lands should be used to define and connect different neighborhoods and districts.

The block, the street, and the building

1. A primary task of all urban architecture and landscape design is the physical definition of streets and public spaces as places of shared use.

2. Individual architectural projects should be seamlessly linked to their surroundings. This issue transcends style.

3. The revitalization of urban places depends on safety and security. The design of streets and buildings should reinforce safe environments, but not at the expense of accessibility and openness.

4. In the contemporary metropolis, development must adequately accommodate automobiles. It should do so in ways that respect the pedestrian and the form of public space.

5. Streets and squares should be safe, comfortable, and interesting to the pedestrian. Properly configured, they encourage walking and enable neighbors to know each other and protect their communities.

6. Architecture and landscape design should grow from local climate, topography, history, and building practice.

7. Civic buildings and public gathering places require important sites to reinforce community identity and the culture of democracy. They deserve distinctive form, because their role is different from that of other buildings and places that constitute the fabric of the city.

8. All buildings should provide their inhabitants with a clear sense of location, weather and time. Natural methods of heating and cooling can be more resource-efficient than mechanical systems.

9. Preservation and renewal of historic buildings, districts, and landscapes affirm the continuity and evolution of urban society.

Congress of the New Urbanism, 140 S. Dearborn St., Suite 310, Chicago, IL, 60603, (312) 551-7300

GLOSSARY OF TERMS IN THE 2005 VENTURA GENERAL PLAN

Abbreviations

ADT: Average number of vehicle trips per day
CEQA: California Environmental Quality Act
CIP: Capital Improvements Program
CNEL: Community Noise Equivalent Level
dB: Decibel
DOF: California Department of Finance
EIR: Environmental Impact Report
FAR: Floor Area Ratio
FEMA: Federal Emergency Management Agency
LAFCo: Local Agency Formation Commission
Ldn: Day and Night Average Sound Level
Leq: Sound Energy Equivalent Level
LOS: Traffic Intersection Level of Service
RDA: City of Ventura Redevelopment Agency
SCAG: Southern California Association of Governments
SOI: Sphere of Influence
TDM: Transportation Demand Management
TOD: Transit-Oriented Development
VCOG: Ventura County Council of Governments

Definitions

Acre: Approximately 43,560 square feet.

Acres, Gross: The entire acreage of a site calculated to the centerline of proposed bounding streets and to the edge of the right-of-way of existing or dedicated streets.

Acres, Net: The portion of a site that can actually be built upon. The following generally are not included in the net acreage of a site**:** public or private road rights-of-way, public open space, and flood ways.

Action: A strategy carried out in response to adopted policy to achieve a specific goal or objective. Policies and action statements establish the "who," "how" and "when" for carrying out the "what" and "where" of goals and objectives.

Adaptive Reuse: The conversion of obsolescent or historic buildings from their original or most recent use to a new use; for example, the conversion of former hospital or school buildings to residential use, or the conversion of a historic single-family home to office use.

Affordable Housing: Housing capable of being purchased or rented by a household with very low, low, or moderate income, based on a household's ability to make monthly payments necessary to obtain housing. Housing is considered affordable when a household pays less than 30 percent of its gross monthly income (GMI) for housing including utilities.

Alley: A narrow service way, either public or private, which provides a permanently reserved but secondary means of public access not intended for general traffic circulation. Alleys typically are located along rear property lines.

Ambient: Surrounding on all sides; used to describe measurements of existing conditions with respect to traffic, noise, air and other environments.

Annex, *v*: To incorporate a land area into an existing district or municipality, with a resulting change in the boundaries of the annexing jurisdiction.

Aquifer: An underground, water-bearing layer of earth, porous rock, sand, or gravel, through which water can seep or be held in natural storage. Aquifers generally hold sufficient water to be used as a water supply.

Arterial: Medium-speed (30-40 mph), medium-capacity (10,000-35,000 average daily trips) roadway that provides intra-community travel and access to the county-wide highway system. Access to community arterials should be provided at collector roads and local streets, but direct access from parcels to existing arterials is common.

Bicycle Lane (Class II): A corridor expressly reserved for bicycles, existing on a street or roadway in addition to any lanes for use by motorized vehicles.

Bicycle Path (Class I): A paved route not on a street or roadway and expressly reserved for bicycles traversing an otherwise unpaved area. Bicycle paths may parallel roads but typically are separated from them by landscaping.

Bicycle Route (Class III): A facility shared with motorists and identified only by signs, a bicycle route has no pavement markings or lane stripes.

Buffer: An area of land separating two distinct land uses that acts to soften or mitigate the effects of one land use on the other.

Building: Any structure used or intended for supporting or sheltering any use or occupancy.

Building Type: a structure category determined by function, disposition on the lot, and configuration, including frontage and height. For example, a rowhouse is a type, not a style.

Buildout: Development of land to its full potential or theoretical capacity as permitted under current or proposed planning or zoning designations.

California Environmental Quality Act (CEQA): Law requiring State and local agencies to regulate activities with consideration for environmental protection. If a proposed activity has the potential for a significant adverse environmental impact, an Environmental Impact Report (EIR) must be prepared and certified before taking action on the proposed project.

Capital Improvements Program (CIP): A program that schedules permanent City improvements at least five years ahead to fit projected fiscal capability. The CIP is reviewed annually.

Channelization: The straightening and/or deepening of a watercourse for purposes of runoff control or ease of navigation; often includes lining banks with retaining material such as concrete.

Character: Special physical characteristics of a structure or area that set it apart from its surroundings and contribute to its individuality.

Charrette: An interactive, multi-day public process in which the community works together with planning and design professionals and City staff and officials to create and support a feasible plan for a specific area of the City that will produce positive and transformative community change.

City: When capitalized, refers to the governmental entity; "city" refers to the geographic area.

Civic: the term defining not-for-profit organizations dedicated to the arts, culture, education, recreation, government, transit, and municipal parking.

Clustered Development: Buildings placed close together with the purpose of retaining open space area.

Co-housing: A residential development with dwelling units for grouped around a common kitchen, gathering room, and child-care facilities. Co-housing developments normally are organized as condominiums.

Collector: Relatively-low-speed (25-30 mph), relatively low-volume (5,000-10,000 average daily trips) street that provides circulation within and between neighborhoods. Collectors usually serve short trips and are intended for collecting trips from local streets and distributing them to the arterial network.

Commerce; Commercial: The buying and selling of commodities and services.

Community Noise Equivalent Level (CNEL): A 24-hour energy equivalent level derived from a variety of single-noise events, with weighting factors of 5 and 10 dBA applied to the evening (7 PM to 10 PM) and nighttime (10 PM to 7 AM) periods, respectively, to allow for the greater sensitivity to noise during these hours.

Community Park: Land with full public access intended to provide recreation opportunities beyond those supplied by neighborhood parks. Community parks are larger in scale than neighborhood parks but smaller than regional parks.

Corridor: Linear features that may form boundaries, as well as connections, between neighborhoods. Corridors frequently encompass major access routes, especially ones with commercial destinations. Corridors also can incorporate parks or natural features such as streams or canyons.

dB: Decibel; a unit used to express the relative intensity of a sound as it is heard by the human ear.

dBA: The "A-weighted" scale for measuring sound in decibels; weighs or reduces the effects of low and high frequencies in order to simulate human hearing. Every increase of 10 dBA doubles the perceived loudness though the noise is actually ten times more intense.

Dedication: The turning over by an owner or developer of private land for public use, and the acceptance of land for such use by the governmental agency having jurisdiction over the public function for which it will be used. Dedications for roads, parks, school sites, or other public uses often are made conditions for approval of a development by a city or county.

Density, Residential: The number of permanent residential dwelling units per gross acres of land.

Density Bonus: The allocation of development rights that allow a parcel to accommodate additional square footage or additional residential units beyond the maximum for which the parcel is zoned, usually in exchange for the provision or preservation of an amenity at the same site or at another location. Under California law, a housing development that provides 20 percent of its units for lower income households, or 10 percent of its units for very low-income households, or 50 percent of its units for seniors, is entitled to a density bonus.

Design Review: The comprehensive evaluation of a development and its impact on neighboring properties and the community as a whole, from the standpoint of site and landscape design, architecture, materials, colors, lighting, and signs, in accordance with a set of adopted criteria and standards.

Detention Basin: A structure constructed to retard flood runoff and minimize the effect of sudden floods. Water is temporarily stored and released through an outlet structure at a rate that will not exceed the carrying capacity of the channel downstream. Basins often are planted with grass and used for open space or recreation in periods of dry weather.

Developer: An individual or business that prepares raw land for the construction of buildings or causes to be built physical space for use primarily by others, and in which the preparation of the land or the creation of the building space is in itself a business and is not incidental to another business or activity.

Development: The physical extension and/or construction of urban land uses, including: subdivision of land; construction or alteration of structures, roads, utilities, and other facilities; installation of septic systems; grading; deposit of refuse, debris, or fill materials; and clearing of natural vegetative cover (with the exception of agricultural activities). Routine repair and maintenance activities are exempted.

Development Fee: (See "Impact Fee.")

District: An area of the city that has a unique character identifiable as different from surrounding areas because of distinctive architecture, streets, geographic features, culture, landmarks, activities, and/or land uses. A neighborhood or parts of neighborhoods can form a district. Districts consist of streets or areas emphasizing specific types of activities. A corridor may also be a district, as when a major shopping avenue runs between adjoining neighborhoods.

Dwelling Unit: A room or group of rooms (including sleeping, eating, cooking, and sanitation facilities, but not more than one kitchen), which constitutes an independent housekeeping unit, occupied or intended for occupancy by one household on a long-term basis.

Encourage, *v*: To stimulate or foster a particular condition through direct or indirect action by the private sector or government agencies.

Enhance, *v*: To improve existing conditions by increasing the quantity or quality of beneficial uses or features.

Environment: The existing physical conditions in an area that will be affected by a proposed project, including land, air, water, mineral, flora, fauna, noise, and objects of historic or aesthetic significance.

Environmental Impact Report (EIR): A report required by CEQA that assesses all the environmental characteristics of an area and determines what effects or impacts will result if the area is altered or disturbed by a proposed action.

Fault: A fracture in the earth's crust forming a boundary between rock masses that have shifted.

Flood, 100-Year: The magnitude of a flood expected to occur on the average every 100 years, based on historical data. The 100-year flood has a one percent chance of occurring in any given year.

Floodplain: The relatively level land area on either side of the banks of a stream regularly subject to flooding. That part of the flood plain subject to a one percent chance of flooding in any given year is designated as an "area of special flood hazard" by the Federal Insurance Administration.

Floodway: The channel of a river or other watercourse and the adjacent land areas that must be reserved in order to discharge the "base flood" without cumulatively increasing the water surface elevation more than one foot. No development is allowed in floodways.

General Plan: A compendium of city or county policies regarding its long-term development, in the form of maps and accompanying text. The General Plan is a legal document required by the State of California Government Code Section 65301 and adopted by the City Council.

Gateway: A point along the edge of a city at which a person gains a sense of having left the environs and entered the city.

Goal: A general, overall, and ultimate purpose, aim, or end toward which the City will direct effort.

Green: A whole-building and systems approach to siting, design, construction, and operation that employs techniques that minimize environmental impacts and reduce the energy consumption of buildings while contributing to the health and productivity of occupants.

Hazardous Material: Any substance that, because of its quantity, concentration, or physical or chemical characteristics, poses a significant present or potential hazard to human health and safety or to the environment if released into the workplace or the environment. The term includes, but is not limited to, hazardous substances and hazardous wastes.

Hillside Area: All that area north of Foothill and Poli Street, and east of Cedar Street and within City limits. This area is subject to the Hillside Management Program.

Hillside Open Space: One of the 19 distinct communities within the City's Planning Area; coterminous with the Hillside Voter Participation Area; generally referred to as "hillsides".

Hillside Voter Participation Area or HVPA: The area subject to the "Hillside Voter Participation Act" (also known as Measure "P") as set forth in Appendix X and coterminous with the "Hillside Open Space" area depicted on the Land Use Diagram.

Hillsides: Synonymous and coterminous with HVPA and "Hillside Open Space".

Historic: Noteworthy for significance in local, state, or national history or culture, architecture or design, or housing works of art, memorabilia, or artifacts.

Household: Persons who occupy a housing unit.

Housing Element: A separately published State-mandated general plan element that assesses existing and projected housing needs of all economic segments of the community, identifies potential sites adequate to provide the amount and kind of housing needed, and contains adopted goals, policies, and implementation programs for the preservation, improvement, and development of housing. The Housing Elements is updated every five years.

Housing Unit: A rooms or a rooms intended for occupancy, separate from any other living space, with direct access from outside or through a common area.

Impact: The direct or indirect effect of human action on existing physical, social, or economic conditions.

Impact or Development Fee: A fee levied on the developer of a project as compensation for otherwise-unmitigated impacts the project will produce, not to exceed the estimated reasonable cost of providing the service for which the fee is charged.

Industry/Industrial: The manufacture, production, and processing of consumer goods. Industrial is often divided into "heavy industrial" uses, such as construction yards, quarrying, and factories; and "light industrial" uses, such as research and development and less intensive warehousing and manufacturing.

Infill: Development of vacant and/or underutilized land within areas already largely developed with urban uses.

Infrastructure: Public services and facilities, such as sewage-disposal systems, water-supply systems, and other utilities.

In-lieu Fee: Payment that substitutes for required dedication of land or provision of structures or amenities.

Institutional: Uses such as hospitals, museums, schools, places of worship, and nonprofit activities of a welfare, educational, or philanthropic nature that cannot be considered residential, commercial, or industrial activities.

Landmark: (1) A building, site, object, structure, or significant tree, having historical, architectural, social, or cultural significance and marked for preservation by the local, state, or federal government. (2) A visually prominent or outstanding structure or natural feature that functions as a point of orientation or identification.

Ldn: Day-Night Average Sound Level. The A-weighted average sound level for a given area (measured in decibels) during a 24-hour period with a 10 dB weighting applied to night-time sound levels. The Ldn is approximately numerically equal to the CNEL for most environmental settings.

Leq: The energy equivalent level, defined as the average sound level on the basis of sound energy (or sound pressure squared). The Leq is a "dosage" type measure and is the basis for the descriptors used in current standards, such as the 24-hour CNEL used by the State of California.

Lease: A contractual agreement by which an owner of real property (the lessor) gives the right of possession to another (a lessee) for a specified period of time (term) and for a specified consideration (rent).

Level of Service, Intersection (LOS): A scale that measures the amount of traffic an intersection is capable of handling. Levels range from A, representing free-flow, to F corresponding to significant stoppage.

Liquefaction: The transformation of loose water-saturated granular materials (such as sand or silt) from a solid into a liquid state, which can lead to ground failure during an earthquake.

Live-Work: A dwelling unit that contains, to a limited extent, a commercial component. A live-work unit is a fee-simple unit on its own lot with the commercial component limited to the ground level. (see Work-Live)

Local Agency Formation Commission (LAFCo): A commission in each county that reviews and evaluates proposals for formation of special districts, incorporation of cities, annexation to special districts or cities, consolidation of districts, and merger of districts with cities. LAFCo members include two county supervisors, two city council members, and one member representing the general public.

Local Coastal Program (LCP): A combination of City land use plans, zoning regulations, and zoning district maps that control land use in the Coastal Zone established under the California Coastal Act of 1976.

Local Street: Relatively low-volume, low-speed streets (not shown on the Roadway Classifications map), whose primary purpose is to provide access to fronting properties.

Lot: A legally-recognized parcel with frontage on a public or City-approved private street.

Low Income: Households with annual income 80 percent of the County median or less.

Maintain: Keep in an existing state. (See “Preserve.”)

Median: The dividing area between opposing lanes of traffic.

Mitigate: Alleviate or avoid to the extent feasible.

Mixed Use: Properties on which various uses, such as office, commercial, and institutional, are combined with residences in a single building or site in an integrated development project with significant functional interrelationships and a coherent physical design. A single site may include contiguous properties.

Neighborhood: The basic building blocks of a community that together comprise the city. Each neighborhood is limited in physical area, with a defined edge and a center. The size of a neighborhood is usually based on the distance that a person can walk in five minutes from the center to the edge – a quarter-mile. Neighborhoods have a fine-grained mix of land uses, providing places to live, work, shop, and be entertained.

Neighborhood Center: The focal point of a neighborhood, commonly featuring places for work, shopping, services, entertainment, leisure, recreation, and social and civic interaction.

Neighborhood Park: A facility intended to serve the recreation needs of people living or working within a one-half mile radius of the park.

Noise: Sound that is undesirable because it interferes with speech and hearing, is intense enough to damage hearing, or is otherwise annoying.

Noise Contour: A line connecting points of equal noise level as measured on the same scale. Noise levels greater than the 60 Ldn contour (measured in dBA) require mitigation in residential development.

Office: Professional or consulting services in fields such as accounting, architecture, design, engineering, finance, law, insurance, medicine, real estate, and similar types of work.

Open Space: An area of land or water that is essentially unimproved and devoted to outdoor recreation and/or the preservation of natural resources.

Outdoor Recreation: Recreation in an urbanized outdoor setting (active recreation) or open-space outdoor setting (passive recreation).

(a) *Active outdoor recreation* includes participant sports or other activities conducted in open or partially enclosed or screened recreational activities facilities. Typical uses include driving ranges, miniature golf courses, golf courses, amusement parks, swimming pools, and tennis courts and usually rely on permanent above-ground improvements, including, but not limited to, playing fields or courts, restrooms, and tables.

(b) *Passive outdoor recreation* includes recreational activities, usually of an individual or small group nature, such as sunbathing, walking, hiking, bird watching, or nature study, conducted in an open-space setting and which, generally, do not rely on the use of permanent aboveground improvements or involve motorized vehicle use.

Parcel: A lot, or contiguous group of lots, in single ownership or under single control, usually considered a unit for purposes of development.

Parks: Open space lands whose primary purpose is recreation.

Parkway: The area between curb and sidewalk, usually planted with ground cover and/or trees.

Pedestrian Shed: an area defined by the average distance that may be traversed at and easy walking pace from its edge to its center. This distance is applied to determine the size of a neighborhood or extent of a community. A standard Pedestrian Shed is one quarter of a mile radius or 1,320 feet. With transit available or proposed, a long Pedestrian Shed has an average walking distance of ½-mile or 2,640 feet. Pedestrian Sheds should be conceived as oriented toward a central destination containing one or more important intersections, meeting places, civic spaces, civic buildings, and the capacity to accommodate a T5 Transect Zone in the future. Sometimes called a Walkshed.

Planning Area: The land area addressed by the General Plan, which includes the City Limits, potentially annexable land in the Sphere of Influence, and neighboring open space and agricultural areas of Ventura County that the City desires to remain in rural condition.

Policy: A statement of principle that anticipates specific actions to be undertaken to meet City goals.

Pollution: The presence of matter or energy whose nature, location, or quantity produces undesired environmental effects.

Preserve: Keep intact and safe from destruction or decay.

Protect: Maintain and preserve beneficial uses in their present condition.

Public and Quasi-public Facilities: Institutional, academic, governmental and community service uses, either publicly owned or operated by non-profit organizations.

Public Art: Signs, other monuments, sculptures, murals, statues, fountains, and other artistic installations in spaces accessible to the general public that accentuate or draw attention to a particular place or feature of the city, provide a focal point for public gathering, and/or serve a specific function, such as to provide seating.

Recreation, Active: A type of recreation that requires organized play areas, such as softball, baseball, football and soccer fields, tennis and basketball courts and various forms of children's play equipment.

Recreation, Passive: Recreation that does not require organized play areas.

Recycling: The process of extracting and reusing materials from waste products.

Redevelop: To demolish existing buildings, or increase the overall floor area existing on a property, or both, irrespective of whether a change occurs in land use.

Redevelopment Agency: The City division created under California Redevelopment Law for the purpose of planning, developing, re-planning, redesigning, clearing, reconstructing, and/or rehabilitating all or part of a specified area with residential, commercial, industrial, and/or public (including recreational) structures and facilities.

Regional: Pertaining to activities or economies at a scale greater than that of a single jurisdiction and affecting a broad geographic area.

Regional Park: A park typically 150-500 acres in size focusing on activities and natural features not included in most other types of parks and often based on a specific scenic or recreational opportunity.

Restore: Renew, rebuild, or reconstruct to a former state.

Ridesharing: Vehicle travel other than driving alone.

Ridgeline: A line connecting the highest points along a ridge and separating drainage basins or small-scale drainage systems from one another.

Right-of-way: Land intended to be occupied by transportation and public use facilities such as roadways, railroads, and utility lines.

Riparian: Areas adjacent to perennial and intermittent streams delineated by the existence of plant species normally found near fresh water.

Runoff: The portion of precipitation that does not percolate into the ground.

Seismic: Caused by or subject to earthquakes or earth vibrations.

Sidewalk: the paved layer of the public frontage dedicated exclusively to pedestrian activity.

Specific Plan: A legal tool allowed by State Government Code Section 65450 et seq. that prescribes detailed regulations, conditions, programs, and/or proposed legislation for a defined area of the city.

Sphere of Influence: The probable ultimate physical boundaries and service area of the city, as determined by LAFCo.

Streetscape: the urban element that establishes the major part of the public realm. The streetscape is composed of thoroughfares (travel lanes for vehicles and bicycles, parking lanes for cars, and sidewalks or paths for pedestrians) as well as the visible private frontages (building facades and elevations, porches, yards, fences, awnings, etc.), and the amenities of the public frontages (street trees and plantings, benches, and streetlights, etc.).

Structure: Anything constructed or erected that requires location on the ground (excluding swimming pools, fences, and walls used as fences).

Subdivision: The division of a land into defined lots or condominiums that can be separately conveyed by sale or lease.

Sustainable: Meeting the needs of the present without compromising the ability of future generations to meet their needs, and successfully balancing economic, environmental, and social equity concerns.

Tourism: The business of providing services for persons traveling for pleasure.

Transect: a system of ordering human habitats in a range from the most natural to the most urban. Based upon six Transect Zones that describe the physical character of place at any scale, according to the density and intensity of land use and urbanism.

Transit-Oriented Development (TOD): Relatively high-density development located within an easy walk of a major transit stop, generally with a mix of residential, employment, and shopping designed primarily for pedestrians.

Transit, Public: A system of regularly-scheduled buses and/or trains available to the public on a fee-per-ride basis.

Transportation Demand Management (TDM): Strategies for reducing the number of vehicle trips by increasing ridesharing, transit use, walking, and biking.

Trip: A one-way journey that proceeds from an origin to a destination via a single mode of transportation.

Truck Route: A route required for all vehicles exceeding set weight or axle limits, which follows major arterials through commercial or industrial areas and avoids sensitive areas.

Underutilized: Non-vacant properties that have not been fully developed with improvements that reach the allowed density and/or floor area.

Urban Design: The attempt to give form, in terms of both beauty and function, to selected urban areas or to whole cities. Urban design is concerned with the location, mass, and design of various urban components and combines elements of urban planning, architecture, and landscape architecture.

Use Permit: The discretionary and conditional review of an activity or function or operation on a site or in a building or facility.

Very Low Income: Households with annual income 50 percent of the County median or less.

View Corridor: The line of sight of an observer looking toward an object of significance (e.g., ridgeline, river, historic building, etc.).

Viewshed: The area within view from a defined point.

Watercourse: Presently or once naturally perennially or intermittently flowing water, including rivers, streams, barrancas, and creeks. Includes waterways that have been channelized, but not ditches or underground drainage and sewage systems.

Watershed: The total area above a given point on a watercourse that contributes water to its flow; also, the entire region drained by a watercourse.

Wetlands: Transitional areas between terrestrial and aquatic systems where the water table is usually at or near the surface, or the land is covered by shallow water. Federal agencies establish hydrology, vegetation, and soil criteria to define wetlands.

Work-Live: A dwelling unit that contains a commercial component. A Work-Live unit is a fee-simple unit on a lot with the commercial component anywhere within the unit. (see Live-Work)

Yield Street: A street whereby by two vehicles, going in opposite directions, one car will often have to pull over slightly and yield to the other vehicle, depending on how many cars are parked on the street. A standard residential street.

Zoning: The regulation of building forms and land uses throughout the city.

Floodplain Management

PURPOSE

The City of Ventura is using this website to educate, inform, and direct interested parties to regulations, policies, and documents associated with the use of property within the City that is likely to be subject to flooding by stormwater.

ORGANIZATION OF AUTHORITY

FEMA administers a National Flood Insurance Program (NFIP) that establishes Floodways and Zones on maps (FIRM's), imposes Development and Use Standards, and issues Policies of Flood Insurance.

The County Watershed Protection District collects a special property-related tax to fund Regional compliance with FEMA's NFIP, to monitor and study regional stormwater flows and systems, and to facilitate regional stormwater management cooperation.

The City of Ventura collects information from FEMA, the County Watershed Protection District, and our own stormwater management programs, facilitates FEMA NFIP development compliance and takes enforcement action when required to maintain compliance with FEMA's NFIP standards.

HELPFUL SOURCES OF INFORMATION

Ventura County 2040 GENERAL PLAN

Chapter 11
Hazards and Safety

Please see the next page.

Please see the next page.

11 HAZARDS AND SAFETY

INTRODUCTION

This chapter summarizes the hazards and safety issues for the County of Ventura. It is organized into the following sections:

- Geologic and Seismic Hazards (Section 11.1)
- Flood Hazards (Section 11.2)
- Wildfire Hazards (Section 11.3)
- Aviation Hazards (Section 11.4)
- Hazardous Materials (Section 11.5)
- Noise and Vibration (Section 11.6)

SECTION 11.1 GEOLOGIC AND SEISMIC HAZARDS

Introduction

This section addresses the geology and soils conditions within Ventura County and the potential risk these conditions pose. Existing and potential problems related to geology and soils include seismic ground shaking, ground failure, and unsuitable soils. This chapter, which is consistent with the 2015 Ventura County Multi-Hazard Mitigation plan, summarizes the geologic and seismic conditions for the County of Ventura, which include the following areas of concern:

- Known Earthquake Faults
- Liquefaction
- Landslides
- Soil Erosion
- Unstable Geologic Units and Soil
- Expansive Soils

Major Findings

- There are several earthquake faults in the County of Ventura that have a status of "Active" or "Potentially Active," according to the California Geological Survey's Regional Geologic Hazards and Mapping Program. Fault designations within the County are subject to change as further evidence is received, providing either clearer proof of potential for activity or convincing geologic evidence of inactivity.
- The entire County of Ventura, including all cities, is susceptible to liquefaction, but the most vulnerable locations are along the Santa Clara River and in the Oxnard Plain.

Existing Conditions

Geologic Structures

Local physiography is dominated by the rugged slopes of the Transverse Ranges and reflects several water courses that run through the County. Three major riverine systems extend from the mountains to the ocean in the county: the Ventura River (watershed area is 227 square miles), the Santa Clara River, (watershed area is 1,634 square miles, approximately 60 percent of which is in Ventura County), and Calleguas Creek (watershed area is 343 square miles). Incised creeks, including Prince Barranca (from Hall Canyon) and Sanjon Barranca, dissect the hills to the north of the City of Ventura. Elevations range from sea level to 2,163 feet along the ridgeline of Red Mountain that lies between the Lake Casitas basin and the Pacific Ocean. The very large Ventura Oil Field runs along the axis of the Ventura Avenue Anticline. Residential and commercial development fills most of the coastal plain and the lowlands along the Ventura River.

Ventura County generally includes late Quaternary alluvial and fluvial sedimentary deposits, beach deposits, and artificial fill. These deposits are composed mainly of volcanic, marine and non-marine sedimentary rocks overlying a basement complex of granitic and metamorphic rock. The Oxnard Plain is immediately underlain by thick alluvial sediments, which overlie the older sedimentary and volcanic rocks. Young Quaternary deposits cover about 13 percent of the Ventura County Quadrangle. Most of the exposed valley alluvium is Holocene (<11,700 years old), with older Quaternary sediments locally exposed on the lower slopes of surrounding hills. Most Holocene sediments exposed along the Ventura River valley are wash (Qw), alluvial (Qya), and marine (Qym) deposits. Superficially, the alluvial fan units are composed of material ranging in size from boulders to clay, with silt and clay being the major components.

Expansive Soils

Soils within Ventura County vary, ranging from soils that are well-drained to excessively drained loamy sands to silty clay barns on alluvial fans and plains, and poorly drained loamy sands to silty clay barns in basins. The soils formed in alluvium derived predominantly from sedimentary rocks and to a lesser extent from basic igneous rocks. These generalized soil types have been derived from the more detailed soil survey of Ventura County and soils map. "Expansive soils" are soils that expand when wet and contract when dry. Historically, expansive soils have caused considerable damage in Ventura County. In the early 1960s, numerous homes were razed and many more were severely damaged in the Shadow Oaks Tract, adjacent to the City of Thousand Oaks. This area experienced soil expansion that cracked many two-inch-thick concrete slabs. As the damage started to appear in the new homes of this tract, many of them were vacated. Other houses were rented; a transient group of people occupied these and the neighborhood generally declined. In time, repairs saved some homes while others were replaced using sturdier construction techniques. The Shadow Oaks case was primarily responsible for the establishment of more stringent building code requirements. Since the initial damage in the 1960s, engineering studies have resulted in design techniques and procedures that provide for safe and economical construction on expansive soils. Local building ordinances have incorporated these techniques and procedures. This has allowed construction even in areas where the hazard is severe.

The resources most often affected by expansive soils are structures. Even though expansive soils are scattered throughout the County, their potential impact on structures is limited to just a few developed areas: portions of the Ojai Valley, the Camarillo Hills and areas around the community of Moorpark. The presence of expansive soils in these developed areas presents no threat, however, because soils tests and engineering solutions can overcome the dangers of expansive soils.

Mineral Resources

The hilly middle and southern onshore areas of the county are developed as oil fields (San Miguelito and Ventura Avenue Oil Fields). The large-scale structural feature responsible for petroleum accumulation is the Ventura Anticline, an east-west trending geologic structure 16 miles long, visible in the numerous rock outcrops in the rugged topography of the area. Within this feature, the primary petroleum-bearing unit is the Pico Formation, a sedimentary unit of turbidite sands of high porosity (16 to 20 percent). Oil was first discovered in the area in March 1919, reaching a depth of 3,498 feet. In 2009, an average of 11,600 barrels of oil per day was being drawn from the formation.

Earthquake Faults

The Transverse Range's geomorphic province is characterized by west-trending folds, thrust faults, and fault-bounded valleys. The structural framework of the region is generally considered the result of regional compression caused by right-lateral, strike-slip movement on the "Big Bend" segment of the San Andreas Fault. Major faults in the region are west-trending reverse faults. The significant faults summarized below are described in the 2015 Ventura County Multi-Hazard Mitigation Plan.

Malibu Coast Fault System

The Malibu Coast fault system includes the Malibu Coast, Santa Monica, and Hollywood faults. The system begins in the Hollywood area, extends along the southern base of the Santa Monica Mountains, and passes offshore a few miles west of Point Dume. The 1973 Point Mugu earthquake is believed to have originated on this fault system.

Oak Ridge Fault System

The Oak Ridge fault system is a steep (65 degrees) southerly dipping reverse fault that extends from the Santa Susana Mountains westward along the southerly side of the Santa Clara River Valley and into the Oxnard Plain. The system is more than 50 miles long on the mainland and may extend an equal or greater distance offshore. Several recorded earthquake epicenters on land and offshore may have been associated with the Oak Ridge fault system. Portions of the system are zoned by the state as active.

Pine Mountain Thrust Fault and Big Pine Fault

These two large faults occur in the mountainous portion of Ventura County, north of the Santa Ynez fault; the faults are located 9 and 16 miles north of the City of Ojai, respectively. The Pine Mountain thrust fault is reported to have ruptured the ground surface for a distance of 30 miles along its length during the northern Ventura County earthquakes of November 1852.

San Andreas Fault

San Andreas is the longest and most significant fault in California. While it does not run through Ventura County, it is located just north of the county boundary, in some cases less than a mile away. Because of clearly established historical earthquake activity, this fault has been designated as active by the State of California. The last major earthquake on the San Andreas Fault near Ventura County was the Fort Tejon earthquake of 1857, which was estimated at magnitude M 8.0 on the Mercalli Scale, causing the roof of Mission San Buenaventura to collapse and damaging its bell tower. It would have caused considerably

more damage if there had been structures in the county at the time. There is a 59 percent chance that a magnitude M 6.7 quake or larger will occur on this fault within the next 30 years.

San Cayetano–Red Mountain–Santa Susana Fault System

This fault system consists of a major series of north-dipping reverse faults that extend over 150 miles from Santa Barbara County into Los Angeles County. Within this system, the San Cayetano fault is the greatest hazard to Ventura County; it is a major, north-dipping reverse fault that extends for 25 miles along the northern portion of the Ventura Basin. The San Fernando earthquake of 1971 was caused by activity along this fault.

Simi–Santa Rosa Fault System

This fault system extends from the Santa Susana Mountains westward along the northern margin of the Simi and Tierra Rejada valleys and along the southern slope and crest of the Las Posas Hills to its westerly termination.

Ventura-Pitas Point Fault

The western half of this fault is known as the Pitas Point fault, and the eastern half is known as the Ventura fault. The Pitas Point fault extends offshore into the Pacific Ocean and is roughly 14 miles long. The Ventura fault extends into the communities of Ventura and Sea Cliff and runs roughly parallel to portions of U.S. 101 and State Route 126. The fault is roughly 12 miles long. The Ventura-Pitas Point fault is a left-reverse fault.

Figure 11-1 shows the general locations of faults in Ventura County.

Ground Shaking

Seismically-induced ground shaking is a critical potential seismic hazard in Ventura County. The severity of ground shaking depends primarily upon the magnitude of the earthquake, the location of the fault with respect to the site, and the soil and/or rock conditions at the site. The two most common measures of earthquake intensity used in the United States are the Modified Mercalli Intensity Scale, which measures felt intensity, and peak ground acceleration (PGA), which measures instrumental intensity by quantifying how hard the earth shakes in a given location. Magnitude is measured by the amplitude of the earthquake waves recorded on a seismograph using a logarithmic scale. The following table, taken from the 2015 Ventura County Multi-Hazard Mitigation Plan, presents intensities that are typically observed at locations near the epicenter of earthquakes of different magnitudes, with interpretations of perceived shaking and potential damage to the built environment (Table 11-1).

TABLE 11-1
MAGNITUDE/INTENSITY/GROUND-SHAKING COMPARISONS

Magnitude	Instrumental Intensity	PGA (% g)	Perceived Shaking	Potential Damage
0 – 4.3	I	<0.17	Not Felt	None
	II – III	0.17 – 1.4	Weak	
4.3 – 4.8	IV	1.4 – 3.9	Light	
	V	3.9 – 9.2	Moderate	Very Light
4.8 – 6.2	VI	9.2 – 18	Strong	Light
	VII	18 – 34	Very Strong	Moderate
6.2 – 7.3	VIII	34 – 65	Violent	Moderate to Heavy
	IX	65 – 124	Very Violent	Heavy
7.3 – 8.9	X	124+	Extreme	Very Heavy
	XI			
	XII			

Source: United States Geological Survey, Earthquake Hazards Program: https://earthquake.usgs.gov/.

The effects of ground shaking in Ventura County depend on 1) conditions of the local geology influence events: solid bedrock is far less subject to intense shaking than loose sediment; 2) duration and intensity of the earthquake are subject generally to the size of the earthquake; and (3) distance (as the distance from the epicenter drops off so the intensity of the shaking decreases). The duration of strong ground motion is a function of magnitude, underlying geology, and distance from the fault. It is probably the single most important factor in producing excessive damage to structures. Long duration, reasonably high acceleration, and considerable amplitudes, such as would likely occur from a maximum seismic event on the Malibu Coast Fault system, are the combination that would cause the most damage to buildings in the County. A distant, maximum seismic event on the San Andreas Fault would produce less intensity of shaking; however, the duration of strong ground motion would be longer, resulting in a high potential for damage to high-rise flexible structures.

Distance is another important factor affecting the severity of ground shaking. Ground shaking from distant seismic events (greater than 40 miles) will be different than events within 10 miles of the County. For more distant, large events (greater than 7.5M), such as those that occur on the San Andreas Fault, the ground shaking will reflect a predominance of long period waves. This will have minimal effects upon structures less than three stories in height, but will affect flexible structures (typically high-rise buildings, and other

buildings taller than three stories), especially if the natural period of the building should coincide with that of the long period earthquake waves. The amplifications of such motions could result in serious damage to high-rise structures. Short period waves, however, are generally very destructive near the epicenter of moderate- and large-magnitude seismic events, causing severe damage predominately to low-rise rigid structures (less than three stories) not specifically designed to resist them.

The ground-shaking hazard exists throughout Ventura County, as it does throughout California. Certain areas may have increased ground shaking due to local geologic conditions, as well as, the location and orientation of the earthquake fault. The highest amplification of ground shaking occurs in areas with the greatest potential for long period wave shaking. Basically, this is the San Andreas Fault zone in the northern part of the county and the Oakridge Fault zone in the southern part of the county.

The areas with the greatest amplification of short period shaking are along the base of the hills, in minor river valleys and in the broken bedrock along fault lines such as the San Cayetano, Oak Ridge and Simi-Santa Rosa Faults. Slight to moderate amplification of short period oscillations may occur on terrace deposits or soft bedrock. However, certain locations may experience higher than normal ground shaking due to boundary effects or wave propagations. These materials are found in young hill areas such as South Mountain, Oak Ridge, Sulphur Mountain, the north coastal hill lands and the Piru area in the south half of the county. In the north half of the county, these are along the margins of the valley areas such as Hungry and Lockwood Valleys and north of Cuyama.

In addition to the forces causing horizontal movement, such as those that predominant along the San Andreas Fault, Ventura County and portions of adjacent areas are subject to compressional forces acting in north-south directions. These forces tend to compress or shorten the distance from the San Andreas Fault south to the coast. These compressional forces caused the San Fernando Earthquake of 1971, resulting in the thrusting of the southern margin of the San Gabriel Mountains several feet southward over the north margin of the San Fernando Valley. These forces also resulted in the 1994 Northridge Earthquake. Several faults in Ventura County have been formed by and are related to these same forces. These fault systems are described in the Surface Fault Rupture section below.

Southern Ventura County

The south half of the county is considered that portion southerly of the east-west projection of Nordoff Ridge located immediately north of Ojai Valley. Even though the historic record indicates that no strong earthquakes or surface displacement have occurred along the faults within the south half, the likelihood of the occurrence of one or more of such events within the next 50 to 100 years is not remote. The San Fernando Earthquake of 1971 occurred along a fault having little historic record of activity. Several of the faults within the south half of the county, such as Santa Susana and San Cayetano, are subject to similar tectonic forces as those that caused the San Fernando Earthquake. Crustal deformation (shortening) resulting in earthquakes will continue into the indefinite future. It is probable that earthquakes of magnitude 6 or larger will occur in the south half of the county, in the nearby offshore areas, and along the San Andreas in the northern portion of the county.

According to the "Geology and Mineral Resources Study of Southern Ventura County" (CDMG 1972) prepared by the State Division of Mines and Geology in cooperation with the Ventura County Department of Public Works, the earthquake history of the south half of the county is dominated by small to moderate shocks. No earthquake greater than magnitude 4.7 has been recorded in Ventura County, or the immediate offshore area, since 1934, when adequate instrumental records became available. These relatively minor shocks have caused local damage but no recorded loss of life. A review of the earlier, less accurate record

from 1769 to 1934 suggests a similar history for the south half, although there were significant earthquakes in 1812, 1857, 1925, 1971, and 1994 that caused structural damage in specific areas of the south half of the county.

Northern Ventura County

The most important faults in the vicinity of the northern county area are the San Andreas, Big Pine, San Gabriel, and Frazier Mountain Thrust, all of which converge at the northeast corner of Ventura County. All of these faults, except perhaps the Frazier Mountain Thrust Fault, are considered to be active (i.e., are potential focal points for the occurrence of earthquakes and displacement of the ground surface). Other mapped and unknown faults within the north half may also prove to be active by future displacement or detailed investigations. The earthquakes of November 1852 were accompanied by about 30 miles of surface faulting in Lockwood Valley. The exact location of the surface breaks is unknown, but geologic evidence and reports indicate that it may have been along the Big Pine Fault, a major left-lateral fault with some oblique slip (subject to both horizontal and vertical displacement).

Several other faults found in the Lockwood Valley area have had recent movement identified by virtue of their cutting of terrace deposits and offset of other faults. These faults range from several hundred to a few thousand feet in length. Some of them indicate the region has recently undergone, and is probably still undergoing compression along north-south directions.

Geologic and survey evidence indicate that stress is building up along the San Andreas Fault to the north. It is just a question of time until the fault in this area again displaces; the resulting earthquake will probably be severe. Prediction of when displacement will occur is not possible at this time; however, it is likely that it will occur within 100 years and possibly much sooner.

Earthquakes and strong-to-severe ground shaking originating along faults within the north half is highly possible, but again, prediction of when this will happen is not possible. The historic record shows that the north half has experienced several severe shocks originating along faults both within and immediately outside of the county.

All of Ventura County is vulnerable to ground shaking from an earthquake and the entire county is in the severe, violent or extreme ground shaking potential categories. Table 11-2 provides information on the percentage of the county's population by jurisdiction that could be affected by severe, violent, or extreme ground shaking.

During severe, violent and extremely violent ground shaking events buildings can be damaged by the shaking itself or by the ground beneath them settling to a different level than it was before the earthquake (subsidence). Buildings can even sink into the ground if soil liquefaction occurs. Liquefaction is the mixing of sand or soil and groundwater (water underground) during the shaking of a moderate or strong earthquake. Buildings can also be damaged by strong surface waves making the ground heave and lurch. Any buildings in the path of these surface waves can lean or tip over from all the movement. The ground shaking may also cause landslides, mudslides, and avalanches on steeper hills or mountains, all of which can damage buildings and hurt people.

TABLE 11-2
PERCENT OF COUNTY POPULATION AFFECTED BY EARTHQUAKE RELATED GROUND SHAKING
(Ventura County, California)

Jurisdictional Area	Severe	Violent	Extreme
Camarillo	–	97.40	2.60
Moorpark	–	89.20	10.80
Ojai	–	100	–
Oxnard	–	20.40	79.6
Santa Paula	–	0.10	99.9

Ground Failure

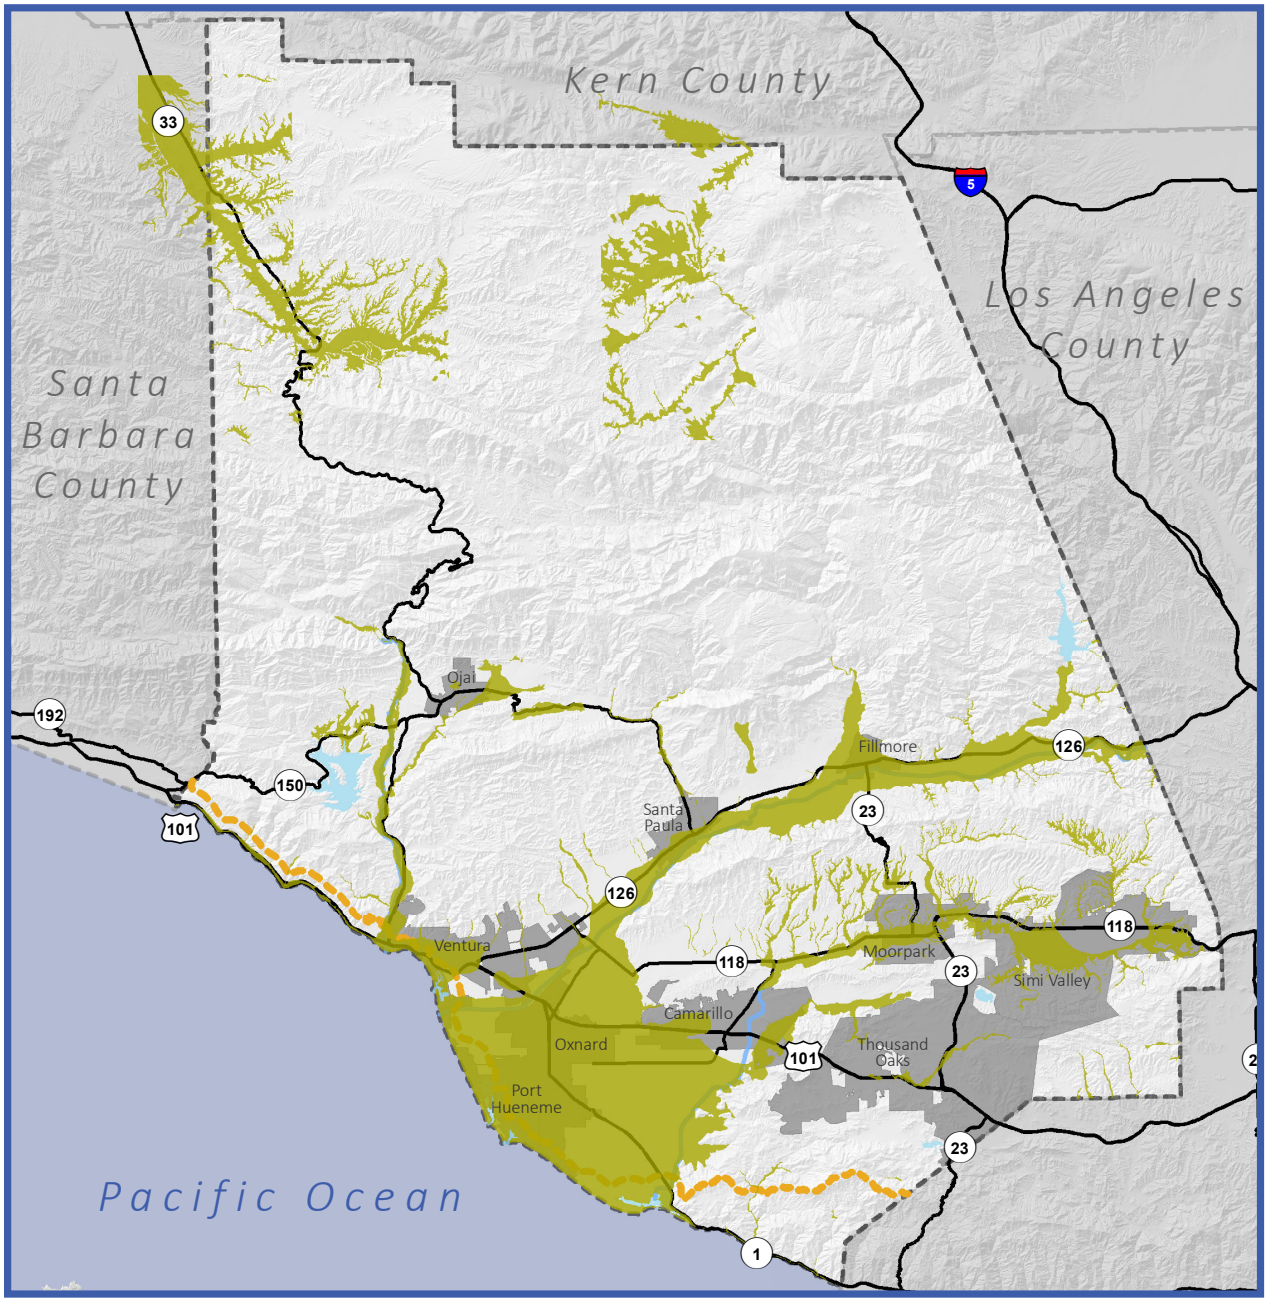
Seismically-induced ground failure includes liquefaction, differential compaction, ground lurching, ground cracking, and earthquake-induced slope failures.

Liquefaction

Liquefaction occurs when seismic waves pass through saturated granular soil, distorting its granular structure, and causing some of the empty spaces between granules to collapse. Poor water pressure may also increase sufficiently to cause the soil to behave like a fluid for a brief period and cause deformations. Liquefaction causes lateral spreads (horizontal movements of commonly 10 to 15 feet, but up to 100 feet), flow failures (massive flows of soil, typically hundreds of feet, but up to 12 miles), and loss of bearing strength (soil deformations causing structures to settle or tip). Liquefaction can cause severe damage to property. Figure 11-2 shows areas prone to liquefaction within the County.

The entire county, including all cities, is susceptible to liquefaction, but the most vulnerable locations are along the Santa Clara River and in the Oxnard Plain. The following percentages of the population live in liquefaction susceptible areas: Camarillo, 23.10 percent; Fillmore, 97.81 percent; Moorpark, 48.64 percent; Ojai, 11.48 percent; Oxnard, 99.99 percent; Port Hueneme, 100 percent; Santa Paula, 34.74 percent; Simi Valley, 42.10 percent; Thousand Oaks; 2.79 percent; Ventura, 40.26 percent; and Unincorporated Ventura County, 32.23 percent.

Liquefaction can result in settling of roadways, rupture of underground pipelines and cables, and shifting of building foundations. As foundations lose support, buildings and other objects on the ground surface can settle, tilt, and collapse. Lightweight buried structures can float to the surface. Four types of failure commonly result from liquefaction: lateral spreading, flow failure, ground oscillation and loss of bearing strength.



Ventura County 2040 GENERAL PLAN

Figure 11-2
Liquefaction

Map Date: July 18, 2016

Source: Ventura County, 2016; California Department of Transportation, 2007; USGS, 2013.

Low coastal terraces could be subject to liquefaction where groundwater is less than 15 feet from the surface. The coastal area of the Oxnard Plain may be particularly prone to liquefaction. A special study completed after the February 21, 1973, Point Mugu earthquake indicates that the areas south of the Santa Clara River, generally between Gonzales Road and Oxnard Shores, have a moderate to low liquefaction potential, while the Preble and Olivas communities, and Channel Islands Harbor extending southward to Arnold Road, have a moderate to high liquefaction potential.

The Central Coast coastal zone is the most heavily populated area along the Ventura coastal zone. Several large industries and utilities are located there, including Southern California Edison Company's Mandalay and Ormond Beach power plants, Oxnard and Ventura wastewater treatment plants, and three harbors. Liquefaction from severe ground shaking could cause major damage and disruption of services.

Differential Compaction/Consolidation or Settlement

Collectively, differential compaction and differential consolidation are known as "differential settlement." Differential compaction is caused by differences in soil types and densities in adjacent materials, leading to varying degrees of settlement when subjected to loads (e.g., buildings or vehicles). Differential consolidation occurs in saturated or nearly saturated soils when excess water pressure in one area is forced to other areas with lower pressure.[1] Differential settlement is a potential hazard in parts of Ventura County. The significance of the hazard at any particular site can be determined only by a site-specific geotechnical investigation.

Ground Cracking, Ground Lurching and Lateral Spreading

Both ground lurching and cracking are secondary effects of strong-to-moderately strong ground shaking and may be associated with liquefaction. Ground cracking usually occurs in near-surface materials, reflecting the differential compaction or liquefaction of underlying materials. The potential for ground cracking exists especially in areas of the county that have a moderate -to-high potential for liquefaction as well as in areas on known artificial fill. Ground lurching can result when soft, water-saturated surface soils are thrown into undulatory motion. Figure 11-2 shows areas prone to liquefaction within the county.

Lateral spreading is referred to as limited displacement ground failure and is often associated with liquefaction. Compact surface materials may slide on a liquefied, or low shear strength, layer at shallow depth, moving laterally several feet down slopes of less than two degrees. Lack of adequate subsurface data prohibits delineating areas in Ventura County prone to lateral spreading. Such a hazard may be present where conditions conducive to shallow liquefaction exist or where soils exist along the bluffs adjacent to the Ventura River.

[1] Soil consolidation relates to forcing water out of soil pores, whereas soil compaction relates to forcing air out of soil pores. Consolidation is the process by which soil particles, under saturated or nearly saturated conditions, are packed more closely together under the application of static loading (e.g. buildings), resulting from gradual drainage of water from soil pores. Consolidation is a natural and gradual process that takes years, compared to soil liquefaction, which results from earthquakes/strong ground shaking.

Surface Fault Rupture

Surface fault rupture is the differential movement of two sides of a fault at the earth's surface. Displacement along faults—both in terms of length and width—varies but can be significant (e.g., up to 20 feet), as can the length of the surface rupture (e.g., up to 200 miles). Surface fault rupture can cause severe damage to linear structures, including railways, highways, pipelines, tunnels, and dams. The likelihood of surface rupture on a given fault can be determined principally by studying the seismic history of the fault and reviewing geologic evidence, which suggests historic or prehistoric surface rupture. Many past studies have shown that future surface fault rupture is most likely to occur where the trace ruptured before, especially so if there is evidence of repeated and significant displacement on the trace. Faults affecting Ventura County are described under Earthquake Faults earlier in this section.

Seiche

A seiche can be considered very similar to a tsunami with the difference being that the water waves are generated in a closed or restricted body of water such as a lake or within a harbor. The most common seiche experienced by county residents in most swimming pools occurred during the 1994 Northridge earthquake. The shaking of an earthquake (or other vibration) can result in large and destructive oscillations that produce waves tens of feet above normal lake (water) level. In harbors (such as Ventura Harbor, Mandalay Bay and the Port of Hueneme) and closed or restricted bays, these waves can destroy harbor and shore facilities. Indirectly, tsunamis, can set up smaller internal oscillations in bays and harbors by causing a rapid change in sea level or more commonly by the wave itself. These seiches are very similar to tsunamis, but the waves are usually smaller and of lower energy. The trigger mechanism for seiche waves is similar to tsunamis wave generation.

The extent of most seiches is small, usually no more than ten to twenty feet above water level, and the duration is short, usually only a few minutes. However, a landslide can displace a wave that could travel hundreds of feet up the opposite shore of a body of water. Also, tsunami-caused seiches can last for many hours due to the possible rejuvenation of the seiche by each passing tsunami crest; however, each seiche would last only a few minutes and be of decreasing severity.

There is no way to alleviate the effects of possible seiches except by prohibiting construction within the hazard area. Typically, where practical, the structure is moved to a slightly higher elevation to reduce the damage potential and amount. Due to the indefinite nature of the triggering mechanisms, it seems doubtful that enough information will ever be known for general prediction of the hazard or predicting accurate seiche uprush limits for planning purposes.

There is no record of a seiche occurring in Ventura County. As such, the actual threat that is posed by seiches in Ventura County is small, in that it is probably the most remote of the hazards studied, although it may not be the least severe.

Erosion

Erosion is the removal of soil and rock from the landscape as a result of wind, water, ice. Erosion occurs as a result of three processes: detachment, entrainment, and transport. Detachment results in particles losing cohesion with surrounding material via a medium that moves the particles, most commonly wind, water, or ice. Entrainment is the lifting of particles, and transport is their movement. The process of erosion eventually ends in the deposition of the eroded particles by some factor that reduces their velocity until they settle.

Erosion can result in a variety of hazards and issues within the planning area. Wind-related erosion and wind-blown sand can cause visibility problems and damage architectural coatings and building material. Erosion due to rain or other fluvial events can deposit sediments in downstream water bodies, possibly changing drainage patterns and affecting biological regimes. Recently-graded soils are most susceptible to erosion. Unpaved roadways and other areas not stabilized by vegetation or otherwise capped can also be eroded. Erosion can also result in the loss or dispersion of nutrient rich topsoil.

Landslide

Landslide is a general term for the dislodging and fall of a mass of soil or rocks along a sloped surface, or for the dislodged mass itself. The term is used for varying phenomena, including mudflows, mudslides, debris flows, rock falls, rock slides, debris avalanches, debris slides, and slump-earth flows. Landslides may result from a wide range of combinations of natural rock, soil, or artificial fill. The susceptibility of hillside and mountainous areas to landslides depends on variations in geology, topography, vegetation, and weather. Landslides may also occur because of indiscriminate development of sloping ground or the creation of cut-and-fill slopes in areas of unstable or inadequately stable geologic conditions.

Additionally, landslides often occur together with other natural hazards, thereby exacerbating conditions, as described below:

- Shaking due to earthquakes can trigger events ranging from rock falls and topples to massive slides.
- Intense or prolonged precipitation that causes flooding can also saturate slopes and cause failures leading to landslides.
- Wildfires can remove vegetation from hillsides, significantly increasing runoff and landslide potential.
- Landslides into a reservoir can indirectly compromise dam safety; a landslide can even affect the dam itself.

Another type of landslide occurs in areas cut by perennial streams. As floodwaters erode channel banks, rivers have undercut clay-rich sedimentary rocks along their south bank, thereby destabilizing the ground and causing the ground above it to slide.

Landslides have occurred in areas along the Rincon Fault, hillsides south of the Santa Clara River, and the east side of the Ventura River. In recent years, the most damaging landslides in Ventura County have occurred in the coastal community of La Conchita, just southeast of the Santa Barbara county line. La Conchita has been the site of multiple non-earthquake-induced landslides.

La Conchita was built on ground that had been graded by the Southern Pacific Railroad after a 1909 landslide slid into the railroad tracks. The land was intended to be a buffer zone between the retreating and eroding cliff and the Pacific Ocean. However, it was subdivided into smaller residential lots in 1924. Along the bluff face above La Conchita, the upper portion of the bluff is underlain by two rock formations separated by the Red Mountain fault.

The bluff above La Conchita has been associated with a variety of landslide activity, with historical accounts dating back to 1865. More recently, two small slides occurred in 1988 and 1991, followed by large movements of the same landslide mass in 1995 and 2005. The 1995 landslide, which occurred one

month after the heaviest rainfall of an extraordinarily wet year, was considered to be a deep, slow-moving landslide. This landslide destroyed nine houses. The January 2005 event was a shallow and highly fluid remobilization of the same material that carried a thick layer of dry, viscous material. This landslide, which occurred at the peak of an extremely wet 2-week period, killed 10 people and destroyed 13 homes. Approximately 400,000 tons of debris cascaded down the slope behind the La Conchita housing development.

Slope failures are associated with landslides, and occurred along shattered ridge crests of the Santa Susana Mountains during the 1994 Northridge Earthquake.

In 2011, the California Geological Survey (CGS) created the "Susceptibility to Deep-Seated Landslides" grip map, covering the entire state of California. The map shows the relative likelihood of deep landsliding based on a methodology developed by Wilson and Keefer (1985), and uses the following information:

- Landslide inventory, including all previously mapped deep-seated landslides in California (approximately 57,000) that were assigned the lowest value of rock strength.
- Geology from a general geologic statewide map and a detailed geologic map over the most populated areas.
- Rock strength to measure the resistance to landsliding, developed from geologic and landslide inventory maps. Geologic units were classified into three rock strength units: (1) highest rock strength unit, which includes crystalline rocks and well-cemented sandstones; (2) intermediate rock strength unit, including weakly cemented sandstones; and (3) weakest rock strength unit, including shale, claystone, pre-existing landslides, and unconsolidated surficial units.
- Slope, including eight slope classes ranging from nearly flat (less than 3 degrees) to very steep (greater than 40 degrees).
- Average annual rainfall in inches.
- Earthquake shaking potential.

As shown on Figure 11-3, the factors listed above were combined to create classes of landslide susceptibility. These classes express the generalization that on very low slopes, landslide susceptibility is low even in weak materials, and that landslide susceptibility increases with slope and in weaker rocks. Very high landslide susceptibility—classes VIII, IX, and X—includes very steep slopes in hard rocks and moderate to very steep slopes in weak rocks. In Ventura County, areas most susceptible to landslide are generally located on the edge of cities, outside of the cities, and in the northern portion of the county. Each city in the county, with the exception of Port Hueneme, has some land mass in the class VII, IX, and X landslide susceptibility zones. Approximately 1,110 square miles of Ventura County located in the Very High Landslide Susceptibility area, including 175 square miles in class VIII, 670 square miles in class IX, and 265 square miles in class X.

This map shows the relative likelihood of deep landsliding. Susceptibility is determined using location of past landslides, the location and relative strength of rock units, and steepness of slope in a methodology developed by Wilson and Keefer (1985). This map does not include landslide triggering events, such as rainstorms or earthquake shaking, nor does it address susceptibility to shallow landslides such as debris flows.
Very high landslide susceptibility, classes VIII, IX, and X, includes very steep slopes in hard rocks and moderate to very steep slopes in weak rocks.
For further details refer to CGS Map Sheet 58.

Subsidence

"Subsidence" is any settling or sinking of the ground surface over a regional area arising from surface or subsurface causes, such as earthquakes or groundwater, or oil and gas extraction. The damage caused by subsidence is generally not of an immediate or violent nature. Except when prompted by seismic shaking, the compaction of alluvium and settling of the land surface is a process that occurs over several tens to thousands of years and over a large area.

Subsidence that results from groundwater withdrawal can be responsible for numerous structural effects. Most seriously affected are long, linear surface infrastructure facilities that are sensitive to slight changes in gradient or slope. Drainage courses, roads, rail lines, wells, oil/gas pipelines, and utility (water, gas, power, and sewer) lines are potentially the most vulnerable to damage. Basically, the process by which this most important type of subsidence occurs involves the extraction of a large quantity of water from an unconsolidated aquifer. As water is removed from the aquifer, the total weight of the overburden that the water used to help to support is placed on the alluvial structure; the overburden can then become compressed. If fine-grained silts and clays make up portions of the aquifer, the additional load can squeeze the water out of these layers and into the coarser grained portions of the aquifer. All of this compaction produces a net loss in volume and hence a depression in the land surface.

Several areas within Ventura County are experiencing subsidence due to groundwater extraction including the Oxnard Plain, the Las Posas Valley, and the Santa Clara River Valley.

Regulatory Setting

State

Alquist-Priolo Earthquake Fault Zoning Act

The Alquist-Priolo Special Studies Zones Act was signed into law in 1972 (renamed the Alquist-Priolo Earthquake Fault Zoning Act in 1994). The Act's primary purpose is to mitigate the fault rupture hazard on human life and property by limiting the potential for siting human occupancy structures across an active fault trace.

The Act requires the State Geologist (Chief of the California Geological Survey) to delineate Earthquake Fault Zones along faults that are "sufficiently active and well defined." These faults show evidence of Holocene surface displacement along one or more of their segments (sufficiently active) and are clearly detectable by a trained geologist as a physical feature at or just below the ground surface (well defined). The boundary of an Earthquake Fault Zone is generally about 500 feet from major active faults, and 200 to 300 feet from well-defined minor faults. The Act dictates that cities and counties withhold development permits for sites within an Earthquake Fault Zone until geologic investigations demonstrate that the sites are not threatened by surface displacements from future faulting.

Alquist-Priolo maps are distributed to all affected cities and counties for planning and controlling new or renewed construction. Local agencies must regulate most development projects within these zones, including all land divisions and most structures for human occupancy. State law exempts single-family wood-frame and steel-frame dwellings less than three stories that are not part of a development of four units or more. However, local agencies can be more restrictive.

Seismic Hazards Mapping Act

The Alquist-Priolo Earthquake Fault Zoning Act addresses the hazard of surface fault rupture but is not directed toward other earthquake hazards. Recognizing this, the State passed the Seismic Hazards Mapping Act (SHMA) in 1990, which addresses non-surface fault rupture earthquake hazards, including strong ground shaking, liquefaction and seismically induced landslides. The California Geological Survey (CGS) is the principal state agency charged with implementing the Act. Pursuant to the SHMA, the CGS is directed to provide local governments with seismic hazard zone maps that identify areas susceptible to liquefaction, earthquake-induced landslides and other ground failures. The goal is to minimize loss of life and property by identifying and mitigating seismic hazards. The seismic hazard zones delineated by the CGS are referred to as "zones of required investigation." Site-specific geological hazard investigations are required by the SHMA when construction projects fall within these areas.

Pursuant to the 1990 SHMA, the CGS has been releasing seismic hazards maps since 1997, with emphasis on the large metropolitan areas of Los Angeles, Orange, and Ventura counties. To date, the CGS has collected data for "zones of required investigation" for most of the county.

California Building Code

The California Building Standards law states that every local agency enforcing building regulations must adopt the provisions of the California Building Code (CBC) within 180 days of its publication; however, each jurisdiction can require more stringent regulations issued as amendments to the CBC. The publication date of the CBC is established by the California Building Standards Commission and the code is known as Title 24 of the California Code of Regulations. In the past, the CBC was modeled on the Uniform Building Code (UBC); however, beginning with the 2007 version, the CBC is now modeled after the International Building Code (IBC). Building codes provide minimum requirements to prevent major structural failure and loss of life related to floods, fires, and earthquakes.

The County of Ventura adopted the 2013 CBC through Ordinance 4456 on January 9, 2014. The 2013 CBC bases its seismic design criteria on maximum considered ground motion through maps prepared by the United States Geological Survey (USGS) for the National Seismic Hazard Mapping Program (see Section 1613). Chapter 18 (Soils and Foundations) and Appendix J (Grading) of the 2013 CBC have also been adopted by the County to establish grading and foundation standards. Standards include requirements for excavation, fill, footings, retaining walls, and pier and pile foundations. Pursuant to the CBC, soils reports are required to be submitted prior to issuance of grading or depending on the permit type, other permits that allow ground disturbance.

Real Estate Disclosure Act

Since June 1, 1998, the Natural Hazards Disclosure Act has required that sellers of real property and their agents provide prospective buyers with a *Natural Hazard Disclosure Statement* when the property being sold lies within one or more State-mapped hazard areas. If a property is located in a Seismic Hazard Zone as shown on a map issued by the State Geologist, the seller or the seller's agent must disclose this fact to potential buyers. The law specifies two ways that this disclosure can be made. One is to use the Natural Hazards Disclosure Statement as provided in Section 1102.6c of the California Civil Code. The other way is to use the Local Option Real Estate Disclosure Statement as provided in Section 1102.6a of the California Civil Code. The Local Option Real Estate Disclosure Statement can be substituted for the Natural Hazards Disclosure Statement only if the Local Option Statement contains substantially the same information and substantially the same warning as the Natural Hazards Disclosure Statement.

Unreinforced Masonry Laws

Enacted in 1986, the Unreinforced Masonry Law (Section 8875 et seq. of the California Government Code) required all cities and counties in Seismic Zone 4 (zones near historically active faults) to identify potentially hazardous unreinforced masonry (URM) buildings in their jurisdictions, establish a URM loss reduction program, and report their progress to the State by 1990. The owners of such buildings were to be notified of the potential earthquake hazard these buildings pose.

Local

2005 Ventura County General Plan

The General Plan covers geologic and seismic hazards in Chapter 2, Hazards. Sections 2.2, 2.3, 2.4, 2.5, 2.6, 2.7, and 2.8 includes goals, policies, and programs related to geologic and seismic hazards. The following Area Plans also contain applicable goals and policies related to geologic and seismic hazards:

- Coastal Area Plan;
- Oak Park Area Plan;
- Ojai Valley Area Plan;
- Piru Area Plan; and
- Lake Sherwood/Hidden Valley Area Plan.

2011 Initial Study Assessment Guidelines

The Initial Study Assessment Guidelines include criteria for evaluating environmental impacts for geologic and seismic hazards. These can be found in the following sections: 10. Fault Rupture Hazard; 11. Ground Shaking Hazard; 12. Liquefaction Hazards; 13. Seiche and Tsunami Hazards; 14. Landslide/Mudflow Hazards; 15. Expansive Soil Hazards; and 16. Subsidence Hazard.

2016 Coastal Zoning Ordinance

The Coastal Zoning Ordinance regulates geologic and seismic hazards through Section 8178-4 Mitigation of Potential Hazards

Key Terms

Alluvium. Loose, unconsolidated soil or sediments, which has been eroded, reshaped by water in some form, and redeposited in a non-marine setting.

Anticline. Anticlines are folds in which each half of the fold dips away from the crest.

Fluvial. Refers to processes associated with rivers and streams and the deposits and landforms created by them.

Holocene. The geological epoch that began after the Pleistocene at approximately 9,700 BCE (before common era) and continues to the present time.

Liquefaction. The process by which water-saturated, unconsolidated sediments are transformed into a substance that acts like a liquid, often in an earthquake.

Pleistocene. The geological epoch that lasted from about 2,588,000 to 11,700 years ago, spanning the earth's recent period of recent glaciations.

Quaternary. The current and most recent of the three periods of the Cenozoic Era. It follows the Neogene Period and span from 2.588 (±0.005) million years ago to the present time. The Quaternary period is divided into two epochs: the Pleistocene and the Holocene.

SECTION 11.2 FLOOD HAZARDS

Introduction

This section addresses the flood hazard conditions within Ventura County and the potential risk these conditions pose. Existing and potential problems related to flood hazards include annual flooding, dam failure, and seismic-induced flooding. This section summarizes the flood hazard conditions for the County of Ventura, which include the following areas of concern:

- General Flooding
- Dam Failure Inundation
- Levee Failure Inundation
- Post-Fire Debris Flow
- Tsunami

These summaries are derived from the County's 2015 Multi-Hazard Mitigation Plan (VCMHMP). Consistent with the VCMHMP, each section includes explanations of the nature, history, location, extent, and probability associated with each type of flood hazard.

Major Findings

- Three types of flood risk have been mapped in Ventura County: upland, broad floodplain, and coastal. The Ventura County Digital Flood Insurance Rate Map (DFIRM) identifies the following Special Flood Hazard Area (SFHAs): 7.8 square miles in the 100-year "coastal high hazard" flood zone; 78.4 square miles in the 100-year flood zone; and 51.7 square miles in the 500-year flood zone.
- According to the Federal Emergency Management Agency's (FEMA) definition, ten dams in Ventura County are considered high hazard (i.e., over 1,000 acre-feet of storage capacity). Eight of these are under State jurisdiction and are inspected annually to ensure that they are in good operating condition. There is no record of a failure of any dam located in Ventura County.
- The Ventura County Watershed Protection District (VCWPD) monitors nine provisionally accredited levees (PALs) in the Calleguas Creek, Santa Clara River, and Ventura River watersheds. Most of these levees, which protect a total 5.2 square miles of land in the county, require rehabilitation to be fully compliant with FEMA levee certification regulations.
- Because of its history of wildfires, Ventura County is susceptible to potentially hazardous debris flows. The susceptibility affects areas adjacent to and downslope of these burn areas, especially in locations that are in ravines and canyons, and at the mouths of canyons.
- Coastal areas in Ventura County are subject to inundation resulting from tsunamis, including areas within the cities of Oxnard, Port Hueneme, and Ventura and unincorporated areas south of Ormond Beach and around Mugu Lagoon.

Existing Conditions

General Flooding

Nature

A flood occurs when the existing channel of a stream, river, canyon, or other watercourse cannot contain excess runoff from rainfall or snowmelt, resulting in overflow onto adjacent lands. Flooding can also occur in areas in low lying areas that have no outlet. In coastal areas, flooding may occur when high winds or tides result in a surge of seawater into areas that are above the normal high tide line.

A floodplain is the area adjacent to a watercourse or other body of water that is subject to recurring floods. Floodplains may change over time as a result of natural processes, changes in the characteristics of a watershed, or human activity such as construction of bridges or channels. In areas where flow contains a high sediment load, such as along the Santa Clara River in Ventura County, the course of a river or stream may shift dramatically during a single flood event. Coastal floodplains may also change over time as waves and currents alter the coastline. Secondary hazards from floods can include the following:

- Erosion or scouring of stream banks, roadway embankments, foundations, footings for bridge piers, and other features.
- Impact damage to structures, roads, bridges, culverts, and other features from high-velocity flow and from debris carried by floodwaters. Such debris may also accumulate on bridge piers and in culverts, increasing loads on these features or causing overtopping or backwater effects.
- Destruction of crops, erosion of topsoil, and deposition of debris and sediment on croplands.
- Release of sewage and hazardous or toxic materials when wastewater treatment plants are inundated, storage tanks are damaged, and pipelines are severed.

In areas such as Ventura County that do not have extended periods of below-freezing temperatures or significant snowfall, floods usually occur during the season of highest precipitation or during heavy rainfalls after prolonged dry periods. Ventura County is dry during the late spring, summer, and early fall and receives most of its rain during the winter months. The rainfall season extends from October 1st through April 15th, with approximately 95 percent of the annual rainfall occurring during this period. The average annual rainfall in Ventura County ranges from less than 8 inches in the Cuyama Valley in northwestern Ventura County to 38 inches in the Ventura River watershed west of Ojai (as measured in the general area of Matilija Dam). Along the coast near Oxnard, Ventura, Simi Valley, and Thousand Oaks, the average rainfall is approximately 14 inches.

The prevailing weather patterns during the winter and the orientation of the mountain ranges in the northern half of the county combine to produce extremely high-intensity rainfall. The peak historic rainfall intensity recorded by a Ventura County rain gage occurred on February 12, 1992. A rainfall intensity of approximately 4 inches per hour was measured during a 15-minute period at the Wheeler Gorge gage, approximately 3 miles northeast of Matilija Dam. Such intensities can produce severe flooding conditions, particularly in small watersheds where flash floods are likely.

Flash floods are particularly dangerous. The National Weather Service (NWS) defines a flash flood as one in which the peak flow travels the length of a watershed within a 6-hour period. These floods arise when

storms produce a high volume of rainfall in a short period over a watershed where runoff collects quickly. They are likely to occur in areas with steep slopes and sparse vegetation. They often strike with little warning and are accompanied by high-velocity flow.

History

Damaging floods in Ventura County were reported as early as 1862. A 1945 report by the Ventura County Flood Control District reported that floods of sufficient magnitude to cause extensive damage occurred in 1862, 1867, 1884, 1911, 1914, 1938, 1941, 1943, and 1944.

The largest and most damaging natural floods recorded in the Santa Clara and Ventura watersheds occurred in January and February of 1969. The January flood was a result of the highest monthly precipitation total ever recorded in Ventura County at that time. The February flood was a result of intense rainfall similar in magnitude to the rainfall that caused the record-breaking flood in January. The combined effects of the 1969 floods were disastrous: 13 people lost their lives, and property damage was estimated at $60 million (1969 dollars). Homes in Casitas Springs, Live Oak Acres, and Fillmore were flooded, and 3,000 residents in Santa Paula and several families in Fillmore were evacuated twice. A break in the Santa Clara River levee threatened the City of Oxnard. Agricultural land, primarily citrus groves, was seriously damaged or destroyed. All over the county, transportation facilities, including roads, bridges, and railroad tracks, were damaged. The Fillmore, Oak View, and Ventura sewage treatment plants were severely damaged and dumped raw sewage into the Santa Clara and Ventura rivers. The untreated sewage polluted the rivers and the beaches at their outlets into the ocean. In addition, sewer trunk lines were broken along the Ventura River and its tributary, San Antonio Creek. Suspended sediment concentrations and discharge in many streams greatly exceeded any previously measured levels in the flood-affected areas. Suspended sediment concentrations reached a maximum of about 160,000 milligrams per liter in the Santa Clara River at Saticoy, and the maximum daily sediment discharge was 20 million tons during the storm peak.

In 1980, Calleguas Creek breached its levee in the Oxnard Plain and caused approximately $9 million (in 1980 dollars) in damage to the Point Mugu Naval Base from flooding and sediment deposition. In addition, approximately 1,500 acres of farmland were covered by floodwaters. The peak discharge was 9,310 cubic feet per second at the Madera Road Bridge in Simi Valley.

In 1983, a federal disaster was declared because of storm damage. Repairs to flood-control facilities have been estimated to cost $15 million (in 1983 dollars). Improved channels in Moorpark and Simi Valley suffered severe damage from erosion during this event, and Calleguas Creek experienced record flooding. Damage to other public and private facilities has been estimated at approximately $39 million, with little more than half of that total due to damage to agricultural lands.

Table 11-1 details the major flood events to affect Ventura County over the past 20 years.

TABLE 11-1 MAJOR DISASTER DECLARATIONS FOR FLOODS, 1995-2015	
Date	**Description**
January 1995	On January 9 and 10, the region was subjected to an intense winter storm that produced more than 6 inches of rain in some areas. A major Disaster Declaration was declared for all but one county throughout California on January 10, 1995.
January through March 1995	A second powerful winter storm brought heavy rain, heavy snow, and strong winds throughout much of California from mid-January to mid-March. On January 13, a Major Disaster Declaration was declared for nearly half the counties in California.
December 1996 through January 1997	A series of subtropical storms hit California from late December through early January, resulting in one of the wettest Decembers on record. On January 4, 1997, a Major Disaster Declaration was declared for half of the counties in California, including Ventura County.
February 1998	El Niño conditions led to extensive flooding throughout California. A Major Disaster Declaration was declared for more than 30 counties, including Ventura County. Countywide damages exceeded $50 million.
December 2004 through January 2005	A powerful Pacific storm brought heavy rain, snow, flash flooding, high winds, and landslides to Central and Southern California. During the multi-day event, rainfall totals ranged from 3 to 10 inches over coastal areas, with up to 32 inches in the mountains. A Major Disaster Declaration was declared on February 4, 2005, for multiple counties, including Ventura County.

Location

Figure 11-4 shows the special flood hazard areas (SFHAs) in Ventura County, including 100- and 500-year flood zones according to the 2015 FEMA Digital Flood Insurance Rate Maps (DFIRMs). The areas of the county that are susceptible to flooding can be categorized into three types: upland, broad floodplains, and coastal, as described below.

Upland Flooding

The mountainous terrain of northern Ventura County and the hills in the central and eastern parts of the county give rise to numerous annual streams, many draining into steep canyons. These streams are subject to floods of relatively short duration, often following high-intensity rainfall. Such floods may occur with little warning and carry large quantities of sediment and debris. Communities adjacent to the upland areas, such as Fillmore, Ojai, Piru, and Santa Paula, are subject to this hazard. Many of the watersheds in question contain dams or basins designed to attenuate flow and trap debris, reducing the effects on downstream communities.

Broad Floodplains

The watersheds of the Santa Clara River (watershed area of 1,650 square miles), Ventura River (watershed area of 226 square miles), and Calleguas Creek (watershed area of 325 square miles) drain to the broad coastal plain in the southern part of Ventura County. This plain is subject to inundation during longer intervals of rain, typically as the result of a series of winter storms. These floods typically have longer duration and may be forecast with more warning time. The Santa Clara River Valley, which crosses central Ventura County, is also subject to flooding. Numerous levees have been built to protect the agricultural lands along the river; because of its sediment load, the river has historically migrated across the valley floor during flooding intervals. The levees are typically not sufficient to withstand severe flood events.

Coastal Flooding

The county's 43-mile coastline is subject to tidal flooding, storm surge, and wave action, all of which usually occur during winter storms. Areas that are susceptible to severe wave action are generally confined to a narrow area immediately adjacent to the tidal zone, including Sea Cliff Colony, Oxnard Shores, Silver Strand Beach, and several sections of U.S. 101 from Rincon Point to Emma Wood State Beach. However, the effects of coastal flooding can be severe—in addition to wave action, beach and bluff erosion can cause significant damage to coast-side homes and infrastructure. Coastal flooding may also occur as the result of tsunamis, which are waves, or series of waves, generated by an earthquake, landslide, volcanic eruption, or even large meteor hitting the ocean. In addition to flooding, winter coastal storms can cause coastal erosion along the shores of Ventura County. Coastal erosion is a natural process that occurs particularly in the winter, when coastal storms wear away land by wave action, tidal currents, or wave currents. Material deposited on beaches during the mild summer and fall months gets redistributed by the waves. According to City of Ventura engineers, the majority of the sand is pulled just off coast and then comes back to shore over time. Although most receding sand stays fairly close to shore, some sand is driven south by currents until it reaches Hueneme Canyon, a large deep-water depression near the Port of Hueneme.

The anticipated rise in sea levels will also impact coastal flooding. As discussed in Chapter 12 (Climate Change), the California Energy Commission has calculated sea-level estimates due to the impacts of climate change. Ventura County could experience coastal erosion of up to 1.4 meters per year (approximately 4.6 feet), by 2100 as a result of sea-level rise and related coastal flooding.

Potential climate impacts due to sea-level rise and storm events in Ventura County include:

- more frequent flooding events due to rising sea levels;
- more extensive and longer duration of flooding;
- permanent inundation in coastal areas due to higher ocean levels and shifts in the tidal range;
- increased shoreline erosion; and
- elevated groundwater levels and salinity intrusion.

Critical infrastructure within the county, including 170 miles of roads and railways, hospitals, schools, emergency facilities, wastewater treatment plants, three power plants, and facilities and structures at Naval Base Ventura County, will be at increased risk of inundation, as will wetland areas and other natural ecosystems. In addition, the cost of replacing property at risk of coastal flooding with a 1.4-meter rise in sea levels is projected at $2.2 billion (in year 2000 dollars) (CEC 2009).

Notably, FEMA released preliminary flood maps for coastal areas of Ventura County in April 2017 and initiated a 90-day Appeal Period, which started in June 2017 and ended in September 2017. FEMA is tentatively anticipating making map changes effective in July 2018. FEMA initiated the California Coastal Analysis and Mapping Project (CCAMP) in December 2011 to restudy coastal flooding risks in all 15 California open Pacific coastal counties. Results from the study are used to remap the coastal flood risk and wave hazards for the entire California coastline. In Ventura County, new flood hazard zones, floodplain boundaries, and coastal base flood elevations for the cities of Ventura, Oxnard, and Port Hueneme, Point Mugu Naval Base, and county unincorporated areas are presented in the revised Flood Insurance Study Report and on the preliminary flood maps. (More information about the updated FEMA maps is available at **www.r9map.org**.)

Unmapped Flood Hazards

Unmapped flood hazard areas include numerous small channels. Agricultural drainage ditches and urban drains cover much of the flatter parts and urban areas of Ventura County. Flooding in these areas is due to high-intensity rainfall occurring over a very short period. The flooding is usually shallow and mainly affects roadways and other low-lying areas. In particular, the Hollywood Beach and Silver Strand residential coastal communities have historically experienced localized flooding conditions primarily due to inadequate storm drainage infrastructure and topography (hence, the "Zone B"/"Zone X-Shaded" FEMA designations on the Flood Insurance Rate Maps [FIRMs] / Digital Flood Insurance Rate Map [DFIRMs]). These residential coastal communities, (which are largely built out) are not currently mapped by FEMA in the "Zone VE" coastal high hazard Special Flood Hazard Area (SFHA). These communities have historically been mapped by FEMA as a Zone B and most recently under the DFIRMs as a Zone X-Shaded (500-year floodplain). Other unmapped hazards include debris flows in the Coastal Mountain areas that can occur after saturation of the surface and intense rainfall storms that deliver 2-inch per hour intensities. Examples are in the Casitas Springs area and the La Conchita Community.

Extent

The magnitude of flooding that is used as the standard for floodplain management in the United States is a flood with a probability of occurrence of one percent in any given year. This flood is also known as the 100-year flood or the base flood. The most readily available source of information regarding the 100-year flood, as well as the 500-year flood, is on the FIRMs prepared by FEMA. These maps are used to support the National Flood Insurance Program (NFIP) described in more detail in the Regulatory Setting section below.

FEMA has recently prepared and updated countywide DFIRM and a Flood Insurance Study (FIS) for the unincorporated areas of Ventura County and for each incorporated city in the county. Figure 11-4 shows the SFHAs identified in the Ventura County DFIRM. The Ventura County DFIRM identifies the following SFHAs: 7.8 miles in the 100-year "coastal high hazard" flood zone; 78.4 square miles in the 100-year flood zone; and 51.7 square miles in the 500-year flood zone.

Probability of Future Events

On average, floods causing major damage within Ventura County occur every 5 years.

Dam Failure Inundation

Nature

Dam failure involves unintended releases or surges of impounded water, resulting in downstream flooding. The high-velocity, debris-laden wall of water released from dam failure results in the potential for human casualties, economic loss, disruption of lifelines (e.g., electric, water, transportation, and emergency service systems), and environmental damage. Although dam failure may involve the total collapse of a dam, this is not always the case, because damaged spillways, overtopping from prolonged rainfall, or other problems—including the unintended consequences from normal operations—can result in the creation of a hazardous situation. Because they occur without advance warning, failures from natural events such as earthquakes or landslides may be particularly severe. Dam failure may be caused by a variety of natural events, human-caused events, or a combination thereof. Dam failure usually occurs when the spillway capacity is inadequate and water overtops the dam, or when internal erosion through the dam foundation occurs (also known as piping). Factors contributing to dam failure events may include structural deficiencies from poor initial design or construction, lack of maintenance or repair, and the gradual weakening of the dam through the normal aging process.

History

There is no record of a failure of any dam located in Ventura County. The 1928 failure of the St. Francis Dam in Los Angeles County, however, had catastrophic effects in Ventura County. The dam, located in the San Francisquitos Canyon in the Santa Clara River watershed, was constructed to provide 38,000 acre-feet of storage for water from the Los Angeles–Owens River Aqueduct. The collapse of the dam occurred after the newly constructed concrete-arch dam was completely filled for the first time. The resulting flood swept through the Santa Clara Valley in Ventura County toward the Pacific Ocean, about 54 miles away. At its peak, the wall of water was reported to be 78 feet high; by the time it hit Santa Paula, 42 miles south of the dam, the water was estimated to be 25 feet deep. Almost everything in its path was destroyed, including structures, railways, bridges, livestock, and orchards. By the time the flood subsided, parts of Ventura County lay under 70 feet of mud and debris. Nearly 500 people were killed, and damage estimates exceeded $20 million. The communities of Piru, Fillmore, Santa Paula, Bardsdale, Saticoy, Montalvo, and El Rio sustained extensive life and property loss from the flood.

Location

Table 11-2 shows the name, year built, capacity, type, and inundation area for the dams that constitute failure hazards for Ventura County. Figure 11-5 shows the name, location, and extent of the dam failure inundation areas for every dam failure that would affect Ventura County. Clearly, it is not anticipated that every dam would fail at the same time. Rather, this map is intended to provide an approximate assessment of total risk for the county. Figure 11-6 illustrates dam failure inundation areas for particular dams. In some instances, if one dam fails there is potential that another dam downstream will also fail. For instance, according to the 2015 Ventura County Multi-Hazard Mitigation Plan, if the Pyramid Dam fails, the Santa Felicia Dam will likely fail too. Figure 11-6 does not illustrate cumulative effects. Additional information on specific dam inundation areas may be obtained from the agency that owns the dam. The map shows that dam failures may occur outside Ventura County but still pose a threat of inundation within the county. In particular, if dams in the Santa Clara River watershed in Los Angeles County fail, the resulting flood would affect the Santa Clara River corridor, which includes the cities of Santa Paula and Oxnard, as demonstrated by the 1928 St. Francis dam failure described above.

Source: DSOD 2015.

Extent

FEMA characterizes a dam as a high hazard if it stores more than 1,000 acre-feet of water, is taller than 150 feet, and has the potential to cause downstream property damage. The hazard ratings for dams are set by FEMA and confirmed with site visits by engineers. Most dams in the county are characterized by increased hazard potential because of downstream development and increased risk as a result of structural deterioration or inadequate spillway capacity.

The Division of Safety of Dams (DSOD) regulates state-size dams and inspects them annually to ensure that they are in good operating condition. Also, as required by DSOD regulations, the flood inundation limits resulting from a dam breach during the design storm (probable maximum precipitation) are established for each state-size dam. The resultant maps contain flood-wave arrival time estimates and flood inundation areas. These maps are developed by Cal Office of Emergency Services (OES) and provided to DSOD and local communities. Inundation areas are shown in Table 11-2.

Probability of Future Events

The probability of dam failure inundation is unknown, but such an event would likely be the result of an extreme storm.

Levee Failure Inundation

Nature

Levees are typically earthen embankments designed to contain, control, or divert the flow of water to provide some level of protection from flooding. Some levee systems are built for agricultural purposes and provide flood protection and flood loss reduction for farm fields and other land used for agricultural purposes. Urban levee systems are built to provide flood protection and flood loss reduction for population centers and the industrial, commercial, and residential facilities within them.

Levees are designed to provide a specific level of flood protection. Agricultural levee systems provide a level of protection that is appropriate based on the value of the assets being protected. Because urban levee systems are designated to protect urban areas, they are generally built to higher standards. Urban levee systems that are shown to provide protection from a one percent annual chance flood occurrence event on a FEMA FIRM must document ongoing compliance with the FEMA Levee Certification requirements found in Section 65.10 of the NFIP regulations (i.e., 44 CFR 65.10). No levee system provides full protection from all flooding events to the people and structures located behind it. Some level of flood risk exists in the levee-affected areas.

Levee failure is the overtopping, breach, or collapse of a levee wall. Levees can fail because of an earthquake, internal erosion, seepage, poor engineering/construction or maintenance, or landslides, but levees most commonly fail as a result of significant flows. During heavy precipitation periods or sudden melting of accumulated snow, excessively large flows may overtop levee sections and cause failure. The overflow of water washes away the top portion of the levee, creating deep grooves. Eventually, the levee weakens, resulting in a breach or collapse of the levee wall and the release of uncontrollable amounts of water.

History

The floods of January and February 1969 were the most damaging floods along the Santa Clara River in Ventura County. The estimated peak discharge of the 1969 flood was 165,000 cubic feet per second (cfs), before the gage data adjustment referenced in the Ventura County hydrology report titled *Santa Clara River 2006 Hydrology Update: Phase I, From Ocean to County Line* (VCWPD 2006) was performed.

The following excerpts taken from the United States Army Corps of Engineers (USACE) report entitled *Floods in Southern California during January and February 1969* (USACE 1969) document the significant damage that occurred to the SCR-1 Levee protecting Oxnard, specifically within the reach from Highway 118 to Highway 101.

> *"The only significant damage that occurred during this reach during the January (1969) flood was damage to the revetment of an existing levee constructed by the Corps of Engineers. February flood flows washed out about 500 feet of State Route 118 Bridge, damaged agricultural properties constructed by the Corps of Engineers. ... The flood eroded the south bank (of the Santa Clara River) near the existing Corps levee, damaging some groins; then deflected, ricocheted from the State Route 118 bridge, and returned to the south bank – where the flood flows cut in close to the Corps levee, bounced off the north bank, and carved a long arch. The flood flows then deflected to south bank where they undercut the toe protection on the Corps levee, causing the failure of about 2,000 feet of levee and eroding the ground behind the levee for a distance of about 100 feet."*

After the 1969 flood, USACE repaired the resulting damage (completed in 1971). In December 1985, the VCWPD completed additional repairs in the vicinity of the 1969 levee failure location. The damage repaired in 1985 may have been due to the 1983 flood, which had a peak discharge of 100,000 cfs. The damage was likely due to the low-flow channel encroaching and washing out parts of the levee. The repair included removal of approximately two feet of existing rock and placement of two tons of rock riprap back to the original design dimensions and backfilling the uncompacted fill. This is the only known non-Corps stone that has been added to the SCR-1 Levee.

Location

In November 2009, the VCWPD completed federally-mandated engineering evaluations of nine provisionally accredited levees (PALs) within the Calleguas Creek, Santa Clara River, and Ventura River watersheds. At that time, VCWPD submitted Levee Certification Report (LCR) compliance documentation packages to FEMA for three of the nine PAL-designated levees. As shown on Figure 11-7, these levees include the ASR-2 Levee Floodwall along Arroyo Santa Rosa in the unincorporated community of Santa Rosa Valley, the AS-6 Levee along Arroyo Simi in Simi Valley, and the SC-1 Levee along Sespe Creek in Fillmore.

At that same time, PAL-Response Reports (PRRs) were also submitted to FEMA for the remaining six PAL-designated levees also shown on Figure 11-7. These are AS-7 along Arroyo Simi in Simi Valley, CC-2 and CC-3 along Calleguas Creek in Camarillo, SCR-1 along the Santa Clara River in Oxnard, VR-1 along the Ventura River in Ventura, and VR-3 in the unincorporated areas of the Ventura River Valley. The PRRs indicated that in their current condition, those six levees could not be certified by the VCWPD before FEMA's November 30, 2009, compliance submittal deadline date.

Subsequently, two additional levee systems, SC-2 (the south half of the Sespe Creek levee in Fillmore) and SCR-3 (along the Santa Clara River in Oxnard) were added to the above list of six VCWPD levees requiring rehabilitation work to be fully compliant with federal levee certification regulations (i.e., 44 CFR 65.10). Also, the VR-2 levee system, along the west bank of the Ventura River, which was originally constructed by the Natural Resources Conservation Service (NRCS) in 1979 to provide flood protection for the unincorporated community of Casitas Springs, was added to the list of VCWPD levees requiring rehabilitation and/or improvement work.

Extent

There are 5.17 square miles in Ventura County protected by VCWPD PALs from the 100-year flood.

Probability of Future Events

The probability of future levee failures in Ventura County is unknown, but may result from a large winter storm or seismic event.

Post-Fire Debris Flow

Nature

Wildfires are a common occurrence in the hills and mountainous regions of Ventura County. By reducing or destroying vegetative cover and altering soil characteristics, fires often result in conditions that can significantly increase runoff and erosion when winter rains begin to fall. These conditions may result in a debris flow (also referred to as mud flow), which is a slurry of water, sediment, and rock that converges in a stream channel.

The threats of erosion, flooding, and debris flows are significantly increased by the following processes:

- **Reduced infiltration and increased runoff:** A fire's consumption of vegetative cover increases exposure of the soil surface to raindrop impact. Soil heating destroys organic matter that binds the soil together. Extreme heating may also cause the development of water-repellant, or "hydrophobic," soil conditions that further reduce infiltration.
- **Changes in hill slope conditions:** Fires remove obstructions to overland flow, such as trees, downed timber, and plants, increasing flow velocity and therefore erosive power. Increased sediment movement also fills depressions, reducing storage capacity and further contributing to increased velocity and volume of flow. These factors combine to allow more of the watershed to contribute flow to the flood at the same time, increasing the volume of the flood.
- **Changes in channel conditions:** Increased overland flow and sediment transport result in increased velocity and volume of flow in defined channels. Channel erosion increases, as do peak discharges.

The occurrence of erosion, floods, and debris flows in burned areas is also dependent on precipitation intensity—storms with high intensity are more likely to initiate the processes described above and result in flood events. Additionally, easily eroded soils facilitate changes in hill slope conditions and increase the volume of runoff. Both of these conditions are likely to occur in Ventura County.

In extreme situations, the conditions described above combine to form a debris flow. These flows are often the most destructive events resulting from heavy rainfall in fire-affected areas. They occur with little warning, carry vast quantities of rock and other material, and strike objects with extreme force. Because of their viscosity and density, debris flows can move or carry away objects as large as vehicles and bridges, and they may travel great distances down canyons and stream valleys. Debris flow fronts may also travel at high speeds, exceeding 50 miles per hour.

History

Evidence of debris-flow movement was widespread following the 1969 storms throughout the mountain ranges in Ventura County. Debris flows occurred in numerous watersheds, including Cozy Dell Canyon, Stewart Canyon, Senior Canyon, Orcutt Canyon, Jepson Wash, and others. Mudflows also occurred in 1969 and 1971 in watersheds that were underlain by fine-grained sedimentary rocks and had been more recently burned by wildfires near Ojai. Witnesses to the mudflows described surges of what appeared to be mud covered with water behind a moving boulder.

In 2014, two post-fire debris flows occurred in the Camarillo Springs area. Around midnight on November 1, 2014, a heavy rain—the first in Ventura County in many months—dislodged debris and

created thick mud from the hills recently burned by the Springs Fire in May 2013. Twenty homes were evacuated, including two homes that were severely damaged. According to the Ventura County Fire Department, a storm drain system that should have prevented the mud and debris from flooding the area apparently filled to capacity, in part because of additional amounts of debris left on the hillside due to Springs Fire.

On December 12, 2014, a second debris flow affected Camarillo Springs when a storm dumped 1.8 inches of rainfall over the region. According to the Ventura County Fire Department, 16 homes were damaged, including 10 homes that were red-tagged. Hours before the storm was expected, mandatory evacuations were ordered for 124 homes. Contractors hired by the City of Camarillo worked to clear drainage areas before the storm hit and had put up K-rails to direct water and mud away from homes in the projected debris flow area. The City of Camarillo has installed steel mesh nets in hillside areas that successfully contain alluvial fan flows and will prevent further damage to private property.

Location

Areas of Ventura County that have been subject to recent wildfires are susceptible to potentially hazardous debris flows. Areas susceptible to debris flow include localities that are adjacent to and downslope of these burn areas, especially in locations that are in ravines and canyons, and at the mouths of canyons. Figure 11-8 shows wildfire perimeters of concern; this includes wildfires since 2012 (Grand and Springs fires) and burned areas that are recovering slowly (Day fire).

Extent and Probability of Future Events

Ventura County has a long history of flooding and wildfires, which are two major factors in the occurrence of post-fire debris flow. However, because a number of complex factors lead to debris flow (basin morphometry, burn severity, soil properties, and rainfall characteristics), the probability and estimate of the volume of post-fire debris flow in Ventura County is unknown. The USGS has developed model predictions that can be calculated at specific basin outlets, and along the draining network within and immediately downstream of a burn area. These models can be applied post- fires to predict the probabilities of debris flows and estimate debris-flow volumes throughout a burn area in response to a specific rainstorm event.

Tsunami

Nature

A tsunami is a series of traveling ocean waves of extremely long length, generated by disturbances associated primarily with earthquakes occurring below or near the ocean floor. Subduction zone earthquakes at plate boundaries often cause tsunamis. However, tsunamis can also be generated by submarine landslides, submarine volcanic eruptions, the collapse of volcanic edifices, and—in very rare instances—large meteorite impacts in the ocean.

In the deep ocean, a tsunami may have a length from wave crest to wave crest of 100 miles or more but a wave height of only a few feet or less. Thus, the wave period can be up to several hours, and wavelengths can exceed several hundred miles. Therefore, tsunamis are unlike typical wind-generated swells on the ocean, which might have a period of about 10 seconds and a wavelength of up to 300 feet. Tsunamis cannot be felt aboard ships and they cannot be seen from the air in the open ocean. In deep water, the waves may reach speeds exceeding 700 miles per hour.

Tsunamis can originate hundreds or even thousands of miles away from coastal areas. Local geography may intensify the effect of a tsunami. Areas at greatest risk are less than 50 feet above sea level and within one mile of the shoreline. Tsunamis arrive as a series of successive crests (high water levels) and troughs (low water levels). These successive crests and troughs can occur anywhere from five to 90 minutes apart. They usually occur 10 to 45 minutes apart.

Tsunamis not only affect beaches that are open to the ocean, but also bay mouths, tidal flats, and the shores of large coastal rivers. Tsunami waves can also diffract around land masses. Because tsunamis are not symmetrical, the waves may be much stronger in one direction than another, depending on the nature of the source and the surrounding geography. However, tsunamis do propagate outward from their source, so coasts in the shadow of affected land masses are usually fairly safe.

History

According to the California Tsunami Evacuation Playbook, City of Ventura – Ventura County (No. 2014-Vent-01), and as shown in Table 11-3, there have been eight notable tsunami events run-ups recorded in Ventura County.

Location

Figure 11-9 shows tsunami evacuation areas based on two scenarios—Phase 3 and Maximum Phase—as described in the California Tsunami Evacuation Playbook, City of Ventura – Ventura County. This map illustrates coastal land areas, including areas in the cities of Oxnard, Port Hueneme, and Ventura, that can become submerged due to tsunami run-up. The area of land subject to inundation is a factor of the following factors:

- Distance of shoreline from the tsunami-generating event
- Magnitude of the earthquake causing the event; duration and period of waves
- Run-up elevations
- Tidal level at time of occurrence
- Location along shore and direction of shore in respect to propagated waves
- Topography of the seabed

TABLE 11-3 TSUNAMI EVENTS Ventura County			
Year	**Source/Source Location**	**Tsunami Location**	**Remarks**
12/21/1812	Earthquake and Landslide	City of Ventura	6.5-foot run-up
4/01/1946	Earthquake – Aleutian Islands, Alaska	Port Hueneme	3-foot run-up
		Ormond Beach	5-foot run-up
11/4/1952	Earthquake – Kamchatka Peninsula	Port Hueneme	2-foot run-up
3/09/1957	Earthquake – Aleutian Islands, Alaska	Port Hueneme	2-foot run-up
3/28/1964	Earthquake and Landslide – Alaska	City of Ventura	Tide dropped 8.0 feet
		Oxnard	Large swells
9/29/2009	Earthquake – Samoa	Ventura	Buoys moved near mouth of harbor
2/27/2010	Earthquake – Chile	Ventura, Oxnard, Port Hueneme	3-foot run-up
3/11/2011	Earthquake – Japan	Ventura, Oxnard	4-foot run-up
		Port Hueneme	5-foot run-up

Source: CGS 2014.

Run-up = the large amount of water that a tsunami pushes onto the shore above the regular sea level, that is the maximum vertical height onshore above sea level reached by a tsunami

Extent

Figure 11-9 shows the Phase 3 Evacuation and Maximum Evacuation Phase, based on models of maximum local and distance tsunamis and for tsunamis coming from the Cascadia Subduction Zone. The Phase 3 Evacuation estimates a tsunami flood level of 1.7 to 5.0 feet above the high tide line, and a tsunami flood level of 7.7 to 11.0 feet above low tide conditions. The Maximum Evacuation Phase estimates a tsunami flood level of more than 5.0 feet above the high tide line, and a tsunami flood level of more than 11.0 feet above low tide conditions.

Probability of Future Events

Based on the history of tsunami run-ups in the region and the history of earthquakes in the Pacific Rim, another tsunami event is likely to occur, although the extent and probability is unknown.

Regulatory Setting

The most effective means of preventing flood damage appears to be floodplain management (i.e., the regulation of the types of activities permitted in flood hazard areas). Floodplain management addresses the problems encountered in the utilization of floodplains and considers the total spectrum of possible solutions to problems involving possible future land uses. Floodplain management cannot, however, protect all existing development. Therefore, to provide for the maximum alleviation of flood hazards, a combination of federal, state, and local corrective and preventive measures is necessary. These measures are discussed in detail below.

Federal

Federal Emergency Management Act (FEMA).

FEMA is the Federal agency that oversees floodplains and manages the National Flood Insurance Program (NFIP), as adopted under the National Flood Insurance Act of 1968. FEMA's regulations govern the delineation of floodplains and establish requirements for floodplain management. FEMA prepares Digital Flood Insurance Rate Maps (DFIRMs) that indicate the regulatory floodplain to assist communities such as Ventura County with land use and floodplain management decisions to meet the requirements of the National Flood Insurance Program. FEMA has prepared a DFIRM for all of Ventura County, effective January 20, 2010.

National Flood Insurance Program (NFIP)

The regulations of the National Flood Insurance Program, which is administered by FEMA, require that communities adopt land use restrictions for the 100-year floodplain to qualify for federally subsidized insurance. The NFIP was enabled by the National Flood Insurance Act of 1968 and Flood Disaster Protection Act of 1973. The type of restrictions communities must adopt are listed in some detail in Title 44 Code of Federal Regulations, Sections 59 through 70. Additionally, the Ventura County Floodplain Management Ordinance 4465, includes a requirement that habitable structures be elevated a minimum of one foot of freeboard above the base flood elevation of the one percent annual chance flood and be flood-proofed. Participation in the National Flood Insurance Program is virtually mandatory, since flood insurance (within identified "special flood hazard" areas) is a prerequisite for receiving mortgages or construction loans from federally regulated lending institutions. Disaster assistance is not available to public agencies in hazard areas if they do not participate and remain compliant in the Program. Thus, the County must be, and is a participating community in the National Flood Insurance Program and thus qualifies for disaster assistance in the event of a declared natural disaster. Outside these limits, the prime responsibility for regulating activities in flood hazard areas lies with state and local government.

Community Rating System for Flood Control

The Community Rating System (CRS) is a program administered by FEMA. The program offers financial incentives to cities and counties that voluntarily exceed the minimum requirements of the National Flood Insurance Program. The three goals of the CRS are to: (1) reduce and avoid flood damage to insurable property; (2) strengthen and support the insurance aspects of the NFIP; and (3) foster comprehensive flood plan management. The CRS includes multiple programs or "activities" in which communities can participate to earn CRS points. These include public outreach and education on flood prevention measures, preserving open space, maintaining special certifications for staff members as Certified Floodplain

Managers, removing debris and sediment from flood control channels, and adoption of an All-Hazards Mitigation Plan. Each community receives a Class Rating based on the number of points earned. The number of points a community has earned determines if a discount is available to property owners on their flood insurance policies. As of 2016, five percent of all NFIP member communities participate in the CRS program, and fifteen percent of all NFIP California communities participate in the program.

CRS Classes are rated from 1 to 9, with Class 1 representing the highest (best) class. On May 1, 2016, Ventura County received a Class 6 rating, and consequently, properties within a floodplain in the unincorporated areas of Ventura County are eligible for a 20 percent premium discount on flood insurance.

Disaster Mitigation Act of 2000 (DMA 2000)

On October 30, 2000, Congress passed DMA 2000 (Public Law 106-390), which amended the Robert T. Stafford Disaster Relief and Emergency Assistance Act of 1988 (Stafford Act) (Title 42 of the United States Code Section 5121 et seq.) by repealing the Act's previous mitigation planning section (409) and replacing it with a new mitigation planning section (322). This new section emphasized the need for state, tribal, and local entities to closely coordinate mitigation planning and implementation efforts. This new section also provided the legal basis for the FEMA's mitigation plan requirements for mitigation grant assistance. Under DMA 2000, local governments throughout the United States must adopt and maintain mitigation plans in order to be eligible for specific types of grant assistance. DMA 2000 is administered by FEMA (in California, Region IX) in collaboration with State Hazard Mitigation Officers (in California, the State Office of Emergency Services).

State

California Dam Safety Act

The California Dam Safety Act (Section 8589.5 California Emergency Services Act) requires the preparation of dam inundation maps showing areas of potential flooding in the event of sudden or total dam failure as well as emergency procedures for notification and evacuation of nearby residents.

Local

2005 Ventura County General Plan

The General Plan covers flood hazards in Chapter 2, Hazards. Section 2.10 includes goals, policies, and programs related to flood hazards. The following Area Plans also contain applicable goals and policies related to flood hazards:

- Coastal Area Plan;
- El Rio/Del Norte Area Plan;
- North Ventura Avenue Area Plan;
- Oak Park Area Plan;
- Ojai Valley Area Plan;
- Piru Area Plan;
- Saticoy Area Plan;
- Thousand Oaks Area Plan; and
- Lake Sherwood/Hidden Valley Area Plan.

2011 Initial Study Assessment Guidelines

The Initial Study Assessment Guidelines include criteria for evaluating environmental impacts for flood hazards. These can be found in Sections 17a. Hydraulic Hazards-Non-FEMA and 17b. Hydraulic Hazards-FEMA.

2016 Coastal Zoning Ordinance

The Coastal Zoning Ordinance regulates flood hazards through Section 8178-4 Mitigation of Potential Hazards

Ventura County Emergency Operations Plan (2012)

The Ventura County Emergency Operations Plan (EOP) describes what the County's general actions will be during a response to an emergency. The EOP also includes appendices that describe in more detail the actions required of each local jurisdiction's departments/agencies. Further, EOP describes the role of the Emergency Operation Center (EOC) and the coordination that occurs between the EOC and each local jurisdiction's departments and other response agencies. Finally, the EOP describes how the EOC serves as the focal point among local, state, and federal governments in times of disaster.

Ventura County Floodplain Management Ordinance

Ventura County's Flood Plain Management Ordinance (Ordinance No. 4465) ensures compliance with the National Flood Insurance Program. This includes permit review for structures built in the floodplain and evaluation of site plans for developments that include identified floodplains. Residential development is not allowed in the FEMA designated floodway.

Office of Emergency Services (OES)

In Ventura County, disaster coordination and planning is the responsibility of the Sheriff's Department through its Office of Emergency Services (OES). The OES serves as the depository for the County's Dam Inundation maps and is charged with ongoing maintenance of the County's Dam Failure Response Plan, which was adopted by the Board of Supervisors on September 13, 1983.

Key Terms

Alluvial Fan. An alluvial fan is a triangle-shaped deposit of gravel, sand, and even smaller pieces of sediment, such as silt (i.e., alluvium). Alluvial fans are usually created as flowing water interacts with mountains, hills, or the steep walls of canyons. Streams carrying alluvium can be trickles of rainwater, a fast-moving creek, a powerful river, or even runoff from agriculture or industry. As a stream flows down a hill, it picks up sand and other particles (alluvium).

Anticlinal. In structural geology, an anticline is a type of fold that is an arch-like shape and has its oldest beds at its core.

Erodibility. An indicator of a soil's susceptibility to rain, runoff, and other erosive processes.

Inundation. To cover with water, especially flood waters. To overwhelm as if with a flood.

Levee. Levees are typically earthen embankments designed to contain, control, or divert the flow of water to provide some level of protection from flooding. Some levee systems are built for agricultural purposes and provide flood protection and flood loss reduction for farm fields and other land used for agricultural purposes. Urban levee systems are built to provide flood protection and flood loss reduction for population centers and the industrial, commercial, and residential facilities within them. Agricultural levee systems provide a level of protection that is appropriate based on the value of the assets being protected.

National Flood Insurance Program (NFIP). The National Flood Insurance Program aims to reduce the impact of flooding on private and public structures. It does so by providing affordable insurance to property owners and by encouraging communities to adopt and enforce floodplain management regulations. These efforts help mitigate the effects of flooding on new and improved structures. Overall, the program reduces the socio-economic impact of disasters by promoting the purchase and retention of general risk insurance, but also of flood insurance, specifically.

Slurry. A semi-liquid mixture, typically of fine particles of manure, cement, or coal suspended in water.

Special Flood Hazard Area (SFHA): The land area covered by the floodwaters of the base flood is the Special Flood Hazard Area (SFHA) on NFIP maps. The SFHA is the area where the NFIP's floodplain management regulations must be enforced and the area where the mandatory purchase of flood insurance applies. The SFHA includes Zones A, AO, AH, A1-30, AE, A99, AR, AR/A1-30, AR/AE, AR/AO, AR/AH, AR/A, VO, V1-30, VE, and V.

SECTION 11.3 WILDFIRE HAZARDS

Introduction

This section addresses the wildfire hazard (also referred to as fire hazard) conditions within Ventura County and the potential risk these conditions pose. Issues related to fire hazards include fire hazard management, emergency response, and high fire hazard areas. This section summarizes the fire hazard conditions in Ventura County based on information from the 2015 Ventura County Multi-Hazard Mitigation Plan (VCMHMP). Consistent with the VCMHMP, each section includes explanations of the nature, history, location, extent, and probability associated with fire hazards. A discussion of fire protection services is included in Section 7.6 of Chapter 9 of this Background Report.

Major Findings

- Within Ventura County, very high fire hazard severity zones (FHSZs) are located in mountainous or hillside areas (west of Lake Casitas, northeast of Ojai, north of Fillmore, and surrounding Thousand Oaks and Simi Valley), where the greatest fuel density exists; very high FHSZs are also located throughout much of the county's large agricultural and cattle-grazing areas. 81.9 square miles are in the high FHSZ and 504.4 square miles are in the very high FHSZ. The populations that live in the very high FHSZ are mainly located in the cities of Moorpark (44.0 percent), Simi Valley (27.7 percent), Thousand Oaks (43.1 percent), as well as the unincorporated area (37.1 percent).
- Vegetation that has dried during long, hot summers provides a living fuel for wildfires and the Santa Ana winds combine to contribute to the high incidence of wildfires in Ventura County. In the past, fires burning more than 1,000 acres have occurred about every one to three years.

Existing Conditions

A wildfire is an uncontrolled fire that spreads through vegetative fuels, exploding and possibly consuming structures. Wildfires often begin unnoticed, spread quickly, and are usually signaled by dense smoke that may be visible from miles around. Wildfires can be human-caused (e.g., by arson or campfires), or can be caused by natural events such as lightning. Wildfires can be categorized into four types:

- **Wildland fires** occur mainly in areas under federal control, such as national forests and parks, and are fueled primarily by natural vegetation.
- **Interface or intermix fires** occur in areas where both vegetation and structures provide fuel. These are also referred to as urban-wildland interface fires.
- **Firestorms** occur during extreme weather (typically high temperatures, low humidity, and high winds) with such intensity that fire suppression is virtually impossible. These events typically burn until the conditions change or the fuel is exhausted.
- **Prescribed fires and prescribed natural fires** are intentionally set or natural fires that are allowed to burn for beneficial purposes.

The following three factors contribute significantly to wildfire behavior; as described more fully below, these factors can be used to identify wildfire hazard areas:

- **Topography:** As slope increases, the rate of wildfire spread increases. South-facing slopes are also subject to greater solar radiation, making them drier and thereby intensifying wildfire behavior. However, ridgetops may mark the end of wildfire spread because fire spreads more slowly or may even be unable to spread downhill.
- **Fuel:** The type and condition of vegetation play a significant role in the occurrence and spread of wildfires. Certain types of plants are more susceptible to burning or burn with greater intensity. Dense or overgrown vegetation increases the amount of combustible material available to fuel the fire (referred to as the "fuel load"); the ratio of living to dead plant matter is also important. The risk of fire is increased significantly during periods of prolonged drought as the moisture content of both living and dead plant matter decreases. The fuel's continuity is also an important factor, both horizontally and vertically.
- **Weather:** The most variable factor affecting wildfire behavior is weather. Variables such as temperature, humidity, wind, and lightning can affect chances for ignition and spread of fire. Extreme weather, such as high temperatures and low humidity, can lead to extreme wildfire activity. By contrast, cooling and higher humidity often signals reduced wildfire occurrence and easier containment. Years of precipitation followed by warmer years tend to encourage more widespread fires and longer burn periods. Also, since the mid-1980s, earlier snowmelt and associated warming due to global climate change has been associated with longer and more severe wildfire seasons in the western United States.

If not promptly controlled, wildfire may grow into an emergency or disaster. Even small fires can threaten lives and resources and destroy improved properties. It is also important to note that in addition to affecting people, wildfire may severely affect livestock and pets. Such events may require the emergency watering/feeding, shelter, evacuation, and even burying of animals.

Wildfires can have serious effects on the local environment. In addition to stripping the land of vegetation and destroying forest resources, including the wildlife that lives in these areas, large, intense fires can harm the soil, waterways, and the land itself. Soil exposed to intense heat may lose its capacity to absorb moisture and support life. Exposed soils erode quickly and enhance siltation of rivers and streams, thereby enhancing flood potential, harming aquatic life, and degrading water quality. Lands stripped of vegetation are also subject to increased debris flow hazards, as described above. Wildfires can also greatly affect the air quality of the surrounding area.

History

Wildfires are a common occurrence in Ventura County. In the last 50 years (1965 through 2015), 23 wildfires, with an extent greater than 10,000 acres, have occurred. Table 11-4 illustrates the 10 largest fires over the last 50 years and Figure 11-10 shows the location of these and other fires between 1965 and 2015. In May 2013, the Springs fire burned 24,251 acres; 10 structures were destroyed and 12 were damaged, and 10 injuries were recorded.

TABLE 11-4 TEN LARGEST VENTURA COUNTY FIRES, 1965 THROUGH 2015		
Name	**Date**	**Acres Affected***
Day	September 2006	162,702
Simi Valley	October 2003	108,204
Piru	October 2003	63,991
Ranch**	October 2007	58,401
Ferndale	October 1985	47,064
Green Meadow	October 1993	38,477
Creek Road	September 1979	32,000
Steckel	October 1993	27,088
Parker Ranch	October 1967	25,000
Hopper	August 1997	24,793

Source: Cal FIRE 2015

*Acres affected = total acreage.

** Fire occurred in both Ventura and Los Angeles counties.

Location and Extent of Fire Hazard Severity Zones

Public Resources Code 4201-4204 and Government Code 51175-89 directed the California Department of Forestry and Fire Protection (Cal FIRE) to map areas of significant fire hazards based on fuels, terrain, weather, and other relevant factors. These zones, referred to as Fire Hazard Severity Zones (FHSZs), are represented as very high, high, or moderate. Specifically, the maps were created using data and models describing development patterns, potential fuels over a 30- to 50-year time horizon, expected fire behavior, and expected burn probabilities. The maps are divided into local responsibility areas and state responsibility areas. Local responsibility areas generally include cities, cultivated agriculture lands, and portions of the desert. Local responsibility area fire protection is typically provided by city fire departments, fire protection districts, counties, and by Cal FIRE under contract to the local government. State responsibility area is a legal term defining the area where the state has financial responsibility for wildfire protection. Incorporated cities and federal ownership are not included. The prevention and suppression of fires in all areas that are not state responsibility areas are primarily the responsibility of federal or local agencies.

Figure 11-11 displays the areas of Ventura County most susceptible to wildfires. Within the unincorporated county, very high FHSZs are located in mountainous or hillside areas (west of Lake Casitas, northeast of Ojai, north of Fillmore, and surrounding Thousand Oaks and Simi Valley), where the greatest fuel density exists; as well as throughout much of the county's large agricultural and cattle-grazing areas. Although these areas are not heavily populated, they are near populated communities. Approximately 37.1 percent of the unincorporated area population is exposed to very high FHSZs. Population exposure in cities is highest in Moorpark (44.0 percent), Simi Valley (27.7 percent), and Thousand Oaks (43.1 percent)

As shown on Figure 11-11, in Ventura County there are 81.9 square miles in the high FHSZ and 504.4 square miles in the very high FHSZ.

Probability of Future Events

The climate in Ventura County is characterized as Mediterranean dry-summer featuring cool, wet winters and warm, dry summers. High moisture levels during the winter rainy season significantly increase the growth of plants. However, the vegetation is dried during the long, hot summers, decreasing plant moisture content and increasing the ratio of dead fuel to living fuel. As a result, fire susceptibility increases dramatically, particularly in late summer and early autumn. In addition, the presence of chaparral, a drought-resistant variety of vegetation that is dependent on occasional wildfires, is expected in Mediterranean dry-summer climates. Also, the history of plant succession in Ventura County is important in predicting fire susceptibility. For several years after a fire has occurred, easily flammable herbaceous species predominate and increase the likelihood of new fires. When woody species become reestablished, they contribute to a lower overall level of fire susceptibility for approximately 10 years. However, after this period, the slow aging plant community becomes ever more likely to burn because of increased levels of dead plant material and lowered plant moisture levels (Ventura County Multi-Hazard Mitigation Plan, September 2015).

In addition, the local meteorological phenomenon known as the Santa Ana winds contributes to the high incidence of wildfires in Ventura County. These winds originate during the autumn months in the hot, dry interior deserts to the north and east of Ventura County. They often sweep west into the county, bringing extremely dry air and high wind speeds that further desiccate plant communities during the period of the year when the constituent species have very low moisture content. The effect of these winds on existing fires is particularly dangerous, as the winds can greatly increase the rate at which fires spread.

Based on the conditions described above and the history of occurrence in the past, future events are very likely to occur. In the past, fires burning more than 1,000 acres have occurred about every one to three years. The extent of future events will depend on specific conditions at the time of the fire.

Regulatory Setting

Federal

Federal Land Assistance, Management, and Enhancement (FLAME) Act

In 2009, Congress passed the Federal Land Assistance, Management, and Enhancement (FLAME) Act (FLAME) as the basis for the U.S. Department of Agriculture (USDA) and the Department of the Interior (DOI) to develop a national cohesive wildland fire management strategy. In response to the FLAME Act, USDA and DOI published the National Cohesive Wildland Fire Management Strategy, which includes the National Strategy and the National Action Plan, both completed in April 2014. Together, these documents address elements requested by Congress after the passage of the FLAME Act and represent an approach wildland fire management based on the goal of achieving safer, more efficient, cost-effective public, and resource protection goals and more resilient landscapes.

Healthy Forest Restoration Act (HFRA)

The Healthy Forest Restoration Act (HFRA), enacted by the U.S. Congress on January 7, 2003, established a protocol for the creation of a type of document that articulated a wildfire safety plan for communities at risk from wildland fires- a Community Wildfire Protection Plan (CWPP). The Ventura County Fire Department has prepared a CWPP for all of Ventura County. As specified by the HFRA, the

Ventura County CWPP was developed in collaboration with local, county, state, and federal agencies as well as various community organizations within the County. The CWPP identifies wildfire risks and clarifies priorities for funding and programs to reduce impacts of wildfire on the communities at risk within Ventura County.

State

Strategic Fire Plan for California

Public Resources Code §4114 and §4130 authorize the State Board of Forestry and Fire Protection (Board) to establish a fire plan which, among other things, establishes the levels of statewide fire protection services for State Responsibility Area (SRA) lands. These levels of service recognize other fire protection resources at the federal and local level that collectively provide a regional and statewide emergency response capability. In addition, California's integrated mutual aid fire protection system provides fire protection services through automatic and mutual aid agreements for fire incidents across all ownerships. In 2010 the Board of Forestry and Fire Protection adopted the Strategic Fire Plan for California. This statewide fire plan was developed in concert between the State Board of Forestry and Fire Protection of and the California Department of Forestry and Fire Protection (CAL FIRE), in consultation with a group of outside experts to complete a needs assessment and to form the Fire Plan Steering Committee. This Committee worked for over a year preparing the 2010 Strategic Fire Plan. The Strategic Fire Plan seeks to protect lives, residential property, and natural resources. It is the basis for assessing California's complex and dynamic natural and man-made environment, and identifying a variety of actions to minimize the negative effects of wildland fire. Implementation of the 2010 Strategic Fire Plan for California is intended to occur at all levels of CAL FIRE, as well as through partnerships with local, state and federal agencies, private organizations (Fire Safe Councils, homeowners associations, industry, etc.) and citizens.

Senate Bill 1704 (Vegetation Management Program)

Senate Bill 1704 established the basic processes and procedures needed to manage chaparral-covered and associated lands within California. The Vegetation Management Program allows private landowners to enter into a contract with the California Department of Forestry and Fire Protection to use prescribed fire to accomplish a combination of fire protection and resource management goals. The main goals of the program are the reduction of conflagration fires, the optimization of soil and water productivity, and the protection and improvement of intrinsic floral and faunal values.

Public Resources Code Section 4291/Government Code Section 51182

Public Resources Code Section 4291 and Government Code Section 51182 require property owners in mountainous areas, forest-covered, lands, or any land that is covered with flammable material to create, at minimum, a 100-foot defensible space (or to the property line) around their homes and other structures. Under the law, property owners or those who control property must establish a 30-foot clean zone and a 70-foot reduced fuel zone.

Local

2005 Ventura County General Plan

The General Plan covers wildfire hazards in Chapter 1, Resources. Section 2.13 includes goals, policies, and programs related to wildfire hazards. The following Area Plans also contain applicable goals and policies related to wildfire hazards:

- Coastal Area Plan;
- Oak Park Area Plan;
- Ojai Valley Area Plan;
- Piru Area Plan;
- Saticoy Area Plan;
- Thousand Oaks Area Plan; and
- Lake Sherwood/Hidden Valley Area Plan.

2011 Initial Study Assessment Guidelines

The Initial Study Assessment Guidelines include criteria for evaluating environmental impacts for rural and wildland areas of the County. These can be found in Section 18. Fire Hazards,

2016 Coastal Zoning Ordinance

The Coastal Zoning Ordinance regulates wildfire hazards through Section 8178-4 Mitigation of Potential Hazards

Unit Strategic Fire Plan, Ventura County Fire Protection District

Ventura County maintains a contractual relationship with Cal Fire. A Unit Plan that is part of the California Strategic Fire Plan is used within the Ventura County Unit. The Unit Fire Plan also serves as the Community Wildfire Protection Plan (CWPP) for the County. The CWPP identifies wildfire risks and clarifies priorities for funding and programs to reduce impacts of wildfire on the communities at risk within Ventura County. Building on the proven and highly effective Weed Abatement Program implemented by Ventura County Fire Department under the authority of the Healthy Forests Restoration Act (HFRA), the County's CWPP documents and prioritizes the projects that stakeholders within communities at risk have identified.

Ventura County Fire Protection District Fire Hazard Reduction Program

The Ventura County Fire Protection District adopted a local ordinance that, among other things, requires mandatory 100-feet of brush clearance around structures located in or adjacent to Hazardous Fire Areas. The Fire Hazard Reduction unit manages this requirement throughout the VCFPD jurisdiction. Failure to comply with the program by the annual June 1st deadline can result in the Fire District completing the work and assessing a fee to the homeowner through a tax lien on their property. The role of individual property owners in responding to fire hazards is probably the most critical. Because of the large size of

the county and the preference of many homeowners to build within or adjacent to Hazardous Fire Areas, these individuals must assume responsibility for the prevention of conditions, that may result in property damage during the fire season. Measures that may be taken by property owners, include the planting of fire-resistant landscaping, landscape maintenance, mandatory clearance of brush around structures, and site design.

Key Terms

Conflagration. An extensive fire that destroys a great deal of land or property.

Herbaceous. Of, denoting, or relating to herbs (in the botanical sense).

Prescribed Fire. The knowledgeable and controlled application of fire to a specific land area to accomplish planned resource management objectives and weather conditions.

SECTION 11.4 AVIATION HAZARDS

Introduction

This section summarizes the aviation issues for the County of Ventura. This chapter discusses the following issues pertaining to aviation:

- Airport Setting
- Airport Facilities
- Aircraft Incidents

Major Findings

- Airspace within the county can be heavily congested. Oxnard and Camarillo airports had a combined total of over 220,000 flights in 2015. Naval Base Ventura County Point Mugu averaged 29,493 annual flight operations between 2009-2013, and an estimated 70,000 flights occur at the Santa Paula Airport.
- Since 2010, there have been a total of 23 reported aviation incidents at Camarillo, Oxnard, Point Mugu, and Santa Paula, of which eight resulted in fatalities. During this same period, there have been a total of 33 reported incidents (five of which resulted in substantial damage to aircraft), and eight near mid-air collisions (all of them at Camarillo).

Existing Conditions

Airport Setting

There are four airports in Ventura County: the County-owned and operated airports at Camarillo and Oxnard, a private airstrip at Santa Paula that is open to the public, and the federally-operated Navy Base Ventura County Point Mugu Site, formerly the Point Mugu Naval Air Weapons Station. Figure 11-12 shows airport spheres of influence in the County. The California Air National Guard has an operation on a 204-acre site adjacent to, and utilizes the runways at, the Point Mugu Site. In addition, there are approximately 13 heliports (five associated with hospitals/medical centers), and a few privately-owned landing strips located in various parts of the county.

Airport Environs Land Use Plans

The *Airport Comprehensive Land Use Plan for Ventura County* is intended to protect and promote the safety and welfare of residents near the military and public use airports in the County, as well as airport users, while promoting the continued operation of those airports. Specifically, the plan seeks to protect the public from the adverse effects of aircraft noise, to ensure that people and facilities are not concentrated in areas susceptible to aircraft accidents, and to ensure that no structures or activities encroach upon or adversely affect the use of navigable airspace.

Implementation of the Comprehensive Land Use Plan for Ventura County promotes compatible urban development and restricts incompatible development in the vicinity of the county's airports, thus allowing for the continued operation of those airports. The three areas of compatibility that are considered in the Plan include:

- Compatibility of surrounding land uses with airport noise levels;
- Compatibility of surrounding land uses with respect to the safety of persons on the ground and persons on board aircraft making controlled crash landings; and
- Protection of airspace needed for safe air navigation near airports.

The Plan applies to all four airports in the county.

Airport Facilities

Oxnard Airport

The Oxnard Airport is 223 acres. Although it is located within the Oxnard city limits, it is owned and operated by the County of Ventura. Oxnard Airport is approximately two miles east of the Pacific Ocean coastline, and is bordered on sides by roads, three of which are major arterials. This airport is situated along the coastal edge of the 200-square mile Oxnard Plain. The City of Oxnard lies equidistant between Santa Barbara to the northwest and Los Angeles to the southeast. Oxnard Airport is classified in the *National Plan of Integrated Airport Systems* (NPIAS) as a primary commercial service airport with inactive status due to not providing scheduled airline service since June 2010. There are 169 aircraft based at the airport. In 2015, there were 75,000 aircraft operations at the Oxnard Airport: 90 percent general aviation, five percent combined air taxi and commuter, and the remaining five percent helicopters.

Camarillo Airport

The Camarillo Airport, owned and operated by the County of Ventura, was formerly known as Oxnard Air Force Base. The airport consists of 654 acres and is located within Camarillo city limits, three miles southwest of the city's central business district. The airport is less than one mile south of the US-101 and seven miles west of the Pacific Ocean coastline. The City of Camarillo lies within the Oxnard Plain, approximately 45 miles northwest of Los Angeles. Camarillo Airport is classified in the *National Plan of Integrated Airport Systems (NPIAS)* as a general aviation reliever for the Los Angeles metropolitan area. Reliever airports provide an alternative to general aviation users in major metropolitan areas. There are 468 fixed-wing aircraft based at the airport. In 2015, there were 136,510 aircraft take-offs and landings at the airport: 93 percent general aviation, four percent air taxi flights, and the remaining three percent helicopters.

Santa Paula Airport

Santa Paula Airport is a privately-owned, public use airport located one mile east of the Santa Paula central business district, south of SR-126. The 24.5-acre airport is owned by the Santa Paula Airport Association, Ltd. and is operated by the owners/stockholders. Santa Paula Airport is classified in the *National Plan of Integrated Airport Systems (NPIAS)* as a general aviation airport. Currently there are several airport-related businesses located at the airport, including the Santa Paula Flight Center, which provides parts, supplies, instruction, fuel and maintenance, plus the airport café and additional aircraft-related businesses. Virtually

all of the estimated 52,400 annual aircraft operations at the airport involve general aviation aircraft. There is no tower, so hours of operation are limited to daytime only. Helicopters also operate out of this facility.

Naval Base Ventura County: Point Mugu

Naval Base Ventura County consists of three operating facilities – Point Mugu, Port Hueneme, and San Nicolas Island – and supports approximately 80 tenant commands that encompass a diverse set of specialties, including three warfare centers (Naval Air Warfare Center – Weapons Division, Naval Surface Water Center – Port Hueneme Division, and Naval Facilities Engineering and Expeditionary Warfare Center). NBVC is also home to deployable units, including the Pacific Seabees and the West Coast E-2 C Hawkeyes.

NBVC Point Mugu occupies 4,486 acres located at the western end of the agricultural lands of the Oxnard Plain, six miles southeast of Oxnard and just over seven miles southwest of Camarillo. The Ventura County and Point Mugu Game preserves (private clubs with no association to the Navy), and Ormond Beach are located to the northwest of the base. California State University Channel Islands is four miles to the northeast. The base is flanked by the Santa Monica Mountains on the east and by the Pacific Ocean to the south. The facility was originally developed during World War II as an extension of the base at Port Hueneme.

The primary mission of NBVC Point Mugu is to provide support for aircraft and test range operations at the installation and surrounding airspace. NBVC Point Mugu is home to the Naval Air Warfare Center – Weapons Division, which manages the 36,000-square mile Point Mugu Sea Range, used for research, development, acquisition, test and evaluation of weapons systems and related devices, and other associated activities. NBVC also manages several special areas, including facilities on Laguna Peak, and the off-shore islands of San Nicholas, Santa Cruz, San Miguel, and Santa Rosa. San Nicolas Island, located approximately 60 miles off the coast of Point Mugu within the Point Mugu Sea Range, serves as an instrumented maritime environment needed for test and evaluation of weapons systems and air-to-sea maneuvering and fleet operations.

NBVC Point Mugu serves a variety of based and transient aircraft. The based military aircraft fleet consists of approximately 75 aircraft. Squadrons based on NBVC Point Mugu include four E-2 Hawkeye squadrons, one test and evaluation squadron and a Reserve C-130T squadron. In 2015, the U.S. Coast Guard announced that two air crews and MH-65D Dolphin helicopters would relocate to NBVC Point Mugu to provide search and rescue operations, homeland security patrols, cargo transport, and drug interdiction operations for the greater Los Angeles region.

NBVC Point Mugu maintains an air traffic control center, which controls all aircraft in southern Ventura County. The air traffic control center provides service seven days a week. Mugu Approach Control provides flight- following service to approximately 125,000 aircraft annually.

Per the 2015 Air Installations Compatible Use Zone (AICUZ) Study, NBVC Point Mugu had 29,493 average total annual flight operations (CY 2009 - 2013). The AICUZ projects 39,500 total annual operations in CY2020. Hours of operation of the airfield are normally between 7 a.m. and 11 p.m. daily and closed on Christmas and New Year's Day. Utilization of the airfield is very low in the early morning and evening hours. Peak hours vary from day to day, depending on changing mission requirements. The least active day is Sunday.

Naval Base Ventura County Joint Land Use Study (JLUS)

The Naval Base Ventura County Joint Land Use Study (JLUS) is a joint, collaborative effort between the cities of Camarillo, Oxnard, and Port Hueneme, the County of Ventura, NBVC, and other stakeholders, to guide planning and land use decisions about development in local governments surrounding NBVC and its operational areas at NBVC Point Mugu, NBVC Port Hueneme, and NBVC San Nicolas Island. The goal of the NBVC JLUS is to protect current and future military training operations while simultaneously guiding community growth, sustaining the environmental and economic health of the region, and protecting public health, safety, and welfare.

Key to the JLUS is the Air Installations Compatible Use Zones (AICUZ) program, which is designed to protect the health, safety, and welfare of civilians and military personnel by encouraging land uses compatible with aircraft operations while protecting the public investment in the installation. The program recommends compatibility measures for both the Navy and surrounding communities, and recommends land uses that are compatible with elevated sound level, accident potential zones, and obstruction clearance criteria associated with military airfield operations.

The JLUS includes diagrams (figures) of Military Compatibility Areas (MCAs), which are used to formally designate a geographic area where military operations may impact local communities, and conversely, where local activities may affect the military's ability to conduct its mission(s). The MCAs include subzones that delineate areas of concern for bird/wildlife aircraft strike hazards, safety, noise, and airfield imaginary surfaces. The MCAs are intended to promote an orderly transition between community and military land uses so that land uses remain compatible; protect public health, safety, and welfare; maintain operational capabilities of military installations and areas; promote an awareness of the size and scope of military training areas to protect areas separate from the actual military installation (e.g., critical air space) used for training purposes; and establish compatibility requirements within the designated area, such as requirements for sound attenuation or avigation easements.

NBVC Point Mugu MCA encompasses four subzones: Bird/Wildlife Aircraft Strike Hazard (BASH), Safety, Noise, and Airfield Imaginary Surfaces.

Bird/Wildlife Aircraft Strike Hazard (BASH) Subzone

The NBVC Point Mugu MCA includes a Bird/Wildlife Aircraft Strike Hazard (BASH) Subzone. The BASH Subzone is a five-mile statutory area from the center of the runway based on Federal Aviation Administration (FAA) recommendations. The BASH Subzone is characterized as an area that could be affected by bird and wildlife strikes due to the lower altitude of flying operations in the area. The following land uses near the NBVC Point Mugu airfield that have the potential to increase BASH incidents include: duck club activities, wetlands, other habitat restorations or new establishments, levees and plantings that attract birds, and changes in land use.

NBVC Point Mugu is located adjacent to the wetlands of Mugu Lagoon, which is an attractive habitat for bird species. There are also two game preserves located immediately west of NBVC Point Mugu. While the Navy's BASH Plan provides a protocol and measurement of management when conditions are high risk for BASH incidents, it does not address or identify the immediate concern of the duck clubs or game preserves adjacent to the airfield. Conversely, the Ventura County Zoning Ordinance does not consider

military compatibility as it relates to BASH incidents, nor does it address concern of duck clubs and game reserves.

Safety Subzone

The Safety Subzone guides compatible land use types, densities, and intensities within the Clear Zones (CZs) and Accident Potential Zones (APZs) I and II of Point Mugu's runways. The purpose of a Safety Subzone is to prevent the development of incompatible land uses in area with the greatest potential for an incident. The location of each Safety Subzone is based on the airfield layout and air operations identified by the Navy.

Noise Subzone

The Noise Subzone is a concern to the public surrounding military installations with flyer missions. NBVC Point Mugu is home to a large airfield that can support many types of aircraft. The area immediately surrounding NBVC Point Mugu is mostly agriculture and open space, which is compatible with military land uses. However, the flight paths could affect population centers and noise sensitive land uses. The Noise Subzone includes all land located off-installation within the 60 dB CNEL noise contour for NBVC Point Mugu.

Imaginary Surfaces Subzone

The Imaginary Surfaces Subzone provides guidance on the height of structures and buildings within the imaginary surfaces areas defined by the FAA and Navy. Imaginary surfaces are 3-D geographic areas comprising approach and departure airspace corridors and safety buffers. The height of structures and buildings are a major concern for flight operations because of the potential for a structure to extend into navigable airspace. Structures of concern include cell towers, power lines, wind turbines, buildings, and trees.

Channel Islands Air National Guard Base

The California Air National Guard 146 Tactical Airlift Wing officially dedicated a 208-acre installation in September of 1990. This property is north of NBVC, at the intersection of Hueneme and Naval Air Roads. This Wing began relocating their C-130 aircraft to this site from Van Nuys Airport in 1989. The Wing uses the NBVC Point Mugu runway and its 2,500-foot taxiway.

The mission of this unit is training for other assigned units once a month with various two-week active duty obligations. This results in over 1,500 personnel during training activities on the base. The Wing operates under the Air Force Mobility Command (AMC). Normal activities average 30 take offs and landings per day between 8 a.m. and 10 p.m. Monday through Friday, with an additional five return flights on weekends. Flight activity increases when the unit performs Fire Support Missions in conjunction with the U.S. Forest Service or the California Department of Forestry.

Aircraft Incidents

The most critical stages of the flight of an aircraft are takeoff and landing where accidents occur more frequently than at other flight stages. This places property in airport approach and departure zones at a higher risk. Hazard zones have been established for the four airports in Ventura County, based on landing

and takeoff patterns, with clear zones (areas that lie immediately beyond the ends of a runway) extending beyond the runway as recommended by the Federal Aviation Administration (FAA).

Oxnard and Camarillo airports had a combined total of over 220,000 annual flights in 2015. With an additional 29,493 average annual aircraft flights at Naval Base Ventura County, Point Mugu, and an estimated 70,000 at Santa Paula Airport, the airspace in this area can be heavily congested. According to Federal Aviation Administration and National Transportation Safety Board databases, since 2010 there have been 12 reported accidents at Camarillo (and one fatality), one accident at Oxnard (one fatality), three accidents at Point Mugu (two fatalities), and seven accidents at Santa Paula (four fatalities). There have been 25 reported incidents at Camarillo (four resulting in substantial aircraft damage, and the rest minor damage), three incidents at Oxnard (all resulting in minor damage), three incidents at Point Mugu (one resulting in substantial aircraft damage, the rest minor damage), and two incidents at Santa Paula (one resulting in substantial aircraft damage, the other minor damage). Only eight near mid-air collisions were reported, all at Camarillo. Air Traffic Control Tower at Camarillo is staffed by FAA personnel and the Tower at Oxnard airport is a Federal Contract Tower. The Towers provide control for aircraft in their respective areas from 7 a.m. to 9 p.m. The tower at Point Mugu is staffed by Navy personnel and is active from 7 a.m. to 10 p.m.

Damage from aircraft accidents varies depending on the weight, speed, and fuel load of the aircraft, as well as the actual land uses (i.e., structures) in the area. The risk to lives would tend to increase with greater density in use (e.g., a school versus a single-family house).

Other effects of aircraft operations include resident concerns over potential aircraft accidents, and aircraft noise.

Regulatory Setting

Federal

FAR 77

Title 14, Regulation 49 of the Code of Federal Regulations (CFR) includes Federal Aviation Regulation, Part 77 (FAR 77). FAR 77 establishes evaluation standards and notification requirements for objects affecting navigable airspace. This includes new construction as well as alterations to existing developments in the vicinity of airports. FAR 77 allows the FAA to identify potential aeronautical hazards in advance, thus preventing or minimizing possible adverse impacts to the safe and efficient use of navigable airspace. The regulation also requires evaluation and determination about potential hazardous effects of proposed construction or alterations, identifies mitigating measures to enhance safe air navigation, and charts new potentially hazardous objects. FAR 77 establishes a series of "Imaginary Surfaces", or horizontal and vertical planes, around airports in order to provide the dimensions within which objects are considered hazardous to airport operating procedures and/or air navigation. These surfaces cover every angle of approach and departure and are based on the specific dimensions, runway types, and operations of a given airport.

State

California Public Utilities Code

The State of California Public Utilities Code (PUC), Sections 21670 et seq., requires the County Board of Supervisors to establish an Airport Land Use Commission (ALUC) in each county with an airport operated for the benefit of the general public. The PUC also sets forth the range of responsibilities, duties, and powers of the Commission. Instead of creating a new body to serve as the ALUC, State law allows the county board of supervisors to authorize an appropriately designated body to fulfill ALUC responsibilities (See Section 21670.1). In Ventura County, the Board of Supervisors has designated the Ventura County Transportation Commission (VCTC) to act as the ALUC for the County. PUC Section 21675 requires the Airport Land Use Commission to formulate a comprehensive land use plan for the area surrounding each public use airport in the County. The Commission is also tasked with formulating a plan for the area surrounding each federal military airport located in the County. Section 21675 specifies that comprehensive land use plans shall provide for the orderly growth of each airport and the area surrounding the airport, and safeguard the welfare of the inhabitants within the vicinity of the airport and the public in general. Section 21676 requires that local general plans conform with the ALUC's comprehensive airport land use plan and grants the ALUC authority to review amendments to general plans, specific plans and zoning ordinances and building regulations that apply within the airport planning boundary.

Senate Bill 1462

Senate Bill 1462 (Chapter 906, Statutes of 2004) expanded the requirements for local governments to notify military installations of proposed development and planning activities. This statute states that "prior to action by a legislative body to adopt or substantially amend a general plan, the planning agency shall refer the proposed action to the branches of the Armed Forces when the proposed project is located within 1,000 feet of a military installation, beneath a low-level flight path, or within Special Use Airspace (SUA)...."

Senate Bill 1468

Senate Bill 1468 (Chapter 971, Statutes of 2002) requires State Office of Planning and Research (OPR) to include guidance concerning incorporating military installation compatibility into a general plan, and how a general plan should consider the impact of civilian growth on readiness activities at military bases, installations, and training areas.

California Aviation System Plan-Policy Element

The California Aviation System Plan (CASP) Policy Element (PE) is the basis for implementing the State Aeronautics Act and identifying the Division of Aeronautics (Division) role in the California Department of Transportation (Caltrans) mission, vision, and values for a multimodal, interregional, transportation system. The PE is updated on approximately a five-year cycle with the last update published in October 2011.

LOCAL

Ventura County Airport Land Use Commission Airport Comprehensive Land Use Plan

Adopted in July 2000, The Airport Comprehensive Land Use Plan (ACLUP) for Ventura County is intended to protect and promote the safety and welfare of residents near the military and public use airports in the County, as well as airport users, while promoting the continued operation of those airports. Specifically, the plan seeks to protect the public from the adverse effects of aircraft noise, to ensure that people and facilities are not concentrated in areas susceptible to aircraft accidents and to ensure that no structures or activities encroach upon or adversely affect the use of navigable airspace.

The ACLUP for NBVC Point Mugu is based on a 1992 AICUZ Study and is due to be updated to reflect the 2015 AICUZ Study. The 2015 AICUZ Study contains updated compatibility analyses and updated noise contour analysis.

2005 Ventura County General Plan

The General Plan covers aviation hazards in Chapter 2, Hazards. Section 2.14 includes goals, policies, and programs related to aviation hazards.

2011 Initial Study Assessment Guidelines

The Initial Study Assessment Guidelines include criteria for evaluating environmental impacts for aviation hazards. These can be found in Section 19. Aviation Hazards.

SECTION 11.5 HAZARDOUS MATERIALS

Introduction

This section addresses hazardous materials, which includes any material that, because of its quantity, concentration, physical or chemical characteristics poses a significant present or potential hazard to human health and safety or to the environment if released into the workplace or the environment. Hazardous materials include, but are not limited to, hazardous substances, hazardous waste, and any material that the administering agency determines to be potentially injurious to the health and safety of persons or harmful to the environment if released into the workplace or the environment. This section summarizes hazardous materials and hazardous waste programs that exist in Ventura County, the types of materials that are managed, and briefly discusses current hazardous waste cleanup efforts within the county.

Major Findings

- There are over 2,600 facilities within Ventura County that store and use hazardous materials, maintain above-ground and under-ground hazardous substance storage tanks, and generate hazardous wastes. The majority of hazardous waste generated in the county is comprised of used oil, waste solvents and waste batteries.
- As of November 2016, there were 300 Hazardous Materials sites located in the unincorporated area of Ventura County, of these sites:
    - 27 were permitted underground storage tanks.
    - 273 have undergone or are undergoing hazardous materials remediation or may require remediation pending further testing. Of these, 162 have been designated as "Completed-Case Closed" including:
        - 22 Cleanup Program Sites,
        - 10 Landfill Disposal Sites,
        - 130 leaking underground fuel storage tank (LUST) sites,
    - One LUST site is designated “Open--Site Assessment,”

Existing Conditions

General Hazardous Materials Framework

A material is considered hazardous if it appears on a list of hazardous materials prepared by a federal, state, or local agency, or if it has characteristics defined as hazardous by such an agency. A hazardous material is defined in CA HSC Section 25501 as: any material that, because of its quantity, concentration, or physical or chemical characteristics, poses a significant present or potential hazard to human health and safety or to the environment if released into the workplace or the environment.

Hazardous materials include, but are not limited to, hazardous substances, hazardous waste, and any material that meets the definition according to the handler or the administering agency. Chemical and

physical properties of a substance are directly related to the degree of hazard it poses, including properties of toxicity, ignitability, corrosiveness, and reactivity.

These materials can pose a substantial present or future hazard to human health or the environment if improperly handled, stored, disposed, remediated, or otherwise managed. If improperly handled, hazardous materials can result in public health hazards through direct human contact with contaminated soils or groundwater, or through airborne releases in vapors, fumes, or dust. There is also the potential for accidental or unauthorized releases of hazardous materials that would pose a public health concern (e.g., drinking water contamination). The health effects of hazardous materials exposure are influenced by the dose to which a person is exposed, the frequency of exposure, the exposure pathway, and individual susceptibility.

Hazardous material releases can result in both short- and long-term effects on the local population and environment. Hazardous materials are governed by regulations that require proper storage and handling, business and environmental management plans, spill contingency plans, employee and public noticing, and other emergency preventive and response measures to minimize the risk of accidental releases and related environmental impacts. Chemicals and other materials found in soils of agricultural land or industrial sites as a result of current or past activity may also be of concern. When development on such sites is considered, potentially hazardous materials are identified and evaluated through a Phase I and/or Phase II environmental site assessment review conducted by the developer.

Hazardous Materials/Waste Generation and Management

Hazardous materials and hazardous waste is generated by a diverse range of industries in the county including agriculture, aerospace, on-shore and off-shore petroleum exploration, biotech, military, automotive services, public utilities, and various manufacturing and service industries. There are over 2,600 facilities within Ventura County that store and use hazardous materials, maintain above-ground and under-ground hazardous substance storage tanks, and generate hazardous wastes. The majority of hazardous waste generated in the county is comprised of used oil, waste solvents and waste batteries. (J. Wada; VC CUPA)

In addition to hazardous materials stored/handled at many facilities within the county, the county is intersected by numerous major transportation routes for highway, rail, ocean, pipeline, and aircraft travel that all carry hazardous substances. The release of hazardous materials is considered a significant environmental and public health threat. Therefore, substantial resources have been dedicated by a variety of agencies to create effective management programs.

Certified Unified Program Agency – CUPA

Part of the Ventura County Environmental Health Division (EHD) is the Ventura County Certified Unified Program Agency, (CUPA). The CUPA implements state and federal laws, regulations, county codes and local policies related to hazardous materials management. The Ventura County CUPA provides regulatory oversight for the following six statewide environmental programs:

- **Hazardous Waste:** The purpose of the hazardous waste program is to ensure that hazardous wastes are properly managed to protect public health and the environment. Waste is generally considered hazardous if it is ignitable, corrosive, toxic, reactive, or if it can be shown to be detrimental to human health or the environment. The EHD conducts routine inspections of

facilities that generate hazardous waste to verify compliance with State hazardous waste laws and regulations contained in the California Health and Safety Code, Chapter 6.5 and the California Code of Regulations, Title 22, Division 4.5. Ventura County facilities that generate hazardous waste, except those in the city of Oxnard, are required to obtain a hazardous waste producer's permit from EHD.

- **Hazardous Materials Business Plan:** A Hazardous Materials Business Plan (HMBP) provides the CUPA, local fire agencies, and the public with information regarding hazardous materials stored/handled at businesses and government facilities. The law requires facilities that store, use, or handle hazardous materials at or above specified threshold amounts to provide the CUPA with a HMBP. The CUPA has developed a Hazardous Materials Reporting Chart that explains the inventory reporting requirements and conditional exemptions in the California Health & Safety Code (HSC), Chapter 6.95, Article 1. The CUPA provides HMBP data to the local fire agencies. These agencies use the information during hazardous materials emergency responses. The CUPA is responsible for HMBP program compliance for the unincorporated area in Ventura County and within the cities of Simi Valley, Thousand Oaks, Moorpark, Fillmore, Santa Paula, Camarillo, Port Hueneme, and Ojai. However, within the cities of Oxnard and Ventura, the city fire departments are responsible for HMBP program compliance.

  The CUPA conducts routine HMBP inspections to ensure compliance, provide guidance on preventing or minimizing the risk of hazardous materials spills or releases, and to verify hazardous materials inventories, Emergency Response Plans, site maps, and training. The law requires that the HMBP, records of employee training, and updated site maps be available for review as part of the inspection process.

- **California Accidental Release Prevention Program (CalARP):** The objective of the CalARP program is to identify the risks associated with the use of extremely hazardous materials and to reduce the chances and negative effects to the public of an extremely hazardous materials release. To accomplish this, a facility must develop and maintain risk management plans and programs contained in the California Code of Regulations, Title 19, Chapter 4.5. Facilities subject to CalARP are inspected and evaluated to determine the completeness and effectiveness of risk management plans and programs. The CUPA regulates facilities subject to CalARP within Ventura County, with the exception of the cities of Oxnard and Ventura.

- **Underground Hazardous Materials Storage Tanks:** EHD regulates the construction, operation, repair and removals of underground storage tank (UST) systems within Ventura County, with the exception of the cities of Oxnard and Ventura. The goal of the UST Program is to protect public health, the environment and groundwater. To accomplish this goal, EHD ensures that facilities with UST operations are properly permitted and meet applicable monitoring requirements. This is accomplished during plan check and inspection activities. Each UST site is inspected annually to determine if the UST facility is in compliance with all applicable sections of the California Health and Safety Code Chapter 6.7 and California Code of Regulations Title 23.

- **Aboveground Petroleum Storage Tanks:** The CUPA regulates facilities subject to the Aboveground Petroleum Storage Act (APSA) within Ventura County with the exception of the cities of Oxnard and Ventura. In general, facilities storing at least 1,320 gallons of petroleum products in aboveground storage tanks/containers are subject to APSA requirements per California Health and Safety Code, Chapter 6.67. APSA requires the facility to maintain a Spill Prevention, Control, and Countermeasure (SPCC) Plan. This plan includes information on: the stored petroleum products, how the tanks/containers will be maintained and inspected, spill prevention measures, and spill response procedures. Such facilities are also required to annually submit a

Tank Facility Statement or Hazardous Materials Business Plan (HMBP). The program allows for certain types of facilities, such as farms, nurseries and construction sites, to qualify as "conditionally exempt" from certain APSA requirements. CUPA is required to establish a fee in order to administer the inspection and enforcement of APSA and to collect a surcharge for Office of the State Fire Marshall for oversight of the program.

- **Onsite Hazardous Waste Treatment/Tiered Permit:** In most cases, businesses in the county that treat hazardous waste onsite (except those in the City of Oxnard), are required to notify the CUPA of the treatment activity and comply with state laws and regulations pertaining to onsite hazardous waste treatment. Treatment is any process designed to change the physical, chemical or biological characteristic or composition of the hazardous waste. Depending on the treatment process and type and amount of hazardous waste treated, the treatment activity may be allowed under one of three treatment tiers managed by the CUPA.

In addition to these programs, the CUPA is involved with hazardous materials emergency response, investigation of illegal disposal of hazardous waste, and public complaints.

Other County Agencies Involved in Hazardous Materials Management

The Ventura County Fire Protection District is responsible in conjunction with an Automatic Aid Agreement to provide hazardous materials response capability to the cities and unincorporated areas of the county. The FPD also participates on a variety of committees that focus on pre-planning, preparation, and grant coordination for terrorism events and hazardous materials response.

The Sheriff, as Director of the Office of Emergency Services (OES), is responsible for population protection activities. The Sheriff's OES, a non-sworn component of the Sheriff's Department, carries out the functions of emergency management, planning and exercise development for response and recovery activities related to hazardous materials and other natural and man-made disasters.

The county's Public Health Officer enforces and observes all of the following in the unincorporated area of the county: (a) orders and ordinances of the Board of Supervisors pertaining to public health and sanitary matters; (b) orders including quarantine and other regulations prescribed by the department; and (c) statutes related to public health. The Public Health Officer may take any preventive measure that may be necessary to protect and preserve the public health from any public health hazard during any "state of war emergency," "state of emergency," or "local emergency," as defined by Section 8558 of the Government Code, within his or her jurisdiction. "Preventive measure" means abatement, correction, removal or any other protective step that may be taken against any public health hazard that is caused by a disaster and affects the public health.

Household Hazardous Waste Management

Residential households generate hazardous wastes that must be property disposed. These wastes may include latex paint, batteries, electronic waste, fluorescent lights, solvents, cleaners, oils, pool chemicals, and medications. The Ventura County Integrated Waste Management Division administers the Household Hazardous Waste (HHW) collection program and the operation of the Pollution Prevention Center, a permanent HHW collection facility which specifically serves residents of the unincorporated area and from the cities of Ojai, Santa Paula, and Fillmore. The County maintains information on permitted household hazardous waste facilities for residents to find out where to drop off various types of household hazardous waste. The County of Ventura holds monthly household hazardous waste collection

events at the County's Pollution Prevention Center. Most municipal jurisdictions within the county also offer similar monthly collection events.

Tracking Hazardous Materials Sites in Ventura County

Information on hazardous materials and contaminated properties is maintained by both the State of California and the County of Ventura. This section explains the agencies and programs responsible for managing this information and explains the presence of hazardous materials and sites in Ventura County.

The California Environmental Protection Agency (CalEPA) maintains the State of California Hazardous Waste and Substances List (also known as the "Cortese List"). Government Code Section 65962.5 requires CalEPA to annually update the Cortese List. The Department of Toxic Substances Control (DTSC) is responsible for providing a portion of the Cortese List information, while other State and local agencies provide the remaining information. The EnviroStor database, managed by DTSC, lists Brownfield sites (a US EPA program for contaminated properties), sites undergoing hazardous materials mitigation, sites with known contamination that may require further investigation, Federal Superfund sites, State response sites, voluntary cleanup sites, and school cleanup sites.

The California Water Resources Control Board and the State's Regional Water Quality Control Boards maintain "GeoTracker," which is a data management system for sites that impact, or have the potential to impact, water quality in California, with emphasis on groundwater. GeoTracker contains records for sites that require cleanup, such as Leaking Underground Storage Tank (LUST) Sites, Department of Defense Sites, and Cleanup Program Sites. GeoTracker also contains records for permitted facilities such as Irrigated Lands, Oil and Gas production, operating Permitted USTs, and Land Disposal Sites. GeoTracker portals retrieve and compile records from multiple State Water Board programs and other agencies.

Effective on January 1, 2013, all businesses that submit facility information such as hazardous materials business plans, underground storage tank, and hazardous waste generator forms and related documents, will be required to use the internet to submit this information to their local agency electronically through an electronic information management system known as the California Environmental Reporting System (CERS). CERS will benefit regulated facilities by simplifying the document submittal process, including new information submittals and updating existing information to the CUPA. CERS will allow response agencies quick access to current data during emergency response activities.

According to State-maintained data (i.e., EnviroStor and GeoTracker), as of November 2016, there were 295 Hazardous Materials sites listed in the unincorporated area of Ventura County, 22 of which were permitted underground storage tanks (while the State reported 22 sites, the county was monitoring 27 sites, therefore for purposes of this Background Report, the County is reporting a total of 300 Hazardous Materials sites and 27 permitted underground storage tanks sites), of these sites:

- 273 have undergone or are undergoing hazardous materials remediation or may require remediation pending further testing. Of these, 162 have been designated as "Completed-Case Closed" including:
    - 22 Cleanup Program Sites,
    - 10 Landfill Disposal Sites,
    - 130 leaking underground fuel storage tank (LUST) sites,
- One LUST site is designated "Open--Site Assessment."

Following is a summary of the geographic distribution of sites within the unincorporated county:

- Newbury Park: 71 sites (47 closed or permitted);
- Somis: 47 sites (23 closed or permitted);
- Saticoy: 22 sites (20 closed or permitted),
- Oak View: 19 sites (18 closed or permitted),
- Piru: 19 sites (10 closed or permitted),
- Other Unincorporated Areas : 117 sites (66 closed or permitted)

Updated information on State-maintained data is available through DTSC's EnviroStor at http://www.envirostor.dtsc.ca.gov/public/ and the Water Boards' GeoTracker at http://geotracker.waterboards.ca.gov/.

Through the CUPA, the County maintains records on particular types of sites that are more up-to-date than those maintained by the State. For instance, as of November 2016, the county was monitoring 27 permitted underground storage tanks in the unincorporated area (as opposed to the 22 reported by the State). A full list of Ventura County CUPA facilities and programs, including USTs, can be found at: http://www.vcrma.org/envhealth/EHD_FACILITY_LISTS/cupa_facilities.pdf.

Ongoing Hazardous Waste Cleanup Sites in Ventura County

Halaco Superfund Site

The Halaco site is located in Oxnard at 6200 Perkins Road. The Halaco Engineering Company operated a secondary metal smelter at the site from 1965 to 2004, recovering aluminum, magnesium, and zinc from dross, castings, cans, car parts, and other scrap metal. The Site includes an 11-acre area containing the former smelter, and an adjacent 26-acre waste management area where wastes were deposited. The site includes a portion of the Ormond Beach wetlands, one of the few remaining wetlands in the area and home to several endangered or threatened species.

During its 40 years of operation, Halaco produced a large quantity of waste (i.e., slag) containing residual metals from the smelting process. From about 1965 to 1970, Halaco discharged waste into unlined settling ponds in or adjacent to the Oxnard Industrial Drain. From about 1970 to 2002, Halaco deposited wastes into unlined earthen settling ponds east of the smelter. More than 700,000 cubic yards of waste remain on-site. The U.S. Environmental Protection Agency took over site clean-up activities in 2007 and is currently conducting a Feasibility Study that will analyze options for site cleanup and reuse.

Santa Susana Field Lab (SSFL)

The SSFL site is comprised of 2,850 acres located in rocky terrain above Simi Valley. The facility opened in 1948 and began as a research, development, and testing location for rocket engines. During its history, the site has been managed by North American Aviation, Rocketdyne, Rockwell, and Boeing, in cooperation with the U.S. Army and Air Force. NASA acquired a portion of the site from the Air Force in 1973 and still manages 451.2 acres within the SSFL site today. The Boeing Company manages the remaining 2,398.8 acres. All operations at SSFL ceased in 2006.

For several decades, state and federal agencies have conducted environmental analysis to determine the extent of potential contamination on site. Studies have been conducted on soils, groundwater, and surface water. In addition, certain facilities on site, including the rocket test stands and other related ancillary structures have been found to have historical significance based on the historic importance of the engine testing and the engineering and design of the structures. The NASA-administered areas of SSFL also contain cultural resources not related to rocket development. SSFL is located near the crest of the Simi Hills that are part of the Santa Monica Mountains running east-west across Southern California. The diverse terrain consists of ridges, canyons, and sandstone rock outcrops.

A clean-up plan addressing soil and water contamination has been developed for the site by state and federal regulators, as well as by Boeing and NASA. Remediation activities are ongoing.

USA Petrochem

The USA Petroleum/Petrochem site is located at 4777 Crooked Palm Road in the unincorporated area of Ventura County, approximately 100 feet from the Ventura River. The refinery was built in the late 1970s, operated for less than 10 years, and shut down in 1984. The site contained a number of very large above ground storage tanks, many of which had oily sludge left from when the refinery closed. Since site closure, a number of leaks were observed from the piping throughout the facility. There was also a large amount of asbestos on the pipes and process units.

Since August 2012, at the request of EHD, the U.S. EPA assumed oversight of cleanup operations at the site. Cleanup activities are ongoing and include, but are not limited to removal of contaminated soil and structures, spill cleanup, and removal of all remaining fuel, sludge, and refining chemicals. The property owner has already located and closed off all outfalls and drainages from the site to the Ventura River.

Talley Facility – Telair International (TFX Aviation site)

The Talley Facility is located at 3085 Old Conejo Road, in Newbury Park. The Facility originally was built in the early 1950s on approximately 12.85 acres of property. The Facility was used by Talley Corporation for manufacturing civilian and military aircraft components from approximately 1956 to 1989. Seven buildings were located on the Facility supporting various manufacturing processes including metal casting, degreasing, pickling, and plating. During the manufacturing process, the Facility generated hazardous wastes, which included the following hazardous constituents: hexavalent chromium (Cr+6), other metals, cyanide, Trichloroethylene (TCE), miscellaneous chlorinated solvents, and waste oils, some of which contained low concentrations of polychlorinated biphenyls (PCBs). On-site waste disposal practices included the use of a surface impoundment and a leachfield.

In 1983 it was discovered that the surface impoundment had leaked. Subsequent investigations revealed that soil and groundwater were contaminated with solvents and heavy metals (mainly TCE and Cr+6). In 1984 the Facility submitted a closure plan to Department of Toxic Substances Control (DTSC) for the surface impoundment. The impoundment was closed in 1984 and a total of 3,200 cubic yards of contaminated soil were later removed. An engineered cap was then installed over the impoundment area.

A final post-closure permit was issued by DTSC on November 24, 1992 which addressed water quality monitoring of the former surface impoundment, closure of the solid waste management units, and post-closure care of the former surface impoundment. Operation of the groundwater treatment plan was subsequently taken out of the final post-closure permit and covered by DTSC's Permit by Rule process. The groundwater treatment plant was authorized by Ventura County under Permit by Rule and is not part

of this permit. The Post-Closure Permit was renewed/ reissued in October 7, 2005, with an expiration date of October 7, 2015.

Corrective action at the Facility has been conducted pursuant to the requirements of the Administrative Order on Consent issued by U.S. EPA in 1988 and the Post-Closure Permit issued by DTSC in 1992. In 1993, U.S. EPA selected extraction and treatment as the remedy for groundwater contamination. The remediation is currently ongoing, treating about 2.5 million gallons of groundwater a month and involving a total of 40 wells used for extraction and monitoring. Continuation of the pumping and treating of the groundwater is necessary to eliminate further migration and prevent future exposure. The groundwater remedy is ongoing and is expected to continue throughout the period of this permit.

Commonly Found Hazardous Materials

Commonly found hazardous materials can occur in structural building components, particularly in older buildings, which sometimes contain hazardous materials such as asbestos, polychlorinated biphenyls (PCBs), lead, and mercury. Businesses that store, use, or handle hazardous materials at or above specified threshold amounts are required to prepare a Hazardous Materials Business Plan and submit it to the County's Certified Unified Program Agency (CUPA). Also, households can generate hazardous materials, and the County of Ventura holds monthly events for the collection of household hazardous waste on an appointment basis at the Pollution Prevention Center.

Structural Building Components

Asbestos. "Asbestos" is a general name for a group of naturally occurring minerals composed of small fibers. Structures built or remodeled between 1930 and 1981 could contain asbestos-containing building materials (ACBM), such as floor coverings, drywall joint compounds, acoustic ceiling tiles, piping insulation, electrical insulation, and fireproofing materials. The presence of ACBM in a building does not mean that the building is itself a health hazard; as long as ACBM remains in good condition and are not disturbed or damaged, exposure is unlikely. Exposure is most likely to result during demolition. Many buildings in Ventura County were constructed prior to 1981 and, therefore, have the potential to contain ACBM.

Regulations formulated by the Ventura County Air Pollution Control District (VCAPCD) and California Division of Occupational Safety and Health (CalOSHA) restrict asbestos emissions from building demolition and renovation activities, and specify safe work practices to minimize release of asbestos fibers. These regulations prohibit emissions of asbestos from asbestos-related manufacturing, demolition, and construction activities; require medical examinations and monitoring of employees engaged in activities that could disturb asbestos; specify precautions and safe work practices that must be followed to minimize the potential for release of asbestos; and require notice to Federal and local government agencies prior to beginning building demolition or renovation activity that could disturb asbestos. CalOSHA and the U.S. EPA define any material with one percent or more asbestos by weight as an ACBM.

PCBs. The manufacture and import of polychlorinated biphenyls (PCBs) have been banned in the U.S. since 1978. Sources of PCBs often include fluorescent light ballasts, electric transformers, and televisions, all of which are presumed to be present in Ventura County. Such items are regulated as hazardous waste and must be transported and disposed of accordingly. DTSC classifies PCBs as hazardous waste when concentrations exceed 5 parts per million (ppm) in liquids or 50 ppm in non-liquids.

Lead. Lead is a highly toxic metal that was used in products found in and around residences. Lead exposure from paint is possible when paint peels or is removed, and the lead can contaminate dust and soil. Construction workers can be exposed to airborne lead during demolition, renovation, or maintenance work. Although lead-based paints were banned from production in the 1970s, many buildings in Ventura County were constructed prior to that and may still contain lead. In addition to residences, areas along older, major roadways may contain aerially deposited lead (ADL), which could have been deposited from vehicle exhaust prior to 1996 when the sale of lead-based gasoline was banned.

CalOSHA standards establish a maximum safe exposure level for types of construction work where lead exposure may occur, including demolition of structures where materials containing lead are present; removal or encapsulation of materials containing lead; and new construction, alteration, repair, or renovation of structures with materials containing lead. Inspection, testing, and removal of lead-containing building materials must be performed by State-certified contractors who comply with applicable health and safety and hazardous materials regulations.

Mercury. Mercury is another toxic metal considered hazardous. It can be found in fluorescent light tubes and bulbs, thermostats, and other electrical equipment. If these items are disposed of in landfills mercury could leach into the soil or groundwater. The mercury typically found in lighting tubes has been known to exceed regulatory thresholds and therefore must be managed in accordance with hazardous waste regulations. Mercury can also be present in traps in the plumbing of older buildings, where mercury-containing equipment has been used. Any items that contain mercury must be disposed of according to applicable hazardous waste regulations.

Business Hazardous Waste

Businesses are required to safely dispose of hazardous waste. Illegal disposal of hazardous waste, such as dumping in the trash, down storm drains, or abandoning it in alleyways, can result in serious legal ramifications for business owners such as fines and/or jail time. Legal disposal for businesses can become complicated, time-consuming, and expensive, since businesses are required to pay for disposal, and business owners will often hire a contractor to dispose of the waste. Ventura County offers several options for certain businesses that make disposal of hazardous waste easier and/or less expensive.

Household Hazardous Waste

Residential households are another source of hazardous materials. The Ventura County Integrated Waste Management Division administers the Household Hazardous Waste (HHW) collection program and the operation of the Pollution Prevention Center, a permanent HHW collection facility which specifically serves residents of the unincorporated area and from the cities of Ojai, Santa Paula, and Fillmore. The County maintains information on permitted household hazardous waste facilities for residents to find out where to drop off various types of household hazardous waste. These wastes may include latex paint, batteries, electronic waste, fluorescent lights, solvents, cleaners, oils, pool chemicals, medications, and more, depending on the location. The County of Ventura holds monthly household hazardous waste collection events at the County's Pollution Prevention Center. Most municipal jurisdictions within the County also offer similar monthly collection events.

Regulatory Setting

This section describes the Federal, State, and local regulatory setting related to existing and potential hazardous materials.

Federal

Federal agencies that regulate hazardous materials include the U.S. Environmental Protection Agency (EPA), Occupational Safety and Health Administration (OSHA), the United States Department of Transportation (DOT), and the National Institutes of Health (NIH). The following Federal laws and guidelines govern hazardous materials storage, handling, and remediation in Ventura County:

- Occupational Safety and Health Act
- Federal Insecticide, Fungicide, and Rodenticide Act
- Comprehensive Environmental Response, Compensation, and Liability Act
- Guidelines for Carcinogens and Biohazards
- Superfund Amendments and Reauthorization Act Title III
- Resource Conservation and Recovery Act
- Toxic Substances Control Act

U.S. Environmental Protection Agency

The Environmental Protection Agency (EPA) is responsible for researching and setting national standards for a variety of environmental programs, and delegates to states and local government responsibility for issuing permits, and monitoring and enforcing compliance. EPA Region IX has authority over the Ventura County region, regulating chemical and hazardous materials use, storage, treatment, handling, transport, and disposal practices; protects workers and the community (along with CalOSHA, see below); and integrates the federal Clean Water Act and Clean Air Act into California legislation.

Federal Occupational Safety and Health Administration

The Federal Occupational Health and Safety Administration (OSHA) establishes and enforces Federal regulations related to health and safety of workers exposed to toxic and hazardous materials. In addition, OSHA sets health and safety guidelines for construction activities and manufacturing facility operations.

State

California passed the Hazardous Waste Control Act (HWCA) in 1972, which created the California Hazardous Waste Control Program. The program surveyed existing hazardous waste generation to determine the need for new or expanded facilities for meeting future waste management demands. The facility permitting program, designed to protect public health and the environment through the issuance of operating permits for facilities that treat, store, or dispose of hazardous wastes, provided a mechanism for in-depth inspections and a permit review of each hazardous waste facility at least every ten years.

California Environmental Protection Agency

In 1991, the California Environmental Protection Agency (CalEPA) was established to oversee and coordinate the activities of the Air Resources Board, Integrated Waste Management Board (succeeded by the Department of Resources Recycling and Recovery), Department of Pesticide Regulation, Department

of Toxic Substances Control, Office of Environmental Health Hazard Assessment, and State Water Resources Control Board.

Certified Unified Program Agency Program

In 1992, Senate Bill 1082 created the Unified Hazardous Waste and Hazardous Materials Management Regulatory Program (Unified Program), to ensure consistency throughout the state regarding hazardous waste and materials standards. Cal EPA oversees the entire Unified Program and certifies local government agencies, known as Certified Unified Program Agencies (CUPA), to implement the program standards.

A local agency, such as a county or city, applies to Cal/EPA for certification as the Unified Program Agency, responsible for implementing the Unified Program within its jurisdiction. A Certified Unified Program Agency must establish a program that consolidates, coordinates and makes consistent the administrative requirements, permits, inspection activities, enforcement activities, and hazardous waste and hazardous materials fees. The implementation of the Unified Program must not result in more fragmentation between jurisdictions than existed before the Unified Program, and the Unified Program must be consistent throughout the entire county.

The Unified Program is implemented at the local level, but the program is certified by the Secretary of California Environmental Protection Agency (CalEPA). The Governor's Office of Emergency Services, Department of Toxic Substances Control, Office of the State Fire Marshal, and State Water Resources Control Board are also involved with the Unified Program.

California Governor's Office of Emergency Services

The California Governor's Office of Emergency Services (OES) supports and enhances emergency management, including preparedness, response, recovery, and mitigation needs, and assists local and tribal governments with hazard mitigation planning. The OES also develops the State Hazard Mitigation Plan, and respond to and aids in the recovery from emergencies within the State. In addition, the OES is responsible for providing technical assistance and evaluation of the Hazardous Material Release Response Plan (Business Plan) and the Area Plan Programs.

California Department of Toxic Substances Control

The California Department of Toxic Substances Control (DTSC) regulates hazardous substances and wastes, oversees remedial investigations, protects drinking water from toxic contamination, and warns public exposed to listed carcinogens. DTSC also provides technical assistance and evaluation for the hazardous waste generator program including onsite treatment (tiered permitting).

CAL FIRE- Office of the State Fire Marshal (CAL FIRE-OSFM)

The Office of the State Fire Marshal (OSFM) is responsible for ensuring the implementation of the Hazardous Material Management Plan (HMMP) and Hazardous Materials Inventory Statement (HMIS) and the Aboveground Petroleum Storage Act (APSA) Programs. The HMMP and HMIS Program is closely tied to the Business Plan Program. In addition, Cal FIRE-OSFM also handle the oversight and enforcement for the aboveground storage tank program. The OSFM is also responsible for ensuring the implementation of the California Fire Code HMMP/HMIS and the APSA program elements.

California Highway Patrol/ California Department of Transportation

The California Highway Patrol (CHP) and California Department of Transportation (Caltrans) have primary regulatory responsibility for the transportation of hazardous wastes and materials.

California Occupational Safety and Health Administration

The California Occupational Safety and Health Administration (CalOSHA) is responsible for promulgating and enforcing State health and safety standards, and implementing Federal OSHA laws. CalOSHA has authority to set and enforce standards to minimize the potential for release of asbestos and lead during construction and demolition activities.

State Water Resources Control Board/Regional Water Quality Control Board

The State Water Resources Control Board provides technical assistance and evaluation for the underground storage tank program. The Los Angeles Regional Water Quality Control Board (RWQCB) is one of nine regional boards in the state charged with protecting surface and groundwater quality from pollutants discharged or threatened to be discharged to the Waters of the State. The RWQCB issues and enforces National Pollutant Discharge Elimination System (NPDES) permits and regulates leaking underground storage tanks and other sources of groundwater contamination.

Local

Local agencies that coordinate and implement hazardous materials regulations and protocols in Ventura County include the Ventura County Air Pollution Control District (VCAPCD), Ventura County CUPA, and the Ventura County Fire Protection District.

Ventura County Air Pollution Control District

The Ventura County Air Pollution Control District (VCAPCD) regulates the demolition of buildings and structures that may contain asbestos through both inspection and law enforcement The VCAPCD is to be notified 10 days in advance of any proposed demolition or abatement work. The provisions that cover these operations are found in VCAPCD Regulation 1, Rule 62 and 62-1: Hazardous Materials and Airborne Toxics; Hazardous Materials. Individual project contractors are required to implement standard State and Federal procedures for asbestos containment and worker safety. The rule requires special handling of asbestos-containing building materials (ACBM) (e.g., by keeping materials continuously wetted). The Rule prohibits any visible emissions of ACBM to outside air. Individual project applicants are required to consult with the VCAPCD Enforcement Division prior to commencing demolition of a building containing ACBM.

Ventura County Environmental Health Division, CUPA Program

Ventura County Environmental Health Division, Certified Unified Program Agency (VC CUPA) is the CUPA for all incorporated and unincorporated areas of Ventura County, with the exception of the City of Oxnard., This means VC CUPA has been certified by the CalEPA to implement the following six state environmental programs:

- Hazardous Waste
- Hazardous Materials Business Plan (HMBP)

- California Accidental Release Prevention Program (CalARP)
- Underground Hazardous Materials Storage Tanks (UST)
- Aboveground Petroleum Storage Tanks /Spill Prevention Control & Countermeasure Plans (APSA)
- Onsite Hazardous Waste Treatment / Tiered Permit

The Hazardous Materials Business Plan (HMBP) is required to include a summary of business activities, owner and operator information including emergency contacts, the type and quantity of reportable hazardous materials, a site map, emergency response procedures, and an employee training program. In general, the submittal of a HMBP is required if a business handles and/or stores a hazardous material equal to or greater than the minimum reportable quantities. These quantities are 55 gallons for liquids, 500 pounds for solids, and 200 cubic feet (at standard temperature and pressure) for compressed gases. Exemptions to filing a HMBP are listed in the Health and Safety Code.

The Ventura County Environmental Health Division also administers the Medical Waste Program, Body Art Program, and has emergency on-call staff available to respond to hazardous and medical waste incidents/releases.

Ventura County Fire Protection District (VCFPD)

The Ventura County Fire Protection District serves the communities of Camarillo, Moorpark, Ojai, Port Hueneme, Simi Valley, and Thousand Oaks. Formed in May 1928, the VCFPD provides all-risk services including Fire Suppression, Rescue, Emergency Medical, Hazardous Materials, Urban Search and Rescue (USAR), Water Rescue, Operational Training, Fire Prevention, Investigation, Community Education, Community Emergency Response Teams (CERT) and Public Information. The VCFPD service area encompasses approximately 484 square miles and serves a population of more than 480,000. All VCFPD fire stations have a staffed fire engine in service. At strategic fire stations throughout the county, the VCFPD staffs a ladder truck along with a fire engine. Fire engines attack a fire; ladder trucks provide support to the fire attack crew. All apparatus are equipped to deliver emergency medical care. Some apparatus staffed with personnel EMTs to provide basic life support (BLS). While other apparatus are staffed with paramedics to deliver advance life support (ALS). In addition the department provides ALS services through the use of staffed paramedic squads.

The VCFPD also maintains other pieces of specialized apparatus throughout the county. The on-duty crew at the station will staff and operate these specialized units when needed. The Department responds to approximately 35,000 calls for service annually.

Ventura County Certified Unified Program Agency Program

The Ventura County CUPA implements Federal and State laws and county regulations related to hazardous waste use, storage, transport, and disposal. The CUPA activities include education on proper handling, storage, and disposal of hazardous wastes; inspections of hazardous waste generators; the investigation of illegal disposal and public complaints; and emergency response to hazardous materials. Additionally, the CUPA provides oversight and regulation of statewide environmental programs, which include the following:

- Hazardous Waste,
- Hazardous Materials Business Plan,
- California Accidental Release Prevention Program,

- Underground Hazardous Materials Storage Tanks,
- Aboveground Petroleum Storage Tanks/ Spill Prevention Control & Countermeasure Plans
- Onsite Hazardous Waste Treatment/ Tiered Permit

For emergency response services, the City of Ventura Fire Department and the Oxnard Fire Department are Participating Agencies of the CUPA and implement the programs in their respective jurisdictions. The remainder of CUPA responsibilities in the county rest with the County Environmental Health Division.

2005 Ventura County General Plan

The General Plan covers hazardous materials in Chapter 2, Hazards. Section 2.15 includes goals, policies, and programs related to hazardous materials.

2011 Initial Study Assessment Guidelines

The Initial Study Assessment Guidelines include criteria for evaluating environmental impacts for hazardous materials. These can be found in Sections 20a. Hazardous Materials/Waste-Materials and 20b. Hazardous Materials/Waste-Waste.

Key Terms

Biohazard. An infectious agent or hazardous biological material that presents a risk or potential risk to the health of humans, animals, or the environment. The risk can be direct through infection or indirect through damage to the environment.

Brownfield. Abandoned, idled, or under-used real property where expansion or redevelopment is complicated by the presence or potential presence of environmental contamination.

Carcinogen. Any substance that can cause or aggravate cancer.

Corrosiveness. The ability to eat away materials and destroy human and animal tissue by chemical action (e.g., oven cleaner).

Exposure Pathway. The route through which a chemical can enter the body (e.g., through the skin, inhaling, ingesting).

Groundwater. Water that exists beneath the land surface in openings (space) between soil and rock. Does not include water residue from underground mining.

Heavy Metal. An individual metal or metal compound that can negatively affect people's health. Though in very small amounts certain heavy metals are necessary to support life (e.g., iron, copper, manganese, zinc), when heavy metals are not metabolized by the body, they can accumulate in the soft tissues and become toxic.

Ignitability. The ability to catch fire; flammable (e.g., lighter fluid, paint remover).

Leach. The process by which soluble substances are dissolved and transported through the soil, which may result in hazardous substances entering surface water, groundwater, or nearby soil.

Petroleum Hydrocarbons. The primary constituents in oil, gasoline, and diesel, plus a variety of solvents.

Polychlorinated Biphenyls (PCBs). Chemicals formerly manufactured for use as coolants and lubricants in transformers, and in other electrical equipment (e.g., fluorescent light ballasts, old televisions). In 1978, PCB production was banned in the U.S. because accumulation in the environment can cause harmful health effects, including cancer.

Reactivity. The ability to create an explosion or produce deadly vapors (e.g., bleach mixed with an ammonia-based cleaner).

Release/Occurrence. Any means by which a substance could harm the environment (e.g., spilling, leaking, dumping).

Remediate. The act or process of removing pollution or contaminants from the soil, groundwater, sediment, or surface water to protect human health and the environment.

Solvent. A substance that dissolves another substance (or substances) to form a solution. Solvents are usually, but not always, liquids. Liquid solutions that do not have water as a solvent are called non-aqueous solutions. For example, solvents can be used to dissolve greases, oils, and paints or thin or mix pigments, paints, glues, pesticides, and epoxy resins.

Toxicity. The ability to produce injury, illness, or damage to people, domestic animals, or wildlife through ingestion, inhalation, or absorption through the body (e.g., cleaning fluids, pesticides, bleach, drain cleaner).

SECTION 11.6 NOISE AND VIBRATION

Introduction

This section includes a description of relevant acoustical background information, including fundamental principles of acoustics, a description of the existing community noise environment in Ventura County, applicable federal, state and local regulations, and key terms.

Major Findings

The major findings with respect to noise are as follows:

- Based on ambient noise level measurements throughout unincorporated areas of the county, the predominant sources of noise include traffic noise on major roadways, transit and freight trains, and aircraft.
- Roadway traffic is the predominant source of noise affecting sensitive land uses in the county. Freeways and major arterial roadways are the primary sources of traffic noise. Based on traffic-noise modeling, the roadways in unincorporated Ventura County with the greatest modeled traffic-noise levels are US-101 and State Routes 23, 118, and 126.
- Of the roadway segments modeled, the 60 A-weighted decibels (dBA) traffic noise contour ranges from 4 to 1,792 feet from the centerline of the roadway. Residential land uses located within the 60 dBA contour along these roadway segments are currently exposed to noise levels above the 60 dBA Community Noise Equivalent Level (CNEL) standard for residential land uses.
- In addition to traffic noise on local roadways and state highways, passenger and freight trains operating within the unincorporated areas of the county contribute to community noise levels. Based on the modeling conducted, the 60 dBA CNEL railroad noise contour is between approximately 154 to 165 feet from the centerline of the rail line. Residential land uses located within the 60 dBA contour along these railroad lines are currently exposed to noise levels above the 60 dBA CNEL standard for residential land uses.
- The Airport Comprehensive Land Use Plan (CLUP) for Ventura County establishes noise compatibility policies for sensitive land uses within the 60 dBA and higher CNEL noise contours. The plan restricts extremely sensitive land uses (e.g., mobile home parks) within the 60 dBA CNEL contour and requires mitigation measures for moderately sensitive land uses within the 60 dBA CNEL contour.
- Noise generated by industrial facilities and other stationary sources contribute to the ambient noise environment in their immediate vicinities.

Existing Conditions

Acoustics Fundamentals

Acoustics is the scientific study that evaluates perception, propagation, absorption, and reflection of sound waves. Sound is a mechanical form of radiant energy, transmitted by a pressure wave through a

solid, liquid, or gaseous medium. Sound that is loud, disagreeable, unexpected, or unwanted is generally defined as noise. Common sources of environmental noise and noise levels are presented in Table 11-5.

TABLE 11-5
TYPICAL NOISE LEVELS

Common Outdoor Activities	Noise Level (dB)	Common Indoor Activities
	110	Rock band
Jet flyover at 1,000 feet	100	
Gas lawnmower at 3 feet	90	
Diesel truck moving at 50 mph at 50 feet	80	Food blender at 3 feet, Garbage disposal at 3 feet
Noisy urban area, Gas lawnmower at 100 feet	70	Vacuum cleaner at 10 feet, Normal speech at 3 feet
Commercial area, Heavy traffic at 300 feet	60	
Quiet urban daytime	50	Large business office, Dishwasher in next room
Quiet urban nighttime	40	Theatre, Large conference room (background)
Quiet suburban nighttime	30	Library, Bedroom at night, Concert hall (background)
Quiet rural nighttime	20	Broadcast/Recording Studio
Threshold of Human Hearing	0	Threshold of Human Hearing

Sound Properties

A sound wave is initiated in a medium by a vibrating object (e.g., vocal chords, the string of a guitar, or the diaphragm of a radio speaker). The wave consists of minute variations in pressure, oscillating above and below the ambient atmospheric pressure. The number of pressure variation cycles occurring per second is referred to as the frequency of the sound wave and is expressed in hertz.

Directly measuring sound pressure fluctuations would require the use of a very large and cumbersome range of numbers. To avoid this and have a more useable numbering system, the decibel scale was introduced. A sound level expressed in decibels (dB) is the logarithmic ratio of two like pressure quantities, with one pressure quantity being a reference sound pressure. For sound pressure in air the standard reference quantity is generally considered to be 20 micropascals, which directly corresponds to the threshold of human hearing. The use of the decibel is a convenient way to handle the million-fold range of sound pressures to which the human ear is sensitive. A decibel is logarithmic; it does not follow normal algebraic methods and cannot be directly summed. For example, a 65 dB source of sound, such as a truck, when joined by another 65 dB source results in a sound amplitude of 68 dB, not 130 dB (i.e., doubling the source strength increases the sound pressure by 3 dB). A sound level increase of 10 dB corresponds to 10 times the acoustical energy, and an increase of 20 dB equates to a 100-fold increase in acoustical energy.

The loudness of sound perceived by the human ear depends primarily on the overall sound pressure level and frequency content of the sound source. The human ear is not equally sensitive to loudness at all frequencies in the audible spectrum. To better relate overall sound levels and loudness to human perception, frequency-dependent weighting networks were developed. The standard weighting networks are identified as A through E. There is a strong correlation between the way humans perceive sound and

A-weighted sound levels (dBA). For this reason, the dBA can be used to predict community response to noise from the environment, including noise from transportation and stationary sources. All sound levels discussed in this section are A-weighted decibels unless otherwise noted.

Noise can be generated by a number of sources, including: mobile (i.e., transportation) sources such as automobiles, trucks, and airplanes; and stationary (i.e., non-transportation) sources such as construction sites, machinery, and commercial and industrial operations. As acoustic energy spreads through the atmosphere from the source to the receiver, noise levels attenuate (i.e., decrease) depending on ground absorption characteristics, atmospheric conditions, and the presence of physical barriers. Noise generated from mobile sources generally attenuate at a rate of 4.5 dB per doubling of distance. Stationary noise sources spread with more spherical dispersion patterns that generally attenuate at a rate of 6 to 7.5 dB per doubling of distance.

Atmospheric conditions such as wind speed, turbulence, temperature gradients, and humidity may additionally alter the propagation of noise and affect levels at a receiver. Furthermore, the presence of a large object (e.g., barrier, topographic features, and intervening building façades) between the source and the receptor can provide significant attenuation of noise levels at the receiver. The amount of noise level reduction (i.e., shielding) provided by a barrier primarily depends on the size of the barrier, the location of the barrier in relation to the source and receivers, and the frequency spectra of the noise. Natural (e.g., berms, hills, and dense vegetation) and human-made features (e.g., buildings and walls) may be used as noise barriers.

All buildings provide some exterior-to-interior noise reduction. A building constructed with a wood frame and a stucco or wood sheathing exterior typically provides a minimum exterior-to-interior noise reduction of 25 dB with its windows closed, whereas a building constructed of a steel or concrete frame, a curtain wall or masonry exterior wall, and fixed plate glass windows of one-quarter-inch thickness typically provides an exterior-to-interior noise reduction of 30–40 dB with its windows closed (Caltrans 2009).

Effects of Noise on Humans

Excessive and chronic exposure to elevated noise levels can result in auditory and non-auditory impacts to humans. Auditory effects of noise on people are those related to temporary or permanent hearing loss caused by loud noises. Non-auditory effects of exposure to elevated noise levels are those related to behavioral and physiological effects. The non-auditory behavioral effects of noise on humans are associated primarily with the subjective effects of annoyance, nuisance, and dissatisfaction, which lead to interference with activities such as communications, sleep, and learning. The non-auditory physiological health effects of noise on humans have been the subject of considerable research attempting to discover correlations between exposure to elevated noise levels and health problems, such as hypertension and cardiovascular disease. The mass of research infers that noise-related health issues are predominantly the result of behavioral stressors and not a direct noise-induced response. The extent to which noise contributes to non-auditory health effects remains a subject of considerable research, with no definitive conclusions.

The degree to which noise results in annoyance and interference is highly subjective and may be influenced by several non-acoustic factors. The number and effect of these non-acoustic environmental and physical factors vary depending on individual characteristics of the noise environment such as sensitivity, level of activity, location, time of day, and length of exposure. One key aspect in the prediction of human response to new noise environments is the individual level of adaptation to an existing noise environment. The greater the change in the noise levels that are attributed to a new noise

source, relative to the environment an individual has become accustom to, the less tolerable the new noise source will be perceived.

With respect to how humans perceive and react to changes in noise levels, a 1 dB increase is imperceptible, a 3 dB increase is barely perceptible, a 6 dB increase is clearly noticeable, and a 10 dB increase is subjectively perceived as approximately twice as loud (Egan 2007). These subjective reactions to changes in noise levels was developed on the basis of test subjects' reactions to changes in the levels of steady-state pure tones or broad-band noise and to changes in levels of a given noise source. It is probably most applicable to noise levels in the range of 50 to 70 dB, as this is the usual range of voice and interior noise levels. For these reasons, a noise level increase of 3 dB or more is typically considered substantial for humans in terms of the degradation of the existing noise environment.

Negative effects of noise exposure include physical damage to the human auditory system, interference, and disease. Exposure to noise may result in physical damage to the auditory system, which may lead to gradual or traumatic hearing loss. Gradual hearing loss is caused by sustained exposure to moderately high noise levels over a period of time; traumatic hearing loss is caused by sudden exposure to extremely high noise levels over a short period of time. Gradual and traumatic hearing loss both may result in permanent hearing damage. In addition, noise may interfere with or interrupt sleep, relaxation, recreation, and communication. Although most interference may be classified as annoying, the inability to hear a warning signal may be considered dangerous. Noise may also be a contributor to diseases associated with stress, such as hypertension, anxiety, and heart disease. The degree to which noise contributes to such diseases depends on the frequency, bandwidth, level of the noise, and the exposure time (Caltrans 2009).

Noise levels can also have adverse impacts on animals. (See Section 8.2, "Biological Resources," for more detail.)

Vibration

Vibration is the periodic oscillation of a medium or object with respect to a given reference point. Sources of vibration include non-human-caused phenomena (e.g., earthquakes, volcanic eruptions, sea waves, and landslides) and those introduced by human activity (e.g., explosions, machinery, traffic, trains, and construction equipment). Vibration sources may be continuous (e.g., operating factory machinery) or transient (e.g., explosions). Vibration levels can be depicted in terms of amplitude and frequency (relative to displacement), velocity, or acceleration.

Vibration amplitudes are commonly expressed in peak particle velocity (PPV) or root-mean-square (RMS) vibration velocity. PPV and RMS vibration velocity are normally described in inches per second (in/sec).

Although PPV is appropriate for evaluating the potential for building damage, it is not always suitable for evaluating human response. It takes some time for the human body to respond to vibration signals. In a sense, the human body responds to average vibration amplitude. The RMS of a signal is the average of the squared amplitude of the signal, typically calculated over a 1-second period. As with airborne sound, the RMS velocity is often expressed in decibel notation as vibration decibels (VdB), which serves to compress the range of numbers required to describe vibration (Federal Transit Association [FTA] 2006). This is based on a reference value of 1 micro (μ) in/sec.

The typical background vibration-velocity level in residential areas is approximately 50 VdB. Groundborne vibration is normally perceptible to humans at approximately 65 VdB. For most people, a

vibration-velocity level of 75 VdB is the approximate dividing line between barely perceptible and distinctly perceptible levels (FTA 2006).

Typical outdoor sources of perceptible ground vibration are construction equipment, steel-wheeled trains, and traffic on rough roads. If a roadway is smooth, the ground vibration is rarely perceptible. The range of interest is from approximately 50 VdB, which is the typical background vibration-velocity level, to 100 VdB, which is the general threshold where minor damage can occur in fragile buildings. Construction activities can generate ground vibrations, which can pose a risk to nearby structures. Constant or transient vibrations can weaken structures, crack facades, and disturb occupants (FTA 2006).

Construction vibrations can be transient, random, or continuous. Transient construction vibrations are generated by events such as blasting, impact pile driving, and wrecking balls. Continuous vibrations result from activities such as vibratory pile drivers, large pumps, and compressors. Random vibration can result from jackhammers, pavement breakers, and heavy construction equipment. Table 11-6 describes the general human response to different levels of ground vibration-velocity levels.

TABLE 11-6
HUMAN RESPONSE TO DIFFERENT LEVELS OF GROUND NOISE AND VIBRATION

Vibration-Velocity Level (VdB)	Human Reaction
65	Approximate threshold of perception.
75	Approximate dividing line between barely perceptible and distinctly perceptible. Many people find that transportation-related vibration at this level is unacceptable.
85	Vibration acceptable only if there are an infrequent number of events per day.

Notes: VdB=vibration decibels referenced to 1 µ inch per second and based on the root mean squared velocity.
Source: FTA 2006

Sensitive Land Uses

Noise-sensitive land uses are generally considered to include those uses where noise exposure could result in health-related risks to individuals, as well as places where quiet is an essential element of their intended purpose. Residential dwellings are of primary concern because of the potential for increased and prolonged exposure of individuals to both interior and exterior noise levels. Additional land uses such as parks, schools, historic sites, cemeteries, sensitive habitats, and recreation areas are also generally considered sensitive to increases in exterior noise levels. Places of worship, hotels and other short-term lodging, libraries, and other places where low interior noise levels are desirable are also considered noise-sensitive. These noise-sensitive uses are also considered vibration-sensitive land uses in addition to commercial and industrial buildings where vibration would interfere with operations within the building, including levels that may be well below those associated with human annoyance.

The following sensitive land uses have been identified in Ventura County (Ventura County 2015a):

- Residential land uses
- Schools;
- Historic Sites;
- Cemeteries;
- Parks, Recreation, and Open Space Areas;
- Hospitals and Care Facilities;

- Sensitive wildlife habitats, including the habitat of rare, threatened, or endangered species;
- Hotels and other short-term lodging (e.g., bed and breakfasts, motels);
- Places of Worship; and
- Libraries.

Existing Community Noise Environment

The predominant noise sources within Ventura County are mobile sources, including motor vehicles on roadways, freight and passenger trains, and aircraft. Stationary sources from existing land uses such as industrial and agricultural operations also contribute to the existing noise environment. A total of 15 ambient noise level measurements consisting of fourteen 30-minute short-term (ST) measurements and one 24-hour long-term (LT) measurement, were conducted to characterize the existing noise environment at different locations throughout the unincorporated county. Figure 11-13 shows the locations of each sound level measurement and Table 11-7 summarizes the measured sound level at each location.

Notes: CNEL=community noise equivalent level, dB=decibel, Leq=equivalent sound level, L_{max}=maximum noise level, L_{min}=minimum noise level, LT= long term, ST= short term. See Figure 11-13 for map of locations.
[1] The LT measurement does not exceed the applicable 60 dB CNEL for the noise-sensitive land uses near this location.
Source: Field data collected by Ascent Environmental, Inc., August and October 2016.

As shown in Table 11-7, the L_{eq} for ST measurement-2, 3, 4, 5, 6,7, 8, 9, 10, 11, and 12 exceed 60 dB. Sensitive receptors near these measurements include residential land use, open space, and recreational areas. It should be noted that these values were taken over the duration of 30 minutes and are intended to reflect ambient noise levels during that period alone; therefore, these values do not indicate CNEL levels at these locations. LT measurement-1, taken over a 24-hour period, provides the CNEL values for that location of 59.3 dB, which does not exceed the applicable threshold of 60 dB.

Existing Traffic Noise

Major highways in Ventura County include US 101, SR 1, SR 33, SR 150, SR 126, and SR 118. There is also a network of rural roadways throughout the county.

Traffic noise was modeled for 131 County-operated roadways segments and 82 state highway segments within the unincorporated county and adjacent areas. Table 11-8 summarizes the modeled existing traffic noise levels at 50 feet from the centerline of each major roadways and lists distances from each roadways centerline to the 70, 65, 60, and 55 dBA CNEL/L_{dn} traffic noise contours. Ascent Environmental performed noise modeling in 2016 based on existing average daily traffic (ADT) volumes and speeds as indicated by a 2015 traffic volumes report provided by the County of Ventura Public Works Agency and supplemented by Caltrans data for freeway segments (Ventura County 2015b; Caltrans 2014). Traffic noise modeling was conducted based on Caltrans' traffic noise analysis protocol and the technical noise supplement (Caltrans 2006, 2013). The modeling does not account for any natural or human-made shielding (e.g., the presence of topography, vegetation, berms, walls, or buildings) and, consequently, represents worst-case noise levels on a horizontal plane.

Notes: CNEL=community noise equivalent level, dB=decibel, Ave.=avenue, Rd.=Road, Blvd.=boulevard, Dr.=drive, Jct.=junction, Rte.=route, Fwy.=freeway, Hwy=highway, n/o=north of, s/o=south of, e/o=east of, w/o=west of

[1] Where applicable, direction of travel is specified based on Caltrans' nomenclature for traffic counts. Even route numbers are assumed to follow an east-to-west pattern and odd route numbers are assumed to follow a north-to-south pattern. ADT values for unnumbered roadways where direction is unclear are labeled either "back" or "ahead." Back typically represents traffic movement south or west of the count location; ahead usually represents traffic north or east of the count location.

Source: Modeling performed by Ascent Environmental, Inc. in 2017 based on Caltrans Annual Average Daily Truck Traffic on California State Highways, 2014; and Traffic Volumes of Ventura County Roadways, 2015.

Existing Railroad Noise

Noise from railroads is generated primarily by diesel locomotive engines, warning horns, and gate bells at railroad crossings. Other components of noise include diesel exhaust, cooling fans, and railroad car wheel/rail interaction. Amtrak, Metrolink, Fillmore and Western Railway, Union Pacific Railroad, and Ventura County Railroad Company all affect portions of the county.

Railroad data (e.g., engine type, trains per day) for the county were obtained from Amtrak (2016), Metrolink (2014), and the Multi-County Goods Movement Action Plan (2008). Using this data, railroad noise generated by Amtrak and Metrolink commuter diesel locomotives and general freight movement was modeled based on Noise Impact Assessment Guidelines for assessing railroad and transit noise (FTA 2006; Amtrak 2016; Metrolink 2014; Los Angeles County Metropolitan Transportation Authority et. al 2008). Table 11-9 summarizes the modeled existing railroad noise levels at 50 feet from the railroad centerline, along with approximate distances from the railroad centerlines to the 70 dB, 65 dB, 60 dB, and 55 dB CNEL/L_{dn} noise contours. The values shown in Table 11-9 assume that the receiver category is residential with no natural or human-made noise shielding or barriers (e.g., topography, vegetation, berms, walls, or buildings, or other attenuation measures), and are therefore considered "worst case" railroad noise conditions along the length of each corridor. The contours shown in Table 11-15 may be used to estimate noise levels at potential sensitive receptors near railroad lines. It is possible that existing or future sensitive receptors (e.g., residential land uses, recreation and open space, hospitals) could be located within the vicinity of a railroad. It should be noted that these contours are not based on data from specific railroad segments and therefore can be used to represent the expected noise levels for areas adjacent to these railroads throughout the unincorporated county.

TABLE 11-9
SUMMARY OF MODELED EXISTING RAILROAD NOISE LEVELS
Ventura County

Railroad Line	CNEL (dB) at 50 feet from Roadway Centerline	Distance (feet)			
		70 CNEL (dBA)	65 CNEL (dBA)	60 CNEL (dBA)	55 CNEL (dBA)
Amtrak	64.1	35	71	154	321
Metrolink	68.5	38	76	164	343
Freight Trains	68.7	38	76	165	344

Notes: CNEL=community noise equivalent level, dB=decibel
Source: Modeling conducted by Ascent Environmental, Inc. 2016 based on FTA, 2006.

Existing Airport Noise

Ventura County contains the Camarillo Airport, Santa Paula Airport, Oxnard Airport, and the Naval Base Ventura County Point Mugu. Camarillo Airport is located within the City of Camarillo, three miles southwest of the city's central business's district. The airport is situated less than one mile south of US-101 and seven miles east of the Pacific Ocean coastline. The Oxnard Airport is located one and a half miles from the Pacific Ocean coastline, four miles south of US-101 and one mile west of the SR 1. The Santa Paula Airport lies within the City of Santa Paula between SR 126 and the Santa Clara River. NBVC Point Mugu is located approximately six and a half miles southeast of Oxnard on the Pacific Coast and is bounded by SR 1 on the east.

The operations and land-use compatibility of these airports are covered by the Ventura County Airport Comprehensive Land Use Plan. A complete discussion of existing and future airport-related noise as described in this plan is discussed in detail below under the Regulatory Setting.

Existing Stationary Source Noise

The primary sources of stationary noise in unincorporated Ventura County consist of industrial and agricultural operations, and miscellaneous sources such as a shooting range in Holser Canyon, and a motocross facility near Piru. Major industrial noise sources include concrete and rock batch plants, sand and gravel mines, and Pepsi Cola and oil supply facilities. Noise from agricultural activities are generated from cultivation and harvesting equipment, irrigation and domestic water pumps, and anti-frost equipment (e.g., wind generators). Noise measurements and modeling were conducted for existing stationary noise sources at the Pepsi Cola supply facility, a batch plant, and a shooting range. See the data presented for Short-Term Measurement 1 (ST-1) for ambient noise levels at the Pepsi Cola supply facility taken in October 2016, ST-2 for ambient noise levels at the Wes Thompsons Shooting Range taken in August 2016, and ST-9 for ambient noise levels at the batch plant taken in August 2016, all contained in Table 11-7, "Summary of Ambient Noise Level Measurements."

Regulatory Setting

Federal

The Federal Noise Control Act of 1972

The Federal Noise Control Act of 1972 established a requirement that all federal agencies must comply with applicable federal, state, interstate, and local noise control regulations. Federal agencies also are directed to administer their programs in a manner that promotes an environment free from noise that jeopardizes public health or welfare.

U.S. Department of Transportation

To address the human response to groundborne vibration, the FTA of the U.S. Department of Transportation (DOT) has set forth guidelines for maximum-acceptable vibration criteria for different types of land uses. Among these guidelines are the following:

- 65 vibration velocity decibels (VdB), referenced to 1 µin/sec and based on the RMS velocity amplitude, for land uses where low ambient vibration is essential for interior operations (e.g., hospitals, high-tech manufacturing, and laboratory facilities);
- 80 VdB for residential uses and buildings where people normally sleep; and
- 83 VdB for institutional land uses with primarily daytime operations (e.g., schools, churches, clinics, and offices) (FTA 2006).

State

California requires each local government to implement a noise element as part of its general plan. California Administrative Code, Title 4, has guidelines for evaluating the compatibility of various land uses as a function of community noise exposure.

Title 24 of the California Code of Regulations

California's noise insulation standards became effective in 1974. In 1988, the Building Standards Commission approved revisions to these standards (Title 24, Part 2, California Code of Regulations). The ruling established that interior noise levels attributable to exterior sources shall not exceed 45 dB in any habitable room. The noise metric is measured in either CNEL or L_{dn}, consistent with the noise element of the local general plan. The commission also specifies that residential buildings or structures proposed to be located within exterior L_{dn} contours of 60 dB or greater, generated by an existing or planned freeway, expressway, parkway, major street, thoroughfare, rail line, rapid transit line, or industrial noise source, shall require an acoustical analysis showing that the building has been designed to limit intruding noise to an interior L_{dn} of 45 dB.

California Governor's Office of Planning and Research

The California Governor's Office of Planning and Research (OPR) publishes the State of California General Plan Guidelines (OPR 2003), which provide recommended standards for the acceptability of various types of land uses within specific Community Noise Equivalent Level (CNEL) contours. The noise standards are intended to provide guidelines for the development of noise elements. These basic guidelines may be tailored to reflect the existing noise and land use characteristics of a particular community. The Noise Compatibility Guidelines in Table 11-10 show the exterior noise standards recommended by the State for new development projects according to land use.

TABLE 11-10
STATE LAND USE COMPATIBILITY STANDARDS FOR COMMUNITY NOISE ENVIRONMENT

Land Use Category	Community Noise Exposure - L_{dn} or CNEL (db)						
	50	55	60	65	70	75	80
Residential – Low-Density Single Family, Duplex, Mobile							
Residential - Multi-Family							
Transient Lodging – Motels, Hotels							
Schools, Libraries, Churches, Hospitals, Nursing Homes							
Auditoriums, Concert Halls, Amphitheaters							
Sports Arenas, Outdoor Spectator Sports							
Playgrounds, Neighborhood Parks							
Golf Courses, Riding Stables, Water Recreation, Cemeteries							
Office Buildings, Business Commercial and Professional							
Industrial, Manufacturing, Utilities, Agriculture							

	Normally Acceptable	Specified land use is satisfactory, based upon the assumption that any buildings involved are of normal conventional construction, without any special noise insulation requirements.
	Conditionally Acceptable	New construction or development should be undertaken only after a detailed analysis of the noise reduction requirements is made and needed noise insulation features are included in the design. Conventional construction, but with closed windows and fresh air supply systems or air conditioning will normally suffice.
	Normally Unacceptable	New construction or development should generally be discouraged. If new construction or development does proceed, a detailed analysis of the noise reduction requirements must be made and needed noise insulation features included in the design.
	Clearly Unacceptable	New construction or development generally should not be undertaken.

Caltrans

In 2004, Caltrans published the Transportation- and Construction-Induced Vibration Manual (Caltrans 2004), which provides general guidance on vibration issues associated with construction and operation of projects in relation to human perception and structural damage.

Table 11-11 presents recommended levels of vibration that could result in damage to structures exposed to continuous vibration.

TABLE 11-11
CALTRANS RECOMMENDED VIBRATION LEVELS

PPV (in/sec)	Effect on Buildings
0.4-0.6	Architectural damage and possible minor structural damage
0.2	Risk of architectural damage to normal dwellings
0.1	Virtually no risk of architectural damage to normal buildings
0.08	Recommended upper limit of vibration to which ruins and ancient monuments should be subjected
0.006-0.019	Vibration unlikely to cause damage of any type

Notes: PPV=peak particle velocity, in/sec=inches per second
Source: Caltrans 2004

In May 2011, Caltrans adopted the Traffic Noise Analysis Protocol (Protocol) for New Highway Construction, Reconstruction, and Retrofit Barrier Projects pursuant to Title 23, Part 772 of the Code of Federal Regulations (23 CFR 772). The Protocol applies to any highway projects or multimodal project that: 1) require FHWA approval regardless of funding sources; or 2) is funded with federal-aid highway funds. Application of the Protocol and the procedures it provides ensures compliance with FHWA noise standards (Caltrans 2011).

Local

2005 General Plan

The Hazards Element in the Ventura County General Plan contains goal and policies that apply to noise in the county under Goals 2.16.1 and 2.16. 2. Table 11-12 summarizes the County's noise compatibility standards that apply to noise-sensitive uses and noise generators during discretionary review, as outlined in Policies 2.16.2.

The Ventura County General Plan also includes several area plans where local issues and concerns are dealt with in greater detail than the countywide elements of the Ventura County General Plan. The area plans with goals and policies differing from those contained in the General Plan are listed below. The Coastal Area and Local Coastal, El Rio/Del Norte, and North Ventura Avenue plans do not contain supplemental noise policies beyond those set forth in the General Plan.

TABLE 11-12 2005 VENTURA COUNTY GENERAL PLAN NOISE COMPATIBILITY STANDARDS (POLICIES 2.16.2)	
Type of Use or Activity, and Location	**Standards**
(1) Noise sensitive uses proposed to be located near highways, trucks routes, heavy industrial activities, and other relatively continuous noise sources	Incorporate noise control measures so that: a. Indoor habitable rooms do not exceed CNEL 45 b. Outdoor noise levels do not exceed CNEL 60 or $L_{eq}1H$ of 65 dB(A) during any hour.
(2) Noise sensitive uses proposed to be located near railroads	Incorporate noise control measures so that: a. Indoor habitable rooms do not exceed CNEL 45 b. Outdoor noise levels do not exceed L_{10} of 60 dB(A)
(3) Noise sensitive uses proposed to be located near airports	a. Prohibited in CNEL 65 or greater noise contour b. Permitted in CNEL 60 to 65 only if measures are taken to ensure interior noise levels of CNEL 45 or less
(4) Noise generators proposed to be located near any noise sensitive use	Noise control measures must ensure that ongoing outdoor noise levels received by sensitive receptors, as measured as the exterior wall of the building, does not exceed any of the following standards: a. $L_{eq}1H$ of 55 dB(A) or ambient noise level plus 3 dB(A), whichever is greater, during any hour from 6:00 a.m. to 7:00 p.m. b. $L_{eq}1H$ of 50 dB(A) or ambient noise level plus 3 dB(A), whichever is greater, during any hour from 7:00 p.m. to 10:00 p.m. c. $L_{eq}1H$ of 45 dB(A) or ambient noise level plus 3 dB(A), whichever is greater, during any hour from 10:00 p.m. to 6:00 a.m.
(5) Construction noise	Shall be evaluated and, if necessary, mitigated in accordance with the County Construction Noise Threshold Criteria and Control Plan

Notes: CNEL = Community Noise Equivalent Level; dB(A) = A-weighted decibel; $L_{eq}1H$ = equivalent noise level for a one-hour period; L_{10} = noise level exceeded for 10 percent of the measurement duration

Oak Park Area Plan

The Hazards Element of the Oak Park Area Plan (2005) contains policies related to noise under Goals 2.4.1-1 and 2.4.1-2. (Ventura County 2005)

Ojai Valley Area Plan

The Hazards Element of the Ojai Valley Area Plan (1995) contains policies related to noise under Goals 2.4.1-1 and 2.4.1-2. (Ventura County 2015c)

Piru Area Plan

The Hazards Element of the Piru Area Plan (2011) contains policies related to noise under Goals 2.4.1-1 and 2.4.1-2. (Ventura County 2011)

Saticoy Area Plan

The Land Use and Mobility elements of the Saticoy Area Plan (2015) contain policies related to noise under LU Goal 3 and MOB Goal 1. (Ventura County 2015d)

Thousand Oaks Area Plan

The Hazards Element of the Thousand Oaks Area Plan (2015) contains policies related to noise Goals 2.3.1.-1 and 2.3.1-2 (Ventura County 2015e)

Lake Sherwood/Hidden Valley Area Plan

The Hazards Element of the Lake Sherwood/Hidden Valley Area Plan (2010) contains policies related to noise under Goals 3.3.1.-1 and 3.3.1-2 and their associated policies. (Ventura County 2010a)

Construction Noise Threshold Criteria and Control Plan

Standardized federal or State criteria have not been adopted for assessing construction noise impacts; therefore, municipal planning criteria are generally developed and applied on a project-specific basis. Construction project noise criteria take into account the existing noise environment, the time-varying noise during the various phases of construction activities, the duration of the construction, and the adjacent land use.

As specific construction noise limits for noise-sensitive locations are not currently specified in the general plan or administrative code of Ventura County, the Construction Noise Threshold Criteria and Control Plan establishes construction noise thresholds and standard noise monitoring and control measures. These threshold criteria, monitoring, and control measures are required for all discretionary development projects. Projects that exceed the noise threshold criteria at sensitive receptor sites are required to implement effective noise mitigation measures recommended by manufacturers (Ventura County 2010b).

Noise sensitive-receptors that would be affected by construction activities within the county are listed in Table 11-13, along with their corresponding periods of greatest sensitivity to construction noise.

TABLE 11-13
NOISE-SENSITIVE RECEPTORS
Ventura County

Sensitive Receptor	Typical Sensitive Time Period
Hospitals, Nursing Homes (quasi-residential)	24 hours
Single-Family and Multi-Family Dwellings (residential)	Evening/Night
Hotels/Motels (quasi-residential)	Evening/Night
Schools, Churches, Libraries (when in use)	Daytime/Evening

Source: Ventura County 2010b

Noise-Sensitive Receptors

Normally, no evening or nighttime construction activity is permitted in areas having noise-sensitive receptors; however, in the event that an activity is deemed necessary and is permitted (e.g., emergency situations or roadway repairs that are timed to avoid peak hour traffic conditions), reduced noise threshold

criteria are provided for construction that must occur during those hours. The County of Ventura construction noise threshold criteria for daytime, evening, and nighttime hours is shown in Table 11-14.

TABLE 11-14
DAYTIME[1] CONSTRUCTION ACTIVITY NOISE THRESHOLD CRITERIA
Ventura County

Construction Duration Affecting Noise-Sensitive Receptors[2]	Noise Threshold Criteria[1]	
	Fixed L_{eq}(h) (dB)	Hourly L_{eq} (dB)[2,3]
Daytime (Mon. to Fri. from 7:00 a.m. to 7:00 p.m.; Sat., Sun., and Holidays from 9:00 a.m. to 7:00 p.m.)		
0 to 3 days	75	Ambient L_{eq}(h) + 3
4 to 7 days	70	Ambient L_{eq}(h) + 3
1 to 2 weeks	65	Ambient L_{eq}(h) + 3
2 to 8 weeks	60	Ambient L_{eq}(h) + 3
Longer than 8 weeks	55	Ambient L_{eq}(h) + 3
Evening (7:00 p.m. to 10:00 p.m.)		
Any Duration	50	Ambient L_{eq}(h) + 3
Nighttime (Mon. to Fri. from 10:00 p.m. to 7:00 a.m.; Sat., Sun., and Holidays from 10:00 p.m. to 9:00 a.m.)		
Any Duration	45	Ambient L_{eq}(h) + 3

Notes: L_{eq}=equivalent noise level, L_{eq}(h)=hourly equivalent noise level, dB= decibel, L_{max}=maximum sound level
[1] The applicable noise threshold criteria shall be the greater of the noise levels presented in the table at the nearest receptor area or 10 feet from the nearest noise sensitive building.
[2] The instantaneous L_{max} shall not exceed the noise threshold criteria by 20 dB more than eight times per daytime hour, six times per evening hour, or four times per nighttime hour.
[3] Local ambient L_{eq} measurements shall be made on any mid-week day prior to project work.
Source: Ventura County 2010b

Ventura County Noise Ordinance

The Ventura County Noise Ordinance was adopted by the County Board of Supervisors to protect residential communities from loud or raucous nighttime noise. The Ordinance prohibits the creation of loud or raucous noise from within a residential zone, which is audible to the human ear during the hours of 9:00 p.m. to 7:00 a.m. at a distance of 50 feet from the property line of the noise source or 50 feet from any such noise source if the noise source is in a public right-of-way. The Ordinance defines "loud or raucous noise" as sounds from (1) the use or operation of any radio, musical instrument, phonograph, television receiver, video cassette recorder, or any machine or device for the production, reproduction, or amplification of the human voice or any other sound, or (2) the use or operation of any lawn mower, backpack blower, blower, lawn edger, riding tractor, or other mechanical or electrical device or hand tool.

Airport Comprehensive Land Use Plan for Ventura County

The State Aeronautics Act (Public Utilities Code, Section 21670 et seq.) requires the preparation of an airport land use compatibility plan (ALUCP) for nearly all public-use airports in the State. The intent of an ALUCP is to encourage compatibility between and airport and the various land uses surrounding it (Caltrans 2011).

California State law requires the County Board of Supervisors to establish an airport land use commission (ALUC) in each county with an airport operated for the benefit of the general public. The Code also sets forth a range of responsibilities, duties, and powers of the ALUC. These include reviewing general plans,

proposed changes to zoning code and ordinances, land use actions and development projects, and airport development plans for consistency with compatibility policies. California State law also dictates that the county and affected cities modify their general and specific plans to be consistent with the ALUC's plan, or to take steps to overrule the ALUC. State law allows the County Board of Supervisors to authorize and appropriately designated body to fulfill ALUC responsibilities. For Ventura County, the Board of Supervisors has designated the Ventura County Transportation Commission (VCTC) to act as the ALUC for the County (Ventura County ALUC 2000).

The Ventura County Airports Comprehensive Land Use Plan (CLUP) serves as a complete plan for the County's three public-use airports and one military airport (i.e., Camarillo, Oxnard, Santa Paula, and Naval Base Ventura County Point Mugu). The CLUP is the primary document used by the Ventura County ALUC to help promote compatibility between the four airports and their environs. Included in the CLUP are a series of compatibility factors, zones and policies related to noise, safety, airspace protection, and over-flight activity (Ventura County ALUC 2000). For the purposes of this section, noise-related impact zones and compatibility policies in the CLUP are discussed below.

The CLUP includes four maps (depicted in Figure 11-14, Figure 11-15, Figure 11-16, Figure 11-17 of this document) showing noise contours depicting the greatest annualized noise impact, measured in terms of CNEL. The mapped noise contours for Oxnard Airport and NBVC Point Mugu are shown for the year 1991, Santa Paula Airport for 2015, and Camarillo Airport for the composite years 2003 and 2018. According to the CLUP, all proposed land use changes beyond the 60 CNEL contour are considered consistent with the noise compatibility policies set forth by the CLUP. For any proposed land-use changes within the 60 CNEL or greater, specific noise compatibility criteria apply based on corresponding land use categories and subcategories. Design and construction mitigation to attenuate noise must be applied to certain land uses to achieve consistency with the CLUP. The CLUP noise compatibility criteria are shown in Table 11-15.

TABLE 11-15
VENTURA COUNTY AIRPORT CLUP: NOISE COMPATIBILITY CRITERIA

Land Use Category1	Exterior Noise Exposure (dB CNEL)				
	60-65	65-70	70-75	75-80	>80

Notes: A=Acceptable land use, C=Land use is conditional upon meeting compatibility criteria (see footnotes), U=Unacceptable land use, CNEL=community noise equivalent level, dB=decibel, NLR=noise level reduction, dBA=A-weighted decibels

[1] New construction or development may be undertaken only after an analysis of noise reduction requirements and necessary noise insulation is included in the design.

[2] NLR from outdoors to indoor of at least 25 dBA must be achieved by incorporation of noise attenuation into the design and construction of the structure.

[3] NLR from outdoor to indoor of at least 30 dBA must be achieve by incorporation of noise attenuation into the design and construction of the structure.

[4] Measures to achieve NLR of 25 dBA must be incorporated into the design and construction of portions of these buildings where the public is received, office areas, noise sensitive areas, or where the normal noise level is low.

[5] Measures to achieve NLR of 30 dBA must be incorporated into the design and construction of portions of these buildings where the public is received, office areas, noise sensitive areas, or where the normal noise level is low.

[6] Measures to achieve NLR of 35 dBA must be incorporated into the design and construction of portions of these buildings where the public is received, office areas, noise sensitive areas, or where the normal noise level is low.

[7] NLR of 25 dBA is required.

[8] NLR of 30 dBA is required.

Notes: A=Acceptable land use, C=Land use is conditional upon meeting compatibility criteria (see footnotes), U=Unacceptable land use, CNEL=community noise equivalent level, dB=decibel

As shown in Figure 11-14 through Figure 11-17, residential, commercial, and/or industrial land uses are located within the 60 CNEL noise contour. Any proposed land use changes in this vicinity may be subject to the Noise Compatibility Criteria. As demonstrated in Table 11-15, land use subcategories within the 60-65 CNEL range identified as "Conditional" would be subject to design and/or construction standards to attenuate airport-related noise on such land uses.

Ventura County Department of Aviation Noise Abatement Procedures

The Ventura County Department of Airports (collectively, "the Department") has adopted noise abatement procedure for visual flight rules (VFR) for Oxnard and Camarillo airports. The Department provides instructions outlining departures, arrivals, and pattern procedures at each airport that are aimed at minimizing noise exposure over noise-sensitive areas without compromising safety. Pilots are requested to follow the published procedures unless circumstances render them unsafe, weather conditions do not allow, or they are otherwise instructed to deviate by the airport traffic control tower.

The following noise abatement procedures apply to all aircrafts departing and/or approaching the Oxnard Airport (Ventura County 2016a):

- Voluntary curfew from 11:00 p.m. to 6:00 a.m.;
- Remain as high as practical over residential areas during overflight, approaches, and departures;
- Use best rate of climb when departing any runway;
- No formation takeoff or landings without prior permissions of the Airport Director;
- Touch-and-go's (i.e., landing on a runway and taking off again without coming to a complete stop) and stop-and-go's are prohibited between the hours of 8:00 p.m. and 7:00 a.m. from Monday to Friday, and from 8:00 p.m. to 8:00 a.m. on the weekends;
- Full stop/taxi back operations will be permitted only if the aircraft plans to depart the airport traffic area; and
- No high-power engine run-ups for maintenance between 7:00 p.m. and 7:00 a.m.

The following noise abatement procedures apply to all aircrafts departing and/or approaching the Camarillo Airport (Ventura County 2016b):

- No aircraft departures between 12:00 a.m. and 5:00 a.m. without prior approval from the Airport director;
- Remain as high as practical over residential areas during overflight, approaches, and departures;
- Use best rate of climb when departing any runway;
- No formation takeoffs or landings without prior permission of the Airport Director;
- Utilize low energy approaches;
- Avoid residential overflights ("Fly Friendly," Air Craft Owners and Pilots Association Guidelines); and
- North traffic fly downwind over US-101.

Key Terms

A-Weighted Sound Level. An A-weighted sound level is the frequency-response adjustment of a sound level meter that conditions the output signal to approximate human hearing response.

Airport Land Use Compatibility Plan (ALUCP). The California State Aeronautics Act (Public Utilities Code, Section 21670 et seq.) requires the preparation of an airport land use compatibility plan (ALUCP) for nearly all public-use airports in the state. The intent of the ALUCP is to encourage compatibility between airports and the various land uses that surround them.

Community Noise Equivalent Level (CNEL). A CNEL is similar to the L_{dn} with an additional 5 dB penalty applied during the noise-sensitive hours from 7 p.m. to 10 p.m., which are typically reserved for relaxation, conversation, reading, and watching television.

Day-Night Noise Level (L_{dn}). L_{dn} is the 24-hour L_{eq} with a 10 dB penalty applied during the noise-sensitive hours from 10 p.m. to 7 a.m., which are typically reserved for sleeping.

Decibel (dB). A dB is a sound level expressed in decibels which is the logarithmic ratio of two like pressure quantities, with one pressure quantity being a reference sound pressure.

Equivalent Noise Level (L_{eq}). An L_{eq} is the equivalent steady-state noise level in a stated period of time that would contain the same acoustic energy as the time-varying noise level during the same period (i.e., average noise level).

Maximum Noise Level (L_{max}). The L_{max} is the highest instantaneous noise level during a specified time period.

Minimum Noise Level (L_{min}). The L_{min} is the lowest instantaneous noise level during a specified time period.

Noise Exposure Contours. Noise exposure contours are noise exposure levels as a function of distance from the noise source.

Noise-Sensitive Area. A noise-sensitive place in a place where noise exposure could result in health-related risks to individuals, as well as places where quiet is an essential element of their intended purpose. Examples include residences, cemeteries, churches, and hospitals.

Peak Particle Velocity (PPV). PPV is defined as the maximum instantaneous positive or negative peak of a vibration signal. PPV is typically used in the monitoring of transient and impact vibration and has been found to correlate well to the stresses experienced by buildings.

Root-Mean-Square (RMS). RMS is the average of the squared amplitude of a vibration signal, typically calculated over a 1-second period. As with airborne sound, the RMS velocity is often expressed in decibel notation as vibration decibels (VdB), which serves to compress the range of numbers required to describe vibration. Because the human body responds to average vibration amplitude, RMS velocity values as measured in VdB are used to estimate vibration effects on humans.

Single-Event Noise Exposure Level (SENEL). The single event noise exposure level, in decibels (dB), is the noise exposure level of a single event, such as an aircraft flyby, measured over the time interval

between the initial and final times for which the noise level of a single event exceeds a given threshold noise level.

Vibration Decibels (VdB). Average vibration amplitude is a more appropriate measure for human response as it takes time for the human body to respond. Average particle velocity over time is zero, so the root-mean-square (RMS) amplitude velocity level, measured in VdB, is used to quantify annoyance.

ACRONYMS

The following acronyms are used throughout the annexes in this volume:

- AASHTO—American Association of State Highway and Transportation Officials
- AB—Assembly Bill
- APCD—air pollution control district
- BEACON—Beach Erosion Authority for Clean Oceans and Nourishment
- BOS—Board of Supervisors
- BRIC—Building Resilient Infrastructure and Communities
- CAAP—Climate Action and Adaptation Plan
- CAL FIRE—California Department of Forestry and Fire Protection
- Cal OES—California Office of Emergency Services
- CalARP—California Accidental Release Prevention Program
- CAMUTCD—California Manual on Uniform Traffic Control Devices
- CDAA—California Disaster Assistance Act
- CDBG—Community Development Block Grant
- CDFW—California Department of Fish and Wildlife
- CEQA—California Environmental Quality Act
- CERT—Community Emergency Response Team
- CFR—Code of Federal Regulations
- CIBCSD—Channel Islands Beach Community Services District
- CIP—capital improvement program
- COS—Conservation and Open Space Element
- COSCA—Conejo Open Space Conservancy Agency
- COSP—City of Santa Paula
- CRPD—Conejo Recreation and Park District
- CRS—Community Rating System
- CSU—California State University
- CSUCI—California State University, Channel Islands
- CTM—Circulation, Transportation, and Mobility Element
- DAC—disadvantaged community
- DFIRM—digital flood insurance rate map
- DHS—Department of Homeland Security
- DSOD—Division of Safety of Dams
- DUNS—Dun and Bradstreet Number
- DWR—Department of Water Resources
- EAP—emergency action plan
- EIR—Environmental Impact Report
- EMPG—Emergency Management Performance Grant
- EOC—emergency operations center
- EOP—emergency operations plan
- EPA—Environmental Protection Agency
- ERP—emergency response plan
- ESRM—Environmental Science and Resource Management
- FB—finance and budgeting

- FEMA—Federal Emergency Management Agency
- FHRP—fire hazard reduction program
- FIPS—Federal Information Processing System
- FIRM—flood insurance rate map
- FMA—Flood Mitigation Assistance Grant Program
- FMAP—Fire Management Assistance Program
- FWS—flood warning system
- GHG—greenhouse gas
- GIS—geographic information system
- GSA—Ventura County General Services Agency
- HHPD—Rehabilitation of High Hazard Potential Dams
- HMA—Hazard Mitigation Assistance
- HMGP—Hazard Mitigation Grant Program
- HMP—hazard mitigation plan
- HPS—City of Santa Paula Hazards and Public Safety Element
- IDF—Inflow Design Flood
- IGC—intergovernmental coordination
- IRWM—Integrated Regional Water Management
- IRWMP—Integrated Regional Water Management Plan
- JP—joint partnership
- LARWQCB—Los Angeles Regional Water Quality Control Board
- LCP—Local Coastal Program
- LLAP—Local Levee Assistance Program
- MDERP—Matilija Dam Ecosystem Restoration Project
- MPSP—master plans, strategies, and programs
- MS4—municipal separate storm sewer system
- MWD—municipal water district
- NFIP—National Flood Insurance Program
- NFWF—National Fish and Wildlife Foundation
- NGO—non-governmental organization
- NOAA—National Oceanic and Atmospheric Administration
- NRCS—Natural Resources Conservation Service
- NWS—National Weather Service
- OBRAP—Ormond Beach Restoration and Access Plan
- OCC—Oxnard City Code
- OES—office of emergency services
- OMC—Ojai Municipal Code
- OVLC—Ojai Valley Land Conservancy
- OVSD—Ojai Valley Sanitary District
- PDM—Pre-Disaster Mitigation Grant Program
- PFS—Public Facilities, Services, and Infrastructure
- PMF—probable maximum flood
- POC—point of contact
- PSPS—public safety power shutoff
- PSR—planning, studies and reports
- PTP—Pumping Trough Pipeline
- PVRPD—Pleasant Valley Recreation & Park District
- RDR—regulation and development review
- RHNA—Regional Housing Needs Allocation

- SB—Senate Bill
- SCADA—supervisory control and data acquisition
- SCAG—Southern California Association of Governments
- SCC—California State Coastal Conservancy
- SCRC—Santa Clara River Conservancy
- SFD—Santa Felicia Dam
- SFHA—special flood hazard area
- SGMA—Sustainable Groundwater Management Act
- SLR—sea-level rise
- SMP—Salinity Management Pipeline
- SO—services and operations
- SVMC—Simi Valley Municipal Code
- SVOES—Simi Valley Office of Emergency Services
- SVPD—Simi Valley Police Department
- SWRCB—California State Water Resources Control Board
- THIRA—Threat & Hazard Identification & Risk Assessment
- TNC—The Nature Conservancy
- TOMC—Thousand Oaks Municipal Code
- USACE—U.S. Army Corps of Engineers
- USBR—U.S. Bureau of Reclamation
- USDA—U.S. Department of Agriculture
- UWCD—United Water Conservation District
- UWMP—urban water management plan
- VCFPD—Ventura County Fire Protection District
- VCOE—Ventura County Office of Education
- VCPWA-RT—Ventura County Public Works Agency—Roads and Transportation Department
- VCPWA-WP—Ventura County Public Works Agency—Watershed Protection
- VCSOES—Ventura County Sheriff's Office of Emergency Services
- VCSSFA—Ventura County Schools Self-Funding Authority
- VCTC—Ventura County Transportation Commission
- VMT—vehicle miles traveled
- VOAD—Voluntary Organizations Active in Disaster
- VRSD—Ventura Regional Sanitation District
- WCB—Wildlife Conservation Board
- WCVC—Watershed Coalition of Ventura County
- WEA—Wireless Emergency Alerts
- WSD—Water and Sanitation District

INTRODUCTION

BACKGROUND

Ventura County's hazard mitigation plan was developed and adopted in 2005 as a multi-jurisdictional process. Subsequent updates conducted in both 2010 and 2015 were also multi-jurisdictional efforts. Multi-jurisdictional hazard mitigation planning can be an effective process to build partnerships between communities that face common hazard risks, leading to shared solutions. It can also help build a foundation to shift priorities as risks and vulnerabilities change. Multi-jurisdictional planning processes are encouraged by the Federal Emergency Management Agency (FEMA), and offer the following advantages:

- Improves communication and coordination among jurisdictions and other regional entities
- Enables comprehensive mitigation approaches to reduce risks that affect multiple jurisdictions
- Maximizes economies of scale by leveraging individual capabilities and sharing costs and resources
- Avoids duplication of efforts, and
  Provides an organizational structure that local jurisdictions may find supportive.

For the *Ventura County Multi-Jurisdictional Hazard Mitigation Plan* 2022 update, a planning partnership was formed that expanded the partnership established during the 2015 hazard mitigation plan update, leveraging resources and meeting requirements of the federal Disaster Mitigation Act for as many eligible local governments as possible. The Disaster Mitigation Act defines a local government as follows:

> "Any county, municipality, city, town, township, public authority, school district, special district, intrastate district, council of governments (regardless of whether the council of governments is incorporated as a nonprofit corporation under State law), regional or interstate government entity, or agency or instrumentality of a local government; any Indian tribe or authorized tribal organization, or Alaska Native village or organization; and any rural community, unincorporated town or village, or other public entity."

In addition to the County, the jurisdictions participating in the *Multi-Jurisdictional Hazard Mitigation Plan* 2022 update include:

- 10 incorporated municipalities
- 14 special districts

All participating jurisdictions in a multi-jurisdictional plan must meet the requirements of Chapter 44 of the Code of Federal Regulations (44 CFR):

> "Multi-jurisdictional plans (e.g., watershed plans) may be accepted, as appropriate, as long as each jurisdiction has participated in the process and has officially adopted the plan." (Section 201.6(a)(4)).

Each participating planning partner prepared a jurisdiction-specific annex to this plan. These annexes, as well as information on the process by which they were created, are contained in this volume.

THE PLANNING PARTNERSHIP

Initial Solicitation and Letters of Commitment

A planning team made up of Ventura County staff solicited the participation of eligible municipalities and special districts in June 2019, at the outset of this update effort. Emails were sent to the applicable points of contact for the 18 members of the 2015 plan and to additional interested parties. Local governments wishing to join the planning effort were asked to provide the California Office of Emergency Services and County with a "letter of commitment" as a participating jurisdiction in the County's plan update process. In all, the planning team received formal commitment from 24 planning partners in addition to the County.

Municipalities/County

- Ventura County
- City of Camarillo
- City of Fillmore
- City of Moorpark
- City of Ojai
- City of Oxnard
- City of Port Hueneme
- City of Santa Paula
- City of Simi Valley
- City of Thousand Oaks
- City of Ventura

Special-Purpose Districts

- California State University, Channel Islands
- Calleguas Municipal Water District
- Casitas Municipal Water District
- Channel Islands Beach Community Services District
- Conejo Recreation & Park District
- Ojai Valley Sanitary District
- Pleasant Valley Recreation & Park District
- Saticoy Sanitary District
- Triunfo Water & Sanitation District
- United Water Conservation District
- Ventura County Fire Protection District
- Ventura County Office of Education
- Ventura County Public Works Agency—Watershed Protection
- Ventura Regional Sanitation District

A map showing the location of participating special-purpose districts is provided at the end of this introduction. Risk assessment maps for all planning areas (countywide) are provided in Volume 1 of this hazard mitigation plan while maps showing the risk assessment results for each of the participating municipalities are provided in the individual annexes for each city.

Planning Partner Expectations

The planning team and consultant, Tetra Tech, developed the following list of planning partner expectations, which were provided and discussed at a formal kickoff meeting held in May 2021 (see Appendix A for details):

- Re-confirm lead and primary points of contact for the update effort.
- Support and participate in the Steering Committee meetings.
- Provide support required to implement the public involvement strategy.
- Participate in the planning process through:
  - Steering Committee meetings
  - Public meetings and outreach efforts
  - Workshops and planning partner-specific training sessions
  - Public review and comment periods prior to adoption.
- Perform a "consistency review" of all technical studies, plans and ordinances specific to hazards.
- Review the risk assessment and identify hazards and vulnerabilities specific to the jurisdiction.
- Attend the mandatory Phase 3 jurisdictional annex workshop.
- Review and determine if the mitigation recommendations chosen in Volume 1 will meet the needs of the jurisdiction.
- Create an action plan that identifies each project, who will oversee the task, how it will be financed, and when it is estimated to occur.
- Formally adopt the hazard mitigation plan.

By adopting the hazard mitigation plan, each planning partner also agrees to the plan implementation and maintenance protocol established in Volume 1. Failure to meet these criteria may result in a partner being dropped from the partnership by the Steering Committee, and thus losing eligibility under the scope of the plan.

Final Coverage

All of the above jurisdictions submitted letters of commitment to participate, completed an annex template, fully met the participation requirements for this update, and will be covered by the updated hazard mitigation plan upon FEMA's approval of the plan and adoption of the plan by their individual governing bodies.

ANNEX DEVELOPMENT

Capability Assessment

A capability assessment creates an inventory of a jurisdiction's mission, programs, and policies, and evaluates its capacity to carry them out. All participating jurisdictions compiled a capability assessment which helped to identify potential gaps in the jurisdictions' capabilities. Specifically, if the capability assessment identified an opportunity to add a missing core capability or expand an existing one, then

doing so has been selected as an action in the jurisdiction's action plan. The sections below describe specific capabilities evaluated under the assessment.

Planning and Regulatory Capabilities

Jurisdictions can develop policies and programs and implement rules and regulations to protect and serve residents. Local policies are typically identified in planning documents, implemented via a local ordinance, and enforced by a governmental body. Because the planning and regulatory authority of counties and municipalities is generally broader than that of special-purpose districts, the assessment of these capabilities is more detailed for those partners.

Development and Permitting Capability

The County and its municipalities regulate land use through the adoption and enforcement of zoning, subdivision, and land development ordinances, building codes, building permit ordinances, floodplain, and stormwater management ordinances. When effectively prepared and administered, these regulations can mitigate hazards. As special-purpose districts typically do not have the ability to regulate land use, this capability was assessed only for the County and municipalities.

Fiscal Capability

Assessing a jurisdiction's fiscal capability provides an understanding of the ability to fulfill the financial needs associated with hazard mitigation projects. This assessment identifies both outside resources, such as grant-funding eligibility, and local jurisdictional authority to generate internal financial capability, such as through impact fees (fees charged to a development project).

Administrative and Technical Capability

Without appropriate personnel, the mitigation strategy may not be implemented. Administrative and technical capabilities focus on the availability of personnel resources responsible for implementing all the facets of hazard mitigation. These resources include technical experts, such as engineers, scientists, and grant writers.

Education and Outreach Capability

Regular engagement with the public on hazard mitigation provides opportunities to open a two-way dialogue that can result in a more resilient community. Use of a jurisdictional website, social media outlets, and other outreach resources to communicate mitigation information are assessed for each planning partner. Assessing outreach and education capability illustrates the connection between the government and community members.

Compliance with National Flood Insurance Program Requirements

Flooding is the costliest natural hazard in the United States and homeowners face increasingly high flood insurance premiums. Community participation in the National Flood Insurance Program (NFIP) opens up opportunities for additional grant funding associated specifically with flooding issues. Assessment of a jurisdiction's current NFIP status and compliance provides a greater understanding of the local flood management program, opportunities for improvement, and available grant funding

opportunities. The NFIP is not available to special-purpose districts, so this set of capabilities was assessed only for municipalities and the County.

Participation in Voluntary Programs

Participation in voluntary programs, such as FEMA's Community Rating System (CRS), the National Weather Service's StormReady and TsunamiReady programs, and the National Fire Protection Association's Firewise USA, can enhance a jurisdiction's ability to mitigate, prepare for, and respond to natural hazards. These programs complement each other by focusing on communication, mitigation, and community preparedness to save lives and minimize the impact of natural hazards on a community. Participation in these programs demonstrates a jurisdiction's commitment to go beyond the minimum requirements set forth by local, state, and federal regulations in order to create a more resilient community. The programs reviewed here are only applicable to municipalities and the County, so were not included in the capability assessments for the special-purpose districts.

Adaptive Capacity

An adaptive capacity assessment evaluates a jurisdiction's ability to anticipate impacts that may occur in the future. By looking at public support, technical adaptive capacity, and other factors, jurisdictions can identify their core capability for resilience against issues such as sea level rise and climate change. The assessment provides jurisdictions with an opportunity to identify areas for improvement by ranking their adaptive capacity as high, medium, or low.

Mitigation Action Plan Development

Risk Ranking

The risk-ranking methodology for partner annexes was the same as that used for the countywide risk ranking described in Volume 1. Each planning partner was asked to review the ranked risk for its jurisdiction, based on the impact on its population and/or facilities. Municipalities and the County based this ranking on the probability of occurrence of each hazard, and its potential impact on people, property, and the economy. Special-purpose districts based this ranking on probability of occurrence and the potential impact on their constituency, vital facilities, and the facilities' functionality after a hazard event.

The objectives of this exercise were to familiarize the planning partnership with how to use the risk ranking, part of the assessment results, as a tool to support other planning and hazard mitigation processes and to help prioritize types of mitigation actions that should be considered. Hazards that were ranked as "high" and "medium" for each jurisdiction were considered to be priorities for identifying mitigation actions, although jurisdictions also identified actions to mitigate hazards ranked "low", as appropriate.

Information Reviewed to Develop the Action Plan

In September 2021, each planning partner was provided with a tool kit of relevant documents to assist in developing their jurisdiction's action plan and was required to attend a workshop that provided guidance to develop their action plans. The tool kits were used during the mandatory Phase 3

workshops and in follow-up work conducted by the planning partners. Planning partners reviewed the following information included in the tool kit to assist in the identification of proposed mitigation actions:

- **Capability assessment**—Reviewed to identify capabilities that the jurisdiction does not currently have but should consider pursuing, or capabilities that should be revisited and updated to include best available information; also reviewed to determine how existing capabilities can be leveraged to increase or improve hazard mitigation in the jurisdiction.
- **National Flood Insurance Program compliance table**—Reviewed to identify opportunities to increase floodplain management capabilities.
- **Adaptive capacity**—Reviewed to identify ways to leverage or continue to improve existing capacities and to improve understanding of other capacities.
- **Future integration opportunities**—Reviewed to identify specific integration actions to be included in the mitigation strategy.
- **Jurisdiction-specific vulnerabilities**—Reviewed to identify actions that could reduce known vulnerabilities.
- **Mitigation best practices catalog**—Reviewed to identify actions that the jurisdiction should consider including in its action plan.
- **Public input**—Reviewed to identify potential actions and community priorities.

Action Plan Prioritization

The mitigation actions recommended in each jurisdiction's action plan were prioritized based on the following factors:

- Cost and availability of funding
- Benefit, based on likely risk reduction to be achieved
- Number of plan objectives achieved
- Timeframe for project implementation
- Eligibility for grant funding programs

Two priorities were assigned for each action:

- A high, medium, or low priority for implementing the action
- A high, medium, or low priority for pursuing grant funding for the action.

The sections below describe the benefit-cost analysis and the assignment of the two priority ratings.

Benefit/Cost Review

Pursuant to 44 CFR, Section 201.6(c)(3)(iii), the action plan must be prioritized according to a benefit-cost analysis (BCA) of the proposed actions. BCA is a method that determines the future risk reduction benefits of a hazard mitigation project and compares those benefits to its costs. For this hazard mitigation plan, a qualitative review was performed for each mitigation action by assigning ratings for benefit and cost as follows:

- Cost:
  - **High**—Existing funding will not cover the cost of the action; implementation would require new revenue through an alternative source (for example, bonds, grants, and fee increases).
  - **Medium**—The action could be implemented with existing funding but would require a re-apportionment of the budget or a budget amendment, or the cost of the action would have to be spread over multiple years.
  - **Low**—The action could be funded under the existing budget. The action is part of, or can be part of, an ongoing, existing program.
- Benefit:
  - **High—**Action will provide an immediate reduction of risk exposure for life and property.
  - **Medium—**Action will have a long-term impact on the reduction of risk exposure for life and property, or action will provide an immediate reduction in the risk exposure for property.
  - **Low—**Long-term benefits of the action are difficult to quantify in the short term.

To assign priorities, each action with a benefit rating equal to or higher than its cost rating (such as high benefit/medium cost, medium benefit/medium cost, medium benefit/low cost, etc.) was considered to be cost-beneficial. It is important to note that this qualitative review is not intended to substitute for the more detailed level of benefit-cost analysis required for some FEMA hazard-related grant programs. More specific analysis would be performed at the time a given action is submitted for grant funding approval.

Implementation Priority

Implementation priority ratings were assigned as follows:

- **High Priority**—An action that meets multiple objectives, has benefits that exceed costs, and has a secured source of funding. Action can be completed in the short term (1 to 5 years).
- **Medium Priority**—An action that meets multiple objectives, has benefits that exceed costs, and is eligible for funding though no funding has yet been secured for it. Action can be completed in the short term (1 to 5 years) once funding is secured. Medium-priority actions become high-priority actions once funding is secured.
- **Low Priority**—An action that will mitigate the risk of a hazard, but has benefits that do not exceed the costs or are difficult to quantify, has no secured source of funding, and is not eligible for any known grant funding. Action can be completed in the long term (1 to 10 years). Low-priority actions may be eligible for grant funding from programs that have not yet been identified.

Grant Pursuit Priority

Grant pursuit priority ratings were assigned as follows:

- **High Priority**—An action that meets identified grant eligibility requirements, has high benefits, and is listed as high or medium implementation priority; local funding options are unavailable or available local funds could be used instead for actions that are not eligible for grant funding.
- **Medium Priority**—An action that meets identified grant eligibility requirements, has medium or low benefits, and is listed as medium or low implementation priority; local funding options are unavailable.

- **Low Priority**—An action that has not been identified as meeting any grant eligibility requirements.

Classification of Actions

Each recommended action was also classified based on the hazard it addresses and the type of mitigation it involves. Mitigation types used for this classification are as follows:

- **Prevention**—Government, administrative or regulatory actions that influence the way land and buildings are developed to reduce hazard losses. Includes planning and zoning, floodplain laws, capital improvement programs, open space preservation, and stormwater management regulations.
- **Property Protection**—Modification of buildings or structures to protect them from a hazard or removal of structures from a hazard area. Includes acquisition, elevation, relocation, structural retrofit, storm shutters, and shatter-resistant glass.
- **Public Education and Awareness**—Actions to inform residents and elected officials about hazards and ways to mitigate them. Includes outreach projects, real estate disclosure, hazard information centers, and school-age and adult education.
- **Natural Resource Protection**—Actions that minimize hazard loss and preserve or restore the functions of natural systems. Includes sediment and erosion control, stream corridor restoration, watershed management, forest and vegetation management, wetland restoration and preservation, and green infrastructure.
- **Emergency Services**—Actions that protect people and property during and immediately after a hazard event. Includes warning systems, emergency response services, and the protection of essential facilities.
- **Structural Projects**—Actions that involve the construction of structures to reduce the impact of a hazard. Includes dams, setback levees, floodwalls, retaining walls, and safe rooms.
- **Climate Resiliency**—Actions that incorporate methods to mitigate and/or adapt to the impacts of climate change. Includes aquifer storage and recovery activities, incorporating future conditions projections in project design or planning, or actions that specifically address jurisdiction-specific climate change risks, such as sea-level rise or urban heat island effects.
- **Community Capacity Building**—Actions that increase or enhance local capabilities to adjust to potential damage, to take advantage of opportunities to build capacity, or to respond to consequences of insufficient capacity. Includes staff training, memorandums of understanding, development of plans and studies, and monitoring programs.

Annex-Preparation Process

Templates

Templates were created for the two types of jurisdictions (municipalities and special districts) participating in this plan to help the planning partners prepare their jurisdiction-specific annexes. The templates were designed so that all criteria of Section 201.6 of 44 CFR for local governments would be met based on the partners' capabilities and mode of operation. The templates were deployed in three phases during the course of the plan update process as follows:

- **Phase 1**—Profile, Trends, Previous Plan Status
  - Deployed: May 10, 2021
  - Due: June 21, 2021
- **Phase 2**—Capability Assessment and Information Sources
  - Deployed: July 6, 2021
  - Due: August 20, 2021
- **Phase 3**—Risk Ranking, Action Plan, and Information Sources
  - Deployed: September 9, 2021
  - Workshops: September 22-23, 2021
  - Due: October 25, 2021

The templates were designed to lead all partners through the necessary steps to generate the Disaster Mitigation Act-required elements specific to their jurisdictions. The templates and their instructions are included in Appendix B of this volume.

Tool Kit

Each planning partner was provided with a tool kit to assist in completing the annex template and developing their jurisdiction's action plan. The tool kits contained the following:

- A copy of the *2015 Ventura County Multi-Hazard Mitigation Plan*
- The vision statement, goals and objectives developed for the plan update
- Information on past hazard events that have impacted the planning area
- The risk assessment results developed for the plan update
- A list of jurisdiction-specific issues noted during the risk assessment
- Information on climate change and expected impacts in the planning area
- Jurisdiction-specific annex templates, with instructions for completing them
- A catalog of mitigation best practices and suggested actions to enhance adaptive capacity
- Information on the FEMA Hazard Mitigation Assistance grant program
- FEMA guidance on plan integration
- AB 2140 compliance guidance
- The results of the public survey on community awareness of hazards conducted as part of the public involvement strategy
- The public service announcement (PSA) hazard mitigation video produced by the Ventura County Sheriff's Office of Emergency Services and the Ventura County Public Works Agency.

Workshop

All partners were required to attend and participate in a virtual technical assistance workshop held the week of September 20, 2021, where key elements of the annex template were discussed. The workshops focused on how the tool kit could be used to facilitate completion of the template and develop each jurisdiction's mitigation action plan. The templates were subsequently completed by a designated point of contact for each partner and a member of the planning team. The workshop addressed the following topics:

- The jurisdictional annex templates and the tool kit
- Natural events history
- Jurisdiction-specific issues
- Risk ranking
- Status of prior actions
- Developing the action plan
- Benefit-cost review
- Prioritization protocol
- Next steps

Following conclusion of the workshop, a copy of the presentation given at the workshop session was added to the tool kit provided to each of the planning partners.

Special Purpose Districts (1 of 2)

- Ojai Valley Sanitary District
- Saticoy Sanitary District
- Ventura Regional Sanitation District
- Triunfo Water & Sanitation District
- Calleguas Municipal Water District
- Casitas Municipal Water District
- County Boundary
- Major Roads

1. VENTURA COUNTY (UNINCORPORATED AREA)

1.1 LOCAL HAZARD MITIGATION PLANNING TEAM

Primary Point of Contact
Bonnie Luke, Senior Program Administrator
800 South Victoria Avenue
Ventura, CA 93009
Telephone: 805-765-7007
e-mail Address: BonnieK.Luke@ventura.org

Alternate Point of Contact
Kathy Gibson, Program Administrator II
800 South Victoria Avenue
Ventura, CA 93009
Telephone: 805-765-0326
e-mail Address:
Kathy.Gibson@ventura.org

This annex was developed by the local hazard mitigation planning team, whose members are listed in Table 1-1.

Table 1-1. Local Mitigation Planning Team Members

Name	Title
Patrick Maynard	Director of Emergency Services, Sheriff's Office of Emergency Services
Bonnie Luke	Senior Program Administrator, Sheriff's Office of Emergency Services
Kathy Gibson	Program Administrator II, Sheriff's Office of Emergency Services
Gerard Kapuscik	Manager, Strategic Resiliency Group, Ventura County Public Works Agency-Watershed Protection
Glenn Shephard	Director, Ventura County Public Works Agency-Watershed Protection
Ashley Bautista	Public Information Officer, County Executive Office
Jackie Nuñez	Assistant Public Information Officer, County Executive Office
Aaron Engstrom	Long Range Planning Manager, Ventura County Planning Division
Dave Ward	Director, Ventura County Planning Division
Matt Wyatt	District Manager West County Office, Ventura County Building & Safety Division
Clay Downing	Program Administrator, Sustainability Division, County Executive Office
Mark Lorenzen	Fire Chief, Ventura County Fire Protection District
Jeff Shea	Division Chief, Ventura County Fire Protection District
Debbie Conner	Management Assistant, Ventura County Fire Protection District

1.2 JURISDICTION PROFILE

1.2.1 Location and Features

Ventura County is located on southern California's Pacific coast, approximately 60 miles northwest of Los Angeles. The County is bordered to the north by Kern County; to the northwest and southwest by

Santa Barbara County and the Pacific Ocean, respectively; and to the east and southeast by Los Angeles County.

Ventura County stretches across 2,208 square miles, of which 1,845 square miles is land and 363 square miles is water. The northern half of the county, comprising approximately 53 percent of the county's total area is located within the Los Padres National Forest, and is mostly uninhabited. Two offshore islands, Anacapa and San Nicolas, are also included within the jurisdictional boundary for Ventura County. Anacapa Island is located approximately 11 miles offshore and is one of five islands that make up Channel Islands National Park. San Nicolas Island is located approximately 61 miles offshore and is operated by the United States Navy as a weapons testing and training facility. For the purposes of statistical analyses, the county is divided into 15 distinct planning areas. Within the County there are 10 cities and 18 unincorporated communities that are recognized census designated places (CDPs).

1.2.2 History

Ventura County was historically inhabited by the Chumash people, who also settled throughout much of Santa Barbara and San Luis Obispo Counties. The Chumash were originally hunters and gatherers, fisherman, traders, and are known for their rock paintings and basketry.

Spanish explorers began arriving in the area in the mid-1500s, although active occupation did not effectively occur until more than 200 years later. The Spanish encouraged settlement of the area with large land grants called ranchos, while the Catholic church established the Mission San Buenaventura in 1782 in what is now the City of Ventura.

On January 1, 1873, just 23 years after California's statehood was attained in 1850, Ventura County was formally established. At this time, however, the area remained largely rural, consisting of a population of less than 5,000 individuals that engaged predominately in ranching and the cultivation of grain crops.

During the early 1900s, increased demand from new markets in the burgeoning Los Angeles area led to a significant expansion and diversification of agriculture in Ventura. Together with the discovery of vast oil reserves in the area, this resulted in an influx of immigrants, wealth, and substantial improvements to transportation infrastructure in the region.

A second, intense population boom (>5% annually) occurred beginning in the 1940s with the construction of Port Hueneme and the establishment of a military base at Point Mugu which brought numerous professionals and ancillary industries to the region. Ventura County, and the Oxnard area in particular, benefitted from the hiring of more than 10,000 civilian workers and 21,000 military personnel, thus providing jobs for local residents and reviving the economy following the Depression of the 1930s. By 1950, the population of the county had increased to over 114,000 individuals, more than double its population in 1930.

The population continued to grow rapidly through the 1970s, assisted further by the completion of highway 101 in the mid-1964, which helped make the commute to Los Angeles easier. Although much of this growth was centered in incorporated communities, development also expanded in the unincorporated areas, particularly on the east side of the County.

1.2.3 Governing Body Format

Ventura County is administered by five elected supervisors who each serve four-year terms. The supervisors appoint department administrators who manage county functions.

The Board of Supervisors assumes responsibility for the adoption of this plan; Ventura County Sheriff's Office of Emergency Services will oversee its implementation.

1.3 CURRENT TRENDS

1.3.1 Population

According to the California Department of Finance, as of January 2020 the unincorporated areas of the County had a population of 95,001. This represents a negligible increase from the 2010 census data (94,937 individuals).

Table 1-2 lists unincorporated communities in Ventura County that are recognized by the United States Census Bureau as census-designated places for the 2020 census:

Table 1-2. Ventura County Unincorporated Communities

Census Designated Place	Population 2020	Population 2010	Population Change Since 2010
Bell Canyon	1,946	2,049	-103
Casa Conejo	3,267	3,249	+18
Channel Islands Beach (e.g. Hollywood Beach and Silver Strand)	2,870	3,103	-233
El Rio	7,037	7,198	-161
Lake Sherwood	1,759	1,527	+180
Meiners Oaks	3,911	3,571	+340
Mira Monte	6,618	6,854	-227
Oak Park	13,898	13,811	+87
Oak View	6,215	4,066	+2,149
Piru	2,587	2,063	+524
Santa Rosa Valley	3,312	3,334	-22
Santa Susana	1,160	1,037	+123
Saticoy	1,133	1,029	+104

Source: United States Census Bureau. https://www.census.gov/.

The bulk of the population within the unincorporated county area is concentrated within four of these communities. Approximately 17,000 people reside in the adjoining communities of Oak View, Meiners Oaks and Mira Monte on the west end of the county. Meanwhile, nearly 14,000 people reside in the community of Oak Park on the east end of the county.

1.3.2 Development

Unincorporated Ventura County is a slow-growth, mostly rural land use jurisdiction with policies and initiatives that seek to focus growth and development in more urbanized areas. Developed areas include about 18 existing census-designated places listed in the previous section, most of which are

governed by one of nine specific area plans. For the period between 2016-2020, single-family residences made up approximately half of the development activity in the unincorporated areas, while accessory dwelling units comprised an additional 35 percent of the development activity. Agricultural worker housing projects represented approximately 1 percent of development activity, while other multi-family projects and subdivisions were uncommon, representing less than 7 percent of the development in the unincorporated areas. Permits for commercial development constituted 9 percent of the development activity. For a more detailed description of development trends, see the 2020 Annual Progress Report available here:

https://vcrma.org/docs/images/pdf/planning/plans/2020_Ventura_County_Annual_Progress_Report.pdf

Table 1-3 summarizes development trends in the unincorporated County in the period since the preparation of the previous (2015) Hazard Mitigation Plan update, as well as expected future development trends.

Table 1-3. Recent and Expected Future Development Trends

Criterion	Response
Has your jurisdiction annexed any land since the preparation of the previous hazard mitigation plan? • **If yes, give the estimated area annexed and estimated number of parcels or structures.**	No
Is your jurisdiction expected to annex any areas during the performance period of this plan? • **If yes, describe land areas and dominant uses.** • **If yes, who currently has permitting authority over these areas?**	No
Provide the number of new construction permits for each hazard area or provide a qualitative description of where development has occurred.	Permitting activity in 2020 was concentrated in the areas around Piru, Oak View, and Meiners Oaks. In particular, within the Piru area, the buildout of the Piru Gateway development (Tract Map 5553, recorded in 2017) has been under construction for the past several years. This development consists of 53 single-family homes, 4 duplex units, and 10 triplex units, for a total of 91 new residential units. Conversely, in the Oak View and Meiners Oaks areas, most new development consisted of legalization of existing, unpermitted accessory units, and construction of new accessory dwelling units. Much of this development is being driven by state-level regulation changes that went into effect on January 1, 2020 which limit local agency authority to regulate accessory dwelling units. Much of the development is located in high fire hazard severity zones, including Piru, the Oak View and Meiners Oaks areas near Ojai, the hills north of Camarillo, and southeast of Simi Valley in Bell Canyon. A small number of single-family permits have also been issued in coastal areas that are primarily for redevelopment of existing structures. Most of these coastal structures are vulnerable to tsunami and other coastal hazards. For a more detailed description of development trends, see the 2020 Annual Progress Report available here: https://vcrma.org/docs/images/pdf/planning/plans/2020_Ventura_County_Annual_Progress_Report.pdf

<table>
<tr><th>Criterion</th><th>Response</th></tr>
<tr><td>Are any areas targeted for development or major redevelopment in the next five years?
• If yes, briefly describe, including whether any of the areas are in known hazard risk areas</td><td>Yes

In February 2021, the County approved a 360-unit farmworker housing project north of the city of Camarillo called “Somis Ranch”, which will be constructed in three phases over the next few years.

Five hundred, ninety-eight additional units are also planned to be constructed over the next four years as part of the continued development (Phase II) of the University Glenn area located adjacent to California State University Channel Islands. This master-planned, mixed-use residential community is proposed to be located on 32 acres south of the City of Camarillo, along the western edge of the Santa Monica Mountains, within a high-fire hazard area. Additional housing is also anticipated to be constructed south of Camarillo as part of the Rancho Sierra Senior Supportive Housing (50 units) on Lewis Road.

Finally, there are a total of 224 dwelling units anticipated to be constructed adjacent to Hwy 126 in the Piru Expansion Area as part of the development of two recorded tract maps: the Reider subdivision, comprising 49 townhomes, and the Finch subdivision, comprising 175 new dwelling units. The Piru Expansion area is partially located within FEMA’s A99 flood zone.

In addition to the new housing outlined above, there are a number of redevelopment projects related to fire rebuilds. Between 2017 and 2018, 337 residential dwelling units were destroyed by the Thomas and the Woolsey Fires, which together burned more than 377,000 acres, most of which were located within Ventura County. As of 2020, rebuilding efforts have included issuance of 122 Planning Permits, 87 Building Permits, and the rebuild of 40 residential units. Many of these units were located in high-fire hazard areas.

Efforts by the County Planning Division are ongoing to implement programs outlined for the disadvantaged communities within the El Rio/ Del Norte Area Plan and Saticoy Area Plan that would accommodate additional development in these areas through roadway, sewer, and water infrastructure improvements.

The County also continues to improve regulatory pathways that support the development of additional affordable housing and agricultural worker housing throughout the County via an update to the General Plan Housing Element, as well as zoning amendments for agricultural worker housing regulations and accessory dwelling units.</td></tr>
<tr><td>How many permits for new construction were issued in your jurisdiction since the preparation of the previous hazard mitigation plan?</td><td>
<table>
<tr><th></th><th>2016</th><th>2017</th><th>2018</th><th>2019</th><th>2020</th></tr>
<tr><td>Single Family</td><td>40</td><td>46</td><td>46</td><td>65</td><td>47</td></tr>
<tr><td>Multi-Family</td><td>0</td><td>0</td><td>14</td><td>3</td><td>21</td></tr>
<tr><td>Other (mobile homes, accessory dwellings, mixed use, etc.)</td><td>23</td><td>35</td><td>52</td><td>40</td><td>50</td></tr>
<tr><td>Commercial</td><td>11</td><td>4</td><td>14</td><td>9</td><td>7</td></tr>
<tr><td>Total</td><td>74</td><td>85</td><td>126</td><td>117</td><td>125</td></tr>
</table>
</td></tr>
<tr><td>Describe the level of buildout in the jurisdiction, based on your jurisdiction’s buildable lands inventory. If no such inventory exists, provide a qualitative description.</td><td>The 2040 Ventura County General Plan Background Report included an inventory of both residential holding capacity and residential development potential. The unincorporated residential development potential was estimated to be 1,361 units (Section 3.7, Table 3-19). The residential development potential accounted for parcels on vacant and underutilized land, as well as other constraints such as steep slopes and floodways. If second dwellings, farmworker housing, Channel Islands University housing, and vacant OS, AE, and RA zone parcels with single-family potential are included, the remaining residential development potential is 28,228 units (Section 3.7, Table 3-22).

The County of Ventura’s General Plan Annual Report details that Unincorporated Ventura County’s Regional Housing Needs Allocation (RHNA) for the period from 2014 to 2021 was 1,015 units. As of 2019 the County has authorized permits for 590 of the 1,015 RHNA units (Exhibit 1, page 7). The Ventura County 2040 General Plan, Chapter 3 Housing Element includes the final RHNA allocation for the period of 2021-2029 which is 1,262 units (Section 3.2, Table 3-1).</td></tr>
</table>

1.4 CAPABILITY ASSESSMENT

This section describes an assessment of existing capabilities for implementing hazard mitigation strategies. The introduction at the beginning of this volume of the hazard mitigation plan describes the components included in the capability assessment and their significance for hazard mitigation planning.

Findings of the capability assessment were reviewed to identify opportunities to expand, initiate or integrate capabilities to further hazard mitigation goals and objectives. Where such opportunities were identified and determined to be feasible, they are included in the action plan. The "Analysis of Mitigation Actions" table in this annex identifies these as community capacity building mitigation actions. The findings of the assessment are presented as follows:

- An assessment of planning and regulatory capabilities is presented in Table 1-4.
- Development and permitting capabilities are presented in Table 1-5.
- An assessment of fiscal capabilities is presented in Table 1-6.
- An assessment of administrative and technical capabilities is presented in Table 1-7.
- An assessment of education and outreach capabilities is presented in Table 1-8.
- Information on National Flood Insurance Program (NFIP) compliance is presented in Table 1-9.
- Classifications under various community mitigation programs are presented in Table 1-10.
- The community's adaptive capacity for responding to the impacts of climate change is presented in Table 1-11.

Table 1-4. Planning and Regulatory Capability

	Local Authority	Other Jurisdiction Authority	State Mandated	Integration Opportunity?

Table 1-5. Development and Permitting Capability

Criterion	Response
Does your jurisdiction issue development permits? ***If no, who does? If yes, which department?*** Planning Division, Public Works Agency	Yes
Does your jurisdiction have the ability to track permits by hazard area?	Yes
Does your jurisdiction have a buildable lands inventory?	Yes

Table 1-6. Fiscal Capability

Financial Resource	Accessible or Eligible to Use?
Community Development Block Grants	Yes
Capital Improvements Project Funding ***Comment:*** Check with Public Works and General Services Agency	Yes
Authority to Levy Taxes for Specific Purposes ***Comment:*** new taxes require 2/3rds Board of Supervisors approval	Yes
User Fees for Water, Sewer, Gas or Electric Service ***If yes, specify:*** Check with Special Districts, typically require fee study	Yes
Incur Debt through General Obligation Bonds **Comment:** Requires Board of Supervisors Approval	Yes
Incur Debt through Special Tax Bonds Comment: Requires Board of Supervisors Approval or voter approval	Yes
Incur Debt through Private Activity Bonds **Comment:** Recovery Zone Economic Development Bonds, 2010 http://bosagenda.countyofventura.org/sirepub/cache/2/qdv0sgxbtlloepc0ihgn2r24/551690082020210412476.PDF	Yes
Withhold Public Expenditures in Hazard-Prone Areas	Yes
State-Sponsored Grant Programs **Comment:** Requires Board of Supervisors Approval to Receive Grants	Yes
Development Impact Fees for Homebuyers or Developers **Comment:** Requires Board of Supervisors Approval	Yes

Table 1-7. Administrative and Technical Capability

Staff/Personnel Resource	Available?
Planners or engineers with knowledge of land development and land management practices	Yes
If Yes, Department /Position: Yes, various positions throughout Planning Division and Public Works Agency	
Engineers or professionals trained in building or infrastructure construction practices	Yes
If Yes, Department /Position: Yes, Building and Safety Department various positions, Public Works Agency—Transportation Department and Watershed Protection, all positions.	
Planners or engineers with an understanding of natural hazards	Yes
If Yes, Department /Position: Building & Safety manager has CFM and Emergency response, Public Works Agency—Watershed Protection, Planning Division, Area Plans and Resources Manager, General Plan Manager	
Staff with training in benefit-cost analysis	Yes
If Yes, Department /Position: Building & Safety management team, Public Works Agency Directors and General Services Agency Parks Department Director	
Surveyors	Yes
If Yes, Department /Position: Public Works Agency, Surveyor's office.	
Personnel skilled or trained in GIS applications	Yes
If Yes, Department /Position: Building & Safety counter staff, plan review engineers and management team, Resource Management Agency GIS Supervisor	
Scientist familiar with natural hazards in local area	Yes
If Yes, Department /Position: PWA Engineering Managers and Hydrologists. For scientists, the Planning Division and Public Works agency also contract with consultants as needed.	
Emergency manager	Yes
If Yes, Department /Position: Sheriff's Office of Emergency Services (OES Director, and 6 additional full-time EMs), Building & Safety district managers	
Grant writers	Yes
If Yes, Department /Position: Planning Division Long Range Planning Managers, County Executive Office, Office of Sustainability Manager, various Public Works Agency departments.	

Table 1-8. Education and Outreach Capability

Criterion	Response
Do you have a public information officer or communications office?	Yes
Do you have personnel skilled or trained in website development?	Yes
Do you have hazard mitigation information available on your website?	Yes
If yes, briefly describe: ReadyVenturaCounty.org contains pages dedicated to the Hazard Mitigation Plan Update, including information on hazard mitigation and links to the existing Hazard Mitigation Plan.	
Do you use social media for hazard mitigation education and outreach?	Yes
If yes, briefly describe: Twitter, Nixle	
Do you have any citizen boards or commissions that address issues related to hazard mitigation?	Yes
If yes, briefly describe: Emergency Planning Council, CERT, Disaster Assistance Response Team, Ventura Regional Fire Safe Council, Ojai Valley Fire Safe Council, Ventu Park Fire Safe Council, and Bell Canyon Fire Safe Council	
Do you have any other programs in place that could be used to communicate hazard-related information?	Yes
If yes, briefly describe: VCEmergency.com; ReadyVenturaCounty.org, VC Alert,	
Do you have any established warning systems for hazard events?	Yes
If yes, briefly describe: VC Alert, Wireless Emergency Alerts (WEA); VCEmergency.com; Hi-Lo Sirens	

Table 1-9. National Flood Insurance Program Compliance

Criterion	Response
What local department is responsible for floodplain management?	Ventura County Public Works Agency-Engineering Services Department, Development Services Section.
Who is your floodplain administrator? (department/position)	Director, Ventura County Public Works Agency
Are any certified floodplain managers on staff in your jurisdiction?	Yes
What is the date that your flood damage prevention ordinance was last amended?	3/27/2018
Does your floodplain management program meet or exceed minimum requirements?	Meets
When was the most recent Community Assistance Visit or Community Assistance Contact?	9/21/2018
Does your jurisdiction have any outstanding NFIP compliance violations that need to be addressed?	No
Are any RiskMAP projects currently underway in your jurisdiction?	No
Do your flood hazard maps adequately address the flood risk within your jurisdiction?	Yes
Does your floodplain management staff need any assistance or training to support its floodplain management program?	Yes
If so, what type of assistance/training is needed?	Additional training on benefit-cost analysis for the BRIC grant program, and green-flood plain management project solutions eligible for FEMA funding.
Does your jurisdiction participate in the Community Rating System (CRS)?	Yes
If yes, is your jurisdiction interested in improving its CRS Classification?	No
How many flood insurance policies are in force in your jurisdiction?[a]	1,346
What is the insurance in force?	$395,320,600
What is the premium in force?	$1,327,849
How many total loss claims have been filed in your jurisdiction?[a]	724
What were the total payments for losses?	$10,126,504

a. According to FEMA statistics as of March 31, 2021

Table 1-10. Community Classifications

	Participating?	Classification	Date Classified
FIPS Code	Yes	06111	N/A
DUNS #	Yes	066691122	N/A
Community Rating System	Yes	5	5/1/2016
Building Code Effectiveness Grading Schedule	No	N/A	N/A
Public Protection	Yes	03/3X	12/21/2018
Storm Ready	Yes	N/A	N/A
Firewise	Yes	N/A	Unknown
Tsunami Ready	Yes	N/A	N/A

Table 1-11. Adaptive Capacity for Climate Change

Criterion	Jurisdiction Rating
Technical Capacity	
Jurisdiction-level understanding of potential climate change impacts	High
Comment: *High level of understanding of anticipated exacerbation of drought and wildfire risks, and sea -level rise-related impacts. Moderate understanding of secondary impacts to agricultural/biological risks, and severe weather/severe storm impacts.*	
Jurisdiction-level monitoring of climate change impacts	Medium
Comment: *2040 General Plan has emission reduction and climate adaptation programs adopted and monitoring programs are being implemented.*	
Technical resources to assess proposed strategies for feasibility and externalities	Medium
Comment: *The Planning Division has access to technical resources in other County Agencies, coordination with outside agencies with resources is frequent, and the County also has the capacity to hire consultants when needed. Additional resources in adaptation pathway planning would be helpful.*	
Jurisdiction-level capacity for development of greenhouse gas emissions inventory	High
Comment: *A GHG inventory was completed for the 2040 General Plan Update with baseline data for 2015. There is also an operational emissions inventory, and monitoring is planned for the future as part of General Plan implementation.*	
Capital planning and land use decisions informed by potential climate impacts	High
Comment: *The 2040 General Plan includes policies related to climate adaptation to guide development due to climate change impacts. The 2040 General Plan also includes implementation programs that function as climate adaptation strategies.*	
Participation in regional groups addressing climate change risks	High
Comment: *Some members of the Board of Supervisors are on committees for sea level rise and beach sediment management. The County's Office of Sustainability, the Long Range sections of the Planning Division, and the Public Works Agency regularly participate with regional groups to address climate change risks. The County Executive Office's* Ventura County Climate Emergency Council *is a citizen advisory committee focused on GHG reductions. The County's* Sustainability Committee is *an interagency work group focused on integrating sustainable practices into agency activities including Climate Action Plan implementation.*	
Implementation Capacity	
Clear authority/mandate to consider climate change impacts during public decision-making processes	High
Comment: *Included in 2040 General Plan policies and programs, see Appendix B.*	
Identified strategies for greenhouse gas mitigation efforts	High
Comment: *Included in 2040 General Plan policies and programs. The County Executive Office's Sustainability Division manages the Ventura County Climate Emergency Council to advise the County's Board of Supervisors on climate action planning and Climate Action Plan implementation. https://www.ventura.org/vccec/*	
Identified strategies for adaptation to impacts	Medium
Comment: *The County's 2019 Sea level Rise Adaptation Report includes adaptation strategies that have yet to be adopted in policy form.*	
Champions for climate action in local government departments	Medium
Comment: *Action ultimately requires Board authorization for policies and programs.* *The County Executive Office's Sustainability Division acts as lead for Climate Action Plan implementation including time invested by a full-time Sustainability Officer and supporting staff. The Sustainability Officer is the Chair of the County's the* Sustainability Committee*, an interagency work group focused on integrating sustainable practices into agency activities including Climate Action Plan implementation.*	
Political support for implementing climate change adaptation strategies	High
Comment: *In June 2020, the County's Board of Supervisors allocated an additional full-time, fixed-term employee to focus on supporting Climate Action Plan implementation efforts as part of its budget hearing process.*	

Criterion	Jurisdiction Rating
Financial resources devoted to climate change adaptation	High
Comment: *The County funded the 2020 Climate Action Plan, which is a component of the 2040 General Plan, and has provided matching funds for sea level rise planning grants. The County Executive Office's Sustainability Division has staff devoted to climate action and adaptation programs, including an additional fixed-term position focused on supporting Climate Action Plan implementation that was approved in June 2020. The County also contributes membership funds to BEACON.*	
Local authority over sectors likely to be negative impacted	High
Comment: *The County exercises land use authority in the unincorporated County.*	
Public Capacity	
Local residents' knowledge of and understanding of climate change risk	Medium
Comment: *Many residents have a general understanding of climate change risks, but ongoing outreach and education is needed for the broader community.*	
Local residents' support of adaptation efforts	Medium
Comment: *While most residents support adaptation efforts, they may be resistant if new requirements impact them financially.*	
Local residents' capacity to adapt to climate impacts	Low
Comment: *Applications for new development and redevelopment have rarely included voluntary climate adaptation features, but some features are required to be included according to 2040 General Plan policies. The County has allowed redevelopment in areas impacted by wildfires.*	
Local economy's current capacity to adapt to climate change impacts	Medium
Comment: *The agricultural industry is a substantial contributor to the local economy, with an estimated gross value in 2020 of over 1.9 billion dollars, and employing over 40,000 individuals. The County (~8,000 employees) and Naval Base Ventura County (>16,000 employees) are the two largest local employers and both are planning for climate change impacts. Additionally, the City of Port Hueneme is conducting a General Plan update that will include a vulnerability assessment and planning for sea level rise impacts at the Port of Hueneme.* *Adaptive capacity is highly dependent on the scope and severity of climate impacts. Rebuilding levees, managed retreat, and rebuilding/relocating buildings and infrastructure in the face of extreme flooding and sea level rise are costly adaptation measures and, in many cases, would require substantial public funding and a multi-jurisdictional approach to implement.*	
Local ecosystems' capacity to adapt to climate change impacts	Low
Comment: *A 2019 report by the Western Regional Climate Center indicated that, as a result of climate change Ventura County will experience air temperature increases, a greater number of extreme heat days annually, and an increased number of annual dry days leading to fewer but more intense rainfall events. Based on these findings, it is anticipated that such changes will lead to challenges in evapotranspiration and crop cultivation, increased potential for flash flooding and/or debris flows, increased susceptibility to drought, and longer wildfire seasons. More work needs to be done to evaluate how ecosystems that often straddle jurisdictional boundaries can migrate and adapt. More community education and benefit-cost analysis is needed to demonstrate how ecosystem services can minimize or abate climate change impacts.* https://wrcc.dri.edu/Climate/reports.php https://wrcc.dri.edu/Docs/VenturaClimate2019_bookmarked.pdf.	

High = Capacity exists and is in use
Medium = Capacity may exist, but is not used or could use some improvement
Low = Capacity does not exist or could use substantial improvement
Unsure = Not enough information is known to assign a rating.

1.5 INTEGRATION REVIEW

For hazard mitigation planning, "integration" means that hazard mitigation information is used in other relevant planning mechanisms, such as general planning and capital facilities planning, and that relevant information from those sources is used in hazard mitigation. This section identifies where such integration is already in place, and where there are opportunities for further integration in the future. Resources listed at the end of this annex were used to provide information on integration. The progress reporting process described in Volume 1 of the hazard mitigation plan will document the progress of hazard mitigation actions related to integration and identify new opportunities for integration.

1.5.1 Existing Integration

Some level of integration has already been established between local hazard mitigation planning and the following other local plans and programs:

- The **Ventura County 2040 General Plan**, Hazards and Safety Element was updated in September, 2020. The update also included a Water Resources Element and a Climate Action Plan.
- The **Non-Coastal Zoning Ordinance (NCZO)** includes standards for hazard mitigation and abatement relative to high fire hazard areas, earthquakes, geology and floods. Recent updates to the NCZO added water efficient landscaping standards and a wildlife corridor overlay zone that includes new standards in fencing and lighting to promote the movement of wildlife.
- The **County's Local Coastal Program (LCP)** is comprised of the **Coastal Area Plan** and **Coastal Zoning Ordinance (CZO)**. The CZO includes standards for hazard mitigation and abatement related to beach erosion, geology, earthquakes, and floods.
- The **Ventura County Subdivision Ordinance** requires consideration of both geologic and flood hazards during the siting and design of proposed lots. Additionally, it requires consideration of wildfire hazards when a proposed subdivision is located in a "state responsibility area" or a "very high fire hazard severity zone".
- **Ventura County Emergency Operations Plan** addresses the County's planned response to hazard events.
- **Ventura County Building Code** is the local adoption of the State codes Title 24

1.5.2 Opportunities for Future Integration

The capability assessment in this annex indicates opportunities to integrate this mitigation plan with other jurisdictional planning/regulatory capabilities. Capabilities were identified as integration opportunities if they can support or enhance the actions identified in this plan or be supported or enhanced by components of this plan. The capability assessment identified the following plans and programs that offer opportunities for future integration or expanded integration with this mitigation plan:

- Although the **Ventura County 2040 General Plan** includes policies and programs for hazard mitigation and abatement relative to high-fire hazard areas, earthquakes, geology and floods, as well as climate change adaptation related to droughts, sea level rise and coastal erosion it needs to be expanded to meet the requirements for compliance with AB 2140.
- The County's **Initial Study Assessment Guidelines (ISAGs)** are in the process of being updated and this may be an integration opportunity.
- The County's **NCZO** is periodically amended per Board of Supervisors directive or as required by state law. Updates per new fire codes related to brush clearance and fire prevention may be needed.
- The **County's LCP** includes standards for hazard mitigation and abatement relative to beach erosion, geology, earthquakes, and floods. The policies and standards related to environmentally sensitive habitat, coastal hazards, and sea level rise are being consolidated and updated, and this effort could present an opportunity for future integration.
- **Wetland Project Permitting Guide, 2006**—this document could be updated with support from the County's Public Works Agency to include hazard integration.

The following projects are currently underway or are planned to be updated. There could be integration opportunities to include hazards in siting and design standards.

- Sea Level Rise Vulnerability Assessment and Adaptation Report, 2019
- Farmworker Housing Ordinance, underway
- Tree Mitigation Fund and County Tree Planting Program
- Land Conservation Act Program
- Initial Study Assessment Guidelines (ISAGs)

Taking action to integrate each of these programs with the hazard mitigation plan was considered as a mitigation action to include in the action plan in this annex.

1.6 RISK ASSESSMENT

1.6.1 Jurisdiction-Specific Natural Hazard Event History

Table 1-12 lists past occurrences of natural hazards for which specific damage was recorded in this jurisdiction Other hazard events that broadly affected the entire planning area, including this jurisdiction, are listed in the risk assessments in Volume 1 of this hazard mitigation plan.

Table 1-12. Past Natural Hazard Events

Type of Event	FEMA Disaster #	Date	Damage Assessment
2019 Easy Fire	FM5298	10/30/2019 to 11/2/2019	1,806 acres burned; 6,500 homes threatened; 30,000 residents evacuated.
2019 Maria Fire	FM5302	10/31/2019 to 11/4/2019	9,412 acres burned including a substantial portion of prime ag lands; 4 structures destroyed; >1,800 homes / 7,500 residents evacuated; triggered temporary shut-down of local oil and natural gas field facilities and pipelines; damage to communications and oil and gas field facilities occurred. 160 acres of avocado orchards and 25 acres of lemon orchards were moderately to severely damaged or destroyed. Damage to avocado and lemon crops was estimated at ~$5.2 million, according to Korinne Bell, Ventura County Chief Deputy Agricultural Commissioner.
2018 Hill Fire	DR4407	11/8/2018 to 11/16/2018	4,531 acres burned; 4 structures destroyed; 4 structures damaged; 5,000 structures threatened.
2018 Woolsey Fire	DR4407/FM5280	11/8/2018 to 11/21/2018	96,949 acres burned; $6 billion in property damage; $10 million in firefighting costs; 1643 structures destroyed, 3 deaths, 295,000 residents (in Ventura and L.A. County) evacuated.
2018 Heat Event (July)		7/4/2018 to 7/6/2018	Extreme 2-day heat event broke records across the county, and resulted in damage to crops. For crops such as avocados and citrus, heat can damage both the current crop and also the fruit set for the coming season, packing a two-year punch. The California Avocado Board estimated a 2019 crop of 210 million pounds, down from 372 million pounds a year earlier, and the smallest crop in over a decade. Citrus officials say it knocked down up to 15 percent of the region's lemon crop at the tail end of the harvest. Lemons dropped by 14% in value in the County's 2019 ag report.

Type of Event	FEMA Disaster #	Date	Damage Assessment
2018 Montecito Debris Flows	DR4353	1/9/2018 – 1/22/2018	A 30-mile section of U.S. Route 101 (US 101) from Santa Barbara to Ventura was shut down for two weeks as sections filled with two feet (60 cm) of mud and debris, some of which also reached beaches 2.25 miles (3.6 km) from the mountains. Following the closure, access to Santa Barbara from the Los Angeles area was limited to a 260-mile (420 km) detour around the Los Padres National Forest or through the use of private ferries to Ventura. This closure severely impacted commerce throughout the county. Based on commuter surveys conducted by the U.S. Census Bureau (2013) and Department of Transportation estimates, in 2017 an average of 2,300 vehicles (2,400 workers) commuted daily from Santa Barbara to Ventura County, and approximately 10,000 vehicles (11,500 workers) commuted from Ventura, in addition to approximately 3,700 commercial trucks. The loss to Ventura County cities from commuter earnings for each week of the closure has been approximated at $12,235,774.
2017 Thomas Fire	FM5224	12/4/2017 to 1/12/2018	Over 280,000 acres burned. Cost of $2.2 billion; $171,296,703 in agricultural losses (crop losses and farm equipment) alone; 1,063 structures destroyed; 280 damaged; 2 deaths; and 104,607 residents evacuated; Businesses, including Ag also experienced loss of perishable goods from the nearly two-week closure of U.S. 101 that shut down commerce and prevented workers from accessing fields.
2017 Winter Storms	NA	2/17/2017 to 2/18/2017	Rainfall amounts from 2 to 6 inches across coastal areas with up to around 10 inches in the local mountains produced numerous reports of flash flooding as well as mud and debris flows. Strong southerly winds with gusts up to 70 mph reported in some areas. Highway 101 was closed in both directions north of Ventura due to mud and debris flows near the Solimar burn area. Flash flooding near the community of Thousand Oaks; three men rescued when Wildwood Creek flooded. Near the community of Camarillo, Conejo Creek to overflow its banks, flooding acres of agricultural land. State disaster declaration No. CA77 and CA77.1
2015 Coastal Erosion and Flooding Event	NA	12/11/2015	Strong waves (up to 15 ft.) from a large westerly swell event resulted in evacuation and closure of the Ventura and Port Hueneme piers. Heavy surf caused approximately 15 pylons to break off the sides of the Ventura pier—triggering an extended (four month) closure while repairs were made. Pier repairs cost $1.4 million. Localized flooding of beachfront homes in the Pierpont neighborhood and nearby streets also occurred Harbor Boulevard between Sanjon Road and California Street in the city of Ventura had to be closed due to flooding. Erosion from this event substantially altered the beach profile along Ventura State Beach near the pier, including impacts to Surfer's Point as well as other exposed coastline areas. At Naval Base Ventura County, officials temporarily closed Family Beach and a nearby campground because of high surf. Farther east along Pacific Coast Highway, State Parks relocated campers inland from the beachside Thornhill Broome State Beach Campground after the combination of high tide and the swell flooded the east and west ends of the campground.
2014 Pacific Coast Highway (Hwy 1) Landslide		11/20/2014 to 3/15/2015	Rocks, boulders, and 4-6 feet of mud slumped onto Hwy 1 near the May 2013 Springs Fire burn area. The substantial slope stabilization and highway repairs required resulted in a months-long closure of 9 miles of Hwy 1 (November through mid-March) between the Mugu and Malibu areas, isolating unincorporated south coast communities, impacting commuter traffic, and limiting access to coastal recreational resources.
2014 Coastal Erosion and Flooding Event (Hurricane Marie)	NA	8/26/2014	Large southeast swells from Hurricane Marie generated high surf conditions along local beaches and resulted in numerous rescues by local lifeguards, beach and campground closures, and flooding of some coastal roads. Local piers experienced some damage including the pier at Port Hueneme. Extensive damage also occurred to the road infrastructure of Hwy 1 near Sycamore Canyon campground in Point Mugu State Park. At postmile (PM) 4.0, the existing revetment was damaged and at PM 4.2, the vegetated slope between the road and beach was severely eroded.
2013 Springs Fire	FM5024	5/2/2013	24,251 acres burned; 15 homes destroyed; 4,000 homes threatened as well as key communications infrastructure (including $1 billion dollar Naval satellite operations station on Laguna Peak). More than $10 million in firefighting costs incurred.

Type of Event	FEMA Disaster #	Date	Damage Assessment
2009 Guiberson Fire	FM2839	9/22/2009 to 9/29/2009	17,500 acres burned;1 structure destroyed; estimated firefighting costs of more than $6.9 million
2007 Ranch Fire	FM1731	10/21/2007	58,401 acres burned in both L.A. and eastern Ventura County near Piru; over $9 million in firefighting costs
2007 Freeze Event	DR-1689	1/11/2007 to 1/17/2007	4 nights of below freezing temperatures caused losses of over $1.3 billion statewide and $281 million in crop damage locally. Damage was mainly to citrus and avocado groves, and the winter strawberry crop that was just going to harvest.
2006 Shekell Complex Fire	FM2681	12/3/2006 to 12/6/2006	13,600 acres burned; 5 homes, 2 comm. Buildings; 11 structures destroyed; $12.8-13 million in damage; 9.2 million in structural damage; 25 million in ag damage
2006 Day Fire	FM2677	9/4/2006 to 10/9/2006	162,702 acres burned, including substantial wilderness and national forest areas; $78 million in fire suppression costs; 11 structures burned, residences threatened in Lockwood Valley and Upper Ojai over course of several weeks.
2005 La Conchita Landslide	DR1577	1/10/2005	The landslide resulted in the deaths of 10 people, destroyed 13 homes and resulted in red-tagging of 23 others. It occurred following a two-week period from Dec 27-Jan 10 in which 430 mm of rainfall fell (a record 15-day rainfall). Estimated costs of ~$1.75 million in county agencies' response to the event.
2005 Winter Storms (January)	DR1577	1/7/2005 to 1/11/2005	Damage totaled more than $200 million. High water flows, scouring, and washouts in the Ventura River damaged several water wells and exposed water lines owned by the Ojai Valley Sanitary District. Severe erosion occurred along both embankments of the Ventura River. The Calleguas Creek topped its banks near the state hospital in Camarillo and flooded nearby ag fields. Homes in Moorpark, Casitas Springs and Ojai were flooded, major roads including Highways 101, 126, 33 and 150 were closed for more than a week, and the Santa Paula Airport was closed for several months due to flood damage to the runway.
2003 Simi Fire	DR1498/ FM2504	10/24/2003	108,204 acres burned; crop losses of nearly $8 million.
1999 Ranch Fire	NA	12/27/1999	4,372 acres burned, including a large proportion of national forest lands in Los Padres National Forest. Reported losses include thousands of dollars in outdoor equipment and numerous small structures at The Ojai Foundation. The fire also threatened numerous homes in Ojai Valley area. Fire officials estimated the cost of fighting the fire at nearly $5 million, and noted that firefighters constructed more than 20 miles of fire lines.
1998 Freeze Event	DR1267	12/20/1998	This severe freeze impacted citrus/avocado/strawberry crops across Ventura County; 1,139 services received; $71,541,000 in damages to agriculture industry. Other sources estimated losses as high as $74.3 million for Ventura County farmers.
1928 St. Francis Dam Failure	NA	3/12/1928	>530 people died; bridges, orchards, farms, and homes were all eradicated in flood's path down the Santa Clara river valley to the Pacific Ocean. Considered to be one of the worst engineering disasters of the 20th century.

1.6.2 Hazard Risk Ranking

Table 1-13 presents a ranking of all hazards of concern for which this hazard mitigation plan provides quantitative risk assessments. As described in detail in Volume 1, the ranking process involves an assessment of the likelihood of occurrence for each hazard, along with its potential impacts on people, property, and the economy. Mitigation actions target hazards with high and medium rankings.

Table 1-13. Hazard Risk Ranking

Rank	Hazard	Risk Ranking Score	Risk Category
1	Landslides	51	High
2	Wildfire	36	High
3	Earthquake	32	High
4	Severe Storms	24	High[a]
5	Severe Weather	24	High[a]
6	Dam Failure	24	High[a]
7	Flooding	18	High[a]
8	Sea Level Rise	12	Low
9	Tsunami	10	Low
10	Drought	9	Low

a. The risk category was increased to High, based on jurisdiction-specific vulnerabilities.

1.6.3 Jurisdiction-Specific Vulnerabilities

Volume 1 of this hazard mitigation plan provides complete risk assessments for each identified hazard of concern. This section provides information on a few key vulnerabilities for this jurisdiction. Available jurisdiction-specific risk maps of the hazards are provided at the end of this annex.

Repetitive Loss Properties

Repetitive loss records are as follows:

- Number of FEMA-identified Repetitive-Loss Properties: 63
- Number of FEMA-identified Severe-Repetitive-Loss Properties: N/A
- Number of Repetitive-Loss or Severe-Repetitive-Loss Properties that have been mitigated: N/A

Other Noted Vulnerabilities

The following jurisdiction-specific issues have been identified based on a review of the results of the risk assessment, public involvement strategy, and other available resources:

- **Prioritization of Open Space / Natural Resource Areas—**In 2015, the U.S. Department of Agriculture named Ventura County the most desirable place to live in America. Ventura's mild climate, varied topography, bountiful open space and natural resources, and proximity to additional natural resource areas are a large part of its draw for residents and visitors. Vast tracts of the unincorporated County lie adjacent to, or within, the Los Padres National Forest, Santa Monica Mountains National Recreation Area, and the Pacific Ocean. Valuation of these resources, and of our interface with these open space areas is outside the scope of FEMA's traditional risk analysis tools (e.g., property/structural damage estimates, loss of life, and critical infrastructure inventories, insurance claims), which can result in radical underestimation of disaster impacts to recreation, tourism, and the overall desirability of living and working here.
- **Santa Ana Winds and Planned/Unplanned Utility Outages—**Warm, dry northeasterly winds are a local weather phenomenon in Southern California that can result in downed trees and power lines, blowing dust and air quality concerns. Although the winds themselves do not cause wildfires and rarely rise to the level of an area-wide disaster on their own, they exacerbate

critical fire weather conditions in our area and substantially complicate wildfire response and containment. These winds may occur throughout the year, but are typically most common from October to March. Nearly all of the region's significant wildfires have occurred in conjunction with strong Santa Ana wind conditions. Local power outages have been enacted with increasing frequency by utility companies in response to high wind/low humidity conditions, both within Ventura County and adjacent counties. Supporting adaptation of local businesses and individual residents to sporadic utility outages triggered by potential wind events, as well as critical facilities (e.g., communications towers and other energy infrastructure) should be prioritized.

- **Localized Flooding—**Many communities within the unincorporated County are located adjacent to rivers (e.g., Santa Clara River, Ventura River, Sespe Creek, Piru Creek, Lockwood Creek) that are prone to flood to varying degrees during periods of heavy rainfall. The effects of this flooding range from localized road closures to damage to property (e.g., flooded croplands), vehicles, and buildings.
- **Ventura County Public Works Agency – Watershed Protection's (VCPWA-WP's) Critical Facilities in the Unincorporated Areas—**Based on the fact that virtually all of VCPWA-WP's critical facility assets were constructed to provide flood protection and/or are geospatially located proximate to and/or in flood plains, and as documented in Table 1.8 Past Natural Hazard Events above, during the aforementioned 56-year period, VCPWA-WP's critical facility flood protection assets experienced $81 Million in damage from flooding, severe storms and severe weather events, VCPWA-WP has ranked Flood risks as "High" in Table 1.9 above.
- **Matilija Dam Seismic Risk Vulnerability—**Matilija Dam in the Ventura River watershed is vulnerable to seismic failure. Many communities are at risk of inundation. Implementation of the Matilija Dam Ecosystem Restoration Project (MDERP) would address this risk while also opening 17 miles of habitat for endangered steelhead trout. MDERP comprises several downstream flood protection and water supply reliability components that must precede removal of the dam, some of which have been completed or are at various stages of completion (alternatives analysis, design, or construction).
- **Levee Rehabilitation and Certification Projects in Unincorporated Areas—**Ventura County Watershed Protection is engaged in preliminary design and CEQA work for levee retrofit and/or flood-protection enhancement projects required to certify all its levees in compliance with federal levee certification requirements. Major levee rehabilitation and ultimate certification projects in the unincorporated areas include: the Ventura River Levee (VR-2) located in the unincorporated community of Casitas Springs, and the Ventura River Levee (VR-3) located in the near the unincorporated community of Oak View. VCPWA-WP is working with FEMA, the U.S. Army Corps of Engineers (USACE), as well as affected cities, residents, and property owners throughout Ventura County to marshal scarce Federal, State, and local funding resources necessary to complete five very important levee retrofit public safety and flood protection projects. Once all VCPWA-WP's levee retrofit projects are completed, VCPWA-WP's levees will fully comply with applicable Federal Levee Certification requirements found in 44 CFR 65.10. At best, full completion of VCPWA-WP's five levee rehab projects will require a minimum of five to ten years, and could take longer, depending on final engineering design plan results, environmental considerations, and availability of project funding required to construct the rehab projects.
- **Unincorporated Area Pump Stations Vulnerable to Sea-Level Rise—**San Nicholas, Santa Monica, and Santa Paula Pump Stations lift stormwater from low elevation coastal neighborhoods and discharge directly to the Pacific Ocean. The Santa Monica and Santa Paula Pump Station outlets are frequently clogged during high tide and heavy surf events, causing the

pumps to shut off and requiring manual removal of sand to ensure the coastal communities do not flood. With sea level rise, the risk increases. While not currently afflicted with the propensity for sand to clog its outlet, San Nicholas Pump Station is vulnerable to failure as sea level rises. The pumps in each facility are over 40 years old and do not have on site backup generators, making them vulnerable to power failures, which cause alarms to sound signaling the need for immediate emergency response. All three facilities need constant repair due to corrosive salt air and water. Upgrades are needed, but more land is required for truly effective solutions, and adjacent land is occupied by high value coastal residences.

- **Ormand Lagoon Coastal Estuary Vulnerable to Sea Level Rise—**Ormond Lagoon is a coastal estuary open to the ocean only during rain events and for a variable period thereafter depending on time between rain events, tides, etc. Sea level rise may reduce the ability of storm runoff from Ormond Lagoon Waterway and Tšumaš Creek to breach the lagoon and flow into the Pacific Ocean. Without a Beach Elevation Management Plan, the following are vulnerable to flooding from storm water backed up in the lagoon: the adjacent Oxnard Wastewater Treatment Plant and Advanced Water Purification Facility, the New-Indy recycled containerboard mill, the Halaco Superfund Site, local residences and roads. Restoration of the Ormond Wetlands complex may help reduce flood potential.
- **Homeless Population—**The size and distribution of the homeless population in the unincorporated area is not easily quantified, but has been increasing in recent years and exacerbates hazard risks and mitigation costs. During a January 2020 point-in-time survey coordinated by the County Executive Office, 128 homeless individuals were counted as residing within the unincorporated County area. Many homeless individuals within the unincorporated area inhabit encampments within the Ventura and Santa Clara river bottoms, where both wildfires and flooding risks are regular concerns. Unsheltered living locations have negative impacts on watershed viability and resilience in addition to posing risks to the broader community. The presence of unauthorized habitation within the watersheds increases wildfire risks (e.g., accidental starts from cooking/warmth fires and arson) as well as the cost of hazard mitigation actions (e.g., brush clearance for wildfire hazard abatement and trash and debris removal efforts prior to winter storm season). Communication barriers, fear of government officials and law enforcement, substance abuse issues, and mental health issues can complicate public outreach and hazard awareness efforts to homeless individuals, and confound accurate assessments of hazard risk and disaster damage.
- **Importance of Agriculture and Potential for Undervaluation of Drought and Ag/Biological Risks—**Agriculture, in the forms of ranching and farming, has been a keystone of Ventura County's economy since its inception. With fertile soils and a mild climate, Ventura remains one of the leading counties for agricultural production in the state. In addition to a variety of row crops and nursery products, the county is one of the top producers of citrus, avocados, and strawberries in the nation. Much of the cultivated land lies within the unincorporated County areas of the Oxnard Plain and Santa Clara River Valley. In addition to generating direct on-farm employment and revenue, agricultural production supports a wide range of other businesses, including packinghouses, equipment dealers, chemical applicators, pest-control firms, labor contractors, fertilizer and other supply dealers, trucking firms, fuel distributors, and repair and manufacturing facilities. Altogether, farming and farm-dependent businesses provide an estimated 43,000 jobs in Ventura County, more than any other sector of the economy except services. Agriculture and agriculture-related businesses account for about 4.4 percent of overall economic activity in Ventura County, generating $2.1 billion in revenue and $76 million in indirect business taxes annually. One in 10 county residents relies to some degree on income derived from farming. However, drought and agricultural/biological hazards (e.g., invasive crop

pests and disease) do not lend themselves to evaluation using FEMA's traditional risk analysis tools (e.g. property, structural damage estimates, loss of life, critical infrastructure inventories), which results in underestimation of the disaster impacts/costs that these hazards can have on the local environment, economy, and area communities.

- **Unauthorized Immigrants—**Ventura County's farm bureau estimates there are about 36,000 immigrant workers in the county, many of them undocumented. Unauthorized immigrants may be disproportionately affected by disasters (e.g., wildfires, flooding, pandemics), particularly those that impact agricultural operations in the unincorporated county areas where many work as farm laborers. Language/ communication barriers and fear of government and law enforcement personnel can complicate public outreach and education efforts to these individuals.

Mitigation actions addressing these issues were prioritized for consideration in the action plan in this annex.

1.7 STATUS OF PREVIOUS PLAN ACTIONS

Table 1-14 summarizes the actions that were recommended in the previous version of the hazard mitigation plan and their implementation status at the time this update was prepared.

Table 1-14. Status of Previous Plan Actions

Action Item from Previous Plan	Completed	Removed; No Longer Feasible	Carried Over to Plan Update	
			Check if Yes	Action # in Update
OA 11—Develop and implement plans to increase the building owner's general knowledge of and appreciation for the value of seismic upgrading of the building's structural and nonstructural elements.			✓	VUC-8
Comment: *This is an ongoing effort to be developed over the next year.*				
OA 19—Maintain vegetation management program that provides vegetation management services to elderly, disabled, or low-income property owners who lack the resources to remove flammable vegetation from around their homes.			✓	VUC-9
Comment: *This is an ongoing program and will be carried over to the plan update.*				
OA 21—Maintain hazards fuel treatment program for areas that have been identified with overgrown/dead brush/trees to reduce the potential for tree-to-tree ignition. Ensure that a "maintenance now" component to provide continued fire resistance is partof the program.			✓	VUC-10
Comment: *This is an ongoing program and will be carried over to the plan update.*				
UVC 1—Continue to participate in the National Weather Service's (NWS) StormReady Program.			✓	VUC-11
Comment: *Ventura County continues to participate in TsunamiReady and StormReady. NWS confirmed that Ventura County was last renewed for both SR and TR on 2/25/2019. The next renewal will be due on 3/19/2022.*				
UVC 2—Develop a plan to identify funding to replace/relocate the Operational Area Emergency Operations Center (EOC).			✓	VUC-12
Comment: *This item was not completed/pursued during the last update cycle (Thomas & Woolsey fire events, OES staffing changes, and COVID impacted planning and development of many items over the last several years) but continues to be a project of interest that will be carried over to the plan update.*				

Action Item from Previous Plan	Completed	Removed; No Longer Feasible	Carried Over to Plan Update: Check if Yes	Carried Over to Plan Update: Action # in Update
UVC 3—Update Seismic Standards for Communications (Cell Towers) Facilities (Building Code).			✓	VUC-13
Comment: *This will be done through the Ventura County Building Code VCBC 2019*				
UVC 4—Reinforce and maintain County roads, bridges, ditches and culverts from flooding through various flood proofing measures.			✓	VUC-17
Comment: *Ventura County Public Works Agency—Roads and Transportation Department (VCPWA-RT) is responsible for the operation and maintenance of County roads, bridges, ditches, and culverts in the unincorporated areas of Ventura County. VCPWA-RT conducts annual ditch cleaning and culvert cleaning before winter storm season to maintain the capacity of ditches and proper drainage flow to mitigate roadway flooding in rural areas of the county. In addition to the annual cleaning of ditches and culverts, the VCPWA-RT is actively working to rehabilitate Bridge Road Bridge (#442) which is currently in design and environmental permitting phase and is expected to be completed in 2023. Replacement of Catalina Drive Bridge (#384) was completed in May 2020 and replacement of Casitas Vista Road Bridge (#327) was completed in September 2020. Mupu Road Bridge and the Wheeler Canyon Road Bridge improvements projects were completed in 2016-2017. The VCPWA-RT is developing a Bridge Management Program to maintain County bridges. The program will identify and prioritize VCPWA-RT's 158 bridge structures which include 81 bridges on the National Bridge Inventory and 77 other structures. This program will identify budget needs, and schedules for preventive maintenance as well as budget for required rehabilitation or replacement of VCPWA-RT maintained bridges for short and long-term planning needs. The Bridge Management Program is expected to be completed in calendar year 2021. In 2020-2021, VCPWA-WP continued to clean flood control channels and catch basins to prepare for winter storm seasons. VCPWA-WP also secured Proposition 1 grant funding for the Santa Ana Bridge and Camino Cielo Bridge replacement projects which are managed by VCPWA-RT (both are components of the MDERP). The design of Camino Cielo Bridge is progressing towards 30% millstone. For the Santa Ana Bridge project, a construction contract was awarded in March 2021 with an estimated completion date of December 2022.*				

1.8 HAZARD MITIGATION ACTION PLAN

Table 1-15 lists the identified actions, which make up the hazard mitigation action plan for this jurisdiction. Table 1-16 identifies the priority for each action. Table 1-17 summarizes the mitigation actions by hazard of concern and mitigation type.

Table 1-15. Hazard Mitigation Action Plan Matrix

Benefits New or Existing Assets	Objectives Met	Lead Agency	Support Agency	Estimated Cost	Sources of Funding	Timeline[a]
Action VUC-1—Where appropriate, support retrofitting, purchase or relocation of structures located in hazard areas, prioritizing those that have experienced repetitive losses and/or are located in high- or medium-risk hazard areas.						
Hazards Mitigated: Landslide, Earthquake, Severe Storm, Severe Weather, Flooding, Wildfire, Dam Failure, Sea Level Rise, Tsunami						
New & Existing	1, 4, 6, 9, 10, 11, 16	Ventura County	NA	High	HMGP, PDM, FMA	Short-term

Benefits New or Existing Assets	Objectives Met	Lead Agency	Support Agency	Estimated Cost	Sources of Funding	Timeline[a]
Action VUC-2—Integrate the Hazard Mitigation Plan into other plans, ordinances and programs that dictate land use decisions in the community, including the 2040 General Plan, Non-Coastal Zoning Ordinance, and Local Coastal Program.						
Hazards Mitigated: Landslide, Earthquake, Severe Storm, Severe Weather, Flooding, Wildfire, Dam Failure, Sea Level Rise, Tsunami, Drought, Agricultural/Biological						
New & Existing	1, 2, 4, 6, 9, 10, 11, 12, 15, 17, 18, 19	Ventura County Resource Management Agency, Ventura County Sheriff's OES, Ventura County Public Works Agency	NA	Low	Staff Time, General Funds	Ongoing
Action VUC-3—Actively participate in the plan maintenance protocols outlined in Volume 1 of this hazard mitigation plan.						
Hazards Mitigated: Landslide, Earthquake, Severe Storm, Severe Weather, Flooding, Wildfire, Dam Failure, Sea Level Rise, Tsunami, Drought, Agricultural/Biological						
New & Existing	1, 2, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19	Ventura County Agencies	NA	Low	Staff Time, General Funds	Short-term
Action VUC-4—Continue to maintain good standing and compliance under the NFIP through implementation of floodplain management programs that, at a minimum, meet the NFIP requirements to: • Enforce the flood damage prevention ordinance. • Participate in floodplain identification and mapping updates. • Provide public assistance/information on floodplain requirements and impacts.						
Hazards Mitigated: Flooding, Severe Storms, Sea Level Rise, Dam Failure						
New & Existing	1, 2, 4, 6, 9, 10, 11, 13, 14, 15, 17, 19	County Public Works	Building and Safety	Low	Staff Time, General Funds	Ongoing
Action VUC-5—Identify and pursue strategies to increase adaptive capacity to climate change including but not limited to the following: • Implementation of 2040 General Plan programs including a Cool Roof Ordinance and Cool Pavement Standards, Performance-Based Building Code for Green Building, Groundwater Basins Resilience Program, Sea Level Impacts Monitoring Program, and Wildfire Vulnerability Assessment and Mapping Program. • Develop programs to increase energy efficiency of new buildings above state-required design requirements						
Hazards Mitigated: Sea Level Rise, Flooding, Drought, Wildfire, Severe Weather, Severe Storms, Agricultural/Biological						
New & Existing	1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19	Ventura County	NA	Low	Staff Time, General Funds	Ongoing and Short-term
Action VUC-6—Purchase and install permanent generators for critical facilities and infrastructure that lack adequate backup power.						
Hazards Mitigated: Dam Failure, Earthquake, Flooding, Severe Weather, Severe Storms, Tsunami, Wildfire						
Existing	2, 6	Ventura County	NA	High	FEMA HMA (BRIC and HMGP), Staff Time & General Funds	Short-term

Benefits New or Existing Assets	Objectives Met	Lead Agency	Support Agency	Estimated Cost	Sources of Funding	Timeline[a]
Action VUC-7—Purchase and install mobile generators for critical facilities and infrastructure that lack adequate backup power.						
Hazards Mitigated: Dam Failure, Earthquake, Flooding, Severe Weather, Severe Storms, Tsunami, Wildfire						
Existing	2, 6	Ventura County	NA	High	FEMA HMA (BRIC and HMGP), Staff Time & General Funds	Short-term
Action VUC-8—Develop and implement plans to increase building owner's general knowledge of and appreciation for the value of seismic upgrading of their building's structural and nonstructural elements. (formerly 2015 Action OA-11)						
Hazards Mitigated: Earthquake						
Exitsting	1, 2, 4, 6, 9, 16, 17	Ventura County Building and Safety	NA	Medium	Staff Time, General Funds	Ongoing and Short-term
Action VUC-9—Maintain new vegetation management program that provides vegetation management services to elderly, disabled, or low-income property owners who lack the resources to remove flammable vegetation from around their homes. (formerly 2015 Action OA-19) (Coordinates with Ventura County Fire Protection District Action VFP-12)						
Hazards Mitigated: Wildfire						
New & Existing	2, 4, 5, 8, 10, 13, 14, 15, 19	VCFPD	Ventura County	Medium	FEMA HMA (BRIC, FMAP and HMGP), Staff Time, General Funds	Ongoing
Action VUC-10—Maintain wildfire hazard fuel reduction program for areas that have been identified with overgrown or dead brush, trees and weeds to reduce the potential for tree-to-tree ignition. Ensure that a "maintenance now" component to provide continued fire resistance is part of the program. (formerly 2015 Action OA-21) (Coordinates with Ventura County Fire Protection District Action VFP-6)						
Hazards Mitigated: Wildfire						
New & Existing	2, 4, 5, 6, 8, 10, 11, 13, 14, 15, 18, 19	VCFPD	CAL FIRE & USDA	Medium	FEMA HMA (BRIC, FMAP and HMGP), Staff Time & General Funds	Ongoing
Action VUC-11—Continue to participate in the National Weather Service's (NWS) StormReady and TsunamiReady Programs. (formerly 2015 Action UVC-1) (Coordinates with Action VCPWA-WP-16)						
Hazards Mitigated: Severe Storms, Severe Weather, Tsunami, Flooding, Dam Failure, Landslide, Sea Level Rise						
New & Existing	1, 2, 7, 8, 17	Ventura County Public Works	Ventura County Sheriff's OES	Low	Staff Time, General Funds	Ongoing
Action VUC-12—Develop a plan to identify funding to replace/relocate the Operational Area Emergency Operations Center (EOC). (formerly 2015 Action UVC-2)						
Hazards Mitigated: Landslide, Earthquake, Severe Storm, Severe Weather, Flooding, Wildfire, Dam Failure, Sea Level Rise, Tsunami						
New & Existing	6, 7, 8	Ventura County Sheriff's OES	NA	High	Staff Time, General Funds	Long-term
Action VUC-13—Update Seismic Standards for Communications (Cell Towers) Facilities (Building Code).						
Hazards Mitigated: Earthquake						
New & Existing	1, 2, 4, 6, 11	Ventura County Building and Safety	NA	High	HMGP, PDM, FMA	Short-term
Action VUC-14—Develop a countywide Evacuation Route Plan to identify and evaluate evacuation routes for wildfires and other hazards.						
Hazards Mitigated: Wildfire, Dam Failure, Flooding, Landslide						
New & Existing	7, 8, 17, 19	Ventura County OES	VCFPD	High	Staff Time, General Funds, Fire Safe Council Grant	Short-term

Benefits New or Existing Assets	Objectives Met	Lead Agency	Support Agency	Estimated Cost	Sources of Funding	Timeline[a]
Action VUC-15—Implement a Post Disaster Critical Facilities Risk Impact Assessment Program designed to capture and geo-reference perishable data after significant events (e.g., preliminary damage estimates, damage photos, event mapping, etc.) in support of future hazard mitigation efforts including the implementation and maintenance of the HMP. Leverage applications (Maintstar v15, ArcGIS Online) to capture information related to VCPWA-RT, W&S, and WP critical facility asset impacts, and establish a centralized location to document and archive critical facilities geospatial data related to disaster events which will facilitate the development and optimize the pursuit of grant funding for future hazard mitigation projects. (Coordinates with Action VCPWA-WP-3) *Hazards Mitigated:* Dam Failure, Drought, Earthquake, Flooding, Landslide, Sea Level Rise, Severe Storms, Severe Weather, Tsunami, Wildfire						
New & Existing	1, 2, 4, 6, 8, 9, 10, 11, 12, 13, 16, 17, 18, 19	VCPWA-WP	Ventura County Departments, Cities, Special-Purpose Districts, and NGOs.	Low	WP Structural Revenues augmented by FEMA Grants (BRIC) and County General Funds, as required	Short Term
Action VUC-16—Improve public awareness and community response to flood event emergencies by upgrading and modernizing the Flood Warning System (FWS) optimized to leverage multi-social media venues. Expand the public outreach of the FWS through targeted marketing based on web-site analytics and develop multiple language interfaces to better reflect the linguistic and cultural diversity found in Ventura County communities. (Coordinates with Action VCPWA-WP-4) *Hazards Mitigated:* Flooding, Landslide, Sea Level Rise, Severe Storms, Severe Weather, Tsunami						
New & Existing	1, 2, 6, 7, 12, 17, 18, 19	VCPWA-WP	DWR, NOAA, VCSOES, Ventura County Departments, Cities, Special-Purpose Districts, community and tribal leaders, community councils, and NGOs	Medium	WP Structural Revenues augmented by DWR and FEMA Grants (BRIC and HMGP) and County General Funds, as required	Short Term
Action VUC-17—Prioritize efforts to upgrade County bridges, culverts, dams, debris and detention basins, flood conveyance channel and pipeline infrastructure, pump stations, roads, water and wastewater community infrastructure, and other critical facilities required to provide adequate flood-proofing protection and enhance the resiliency of vital community lifelines in Ventura County. (Coordinates with Action VCPWA-WP-5) *Hazards Mitigated:* Dam Failure, Earthquake, Flooding, Landslide, Sea Level Rise, Severe Storms, Severe Weather, Tsunami, Wildfire						
New & Existing	1, 2, 5, 6, 8, 9, 10, 11, 13, 16, 18, 19	VCPWA Departments	Ventura County Departments, Cities, Special-Purpose Districts	High	WP Structural Revenues augmented by FEMA Grants (BRIC, HMGP) DWR, VCTC, Caltrans and County General Funds, as required	Long-term
Action VUC-18—Complete project feasibility analyses, design engineering and CEQA work for the Ventura River Levee (VR-2) in the unincorporated community of Casitas Springs, and the Live Oak Acres Levee (VR-3) near the unincorporated community of Oak View required to evidence local compliance with Federal Levee Certification Regulations (44 CFR 65.10) (Coordinates with Action VCPWA-WP-6) *Hazards Mitigated:* Dam Failure, Earthquake, Flooding, Landslide, Sea Level Rise, Severe Storms, Severe Weather, Tsunami						
New & Existing	1, 2, 5, 6, 8, 9, 10, 11, 13, 16, 18, 19	VCPWA-WP	Ventura County Departments and Cities of Camarillo, Oxnard, and San Buenaventura	High	WP Structural Revenues augmented by FEMA Grants (BRIC and HMGP) DWR-LLAP Grants USACE, and County General Funds, as required	Long Term

Benefits New or Existing Assets	Objectives Met	Lead Agency	Support Agency	Estimated Cost	Sources of Funding	Timeline[a]
Action VUC-19—Strengthen the unincorporated area's participation in the NFIP by maintaining a CRS Class 5 Rating; and pursue a renewed emphasis on the planning and implementation of flood mitigation projects for repetitive loss properties eligible for grant funding under FEMA's Building Resilient Infrastructure and Communities (BRIC) program with the goal of reducing the number of repetitive loss properties in Ventura County. (Coordinates with Action VCPWA-WP-7)						
Hazards Mitigated: Flooding, Landslide, Sea Level Rise, Severe Storms, Severe Weather, Tsunami						
New & Existing	1, 2, 4, 6, 9, 10, 11, 12, 13, 16, 18, 19	VCPWA-WP	Ventura County Departments, DWR, FEMA	High	WP Structural Revenues augmented by Grants (FMA, BRIC, HMGP) and County General Funds, as required	Ongoing
Action VUC-20—Partner with the Nature Conservancy, Santa Clara River Conservancy, Ojai Valley Land Conservancy, and other NGOs in cooperative efforts to acquire floodplain properties, carry out restoration projects, and enhance resiliency to natural disasters with green design elements included in hazard mitigation projects where feasible. (Coordinates with Action VCPWA-WP-8)						
Hazards Mitigated: Dam Failure, Drought, Flooding, Landslide, Sea Level Rise, Severe Storms, Severe Weather, Tsunami, and Wildfire						
New & Existing	1, 2, 5, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18	VCPWA-WP	Ventura County Departments, TNC, SCRC, OVLC, DWR, CDFW, State Coastal Conservancy	High	WP Structural Revenues augmented by Grants (FMA, BRIC, HMGP, DWR, SCC, etc.) and County General Funds, as required	Ongoing
Action VUC-21—Advance planning, feasibility analyses, preliminary design, and ultimate construction of multi-benefit stormwater capture projects through a regionally collaborative approach; as well as pursue strategies to maximize stormwater as a resource (enhance recycled water, stormwater capture and sanitary system diversion, and groundwater recharge) where possible in infrastructure planning and implementation of WP stormwater capital projects. (Coordinates with Action VCPWA-WP-9)						
Hazards Mitigated: Drought, Flooding, Sea Level Rise, Severe Storms, Severe Weather						
New	1, 2, 9, 10, 11, 12, 14, 15, 16, 17, 18, 19	VCPWA-WP	Ventura County Departments, SWRCB, LARWQCB, DWR, SGMAs, NGOs and Private Landowners	High	WP Structural Revenues augmented by FEMA Grants (BRIC & HMGP) DWR, IRWM, LARWQB, SWRCB) and County General Funds, as required	Ongoing
Action VUC-22—Coordinate with FEMA Region IX to proactively address flood plain management and flood risk mapping issues that could adversely impact local hazard mitigation project planning and implementation efforts which may arise from updates to the Countywide DFIRMs, Community Assistance Visits, and/or other risk mapping initiatives. (Coordinates with Action VCPWA-WP-10)						
Hazards Mitigated: Flooding, Sea Level Rise, Severe Storms, Severe Weather						
New & Existing	1, 2, 4, 6, 8, 9, 10, 11, 12, 16, 17, 18, 19	VCPWA-WP	Ventura County Departments, DWR, FEMA, Cities, NGOs, and Private Landowners	Medium	WP Structural Revenues augmented by FEMA Grants (BRIC & HMGP) DWR, and County General Funds, as required	Ongoing
Action VUC-23—Work closely with CA Division of Safety of Dams (DSOD), County Sheriff Office of Emergency Services (OES), and other Federal, State, and local agencies to update and refine the Emergency Action Plans (EAPs) for the state size dams owned by the County. (Coordinates with Action VCPWA-WP-11)						
Hazards Mitigated: Dam Failure, Flooding, Earthquake, Severe Storms, Severe Weather						
New & Existing	1, 2,4, 7,8, 12, 17, 18	VCPWA-WP	Ventura County Departments, FEMA, DWR, Cities, NGOs, and Private Landowners	Medium	WP Structural Revenues augmented by FEMA Grants (BRIC), DWR, and County General Funds, as required	Short-Term

Benefits New or Existing Assets	Objectives Met	Lead Agency	Support Agency	Estimated Cost	Sources of Funding	Timeline[a]
Action VUC-24—Complete project feasibility analyses, design engineering, CEQA, and implementation of the removal of Matilija Dam, reconstruction of the Camino Cielo Bridge crossing, and work with the Casitas Municipal Water District to reconstruct the Robles Diversion, as well as complete the construction of flood protection projects in the unincorporated community of Meiners Oaks in compliance with DSOD requirements. (Coordinates with Action VCPWA-WP-12) *Hazards Mitigated:* Dam Failure, Drought, Earthquake, Flooding, Severe Storms, Severe Weather						
New & Existing	1, 2, 4, 6, 8, 9, 10, 11, 12, 13, 14, 15, 17, 18, 19	VCPWA-WP	Ventura County Departments, Casitas Municipal Water District, Bureau of Reclamation, Caltrans, CDFW, DSOD, DWR, FEMA, USACE, NGOs	High	WP Structural Revenues augmented by FEMA Grants (BRIC & HMGP) CDFW, DWR, NFWF, NRCS, SCC, WCB, and NGO's and County and Casitas General Funds, as required	Long-Term
Action VUC-25—Collaborate with the City of Oxnard, Nature Conservancy, and State Coastal Conservancy to advance planning, design, and implementation of the Ormond Beach Restoration and Access Plan (OBRAP), particularly those components alleviating flooding along the Ormond Lagoon Waterway and creating public access along *tšumaš* Creek. (Coordinates with Action VCPWA-WP-13 and supports the City of Oxnard Action OXN-12) *Hazards Mitigated:* Drought, Flooding, Severe Weather, Severe Storms, Sea Level Rise, Tsunami						
New & Existing	1, 2, 3, 9, 12, 13, 14, 15, 17, 18, 19	City of Oxnard	VCPWA-WP	High	City Structural Revenues augmented by FEMA Grants (BRIC), CDFG	Ongoing
Action VUC-26—Coordinate efforts to plan, develop, and ultimately construct multi-benefit, flood resiliency and other risk hazard mitigation projects with the Watershed Coalition of Ventura County (OBRAP) 3-Watershed Councils, its Disadvantaged Community Committee, and nonprofit partners by increasing outreach and engagement with disadvantaged and socially vulnerable communities and tribal groups to better understand their unique community-lifeline vulnerabilities, facilitate the development of flood hazard mitigation multi-benefit projects, and align and leverage advocacy efforts to optimize grant funding opportunities. (Coordinates with Action VCPWA-WP-14) *Hazards Mitigated:* Flooding, Severe Weather, Severe Storms, Severe Weather, Sea Level Rise, Tsunami						
New & Existing	1, 2, 4, 8, 9, 10, 11, 12, 14, 15, 16, 17, 18, & 19	VCPWA-WP	County of Ventura Departments, Cities, Special-Purpose Districts, community and tribal leaders, community councils, WCVC, and NGOs	Medium	WP Structural Revenues augmented by FEMA Grants (BRIC & HMGP) DWR, IRWM, and City and County General Funds as required	Ongoing

a. Short-term = Completion within 5 years; Long-term = Completion within 10 years; Ongoing= Continuing new or existing program with no completion date

Acronyms used here are defined at the beginning of this volume.

1.9 INFORMATION SOURCES USED FOR THIS ANNEX

The following technical reports, plans, and regulatory mechanisms were reviewed to provide information for this annex.

- **Ventura County Ordinance**—The ordinance code was reviewed for the full capability assessment and for identifying opportunities for action plan integration.
- **2040 General Plan**—This document was reviewed to identify opportunities for hazard plan integration.

- **Coastal and Noncoastal Zoning Ordinances**—These documents were reviewed to identify opportunities for hazard plan integration.
- **Ventura County Subdivision Ordinance, 2020**—This document was reviewed to identify opportunities for hazard plan integration.
- **Initial Study Assessment Guidelines, 2011**
- **Sea Level Rise Vulnerability Assessment, 2018**
- **Sea Level Rise Adaptation Report, 2019**
- **VCPWA-WP's Integrated Watershed Protection Plan Project Prioritization Process**—Explored possible opportunities to better integrate the development of multi-benefit flood protection project partnerships with public and private sector agencies and organizations aimed at improving community resiliency to flood hazard risk, flood plain management, groundwater conservation, stormwater capture, environmental protection, and helping to secure a sustainable water supply for agricultural and urban users.
- **VCPWA-WP 5 Year Capital Improvement Projects Plan, Annual Update**—Confirmed inclusion of flood protection projects in WP's current 5-year portfolio which address a mix of high, medium, and low hazard risks found in WP's current Jurisdiction Annex, keying-up those projects as entries in WP's new 5-year Action Plan portfolio, including seven levee rehabilitation projects which when completed will ultimately result in local compliance with Federal Levee Certification regulations found in 44CFR65.10.
- **Ventura County Flood Mitigation and Safety Plans**—Consulted current plan documents to identify opportunities of alignment and optimization of WP's new 5-Year Action Plan submittal with the baseline framework found in these historical County flood mitigation and safety plan documents.
- **VCPWA-WP's Preparation of Annual Recertifications and Cycle Verification of Class V Rating for Unincorporated Ventura County under FEMA's Community Rating System Program**—Consulted the current Class 5 Rating program performance and reporting requirements to ensure continuation of this rating, as well as identified opportunities for renewed emphasis on the planning and implementation of flood mitigation projects for repetitive loss properties eligible for grant funding under FEMA's Building Resilient Infrastructure and Communities (BRIC) program with the goal of reducing the number of repetitive loss properties in Ventura County.
- **Ventura County Emergency Services Planning Documents**—Reviewed emergency services planning documents prepared by the Ventura County Sheriff's Office of Emergency Services to gain a better understanding of how best to facilitate appropriate development of WP's new 5-year Action Plan submittal by complementing and supplementing countywide risk hazard emergency planning rubric defined by County's Emergency Action Plan, as well as refine Emergency Action Plans for the state-sized dams owned by the County.
- **Ventura County Integrated Regional Water Management Plan (IRWMP) Updates and DAC Public Outreach Engagement Initiative**—Explored framing potential opportunities to better coordinate joint efforts to plan, develop, and ultimately construct multi-benefit, flood resiliency and other risk hazard mitigation projects contained in WP's new 5-Year Action Plan submittal by increasing outreach and engagement with disadvantaged and socially vulnerable communities and tribal groups to better understand their unique community-lifeline vulnerabilities, facilitate

the development of flood hazard mitigation multi-benefit projects, and align and leverage advocacy efforts to optimize grant funding opportunities.

The following outside resources and references were reviewed:

- **Hazard Mitigation Plan Annex Development Toolkit**—The toolkit was used to support the identification of past hazard events and noted vulnerabilities, the risk ranking, and the development of the mitigation action plan.
- **BEACON Regional Sediment Management Plan**
- **General Services Agency, Energy Action Plan, April 2010**
- **Climate Protection Plan for Government Operations, April 2012**
- **Los Padres National Forest Land Management Plan, 2005**

2. CITY OF CAMARILLO

2.1 LOCAL HAZARD MITIGATION PLANNING TEAM

Primary Point of Contact
Carmen Nichols, Assistant City Manager
601 Carmen Drive
Camarillo, CA 93010
805-388-5312
cvnichols@cityofcamarillo.org

Alternate Point of Contact
Roger Pichardo, Sr. Management Analyst
601 Carmen Drive
Camarillo, CA 93010
805-388-5392
rpichardo@cityofcamarillo.org

Table 2-1 lists the members of the local hazard mitigation planning team that developed this annex.

Table 2-1. Local Mitigation Planning Team Members

Name	Title	Name	Title
Tali Tucker	Assistant Director of Public Works/City Engineer	**Kristen Madary**	Finance/Accounting Manager
David Moe	Assistant Comm. Development Director	**Roger Pichardo**	Senior Management Analyst
Jaclyn Lee	Principal Planner	**Carmen Nichols**	Assistant City Manager
Tom Magdaleno	GIS Specialist	**Michelle D'Anna**	Community Relations Officer
Tom Juzwiak	Deputy Building Official	**Wendy Milligan**	Terra Firma Enterprises (Consultant)

2.2 JURISDICTION PROFILE

2.2.1 Location and Features

Camarillo encompasses 19.86 square miles in west Ventura County at the base of the Conejo Grade, within the Oxnard Plain. The City is some eight miles from the ocean and the Pt. Mugu entrance to Naval Base Ventura County. Homes along the City's northern border are nestled among rolling hills and citrus groves; the northernmost boundary traverses the Las Posas Country Club. Pleasant Valley Road designates much of Camarillo's southern border, though the southernmost point is on Howard Road, near the southeast corner of the City. The eastern edge of Camarillo is situated partially up the Conejo Grade, along the Ventura Freeway (Hwy 101). Camarillo's furthest point west is at the end (cul-de-sac) of Del Norte Road, just north of Hwy 101.

2.2.2 History

The City of Camarillo was incorporated in 1964. In 1837, a large expanse of what would be the Conejo and Pleasant Valleys was established though a Mexican land grant, which Juan Camarillo purchased in 1875. Juan's sons, Adolfo and Juan, Jr., would govern the 10,000-acre Rancho Calleguas for many years. Adolfo oversaw the development of the Camarillo House and Ranch in 1892, and his brother would have a prominent role in the construction of the St. Mary Magdalen Chapel in 1913.

In 1899, a line of the Southern Pacific Railroad was extended from Somis to Oxnard. At the time, a businessman named John Sebastian relocated a store and post office that were displaced from an area called Springville by the new rail line. When asked to provide a name for the new location of the store and post office, Sebastian suggested Calleguas, though the post office representative felt that name was confusing. Sebastian then proposed calling the area Camarillo, and by 1901 it was the official name for the settlement.

For years, from horse-drawn wagons to early automobiles, the route from Thousand Oaks north down the Conejo Grade involved 24 switchbacks. The journey was quite a trek, especially during warmer days. As travelers looked down the grade toward present day Camarillo, they often commented on it being such a pleasant valley.

Eventually, the region from Somis south to Pt. Mugu became known as Pleasant Valley and would be an integral part of the larger farming industry in Ventura County.

In 1942, with America involved in World War II, Naval Base Ventura County was commissioned, and a military airfield was built near Camarillo. In 1945, the airfield was officially known as Oxnard Air Force Base. The County of Ventura purchased the site in 1976 and began the transformation of the base to what is now Camarillo Airport.

In the early 1960s, a movement by the City of Oxnard to annex Camarillo galvanized community leaders, who organized a push for cityhood. In September 1964, cityhood was approved by voters and the following month Camarillo was officially recognized as an incorporated city. At the time, the City had approximately 12,000 residents, and an area of 5.5 square miles.

2.2.3 Governing Body

Camarillo is a general law city. The five-member City Council is the governing body with the responsibility of adopting the HMP. The responsibility for implementing the plan is shared by the Office of the City Manager, and the Community Development and Public Works Departments.

2.3 CURRENT TRENDS

2.3.1 Population

Camarillo has an estimated population of 70,261 (California Department of Finance estimate 2020). Camarillo is currently growing at a rate of 1.42% annually (https://worldpopulationreview.com).

2.3.2 Development

Table 2-2 summarizes development trends in the period since the preparation of the previous hazard mitigation plan, as well as expected future development trends.

Table 2-2. Recent and Expected Future Development Trends

Criterion	Response
Has your jurisdiction annexed any land since the preparation of the previous hazard mitigation plan? • **If yes, give the estimated area annexed and estimated number of parcels or structures.**	Yes Annexations since the County's last HMP update included a 3-acre parcel, initiated by the City, for the Camarillo LDS Church (n/e corner of Las Posas Road and Camino Alvarez); also, properties near the n/w corner of Lewis (Hwy 34) and Las Posas Roads were annexed for the development of the City's new desalter plant. Construction is underway, and the desalter could be operational by early 2022. The City annexed 7.81-acres for the project from the Ventura Co. Resource Conservation District, 4.5-acres of which is under the purview of the Camarillo Sanitary District.
Is your jurisdiction expected to annex any areas during the performance period of this plan?	No
Are any areas targeted for development or major redevelopment in the next five years? • **If yes, briefly describe, including whether any of the areas are in known hazard risk areas**	Yes. Over the past five years Camarillo has had significant residential construction activity, which is expected to continue for several years. A prominent commercial development is also underway just south of the 101 Freeway, and a steady progression of reuse and new industrial projects is anticipated. The primary natural hazard concerns for Camarillo include earthquakes and liquefaction, and wildland fires. Ongoing drought and dry vegetation continue to pose an elevated risk for fires, though the main areas of concern are in existing hillside communities in the northern portions of the City. The main faults in/near Camarillo include the Bailey, Simi-Santa Rosa, and Wright Faults. While these faults have limited intersection with properties proposed for development, major ruptures along the state's larger fault lines could generate substantial ground movement -- though to what extent is difficult to forecast. As is the case in much of Ventura County, liquefaction is a potential threat connected to earthquakes. Approximately 25% of Camarillo's soil is identified as being in liquefaction zones, primarily in the southeast and southwest sections of the City.
Permits for new construction issued since the preparation of the previous hazard mitigation plan. (For single-family, each residence equals one permit; for multi-fam., the numbers are total units. Multi-fam. refers to apartments, townhomes, and duplexes. A permit for one apartment building may include 20 units.)	

	2016	2017	2018	2019	2020
Single Family	90	78	37	2	11
Multi-Family	67	821	619	199	53
Other (commercial, mixed use, etc.)	4	9	8	6	2
Total	**161**	**908**	**664**	**207**	**66**

Criterion	Response
Provide the number of new-construction permits for each hazard area or provide a qualitative description of where development has occurred.	• Special Flood Hazard Areas: 0 • Landslide: 0 • High Liquefaction Areas: 0 • Tsunami Inundation Area: 0 • Wildfire Risk Areas: Please see clarification below. Of the considerable residential development in Camarillo over the past 5+ years, no units have been built, or are currently under construction within a 100-year flood zone. During this period, approximately 350 residences (low-medium-high density) have been built in 500-yr. areas, and another high-density project (385 units) is pending approval. There is a low-income project (75 units) proposed for a 2.5-acre site that is owned by the City; if these apartments are ultimately constructed, the project would likely require flood mitigation measures (100-yr.). As noted, areas of greatest concern for wildland fire, and those most involved in PSPS events, are in the northwest section of Camarillo, and parts outside (north of) the City. A large project with 281 homes (single-family and duplexes) is under construction approximately 0.8-miles west of a high fire risk zone, with a very-high zone just beyond. This development, for persons 55 years and older, is located east of Hwy 34, on the north side of Upland Road. Another project that is currently under review would result in 248 low-medium density homes in a section of the Camarillo Springs Golf Course, which lies in a very-high fire risk zone.
Describe the level of buildout in the jurisdiction, based on your jurisdiction's buildable lands inventory. If no such inventory exists, provide a qualitative description.	Under current zoning, and considering sites under construction or entitled for building, about 60-acres of land is under review for potential housing projects. Over 150-acres are proposed for changes in zoning for industrial projects. There are also 46-acres of commercially-zoned land just off (south of) the 101 Freeway, at Las Posas Road. This site has the potential for 325,000 sq. ft. of retail, though internet sales have changed the brick/mortar outlook for many retailers. Additionally, another 25-acres of vacant land could be considered for recreational uses (ice rinks, bowling, etc.) in the future.

2.4 CAPABILITY ASSESSMENT

This section describes an assessment of existing capabilities for implementing hazard mitigation strategies. The introduction at the beginning of this volume of the hazard mitigation plan describes the components included in the capability assessment and their significance for hazard mitigation planning.

Findings of the capability assessment were reviewed to identify opportunities to expand, initiate or integrate capabilities to further hazard mitigation goals and objectives. Where such opportunities were identified and determined to be feasible, they are included in the action plan. The "Analysis of Mitigation Actions" table in this annex identifies these as community capacity building mitigation actions. The findings of the assessment are presented as follows:

- An assessment of planning and regulatory capabilities is presented in Table 2-3.
- Development and permitting capabilities are presented in Table 2-4.
- An assessment of fiscal capabilities is presented in Table 2-5.
- An assessment of administrative and technical capabilities is presented in Table 2-6.
- An assessment of education and outreach capabilities is presented in Table 2-7.
- Information on National Flood Insurance Program (NFIP) compliance is presented in Table 2-8.
- Classifications under various community mitigation programs are presented in Table 2-9.
- The community's adaptive capacity for the impacts of climate change is presented in Table 2-10.

Table 2-3. Planning and Regulatory Capability

	Local Authority	Other Jurisdiction Authority	State Mandated	Integration Opportunity?
Codes, Ordinances, & Requirements				
Building Code	Yes	No	Yes	Yes

Table 2-4. Development and Permitting Capability

Criterion	Response
Does your jurisdiction issue development permits?	Yes
If no, who does? If yes, which department? Planning, and the Building/Safety Divisions.	
Does your jurisdiction have the ability to track permits by hazard area?	No
Does your jurisdiction have a buildable lands inventory?	Yes

Table 2-5. Fiscal Capability

Financial Resource	Accessible or Eligible to Use?
Community Development Block Grants	Yes
Capital Improvements Project Funding	Yes
Authority to Levy Taxes for Specific Purposes	Yes
User Fees for Water, Sewer, Gas or Electric Service	Yes
If yes, specify: *Public Works user fees pertain to sewer and water connection.*	
Incur Debt through General Obligation Bonds	Yes
Incur Debt through Special Tax Bonds	Yes
Incur Debt through Private Activity Bonds	Yes
Withhold Public Expenditures in Hazard-Prone Areas	Yes
State-Sponsored Grant Programs	Yes
Development Impact Fees for Homebuyers or Developers	Yes

Table 2-6. Administrative and Technical Capability

Staff/Personnel Resource	Available?
Planners or engineers with knowledge of land development and land management practices	Yes
If Yes, Department /Position: Community Development Department (Planning + Building and Safety), and Public Works (engineers in land development).	
Engineers or professionals trained in building or infrastructure construction practices	Yes
If Yes, Department /Position: Building and Safety Division, and Public Works for infrastructure projects (streets, sewer, water, storm drains).	
Planners or engineers with an understanding of natural hazards	Yes
If Yes, Department /Position: Community Development and Public Works, though consultants are also hired for certain projects.	
Staff with training in benefit-cost analysis	Yes
If Yes, Department /Position: Building and Safety, and Public Works for infrastructure projects (streets, sewer, water, storm drains). Again, consultants are hired for certain projects.	
Surveyors	No
Personnel skilled or trained in GIS applications	Yes
If Yes, Department /Position: Administrative Services, GIS Specialist	
Scientist familiar with natural hazards in local area	No
Emergency manager	Yes
If Yes, Department /Position: The Sr. Management Analyst in the City Manager's Office serves as the EOC Coordinator.	
Grant writers	Yes
If Yes, Department /Position: Sr. Management Analyst, City Manager's Office.	
Other	Yes
If Yes, Department /Position: Civil Engineer, Public Works Dept.	

Table 2-7. Education and Outreach Capability

Criterion	Response
Do you have a public information officer or communications office?	Yes
Do you have personnel skilled or trained in website development?	Yes
Do you have hazard mitigation information available on your website? ***If yes, briefly describe:*** Links to several emergency preparedness websites are available on the City's website (https://www.ci.camarillo.ca.us/departments/fire/emergencies.php).	Yes
Do you use social media for hazard mitigation education and outreach? ***If yes, briefly describe:*** City of Camarillo Government Facebook, Instagram, Twitter, LinkedIn.	Yes
Do you have any citizen boards or commissions that address issues related to hazard mitigation? ***If yes, briefly describe:*** The City has an active Community Emergency Response Team.	Yes
Do you have any other programs in place that could be used to communicate hazard-related information? ***If yes, briefly describe:*** VC Alert, City "Notify Me!" Emergency Email Distribution, City website (www.cityofcamarillo.org)	Yes
Do you have any established warning systems for hazard events? ***If yes, briefly describe:*** VC Alert	Yes

Table 2-8. National Flood Insurance Program Compliance

Criterion	Response
What local department is responsible for floodplain management?	Public Works
Who is your floodplain administrator? (department/position)	City Engineer (Public Works)
Are any certified floodplain managers on staff in your jurisdiction?	Yes
What is the date that your flood damage prevention ordinance was last amended?	1993
Does your floodplain management program meet or exceed minimum requirements?	Meets
When was the most recent Community Assistance Visit or Community Assistance Contact?	September 2018
Does your jurisdiction have any outstanding NFIP compliance violations that need to be addressed?	No
Are any RiskMAP projects currently underway in your jurisdiction?	No
Do your flood hazard maps adequately address the flood risk within your jurisdiction?	Yes
Does your floodplain management staff need any assistance or training to support its floodplain management program?	No
Does your jurisdiction participate in the Community Rating System (CRS)? ***If no, is your jurisdiction interested in joining the CRS program?*** Yes	No
How many flood insurance policies are in force in your jurisdiction?[a] ***What is the insurance in force?*** $203,471,400 ***What is the premium in force?*** $534,728	664
How many total loss claims have been filed in your jurisdiction?[a] ***What were the total payments for losses?*** $1,135,612	21

a. According to FEMA statistics as of March 31, 2021

Table 2-9. Community Classifications

	Participating?	Classification	Date Classified
FIPS Code	Yes	111-10046	
DUNS #	Yes	070207006	
Community Rating System	No		
Building Code Effectiveness Grading Schedule	Yes	Grading Class-2	
Public Protection	Yes	03/3X	12/21/2018
Storm Ready	No		
Firewise	No		
Tsunami Ready	No		

Table 2-10. Adaptive Capacity for Climate Change

Criterion	Jurisdiction Rating[a]
Technical Capacity	
Jurisdiction-level understanding of potential climate change impacts	Medium
Comment: *To be further evaluated in the Climate Action Plan that the City is planning on developing in the near future.*	
Jurisdiction-level monitoring of climate change impacts	Medium
Comment: *To be further evaluated in the Climate Action Plan that the City is planning on developing in the near future.*	
Technical resources to assess proposed strategies for feasibility and externalities	Medium
Comment: *To be further evaluated in the Climate Action Plan that the City is planning on developing in the near future.*	
Jurisdiction-level capacity for development of greenhouse gas emissions inventory	Medium
Comment: *To be further evaluated in the Climate Action Plan that the City is planning on developing in the near future.*	
Capital planning and land use decisions informed by potential climate impacts	Medium
Comment: *To be further evaluated in the Climate Action Plan that the City is planning on developing in the near future.*	
Participation in regional groups addressing climate risks	Medium
Comment: *To be further evaluated in the Climate Action Plan that the City is planning on developing in the near future.*	
Implementation Capacity	
Clear authority/mandate to consider climate change impacts during public decision-making processes	Medium
Comment: *To be further evaluated in the Climate Action Plan that the City is planning on developing in the near future.*	
Identified strategies for greenhouse gas mitigation efforts	Medium
Comment: *To be further evaluated in the Climate Action Plan that the City is planning on developing in the near future.*	
Identified strategies for adaptation to impacts	Medium
Comment: *To be further evaluated in the Climate Action Plan that the City is planning on developing in the near future.*	
Champions for climate action in local government departments	Medium
Comment: *To be further evaluated in the Climate Action Plan that the City is planning on developing in the near future.*	
Political support for implementing climate change adaptation strategies	Medium
Comment: *To be further evaluated in the Climate Action Plan that the City is planning on developing in the near future.*	
Financial resources devoted to climate change adaptation	Low
Comment: *To be further evaluated in the Climate Action Plan that the City is planning on developing in the near future.*	
Local authority over sectors likely to be negative impacted	Medium
Comment: *To be further evaluated in the Climate Action Plan that the City is planning on developing in the near future.*	
Public Capacity	
Local residents' knowledge of and understanding of climate risk	Medium
Comment: *To be further evaluated in the Climate Action Plan that the City is planning on developing in the near future.*	
Local residents' support of adaptation efforts	Medium
Comment: *To be further evaluated in the Climate Action Plan that the City is planning on developing in the near future.*	

Criterion	Jurisdiction Rating[a]
Local residents' capacity to adapt to climate impacts	Medium
Comment: *To be further evaluated in the Climate Action Plan that the City is planning on developing in the near future.*	
Local economy current capacity to adapt to climate impacts	Medium
Comment: *To be further evaluated in the Climate Action Plan that the City is planning on developing in the near future.*	
Local ecosystems capacity to adapt to climate impacts	Medium
Comment: *To be further evaluated in the Climate Action Plan that the City is planning on developing in the near future.*	

a. High = Capacity exists and is in use; Medium = Capacity may exist but is not used or could use some improvement; Low = Capacity does not exist or could use substantial improvement; Unsure= Not enough information is known to assign a rating.

2.5 INTEGRATION REVIEW

For hazard mitigation planning, "integration" means that hazard mitigation information is used in other relevant planning mechanisms, such as general planning and capital facilities planning, and that relevant information from those sources is used in hazard mitigation. This section identifies where such integration is already in place, and where there are opportunities for further integration in the future. Resources listed at the end of this annex were used to provide information on integration. The progress reporting process described in Volume 1 of the hazard mitigation plan will document the progress of hazard mitigation actions related to integration and identify new opportunities for integration.

2.5.1 Existing Integration

Some level of integration has already been established between local hazard mitigation planning and the following other local plans and programs:

- **City of Camarillo General Plan, Safety Plan, Policy SAF-1.1a–** Incorporate new and updated hazards information relevant to the City of Camarillo into the Safety Element, Emergency Operations Plan, and/or Local Hazard Mitigation Plan, as appropriate.
- **City of Camarillo, Emergency Operations Plan (EOP), 2021 (pending approval)—**Section Eight-Hazard Summary for City of Camarillo presents a summary of all the hazards the City is subject to and references the Ventura County Multi-Hazard Mitigation Plan for more specific information.
- **Capital Improvement Plan**—The capital improvement plan includes projects that can help mitigate potential hazards. The City will act to ensure consistency between the hazard mitigation plan and the current and future capital improvement plans. The hazard mitigation plan may identify new possible funding sources for capital improvement projects and may result in modifications to proposed projects based on results of the risk assessment.
- **Building Code, Title 16, Chapter 16.34.340, Hazard Mitigation Plan**—Identifies that the planning commission shall consider whether proposed development is in or affects a known floodplain, practical alternatives to the proposed development if in a floodplain, impacts of the project on the floodplain and plans to mitigate the impact of the development on the floodplain.

2.5.2 Opportunities for Future Integration

The capability assessment in this annex indicates opportunities to integrate this mitigation plan with other jurisdictional planning/regulatory capabilities. Capabilities were identified as integration opportunities if they can support or enhance the actions identified in this plan or be supported or enhanced by components of this plan. The capability assessment identified the following plans and programs that do not currently integrate hazard mitigation information but provide opportunities to do so in the future:

- **Climate Action Plan—**The Climate Action Plan is a comprehensive roadmap that outlines the specific activities that an agency will undertake to reduce greenhouse gas emissions. Currently, the City does not have a Climate Action Plan but is planning to develop one in the near future.
- **Capital Improvement Projects**—Capital improvement project proposals may take into consideration hazard mitigation potential as a means of evaluating project prioritization.
- **Post-Disaster Recovery Plan**—The City does not have a recovery plan but may consider developing one as a mitigation planning action if funds become available. The plan will build on the goals and objectives identified in the hazard mitigation plan.

Taking action to integrate each of these programs with the hazard mitigation plan was considered as a mitigation action to include in the action plan in this annex.

2.6 RISK ASSESSMENT

2.6.1 Jurisdiction-Specific Natural Hazard Event History

Table 2-11 lists past occurrences of natural hazards for which specific damage was recorded in this jurisdiction Other hazard events that broadly affected the entire planning area, including this jurisdiction, are listed in the risk assessments in Volume 1 of this hazard mitigation plan.

Table 2-11. Past Natural Hazard Events

Type of Event	FEMA Disaster #	Date	Damage Assessment
COVID-19 Pandemic	DR-4482	January 20, 2020 and continuing	City did not experience any property damages from COVID19 just emergency protective measures response related costs total approximately $30,176.
Maria Fire	FM-5302	November 1, 2019	City was not directly impacted by this fire, however, The Arc of Ventura County opened a community shelter at the Camarillo Community Center.
Wildfires, Flooding, Mudflows, and Debris Flows (Thomas Fire)	DR-4353	December 4, 2017- January 31, 2018	Although this fire burned 281,893 acres in both Ventura County and Santa Barbara County, the City was only indirectly impacted by smoke.
Camarillo Springs Mudflow		November 1 and December 12, 2014	Nov. 1 -Twenty homes were evacuated, including two homes that were severely damaged. Dec. 12. Sixteen homes were damaged, including 10 homes that were red-tagged
Springs Fire	FM-5024	May 2 – 11, 2013	24,251 acres burned; 10 outbuildings destroyed; 6 commercial properties and 6 outbuildings damaged.

Type of Event	FEMA Disaster #	Date	Damage Assessment
Wildfires, Flooding, Mudflows, and Debris Flows	DR-1731	October 21 – March 31, 2008	Although Ventura County was impacted by the Ranch Fire, the City of Camarillo was not directly impacted except for heavy smoke.
Severe Freeze	DR-1689	January 11 – 17, 2007	This disaster impacted mainly the citrus and avocado crops throughout Ventura County, but no crops in the City were impacted.
Shekell Fire	FM-2681	December 3 – 6, 2006	This fire burned in Fillmore and Moorpark. Camarillo had no direct impacts from the fire only indirectly from smoke.
Day Fire	FM-2677	September 25 – 30, 2006	City of Camarillo was not directly impacted except for heavy smoke.
Topanga Fire	FM-2583	September 28 – October 10, 2005	City of Camarillo was not directly impacted except for smoke.
Severe Storms, Flooding, Landslides, and Mud and Debris Flows	DR-1585	February 16 – 23, 2005	City experienced localized flooding. No significant losses were documented.
Severe Storms, Flooding, Debris Flows, and Mudslides	DR-1577	December 27, 2004 – January 11, 2005	Water and mudslides damaged at least two homes after debris jammed a city storm drain.
Wildfires, Flooding, Mudflow and Debris Flow	DR-1498	October 21, 2003 – March 31, 2004	City of Camarillo was not directly impacted from the fires in Piru and Fillmore except for heavy smoke. Flooding caused downed trees and blocked roads.
Severe Winter Storms and Flooding	DR-1203	February 2 – April 30, 1998	Channel at Las Posas Rd. and Ventura Blvd. damaged ($500,000), clogged storm drains. Camarillo Springs Golf course was damaged. It took 31 men about 10 full days of work to bring the course back to playability. Backed up storm drains impacted several homes. City Hall flooded.
Severe Winter Storms, Flooding, Landslides, Mud Flows	DR-1046	February 13 – April 19, 1995	Large agricultural losses. Localized flooding and clogged storm drains. No major impact to the City of Camarillo.
Severe Winter Storms, Flooding, Landslides, Mud Flows	DR-1044	January 3 – February, 1995	Localized flooding and clogged storm drains. No major impact to the City of Camarillo.
Northridge Earthquake	DR-1008	January 17 – November 30,1994	Drywall sustained large cracks; exterior concrete block walls sustained hairline cracks; a few chimneys were cracked; a few windows cracked; several small objects overturned and fell; light furniture overturned; heavy furniture was displaced; hanging objects and doors swung violently; many items were thrown from store shelves; masonry fences or retaining walls were partially fallen; underground pipes were broken.
Fires, Mud & Landslides, Soil Erosion, Flooding	DR-1005	October 26 – April 22, 1994	Multiple fires around Ventura County and subsequent flooding. Camarillo was not directly impacted except for smoke from the surrounding fires and backed up storm drains.
Severe Storm, Winter Storm, Mud & Landslides, Flooding	DR-979	January 5 – March 20, 1993	Camarillo trailer park flooded (Casa del Norte). Localized street flooding.
Snow Storm, Heavy Rain, High Winds, Flooding, Mudslide	DR-935	February 10 – 19, 1992	Countywide agricultural damages. City experienced localized street flooding.

Type of Event	FEMA Disaster #	Date	Damage Assessment
Severe Freeze	DR-894	December 19, 1990 – January 3, 1991	Countywide agricultural damages. Agricultural crops within the City suffered losses to their crops. More than $100 million worth of avocados, oranges, strawberries and other fruits were destroyed.
Grass, Wildlands, Forest Fires	DR-739	June 26 – July 19, 1985	City of Camarillo was not directly impacted except for heavy smoke.
Coastal Storms, Floods, Slides, Tornadoes	DR-677	January 21 – March 30, 1983	Countywide crop damage. Flood flows broke through the leveed banks of Calleguas Creek in the lower reach below U.S. 101 and caused an estimated $21.5 million in damage to agricultural properties. The City estimate of damages was $160,000.
Severe Storms, Mudslides, Flooding	DR-615	January 8, 1980	Flooding countywide. No significant damage in the City of Camarillo
Coastal Storms, Mudslides, Flooding	DR-547	February 15, 1978	Evacuation of Leisure Village (150 homes) due to weakened earthen catch basin. Fallen trees (65-75) throughout the City totalling $500,000 loss.
Severe Storms, High Tides, Flooding	DR-364	February 8, 1973	Countywide rain and flooding. Minor damages in the City of Camarillo
Forest, Brush Fires	DR-295	September 29, 1970	5 dwellings destroyed in the Camarillo Hills area, historic structure Rancho Lomita mansion destroyed and 10-15 outbuildings.
Severe Storms, Flooding	DR-253	January 26, 1969	Downed trees. Flooded streets, bridge damage (Calleguas Road Bridge) curb and gutter damage. Flood Control damages estimated at $2,150, roads, streets and bridges damage is estimated at $110,979.
Heavy Rains, Flooding	DR-211	December 7, 1965	Countywide flooding, Minimal damage to City of Camarillo.

2.6.2 Hazard Risk Ranking

Table 2-12 presents a local ranking of all hazards of concern for which this hazard mitigation plan provides complete risk assessments. As described in detail in Volume 1, the ranking process involves an assessment of the likelihood of occurrence for each hazard, along with its potential impacts on people, property, and the economy. Mitigation actions primarily target hazards with high and medium rankings.

Table 2-12. Hazard Risk Ranking

Rank	Hazard	Risk Ranking Score	Risk Category
1	Earthquake	32	Medium
2	Severe Storms	24	Medium
3	Severe Weather	24	Medium
4	Dam Failure	22	Medium
5	Flooding	18	Medium
6	Landslide[a]	18	Medium
7	Wildfire	12	Medium
8	Drought	9	Low
9	Tsunami	0	Low
10	Sea Level Rise	0	Low

a. Landslide ranking is based only on the Very High susceptibility category.

2.6.3 Jurisdiction-Specific Vulnerabilities

Volume 1 of this hazard mitigation plan provides complete risk assessments for each identified hazard of concern. This section provides information on a few key vulnerabilities for this jurisdiction. Available jurisdiction-specific risk maps of the hazards are provided at the end of this annex.

Repetitive Loss Properties

Repetitive loss records are as follows:

- Number of FEMA-identified Repetitive-Loss Properties: 0
- Number of FEMA-identified Severe-Repetitive-Loss Properties: 0
- Number of Repetitive-Loss Properties or Severe-Repetitive-Loss Properties that have been mitigated: 0

Other Noted Vulnerabilities

The following jurisdiction-specific issues have been identified based on a review of the results of the risk assessment, public involvement strategy, and other available resources: N/A

Mitigation actions addressing these issues were prioritized for consideration in the action plan in this annex.

2.7 STATUS OF PREVIOUS PLAN ACTIONS

Table 2-13 summarizes the actions that were recommended in the previous version of the hazard mitigation plan and their implementation status at the time this update was prepared.

Table 2-13. Status of Previous Plan Actions

Action Item	Completed	Removed; No Longer Feasible	Carried Over to Plan Update: Check if Yes	Carried Over to Plan Update: Action # in Update
OA 7—Develop a water conservation public outreach program to increase awareness about the drought, fines and penalties for overuse and solutions for conserving water.			✓	CAM-1
Comment: Ongoing. Water conservation information is on the City's website regarding the City's Stage 1 measures: Including a rebate program to retrofit indoor plumbing fixtures with water-efficient versions. • Rebates for landscaping controllers and replacement of hose nozzles. • Daily inspections throughout the City's water service area to ensure compliance with Stage 1 measures. • Best management tools for water conservation.				
OA 11—Develop and implement plans to increase the building owner's general knowledge of and appreciation for the value of seismic upgrading of the building's structural and nonstructural elements.			✓	CAM-2
Comment: Ongoing. For several years, the City has been contacting the owners of apartment complexes (and one hotel) regarding the importance of retrofitting their soft-story carports. In March 2021, the City applied to Cal OES to retrofit the carports at four of these properties. Unfortunately, the grant did not get funded, but staff has continued to reach out to the owners about future grant applications and financing options.				

Action Item	Completed	Removed; No Longer Feasible	Carried Over to Plan Update: Check if Yes	Carried Over to Plan Update: Action # in Update
OA 13—Reinforce roads/bridges from flooding through protection activities, including elevating the roads/bridges and installing/widening culverts beneath the roads/bridges or upgrading storm drains.			✓	CAM-3
Comment: While no projects are currently planned, this may change in the near future.				
CA 1—Broaden outreach efforts to get as many residents as possible registered with the VC Alert system.			✓	CAM-4
Comment: Ongoing. The City continues to disseminate information on the VC Alert and Pulse-Point programs through our CityScene and CERT-Scene newsletters, on our government TV channel programming, via social media, and on our website.				
CA 2—Develop a vegetation restoration/enhancement program for areas that have shown to be susceptible to landslides.	✓			
Comment: A vegetation restoration program was implemented for the hillsides above the Camarillo Springs communities. These efforts were in response to extensive damage caused first by the Springs Fire, and later by landslides that occurred in Camarillo Springs. No programs are currently planned for other sites in Camarillo.				

2.8 HAZARD MITIGATION ACTION PLAN

Table 2-14 lists the identified actions, which make up the hazard mitigation action plan for this jurisdiction. Table 2-15 identifies the priority for each action. Table 2-16 summarizes the mitigation actions by hazard of concern and mitigation type.

Table 2-14. Hazard Mitigation Action Plan Matrix

Benefits New or Existing Assets	Objectives Met	Lead Agency	Support Agency	Estimated Cost	Sources of Funding	Timeline[a]
Action CAM-1—Develop a water conservation public outreach program to increase awareness about the drought, fines and penalties for overuse and solutions for conserving water.						
Hazards Mitigated: Drought						
New & Existing	1, 17	Public Works	None	Medium	Staff time and General Funds HMGP, BRIC	Ongoing
Action CAM-2—Develop and implement plans to increase the building owner's general knowledge of and appreciation for the value of seismic upgrading of the building's structural and nonstructural elements.						
Hazards Mitigated: Earthquake						
New & Existing	1, 9, 12, 16, 17	Community Development/ Building & Safety	None	Medium	Staff time and General Funds	Ongoing
Action CAM-3—Reinforce roads/bridges from flooding through protection activities, including elevating the roads/bridges and installing/widening culverts beneath the roads/bridges or upgrading storm drains.						
Hazards Mitigated: Flooding						
Existing	2, 6, 9	Public Works	None	High	Staff Time, General Funds, HMGP, BRIC, FMA	Ongoing

Benefits New or Existing Assets	Objectives Met	Lead Agency	Support Agency	Estimated Cost	Sources of Funding	Timeline[a]
Action CAM-4—Broaden outreach efforts to get as many residents as possible registered with the VC Alert system.						
Hazards Mitigated:	Earthquake, Severe Storms, Severe Weather, Dam Failure, Flooding, Landslide, Wildfire, Tsunami, Drought, Sea Level Rise					
New & Existing	1, 7, 17	Community Relations Officer	None	Low	Staff Time, General Funds	Ongoing
Action CAM-5—Integrate the hazard mitigation plan into other plans, ordinances and programs that dictate land use decisions in the community.						
Hazards Mitigated:	Earthquake, Flood, Wildfire, Landslide					
New	19	City Manager's Office	Community Development / Building and Safety, Public Works	Low	Staff Time, General Funds	Ongoing
Action CAM-6—Actively participate in the plan maintenance protocols outlined in Volume 1 of this hazard mitigation plan.						
Hazards Mitigated:	Earthquake, Severe Storms, Severe Weather, Dam Failure, Flooding, Landslide, Wildfire, Tsunami, Drought, Sea Level Rise					
New & Existing	17, 19	City Manager's Office	Public Works/Community Development/ Building & Safety	Low	Staff Time, General Funds	Short-term
Action CAM-7—Continue to maintain good standing and compliance under the NFIP through implementation of floodplain management programs that, at a minimum, meet the NFIP requirements: • Enforce the flood damage prevention ordinance. • Participate in floodplain identification and mapping updates. • Provide public assistance/information on floodplain requirements and impacts.						
Hazards Mitigated:	Flood					
New & Existing	1, 4, 17, 18	Public Works	FEMA	Low	Staff Time, General Funds	Ongoing
Action CAM-8—Identify and pursue strategies to increase adaptive capacity to climate change including developing a Climate Action Plan.						
Hazards Mitigated:	Drought, Sea Level Rise, Severe Storms, Severe Weather, Flooding					
New & Existing	1, 2, 6, 12, 15, 17, 19	Community Development	Public Works	Medium	Staff Time, General Funds, HMGP, BRIC	Short-term
Action CAM-9—Purchase generators for critical facilities and infrastructure that lack adequate backup power, including City Hall, Library, Corporation Yard, Sanitation Plant.						
Hazards Mitigated:	Earthquake, Severe Storms, Severe Weather, Dam Failure, Flooding, Landslide, Wildfire, Tsunami					
Existing	2, 6	Public Works	None	Medium	Staff Time, General Funds, HMGP, BRIC	Short-term
Action CAM-10—Analyze the feasibility of developing a Post-Disaster Recovery Pan and develop Plan should funds become available.						
Hazards Mitigated:	Earthquake, Severe Storms, Severe Weather, Dam Failure, Flooding, Landslide, Wildfire, Tsunami					
New & Existing	2, 6, 8, 19	City Manager's Office		Low	HMGP, PDM, FMA	Short-term
Action CAM-11—Analyze the feasibility of developing a Debris Management Plan and develop Plan should funds become available.						
Hazards Mitigated:	Earthquake, Severe Storms, Severe Weather, Dam Failure, Flooding, Landslide, Wildfire, Tsunami					
New & Existing	2 ,8, 18	Public Works	None	Low	Staff Time, General Funds	Ongoing

Benefits New or Existing Assets	Objectives Met	Lead Agency	Support Agency	Estimated Cost	Sources of Funding	Timeline[a]
Action CAM-12—Analyze the feasibility of developing a Continuity of Operations Plan and develop Plan should funds become available.						
Hazards Mitigated: Earthquake, Severe Storms, Severe Weather, Dam Failure, Flooding, Landslide, Wildfire, Tsunami						
New & Existing	8, 18	City Manager's Office		Low	Staff Time, General Funds	Short-term
Action CAM-13—Continue analyzing the cost/benefit of joining the Community Rating System program						
Hazards Mitigated: Flooding						
New & Existing	1, 2, 4, 9, 10, 16, 17	Public Works	FEMA	Low	Staff Time, General Funds	Ongoing
Action CAM-14—Continue to participate in updating the County's Community Wildfire Protection Plan.						
Hazards Mitigated: Wildfire						
New & Existing	2, 5, 8, 12, 17, 18	Ventura County Fire Protection District	Community Development	Low	Staff Time, General Funds	Ongoing
Action CAM-15—Update Building Code to reference better the HMP for building in all hazard areas.						
Hazards Mitigated: Earthquake, Dam Failure, Flooding, Landslide, Wildfire, Tsunami						
New & Existing	4	Community Development/ Building & Safety	None	Low	Staff Time, General Funds	Short-term
Action CAM-16—Develop a Threat and Hazard Identification and Risk Assessment specific to the City should funds become available.						
Hazards Mitigated: Earthquake, Severe Storms, Severe Weather, Dam Failure, Flooding, Landslide, Wildfire, Tsunami, Drought and Sea Level Rise						
New & Existing	1, 17	City Manager's Office	Community Development	Low/Medium	Staff Time, General Funds, HMGP, BRIC	Short-term
Action CAM-17—Analyze the feasibility of developing a City-specific Stormwater Management Plan.						
Hazards Mitigated: Flooding, Severe Storms						
New & Existing	1, 2, 4, 6, 9, 15, 17, 18	Public Works	Ventura County Watershed Protection	Low	Staff Time, General Funds	Short-term
Action CAM-18—Where appropriate, support retrofitting, purchase or relocation of structures located in hazard areas, prioritizing those that have experienced repetitive losses and/or are located in high- or medium-risk hazard areas.						
Hazards Mitigated: Earthquake, Flood, Wildfire, Landslide, Dam Failure						
Existing	9, 11	City Manager's Office	Community Development	High	HMGP, PDM, FMA	Short-term

a. Short-term = Completion within 5 years; Long-term = Completion within 10 years; Ongoing= Continuing new or existing program with no completion date

Acronyms used here are defined at the beginning of this volume.

2.10 INFORMATION SOURCES USED FOR THIS ANNEX

The following technical reports, plans, and regulatory mechanisms were reviewed to provide information for this annex.

- **City of Camarillo Municipal Code**—The Municipal Code was reviewed for the full capability assessment and for identifying opportunities for HMP integration.
- **City of Camarillo General Plan, Safety Plan, Policy SAF-1.1a–** The Safety Plan was reviewed for identifying risk assessment information and for identifying opportunities for HMP integration.
- **City of Camarillo, Emergency Operations Plan (EOP)—**The EOP was used to gather risk assessment information and to assess the City's capabilities associated with response in addition to identifying opportunities for HMP integration.
- **City of Camarillo 2020 Urban Water Management Plan**—The Urban Water Management Plan was reviewed for the full capability assessment and for identifying opportunities for HMP integration.
- **City of Camarillo Economic Development Strategic Plan**—The Economic Development Strategic Plan was reviewed for the full capability assessment.
- **Capital Improvement Plan**—The Capital Improvement Plan was used to identify possible hazard mitigation actions to add to the HMP and to identify opportunities for HMP integration.
- https://www.ci.camarillo.ca.us/departments/administrativeservices/geographicalinformationsystems/gis_maps2/index.php, accessed October 4, 2021—Used to document location and features for the Jurisdictional Profile.
- **City of Camarillo, Resolution to Accompany Application for State Aid Under the Emergency Flood Relief Law, Resolution 585, May 28, 1969 --** Used to document natural hazard event damage assessment.

- **City of Camarillo, Resolution to Accompany Application for State Aid Under the Emergency Flood Relief Law, Resolution 586, May 28, 1969-—**Used to document natural hazard event damage assessment.

The following outside resources and references were reviewed:

- **Ventura County Fire Protection District, Unit Strategic Fire Plan, May 2020, page 6**—Used to document natural hazard event damage assessment.
- **Hazard Mitigation Plan Annex Development Toolkit**—The toolkit was used to support the identification of past hazard events and noted vulnerabilities, the risk ranking, and the development of the mitigation action plan.
- Levin, Charles, "Storm's fury: flooding", ***Ventura County Star***, January 10, 2005, Main News, pg.1-- Used to document natural hazard event damage assessment.
- Dodge, Dani and Levin, Charles, "County gets a wet Christmas", ***Ventura County Star***, December 26, 2003, Main News, pg. 1-- Used to document natural hazard event damage assessment.
- Mansfield, Gregg, "Airport can see light at ditch's end—Repairs on flood-damaged channel near completion EL NINO'S WAKE: Camarillo, county wrangle over who must come up with $500,000 to pay for work", ***Ventura County Star***, March 19, 1998, News, A3-- Used to document natural hazard event damage assessment.
- Zintel, Ed, "Out of bounds on the fairway—RAIN: Pre-planning helps courses survive deluge", ***Ventura County Star***, March 18, 1998, Sports, B4-- Used to document natural hazard event damage assessment.
- Mansfield, Ed, "Camarillans say city lagged in dealing with severe flooding—Neighborhood angry: Residents complain to council, but city defends its handling of job, says it couldn't be everywhere at once during last Friday's downpour", ***Ventura County Star***, February 13, 1998, New, A3-- Used to document natural hazard event damage assessment.
- Dewey, James, et.al., **U.S. Department of the Interior U.S.Geological Survey, "Intensity Distribution and Isoseismal Maps for the Northridge**, California, Earthquake Of January 17,1994", 1995- Used to document natural hazard event damage assessment.
- Lozano, Carlos, "Storm Floods Camarillo Trailer Park : Weather: Rising water surrounds mobile home residents. Sheriff's deputies airlift farm workers stranded in a field. More rain is expected", ***Los Angeles Times***, February 19, 1993, accessed digitally on October 18, 2021- Used to document natural hazard event damage assessment.
- Gorman, Gary, "1990 in Ventura County: Year in Review: Slow Economy: Freeze Ruins Crops", ***Los Angeles Times***, December 31, 1990, LA Times Archives- Used to document natural hazard event damage assessment.
- **Federal Emergency Management Agency, *Flood Insurance Study, Volume 1 of 3***, Ventura County, California, January 20, 2010- Used to document natural hazard event damage assessment.
- Bevol, Steve. "Weary county cleans up", ***Camarillo Daily News***, February 12, 1978, p.A1- Used to document natural hazard event damage assessment.
- "Worst Fire in History Hits City", ***Camarillo Daily News*** September 28, 1970, p.A1- Used to document natural hazard event damage assessment.

- Sacramento Associated Press, “President Johnson Declares County Disaster Area”, ***Camarillo Daily News***, December 9, 1965, p.A2- Used to document natural hazard event damage assessment.

3. CITY OF FILLMORE

3.1 LOCAL HAZARD MITIGATION PLANNING TEAM

Primary Point of Contact
D. Keith Gurrola, Fire Chief
250 Central Ave
Fillmore, CA 93015
805-524-1500
keithg@fillmoreca.gov

Alternate Point of Contact
David Rowlands, City Manager
250 Central Ave
Fillmore, CA 93015
805-524-1500
drowlands@fillmoreca.gov

This annex was developed by the local hazard mitigation planning team, whose members are listed in Table 3-1.

Table 3-1. Local Mitigation Planning Team Members

Name	Title
D. Keith Gurrola	Fire Chief
David Rowlands	City Manager
Kevin McSweeney	City Planning Director
Ines Ebell	Planning Department Admin Assistant

3.2 JURISDICTION PROFILE

3.2.1 Location and Features

The City of Fillmore is in the western portion of the County of Ventura, California.

The current boundaries generally extend from the Santa Clara River going north, the Sespe Creek going east, slightly east of Pole Creek going west and the northern city boundary is the start of the foothills to the Los Padres National Forest. Fillmore is bordered on three sides by waterways, encompassing an area of 4.3 square miles.

Fillmore is located in the historic Santa Clara River Valley which is primarily all agricultural land, used to grow a wide variety of fair weather crops. As mentioned, the City is bordered by three separate waterways and open wildlands to the north

3.2.2 History

The City of Fillmore was incorporated in 1914. The town was established in the late 1800s and was known primarily as a railroad stop for travelers. With its fertile soils, the town quickly became an agricultural community. Oil was discovered years later in the hills that surround the Community and Fillmore started supporting businesses associated with oil production and support services. With the decline of the oil industry, Fillmore was able to diversify with light industry. The agricultural image of Fillmore has never gone away and is still quite robust. Fillmore is now known as a "bedroom community" where the majority of its working class residents commute to other near-by cities to work.

3.2.3 Governing Body Format

The City of Fillmore is governed by a Council–Manager form of government.

The Fillmore City Council assumes responsibility for the adoption of this plan; the Fillmore City Manager will oversee its implementation through the oversight of the various City Departments.

3.3 CURRENT TRENDS

3.3.1 Population

According to the California Department of Finance, the population of the City of Fillmore as of January 2020 was 15,566. Since 2010, the population has grown at an average annual rate of 0.37 percent.

3.3.2 Development

General development, overall has been primarily single family dwellings with an occasional multi-family unit. An industrial business park has had only one project developed. Currently there are several plans for in-fill of multi-family structures.

Table 3-2 summarizes development trends in the period since the preparation of the previous hazard mitigation plan, as well as expected future development trends.

3.4 CAPABILITY ASSESSMENT

This section describes an assessment of existing capabilities for implementing hazard mitigation strategies. The introduction at the beginning of this volume of the hazard mitigation plan describes the components included in the capability assessment and their significance for hazard mitigation planning.

Findings of the capability assessment were reviewed to identify opportunities to expand, initiate or integrate capabilities to further hazard mitigation goals and objectives. Where such opportunities were identified and determined to be feasible, they are included in the action plan. The "Analysis of Mitigation Actions" table in this annex identifies these as community capacity building mitigation actions.

Table 3-2. Recent and Expected Future Development Trends

Criterion	Response					
Has your jurisdiction annexed any land since the preparation of the previous hazard mitigation plan? • **If yes, give the estimated area annexed and estimated number of parcels or structures.**	Yes 3 acres, 0 structures					
Is your jurisdiction expected to annex any areas during the performance period of this plan?	No					
Are any areas targeted for development or major redevelopment in the next five years? • **If yes, briefly describe, including whether any of the areas are in known hazard risk areas**	Yes Industrial Park, no known hazard areas					
How many permits for new construction were issued in your jurisdiction since the preparation of the previous hazard mitigation plan?		**2016**	**2017**	**2018**	**2019**	**2020**
	Single Family	30	73	19	124	133
	Multi-Family	0	0	0	0	0
	Other (commercial, mixed use, etc.)	0	1	0	0	0
	Total	**30**	**74**	**19**	**124**	**133**
Provide the number of new-construction permits for each hazard area or provide a qualitative description of where development has occurred.	All of the permits issued were in the flood hazard area. There was no new development in the wildland-urban interface zone.					
Describe the level of buildout in the jurisdiction, based on your jurisdiction's buildable lands inventory. If no such inventory exists, provide a qualitative description.	85%					

The findings of the assessment are presented as follows:

- An assessment of planning and regulatory capabilities is presented in Table 3-3.
- Development and permitting capabilities are presented in Table 3-4.
- An assessment of fiscal capabilities is presented in Table 3-5.
- An assessment of administrative and technical capabilities is presented in Table 3-6.
- An assessment of education and outreach capabilities is presented in Table 3-7.
- Information on National Flood Insurance Program (NFIP) compliance is presented in Table 3-8.
- Classifications under various community mitigation programs are presented in Table 3-9.
- The community's adaptive capacity for the impacts of climate change is presented in Table 3-10.

Table 3-4. Development and Permitting Capability

Criterion	Response
Does your jurisdiction issue development permits?	Yes
If no, who does? If yes, which department? Planning, Building, Fire	
Does your jurisdiction have the ability to track permits by hazard area?	Yes
Does your jurisdiction have a buildable lands inventory?	Yes

Table 3-5. Fiscal Capability

Financial Resource	Accessible or Eligible to Use?
Community Development Block Grants	Yes
Capital Improvements Project Funding	Yes
Authority to Levy Taxes for Specific Purposes	Yes
User Fees for Water, Sewer, Gas or Electric Service	Yes
If yes, specify: All utilities	
Incur Debt through General Obligation Bonds	Yes
Incur Debt through Special Tax Bonds	Yes
Incur Debt through Private Activity Bonds	No
Withhold Public Expenditures in Hazard-Prone Areas	Yes
State-Sponsored Grant Programs	Yes
Development Impact Fees for Homebuyers or Developers	Yes
Other	Yes (Maintenance Assessment Districts)

Table 3-6. Administrative and Technical Capability

Staff/Personnel Resource	Available?
Planners or engineers with knowledge of land development and land management practices ***If Yes, Department /Position:*** Planning, Engineering	Yes
Engineers or professionals trained in building or infrastructure construction practices ***If Yes, Department /Position:*** Planning, Engineering	Yes
Planners or engineers with an understanding of natural hazards ***If Yes, Department /Position:*** Planning, Engineering	Yes
Staff with training in benefit-cost analysis ***If Yes, Department /Position:*** Planning, Engineering, Finance	Yes
Surveyors ***If Yes, Department /Position:*** Engineering	Yes
Personnel skilled or trained in GIS applications ***If Yes, Department /Position:*** Engineering	Yes
Scientist familiar with natural hazards in local area	No
Emergency manager ***If Yes, Department /Position:*** Fire	Yes
Grant writers ***If Yes, Department /Position:*** Finance, Fire	Yes

Table 3-7. Education and Outreach Capability

Criterion	Response
Do you have a public information officer or communications office?	Yes
Do you have personnel skilled or trained in website development?	Yes
Do you have hazard mitigation information available on your website? ***If yes, briefly describe:*** Both the Police and Fire Department websites contain information.	Yes
Do you use social media for hazard mitigation education and outreach? ***If yes, briefly describe:*** Yes, the major providers are all used for information sharing	Yes
Do you have any citizen boards or commissions that address issues related to hazard mitigation?	No
Do you have any other programs in place that could be used to communicate hazard-related information? ***If yes, briefly describe:*** The City participates with County OES to disseminate emergency information	Yes
Do you have any established warning systems for hazard events? ***If yes, briefly describe:*** Yes, we utilize County OES along with neighborhood notification via Police/Fire	Yes

Table 3-8. National Flood Insurance Program Compliance

Criterion	Response
What local department is responsible for floodplain management?	Engineering
Who is your floodplain administrator? (department/position)	Engineering
Are any certified floodplain managers on staff in your jurisdiction?	No
What is the date that your flood damage prevention ordinance was last amended?	1998
Does your floodplain management program meet or exceed minimum requirements?	Meets
When was the most recent Community Assistance Visit or Community Assistance Contact?	unknown

Criterion	Response
Does your jurisdiction have any outstanding NFIP compliance violations that need to be addressed? ***If so, state what they are.***	No
Are any RiskMAP projects currently underway in your jurisdiction?	No
Do your flood hazard maps adequately address the flood risk within your jurisdiction? ***If no, state why.***	Yes
Does your floodplain management staff need any assistance or training to support its floodplain management program?	No
Does your jurisdiction participate in the Community Rating System (CRS)? ***If no, is your jurisdiction interested in joining the CRS program?*** Unknown, would have to learn more	No
How many flood insurance policies are in force in your jurisdiction?[a] ***What is the insurance in force?*** $22,517,800 ***What is the premium in force?*** $34,315	74
How many total loss claims have been filed in your jurisdiction?[a] ***What were the total payments for losses?*** $226,509	37

a. According to FEMA statistics as of March 31, 2021

Table 3-9. Community Classifications

	Participating?	Classification	Date Classified
FIPS Code	Yes	0611124092	N/A
DUNS #	Yes	363056201	N/A
Community Rating System	No	N/A	N/A
Building Code Effectiveness Grading Schedule	No	N/A	N/A
Public Protection	Yes	04/4X	2018
Storm Ready	No	N/A	N/A
Firewise	No	N/A	N/A
Tsunami Ready	No	N/A	N/A

Table 3-10. Adaptive Capacity for Climate Change

Criterion	Jurisdiction Rating[a]
Technical Capacity	
Jurisdiction-level understanding of potential climate change impacts ***Comment:*** *Members of City Staff participate in local, regional, state and national committees*	High
Jurisdiction-level monitoring of climate change impacts ***Comment:*** *Members of City Staff participate in local, regional, state and national committees*	High
Technical resources to assess proposed strategies for feasibility and externalities ***Comment:*** *Through committee contacts, unlimited to access via internet*	High
Jurisdiction-level capacity for development of greenhouse gas emissions inventory ***Comment:*** *Fillmore is a small geographical city with specifically known sources of emission*	High
Capital planning and land use decisions informed by potential climate impacts ***Comment:*** *Fillmore implements an extensive review process, the total number of projects are manageable*	High
Participation in regional groups addressing climate risks ***Comment:*** *City Staff participates at many levels*	High

Criterion	Jurisdiction Rating[a]
Implementation Capacity	
Clear authority/mandate to consider climate change impacts during public decision-making processes ***Comment:*** *Planning Commission and City Council advocate*	High
Identified strategies for greenhouse gas mitigation efforts ***Comment:*** *Currently addressing vehicle exhaust emissions*	Low
Identified strategies for adaptation to impacts ***Comment:*** *Costs effectiveness*	Medium
Champions for climate action in local government departments ***Comment:*** *Looking at opportunities for all new vehicles and equipment*	Medium
Political support for implementing climate change adaptation strategies ***Comment:*** *All levels of decision making are to embrace*	Medium
Financial resources devoted to climate change adaptation ***Comment:*** *Looking for grants, new purchases*	Medium
Local authority over sectors likely to be negative impacted ***Comment:*** *The City has full authority over all Departments*	High
Public Capacity	
Local residents' knowledge of and understanding of climate risk ***Comment:***	Low
Local residents' support of adaptation efforts ***Comment:*** *General support, no negative reports*	Medium
Local residents' capacity to adapt to climate impacts ***Comment:*** *General support, no negative reports*	Medium
Local economy current capacity to adapt to climate impacts ***Comment:*** *Limited impact in short term*	Medium
Local ecosystems capacity to adapt to climate impacts ***Comment:*** *Limited impact in short term, some impact from agriculture*	Medium

a. High = Capacity exists and is in use; Medium = Capacity may exist, but is not used or could use some improvement; Low = Capacity does not exist or could use substantial improvement; Unsure= Not enough information is known to assign a rating.

3.5 INTEGRATION REVIEW

For hazard mitigation planning, "integration" means that hazard mitigation information is used in other relevant planning mechanisms, such as general planning and capital facilities planning, and that relevant information from those sources is used in hazard mitigation. This section identifies where such integration is already in place, and where there are opportunities for further integration in the future. Resources listed at the end of this annex were used to provide information on integration. The progress reporting process described in Volume 1 of the hazard mitigation plan will document the progress of hazard mitigation actions related to integration and identify new opportunities for integration.

3.5.1 Existing Integration

Some level of integration has already been established between local hazard mitigation planning and the following other local plans and programs:

- Fillmore Municipal Code

- Developer Impact Fees
- 1994 City of Fillmore Zoning Code
- 2015 County of Ventura Disaster Management Plan
- General Plan Land Use Element 2005

3.5.2 Opportunities for Future Integration

The capability assessment in this annex indicates opportunities to integrate this mitigation plan with other jurisdictional planning/regulatory capabilities. Capabilities were identified as integration opportunities if they can support or enhance the actions identified in this plan or be supported or enhanced by components of this plan. The capability assessment identified the following plans and programs that do not currently integrate hazard mitigation information but provide opportunities to do so in the future:

- Central Ventura County Regional Fire Safe Council Wildland Fire Mitigation Plan
- City of Fillmore Capital Improvement Plan 2021

Taking action to integrate each of these programs with the hazard mitigation plan was considered as a mitigation action to include in the action plan in this annex.

3.6 RISK ASSESSMENT

3.6.1 Jurisdiction-Specific Natural Hazard Event History

Table 3-11 lists past occurrences of natural hazards for which specific damage was recorded in this jurisdiction Other hazard events that broadly affected the entire planning area, including this jurisdiction, are listed in the risk assessments in Volume 1 of this hazard mitigation plan.

3.6.2 Hazard Risk Ranking

Table 3-12 presents a local ranking of all hazards of concern for which this hazard mitigation plan provides complete risk assessments. As described in detail in Volume 1, the ranking process involves an assessment of the likelihood of occurrence for each hazard, along with its potential impacts on people, property, and the economy. Mitigation actions primarily target hazards with high and medium rankings.

3.6.3 Jurisdiction-Specific Vulnerabilities

Volume 1 of this hazard mitigation plan provides complete risk assessments for each identified hazard of concern. This section provides information on a few key vulnerabilities for this jurisdiction. Available jurisdiction-specific risk maps of the hazards are provided at the end of this annex.

Table 3-11. Past Natural Hazard Events

Type of Event	FEMA Disaster #	Date	Damage Assessment
COVID-19 Pandemic	DR-4482	Jan 20, 2020-current	N/A
Thomas Fire	FM-5302	Dec 4, 2017-Jan 2018	No structural damage, but air quality issues and provided mutual aid. Opened evacuation centers at the high school and the recreation facility.
Guiberson Fire	FM-2839	Sept 2009	No structural damage, but air quality issues and provided mutual aid.
Day Fire	FM-2677	Sept 2006	No structural damage, but air quality issues and provided mutual aid.
Wildfires	DR-1498	Oct 2003	No structural damage, but air quality issues and provided mutual aid.
Severe Fires	EM-3120	Oct 1996	No structural damage, but air quality issues and provided mutual aid.
Winter Storm	DR-1046	Feb 1995	Economic impacts affecting agricultural packinghouses
Northridge Earthquake	DR-1008	Jan 1994	$50 million in damage and building inspectors red-tagged about 200 buildings and homes as too dangerous to inhabit.
Severe Storm	DR-935	Feb, 1992	N/A
Severe Storm	DR-615	Jan 1980	N/A
Flooding	DR-547	Feb 1978	Evacuations
Sylmar Earthquake	N/A	Feb 9, 1971	N/A
Brush Fires	DR-295	Sept 1970	Packing house within the city limits burned, but may have been an arson of opportunity.
Flooding	DR-253	Jan 1969	Evacuations
Flooding	N/A	Numerous pre 1964	N/A
St Francis Dam Disaster		March 12, 1928	$7 Million (1928)—Inundation of nearly the entire city, flooding, debris flows, destruction of infrastructure, high loss of life

Table 3-12. Hazard Risk Ranking

Rank	Hazard	Risk Ranking Score	Risk Category
1	Dam Failure	36	High
2	Earthquake	32	Medium
3	Severe Storm	24	Medium
4	Severe Weather	24	Medium
5	Wildfire	18	Medium
6	Flooding	18	Medium
7	Landslide	18	Medium
8	Drought	9	Low

Repetitive Loss Properties

Repetitive loss records are as follows:

- Number of FEMA-identified Repetitive-Loss Properties: 0
- Number of FEMA-identified Severe-Repetitive-Loss Properties: 0
- Number of Repetitive-Loss Properties or Severe-Repetitive-Loss Properties that have been mitigated: 0

Other Noted Vulnerabilities

The following jurisdiction-specific issues have been identified based on a review of the results of the risk assessment, public involvement strategy, and other available resources: N/A

- Two large-scale evacuations due to hazardous material fires. Both events triggered evacuations of 25 percent of the city's population.
- City recreation facility is used as an evacuation center but lacks showers.

Mitigation actions addressing these issues were prioritized for consideration in the action plan in this annex.

3.7 STATUS OF PREVIOUS PLAN ACTIONS

Table 3-13 summarizes the actions that were recommended in the previous version of the hazard mitigation plan and their implementation status at the time this update was prepared.

Table 3-13. Status of Previous Plan Actions

Action Item	Completed	Removed; No Longer Feasible	Carried Over to Plan Update: Check if Yes	Carried Over to Plan Update: Action # in Update
F 1—Construction of Pole Creek Debris Basin. The basin is awaiting Ventura County Watershed District approval for improvements to Final and to accept construction. The Basin will accept mud and debris flow from the Pole Creek watershed in a 100 year rain event and protect all future homes in the Heritage Valley Parks Specific Plan consisting of 750 residential units. The debris basin project includes levees, basin maintenance roads and water flow to the Santa Clara River. The Basin is proposed to be owned and operated by Ventura County Water Shed Protection District.	✓			
Comment: The Basin was completed in 2009, it is maintained by the Developer until Ventura County Watershed accepts				
F 2—Completion of the Heritage Valley Parks Levees. Over 1.5 miles of soil cement levee was constructed for protection of a 100 year storm and water flow from the Santa Clara River. Parks and streets about the levee in order to avoid any emergency conflict with proposed residential units. The Levee system protects the 750 proposed residential units in the Heritage Valley Parks Specific Plan and a proposed 110 condominium project proposed by KB Homes.	✓			
Comment: The levee was completed in 2006 but not yet certified, awaiting final construction of the last few remaining residential units				
F 3—Completion of the Lower Sespe Creek Levee. A ½ mile in length soil cement levee was constructed south of Hwy 23 to protect the newly constructed Water Recycling Plant and protect the future Business Park Master Plan.	✓			
Comment: This levee was completed in 2008 from Hy 126 south to the City limits				
F 4—Completion of the Central Avenue Storm Drain. A large storm drain was installed in Central Ave to protect the Central Business District from floods that historically threatened downtown.	✓			
Comment: This storm drain project was completed in 2008 and drains into the Santa Clara River, improvements will be made on last 100 yards				
F 5—Continue to monitor the need to demolish abandoned and dilapidated buildings.	✓			
Comment: This is an ongoing project, numerous buildings have been demolished, looking for opportunities as they present themselves for additional structures				

3.8 HAZARD MITIGATION ACTION PLAN

Table 3-14 lists the identified actions, which make up the hazard mitigation action plan for this jurisdiction. Table 3-15 identifies the priority for each action. Table 3-16 summarizes the mitigation actions by hazard of concern and mitigation type.

Table 3-14. Hazard Mitigation Action Plan Matrix

Benefits New or Existing Assets	Objectives Met	Lead Agency	Support Agency	Estimated Cost	Sources of Funding	Timeline[a]
Action FIL-1—Where appropriate, support retrofitting, purchase or relocation of structures located in hazard areas, prioritizing those that have experienced repetitive losses and/or are located in high- or medium-risk hazard areas.						
Hazards Mitigated:	Dam Failure, Earthquake, Severe Storm, Severe Weather, Wildfire, Flooding, Landslide					
Existing	2, 6, 9, 10, 11	Public Works.	Community Development	High	Grant Funding-FEMA HMA (BRIC, FMA, HMGP)	Short-term
Action FIL-2—Integrate the hazard mitigation plan into other plans, ordinances and programs that dictate land use decisions in the community.						
Hazards Mitigated:	Dam Failure, Earthquake, Severe Storm, Severe Weather, Wildfire, Flooding, Landslide, Drought					
New & Existing	1, 2, 3, 4, 5, 7, 8, 9, 10, 11, 12, 13, 14, 15, 17, 19	Community Development	Public Works	Low	Staff Time, General Funds	Ongoing
Action FIL-3—Actively participate in the plan maintenance protocols outlined in Volume 1 of this hazard mitigation plan.						
Hazards Mitigated:	Dam Failure, Earthquake, Severe Storm, Severe Weather, Wildfire, Flooding, Landslide, Drought					
New & Existing	1, 2, 4, 6, 7, 8, 9, 11, 12, 13, 14, 15	Public Works	Community Development	Low	Staff Time, General Funds	Short-term
Action FIL-4—Continue to maintain good standing and compliance under the NFIP through implementation of floodplain management programs that, at a minimum, meet the NFIP requirements: • Enforce the flood damage prevention ordinance. • Participate in floodplain identification and mapping updates. • Provide public assistance/information on floodplain requirements and impacts.						
Hazards Mitigated:	Flooding					
New & Existing	1, 2, 6, 7, 17	Public Works	Community Development	Low	Staff Time, General Funds	Ongoing
Action FIL-5—Identify and pursue strategies to increase adaptive capacity to climate change.						
Hazards Mitigated:	Severe Storm, Severe Weather, Wildfire, Flooding, Drought					
New & Existing	1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 19	Community Development	Public Works	Low	Staff Time, General Funds, Grant Funding-FEMA HMA (BRIC, FMA, HMGP)	Short-term
Action FIL-6—Purchase generators for critical facilities and infrastructure that lack adequate backup power.						
Hazards Mitigated:	Dam Failure, Earthquake, Severe Storm, Severe Weather, Wildfire, Flooding, Landslide					
Existing	2, 19	Public Works	Community Development	High	Grant Funding-FEMA HMA (BRIC and HMGP)	Short-term
Action FIL-7—Study feasibility of developing a resilience hub in the city to provide the resources residents need to enhance their own individual capacity while also supporting and strengthening the community before and during a disaster event.						
Hazards Mitigated:	Dam Failure, Earthquake, Severe Storm, Severe Weather, Wildfire, Flooding, Landslide					
New	2, 3, 7, 8, 12, 17	Community Development		High	Staff Time, General Funds, Grant Funding-FEMA HMA (BRIC, FMA, HMGP)	Short-term

Benefits New or Existing Assets	Objectives Met	Lead Agency	Support Agency	Estimated Cost	Sources of Funding	Timeline[a]
Action FIL-8—Study feasibility of developing an alternative Emergency Operations Center (EOC) location to use during a disaster.						
Hazards Mitigated: Earthquake, Severe Storm, Severe Weather, Wildfire, Flooding, Terrorism						
New	2, 3, 7, 8, 12, 17	Community Development		High	Staff Time, Grant Funding-FEMA HMA (BRIC, FMA, HMGP)	Long-term
Action FIL-9—Hardening of the City Water Delivery System and computerized upgrade.						
Hazards Mitigated: Dam Failure, Severe Storm, Severe Weather, Drought, Wildfire, Flooding, Terrorism						
New	2, 6, 9, 10, 11	Public Works		High	Staff Time, Grant Funding-FEMA HMA (BRIC, FMA, HMGP)	Short-term
Action FIL-10—Continue and enhance the public outreach program for wildfire education and prevention among school children and the general community.						
Hazards Mitigated: Wildfire						
New & Existing	2, 5, 7, 8, 10, 11, 12, 13, 14, 15, 17	Fillmore Fire Department	Fire Safe Council	Low	Staff Time, Fillmore Volunteer Firefighter Foundation, Grant Funding—Edison International Utility Grant	Ongoing
Action FIL-11—Maintain wildfire hazard fuel reduction program for areas that have been identified with overgrown or dead brush, trees and weeds to reduce the potential for tree-to-tree ignition. Ensure that a "maintenance now" component to provide continued fire resistance is part of the program. (Coordinates with VCFPD Action VFP-6)						
Hazards Mitigated: Wildfire						
New & Existing	2, 4, 5, 6, 8, 10, 11, 13, 14, 15, 18, 19	Fillmore Fire Department	CAL FIRE, Ventura County Fire Protection District, Fire Safe Council	Low	FEMA HMA (BRIC, FMAP and HMGP), Staff Time & General Funds	Ongoing

a. Short-term = Completion within 5 years; Long-term = Completion within 10 years; Ongoing= Continuing new or existing program with no completion date

Acronyms used here are defined at the beginning of this volume.

Table 3-15. Mitigation Action Priority

Action #	# of Objectives Met	Benefits	Costs	Do Benefits Equal or Exceed Cost?	Is Project Grant-Eligible?	Can Project Be Funded Under Existing Programs/ Budgets?	Implementation Priority[a]	Grant Pursuit Priority[a]

3.9 PUBLIC OUTREACH

Table 3-17 lists public outreach activities for this jurisdiction.

Table 3-17. Local Public Outreach

Local Outreach Activity	Date	Number of People Involved
Disaster preparedness	Every September	500
Earth Day	Every April	500
Hazardous vegetation chipping days	May & September	100
Fire department children education	10 times a year	10,000

3.10 INFORMATION SOURCES USED FOR THIS ANNEX

The following technical reports, plans, and regulatory mechanisms were reviewed to provide information for this annex.

- **City of Fillmore Municipal Code**—The municipal code was reviewed for the full capability assessment and for identifying opportunities for action plan integration.
- **City of Fillmore Flood Damage Prevention Ordinance**—The flood damage prevention ordinance was reviewed for compliance with the National Flood Insurance Program.
- **City of Fillmore General Plan**—The GP was reviewed for the capability assessment.
- **City of Fillmore Capital Improvement Program**—The CIP was reviewed for identifying opportunities for action plan integration.

The following outside resources and references were reviewed:

- **Hazard Mitigation Plan Annex Development Toolkit**—The toolkit was used to support the identification of past hazard events and noted vulnerabilities, the risk ranking, and the development of the mitigation action plan.

4. CITY OF MOORPARK

4.1 LOCAL HAZARD MITIGATION PLANNING TEAM

Primary Point of Contact
Mack Douglass, Program Manager
799 Moorpark Ave.
Moorpark, CA 93021
Telephone: 805-517-6241
e-mail Address: mdouglass@Moorparkca.gov

Alternate Point of Contact
Kambiz Borhani, Finance Director
799 Moorpark Ave.
Moorpark, CA 93021
Telephone: 805-517-6249
e-mail Address:
kborhani@Moorparkca.gov

This annex was developed by the local hazard mitigation planning team, whose members are listed in Table 4-1.

Table 4-1. Local Mitigation Planning Team Members

Name	Title
Mack Douglass	Program Manager, Emergency Management
Robert Valery	Parks and Facilities Supervisor
Leonard Mendez	Public Works Supervisor
PJ Gagajena	Assistant City Manager
Douglas Spondello	Interim Community Development Director

4.2 JURISDICTION PROFILE

4.2.1 Location and Features

Founded by Robert Poindexter in 1900 and incorporated in July 1983, the City of Moorpark is one of ten incorporated cities of Ventura County and is located in the eastern portion of the County. The City encompasses approximately 12.4 square miles and a population of 36,278 as of 2020. It is generally bounded by the City of Simi Valley to the east, the Tierra Rejada Valley and City of Thousand Oaks to the south, and unincorporated lands to the west and north. Lands west of the city are largely agricultural and protected from development by the Save Open Space and Agricultural Resources voter approved initiatives requiring the public's vote before any agricultural or open space lands are rezoned for development. Lands to the north of City's boundary are largely mountainous. It is connected to the region by two freeways, SR-118 to the east and SR-23 to the south, and Los Angeles Avenue (SR-118) to the west. Moorpark is home to Moorpark Community College, and is served by the Moorpark Unified School District for grades K-12.

Significant geographical features include the Arroyo Simi, which runs from east to west through central Moorpark. The City is also bisected by State Routes 118 and 23.

4.2.2 History

What is known about the settled history of Moorpark begins with the Chumash tribe of Native Americans, who lived and traded in the area prior to the arrival of Spanish explorers in the 16th century and missionaries in the centuries that followed. The Chumash village of Quimisac was located northeast of present-day Moorpark in the vicinity of what is now known as Happy Camp Canyon Park. Permanent settlement of the area can be traced back to successive eras of land ownership, starting with the gifting of the Rancho San Jose de Nuestra Señora de Altagarcia y Simi (Rancho Simi) to Francisco Javier Pico and his brothers by Governor Diego de Borica in 1795. When Moorpark was founded, the small farming communities of Fremontville and Epworth were already established in the area. In 1900, Robert W. and Madeleine Poindexter established a town site in anticipation of the arrival of the Southern Pacific Railroad and named it Moorpark, after the apricot variety that grew in the region. A depot was constructed that year, and several buildings originally constructed in Fremontville and Epworth were relocated to the burgeoning town. Growth began in earnest after 1904, when the railroad tunnels through the Santa Susana Mountains were completed to the east, connecting the area to the Los Angeles basin. Early development in Moorpark was concentrated in the downtown area along High Street, with the area south of the railroad tracks remaining largely farmland for many years.

The railroad and its connection to faraway markets facilitated the growth of the agriculture industry, the economic lifeblood of Moorpark. In the City's early years, dry land crops such as apricots, black-eyed beans, hay, and lima beans were the primary farming staples. Though agriculture remained an economic engine after World War II, the growth of turkey, chicken, and egg ranches fed the development of the poultry industry and a diversifying economy.

Moorpark became one of the first cities in the world to run off commercial nuclear power in 1957. Moorpark Community College opened on September 11, 1967.

Moorpark was incorporated as a city on July 1, 1983, marking the most dramatic period of growth of new homes and businesses in the City's history. This period saw a substantial shift in the Moorpark's center of activity, with large-scale development occurring in many areas that had heretofore been used for agriculture. High Street and the surrounding area remained the social and retail center of Moorpark through the 1980s until commercial activity began to shift to the south and suburban-style, multitenant retail centers grew along Los Angeles Avenue. Significant growth in home construction began in the late 1970s and accelerated through the 1980s as subdivisions such as Mountain Meadows and Peach Hill expanded the city's built footprint from the flatlands into the surrounding hillsides. Despite this growth, vestiges of the City's history still remain. Moorpark contains three locally significant resources, nine Points of Historic Interest, and one built environment resource listed in the California Register of Historical Resources (CRHR). Locally significant resources include the Taylor House, the First Southern Baptist Church and High Street's Pepper Trees. The highest level of significance conferred on a historical resource in the City is applied to Tanner's Corner, which is listed in the CRHR as an individual property.

4.2.3 Governing Body Format

The City of Moorpark operates under a council-manager form of government. The City Council assumes responsibility for the adoption of this plan; the City of Moorpark will oversee its implementation.

4.3 CURRENT TRENDS

4.3.1 Population

According to the California Department of Finance, the population of the City of Moorpark as of January 2020 was 36,278. Since 2010, the population has grown at an average annual rate of 0.54 percent. Moorpark's median age of 37.6 is close to the County median of 37.9, but younger that the neighboring cities. The percentage of the population under 18 years old is 23.1 percent, close to the state and County and higher than its three neighbors. Its percentage of population 65 years and above is lower than the state and County and substantially lower than the neighboring cities.

4.3.2 Development

Table 4-2 summarizes development trends in the period since the preparation of the previous hazard mitigation plan, as well as expected future development trends. Figure 4-1 describes the existing land uses and development characteristics within the City of Moorpark.

Table 4-2. Recent and Expected Future Development Trends

Criterion	Response					
Has your jurisdiction annexed any land since the preparation of the previous hazard mitigation plan?	No					
Is your jurisdiction expected to annex any areas during the performance period of this plan?	No					
Are any areas targeted for development or major redevelopment in the next five years? • **If yes, briefly describe, including whether any of the areas are in known hazard risk areas**	Yes There are several major development projects that have been entitled in various locations within Moorpark, including approximately 1,200 housing units, commercial and industrial projects. There are also several significant applications that are pending entitlement. Each site is unique but generally potential risks that have been assessed and mitigated with each project include areas of known liquefaction, potential flooding, and designated Very High Fire Hazard Severity Zones. The Moorpark Community Development Department maintains a list of pending development projects on the City's website.					
How many permits for new construction were issued in your jurisdiction since the preparation of the previous hazard mitigation plan?		**2016**	**2017**	**2018**	**2019**	**2020**
	Single Family	87	66	27	4	21
	Multi-Family	0	0	0	0	185
	Other (commercial, mixed use, etc.)	16	10	7	6	10
	Total	**103**	**76**	**34**	**10**	**216**

Criterion	Response
Provide the number of new-construction permits for each hazard area or provide a qualitative description of where development has occurred.	The majority of the City is within a designated Very High Fire Hazard Severity Zone. Many properties near the Arroyo Simi are also within a FEMA Special Flood Hazard Area. Large areas of the City are also vulnerable to liquefaction, primarily along the Arroyo Simi and tributary streams.
Describe the level of buildout in the jurisdiction, based on your jurisdiction's buildable lands inventory. If no such inventory exists, provide a qualitative description.	Moorpark is approaching build out, with infill and redevelopment projects comprising the bulk of our construction activity. Limited numbers of development projects located around the periphery of the City, such as Hitch Ranch are moving through the entitlement process, but may not break ground in the near future.

LAND USES BY ACREAGE

Land Use	Acres	Percent
Residential	2,274	28%
• Single-Family	1,744	22%
• Multifamily	202	3%
• Mobile Home	41	.5%
• Rural Residential	287	4%
Right of Way	1,155	14%
Office	37	0.5%
Commercial and Services	152	2%
Public Facilities and Quasi-Public	101	1%
Education	296	4%
Industrial	280	4%
Transportation, Communications, and Utilities	217	3%
Open Space and Recreation	2,240	28%
Agriculture	29	.5%
Vacant	1,069	13%
Water	141	2%
TOTAL	7,991	100%

RESIDENTIAL BUILDOUT*

Type	Dwelling Units	Percent
Single-Family Residential	9,859	86%
Multifamily Residential	1,412	12%
Mobile Homes	144	1%
TOTAL	11,415	100%

4.4 CAPABILITY ASSESSMENT

This section describes an assessment of existing capabilities for implementing hazard mitigation strategies. The introduction at the beginning of this volume of the hazard mitigation plan describes the components included in the capability assessment and their significance for hazard mitigation planning.

Findings of the capability assessment were reviewed to identify opportunities to expand, initiate or integrate capabilities to further hazard mitigation goals and objectives. Where such opportunities were identified and determined to be feasible, they are included in the action plan. The "Analysis of Mitigation Actions" table in this annex identifies these as community capacity building mitigation actions. The findings of the assessment are presented as follows:

- An assessment of planning and regulatory capabilities is presented in Table 4-3.
- Development and permitting capabilities are presented in Table 4-4.
- An assessment of fiscal capabilities is presented in Table 4-5.
- An assessment of administrative and technical capabilities is presented in Table 4-6.
- An assessment of education and outreach capabilities is presented in Table 4-7.
- Information on National Flood Insurance Program (NFIP) compliance is presented in Table 4-8.
- Classifications under various community mitigation programs are presented in Table 4-9.
- The community's adaptive capacity for the impacts of climate change is presented in Table 4-10.

Table 4-3. Planning and Regulatory Capability

	Local Authority	Other Jurisdiction Authority	State Mandated	Integration Opportunity?
Codes, Ordinances, & Requirements				
Building Code	Yes	Yes	Yes	Yes
Comment: *California Building Code, 2019 Edition, adopted in Moorpark Municipal Code, Chapter 15.08 Building Code (Ord. 474 § 3, 2019)*				
Zoning Code	Yes	No	Yes	Yes
Comment: *Moorpark Municipal Code Title 17, (Ord. 189 § 3 (8101-0), 1994)*				
Subdivisions	Yes	No	Yes	Yes

Post-Disaster Recovery Plan	Yes	No	No	Yes
Comment: *This is part of the City of Moorpark Emergency Operations Plan (EOP) 2014*				

	Local Authority	Other Jurisdiction Authority	State Mandated	Integration Opportunity?
Continuity of Operations Plan	Yes	No	Yes	Yes
Comment: *2014 Moorpark Emergency Operations Plan. Comprehensive EOP Update currently underway.*				
Public Health Plan	No	Yes	Yes	No
Comment: *The General Plan Update will include an Element regarding Public Health however the City does not currently have a Public Health Plan. County of Ventura Health Care Agency Public Health Emergency Response Plan (ERP)*				

Table 4-4. Development and Permitting Capability

Criterion	Response
Does your jurisdiction issue development permits?	Yes
If no, who does? If yes, which department? Community Development	
Does your jurisdiction have the ability to track permits by hazard area?	No
Does your jurisdiction have a buildable lands inventory?	Yes

Table 4-5. Fiscal Capability

Financial Resource	Accessible or Eligible to Use?
Community Development Block Grants	Yes
Capital Improvements Project Funding	Yes
Authority to Levy Taxes for Specific Purposes	Yes
User Fees for Water, Sewer, Gas or Electric Service	No
Incur Debt through General Obligation Bonds	Yes
Incur Debt through Special Tax Bonds	Yes
Incur Debt through Private Activity Bonds	Yes
Withhold Public Expenditures in Hazard-Prone Areas	Yes
State-Sponsored Grant Programs	Yes
Development Impact Fees for Homebuyers or Developers	Yes

Table 4-6. Administrative and Technical Capability

Staff/Personnel Resource	Available?
Planners or engineers with knowledge of land development and land management practices	Yes
If Yes, Department /Position: Community Development and Public Works	
Engineers or professionals trained in building or infrastructure construction practices	Yes
If Yes, Department /Position: Public Works	
Planners or engineers with an understanding of natural hazards	Yes
If Yes, Department /Position: Community Development and Public Works	
Staff with training in benefit-cost analysis	Yes
If Yes, Department /Position: Finance	
Surveyors	No
Personnel skilled or trained in GIS applications	No
Scientist familiar with natural hazards in local area	No
Emergency manager	Yes
If Yes, Department /Position: Program Manager, Finance Department	
Grant writers	No

Table 4-7. Education and Outreach Capability

Criterion	Response
Do you have a public information officer or communications office?	Yes
Do you have personnel skilled or trained in website development?	Yes
Do you have hazard mitigation information available on your website?	No
Do you use social media for hazard mitigation education and outreach?	No
Do you have any citizen boards or commissions that address issues related to hazard mitigation?	No
Do you have any other programs in place that could be used to communicate hazard-related information?	Yes
If yes, briefly describe: Community Emergency Response Team	
Do you have any established warning systems for hazard events?	No
If yes, briefly describe:	

Table 4-8. National Flood Insurance Program Compliance

Criterion	Response
What local department is responsible for floodplain management?	Public Works
Who is your floodplain administrator? (department/position)	Public Works Director
Are any certified floodplain managers on staff in your jurisdiction?	No
What is the date that your flood damage prevention ordinance was last amended?	2002
Does your floodplain management program meet or exceed minimum requirements?	Meets
When was the most recent Community Assistance Visit or Community Assistance Contact?	Unknown
Does your jurisdiction have any outstanding NFIP compliance violations that need to be addressed?	No
Are any RiskMAP projects currently underway in your jurisdiction?	No
Do your flood hazard maps adequately address the flood risk within your jurisdiction?	Yes
Does your floodplain management staff need any assistance or training to support its floodplain management program?	No
Does your jurisdiction participate in the Community Rating System (CRS)? ***If no, is your jurisdiction interested in joining the CRS program?*** No	No
How many flood insurance policies are in force in your jurisdiction?[a] ***What is the insurance in force?*** $39,692,000 ***What is the premium in force?*** $114,239	117
How many total loss claims have been filed in your jurisdiction?[a] ***What were the total payments for losses?*** $33,576	2

a. According to FEMA statistics as of March 31, 2021

Table 4-9. Community Classifications

	Participating?	Classification	Date Classified
FIPS Code	Yes	0611149138	N/A
DUNS #	Yes	628053464	N/A
Community Rating System	No	N/A	N/A
Building Code Effectiveness Grading Schedule	No	N/A	N/A
Public Protection	No	N/A	N/A
Storm Ready	No	N/A	N/A
Firewise	No	N/A	N/A
Tsunami Ready	No	N/A	N/A

Table 4-10. Adaptive Capacity for Climate Change

Criterion	Jurisdiction Rating[a]
Technical Capacity	
Jurisdiction-level understanding of potential climate change impacts	Medium
Comment: *Staff and elected officials understand potential climate change impacts.t*	
Jurisdiction-level monitoring of climate change impacts	Low
Comment:	
Technical resources to assess proposed strategies for feasibility and externalities	Low
Comment:	
Jurisdiction-level capacity for development of greenhouse gas emissions inventory	Low
Comment:	
Capital planning and land use decisions informed by potential climate impacts	High
Comment: *General Plan Update will include a climate action plan element.*	
Participation in regional groups addressing climate risks	Low
Comment:	
Implementation Capacity	
Clear authority/mandate to consider climate change impacts during public decision-making processes	High
Comment: *City Council and the City Manager have the authority to consider and direct action to address potential climate change impacts*	
Identified strategies for greenhouse gas mitigation efforts	High
Comment: *City Council recently enacted an SB 1383 compliant ordinance, which will reduce GHG emissions from organic waste*	
Identified strategies for adaptation to impacts	Low
Comment:	
Champions for climate action in local government departments	Unsure
Comment:	
Political support for implementing climate change adaptation strategies	Unsure
Comment:	
Financial resources devoted to climate change adaptation	Low
Comment:	
Local authority over sectors likely to be negative impacted	Low
Comment:	
Public Capacity	
Local residents' knowledge of and understanding of climate risk	Medium
Comment: *Evidence of climate change is obvious in Moorpark and directly affects the lives of residents through sustained droughts, frequent wildfires, high wind events and Public Safety Power Shutoffs.*	
Local residents' support of adaptation efforts	Unsure
Comment:	
Local residents' capacity to adapt to climate impacts	Unsure
Comment:	
Local economy current capacity to adapt to climate impacts	Low
Comment:	
Local ecosystems capacity to adapt to climate impacts	Unsure
Comment:	

a. High = Capacity exists and is in use; Medium = Capacity may exist, but is not used or could use some improvement; Low = Capacity does not exist or could use substantial improvement; Unsure= Not enough information is known to assign a rating.

4.5 INTEGRATION REVIEW

For hazard mitigation planning, “integration” means that hazard mitigation information is used in other relevant planning mechanisms, such as general planning and capital facilities planning, and that relevant information from those sources is used in hazard mitigation. This section identifies where such integration is already in place, and where there are opportunities for further integration in the future. Resources listed at the end of this annex were used to provide information on integration. The progress reporting process described in Volume 1 of the hazard mitigation plan will document the progress of hazard mitigation actions related to integration and identify new opportunities for integration.

4.5.1 Existing Integration

Some level of integration has already been established between local hazard mitigation planning and the following other local plans and programs:

- **County of Ventura Hazard Mitigation Plan**
- **City of Moorpark Emergency Operations Plan**
- **City of Moorpark General Plan, Safety Element (2001)**

4.5.2 Opportunities for Future Integration

The capability assessment in this annex indicates opportunities to integrate this mitigation plan with other jurisdictional planning/regulatory capabilities. Capabilities were identified as integration opportunities if they can support or enhance the actions identified in this plan or be supported or enhanced by components of this plan. The capability assessment identified the following plans and programs that do not currently integrate hazard mitigation information but provide opportunities to do so in the future:

- **City of Moorpark General Plan**—The City of Moorpark is engaged in a comprehensive update to the General Plan and zoning ordinance that will include a full evaluation of potential hazards, climate issues, and Program Environmental Impact Report.

Taking action to integrate each of these programs with the hazard mitigation plan was considered as a mitigation action to include in the action plan in this annex.

4.6 RISK ASSESSMENT

4.6.1 Jurisdiction-Specific Natural Hazard Event History

Table 4-11 lists past occurrences of natural hazards for which specific damage was recorded in this jurisdiction Other hazard events that broadly affected the entire planning area, including this jurisdiction, are listed in the risk assessments in Volume 1 of this hazard mitigation plan.

Table 4-11. Past Natural Hazard Events

Type of Event	FEMA Disaster #	Date	Damage Assessment
COVID-19 Pandemic	DR-4482	January 20, 2020 and continuing	COVID-19 Pandemic
Maria Fire	FM-5302-CA	11/1/2019	$6,199,112.56
Easy Fire	FM-5298-CA	10/30/2019	$2,833,870.64
Heat Event	N/A	7/4/2018 to 7/6/2018	Extreme 2-day heat event broke records across the county.
Thomas Fire	FM-5224	December 4, 2017	Unknown
Winter Storms	N/A	2/17/2017 to 2/18/2017	Rainfall amounts from 2 to 6 inches across coastal areas with up to around 10 inches in the local mountains produced numerous reports of flash flooding as well as mud and debris flows. Strong southerly winds with gusts up to 70 mph reported in some areas.
Guiberson Fire	FM-2839-CA	9/22/2009	$8,033,270.01
Flash Flood	N/A	January 25, 2008	California Highway Patrol reported heavy rain and flash flooding near the community of Moorpark. Reports indicated flash flooding along Tierra Rejada Drive at Hillside Drive.
Severe Freeze Event	DR-1689	1/11/2007 to 1/17/2007	4 nights of below freezing temperatures.
Shekell Fire	FM-2681-CA	12/3/2006	$1,153,198.47
Winter Storms	DR1577	1/7/2005 to 1/11/2005	Major roads including Highways 101, 126, 33 and 150 were closed for more than a week due to severe flooding
Wildfires, Flooding, Mudflow and Debris Flow	DR-1498	October 21, 2003 – March 31, 2003	Unknown
1928 St. Francis Dam Failure	N/A	3/12/1928	>530 people died; bridges, orchards, farms, homes all eradicated in flood's path down the Santa Clara river valley to the Pacific Ocean.

4.6.2 Hazard Risk Ranking

Table 4-12 presents a local ranking of all hazards of concern for which this hazard mitigation plan provides complete risk assessments. As described in detail in Volume 1, the ranking process involves an assessment of the likelihood of occurrence for each hazard, along with its potential impacts on people, property, and the economy. Mitigation actions primarily target hazards with high and medium rankings.

Table 4-12. Hazard Risk Ranking

Rank	Hazard	Risk Ranking Score	Risk Category
1	Wildfire	36	High
1	Landslide	36	High
3	Earthquake	32	Medium
4	Dam Failure	26	Medium
5	Severe Weather	24	Medium
5	Severe Storms	24	Medium
7	Flooding	18	Medium
8	Drought	9	Low

4.6.3 Jurisdiction-Specific Vulnerabilities

Volume 1 of this hazard mitigation plan provides complete risk assessments for each identified hazard of concern. This section provides information on a few key vulnerabilities for this jurisdiction. Available jurisdiction-specific risk maps of the hazards are provided at the end of this annex.

Repetitive Loss Properties

Repetitive loss records are as follows:

- Number of FEMA-identified Repetitive-Loss Properties: 0
- Number of FEMA-identified Severe-Repetitive-Loss Properties: 0
- Number of Repetitive-Loss Properties or Severe-Repetitive-Loss Properties that have been mitigated: 0

Other Noted Vulnerabilities

The following jurisdiction-specific issues have been identified based on a review of the results of the risk assessment, public involvement strategy, and other available resources:

- Loss of power due to human action (PSPS).
  - At least 10 PSPS events affected the city during 2020, including several events that lasted for multiple days.
  - Traffic signals were affected.
  - City Hall itself was left on backup power for several days.
  - Police Service Facility has a lack of reliable power due to a faulty power switchover device.
  - City was unable to provide a cooling center to residents due to a lack of power.
  - A charity using a City Facility to conduct food bank operations is susceptible to loss of perishable items due to power outages.
- Frequent urban flooding at the intersection of Millard St. and Sherman Ave.

Mitigation actions addressing these issues were prioritized for consideration in the action plan in this annex.

4.7 STATUS OF PREVIOUS PLAN ACTIONS

Table 4-13 summarizes the actions that were recommended in the previous version of the hazard mitigation plan and their implementation status at the time this update was prepared.

Table 4-13. Status of Previous Plan Actions

Action Item	Completed	Removed; No Longer Feasible	Carried Over to Plan Update: Check if Yes	Carried Over to Plan Update: Action # in Update
OA 1—Integrate the hazard analysis and mitigation strategy with the General Plan's Safety Element.			✓	MPK-2
Comment: General Plan update including safety element is underway.				
OA 6—Develop a public outreach program that informs property owners located in the dam and levee failure inundation areas about voluntary flood insurance.			✓	MPK-7
Comment: Public Works requires additional staff resources to complete this Action.				
OA 7—Develop a water conservation public outreach program to increase awareness about the drought, fines and penalties for overuse and solutions for conserving water.	✓			
Comment: Done in concert with Calleguas MWD. Most recently implemented a drought impact plan on 7/01/15.				
OA 8—Adopt emergency water conservation measures and/or water conservation ordinance to limit irrigation.	✓			
Comment: MMC 15.23.010 was amended most recently on 12/18/19.				
OA 10—Seismically retrofit or upgrade seismically deficient government facilities and pre-identified shelter facilities.			✓	MPK-1
Comment: City Hall will likely be changing location to a seismically suitable facility in the near future				
OA 19—Maintain vegetation management program that provides vegetation management services to elderly, disabled, or low-income property owners who lack the resources to remove flammable vegetation from around their homes.			✓	MPK-8
Comment: City requires additional staff resources to complete this action item.				
MP 1—Generators: Purchase and install back-up generators for 3 facilities, one of which is often used by Ventura County Fire and Sheriff as an Incident Command Center and serves as an alternate Emergency Operation Center (EOC) for the City (Capital Improvement Project 7710)	✓			
Comment: Completed in 2009.				
MP 2—Hazardous Mitigation Planning: Modify current Neighborhood and Business Watch Programs with focus on electronic format including real-time information exchange between law enforcement and the community	✓			
Comment: Completed in 2016.				
MP 3—Wildfire Mitigation: Work with Ventura County Fire to consider siting/planning for a new fire station by Moorpark College (east end of City)	✓			
Comment: Placement of new fire station under consideration by City and VCFPD.				
MP 4—Mitigation Reconstruction: Reconstruct fire sprinkler system for the Community Center facility		✓		
Comment: Use of Community Center Facility may be modified or discontinued when City Hall changes location so this action is no longer feasible.				

4.8 HAZARD MITIGATION ACTION PLAN

Table 4-14 lists the identified actions, which make up the hazard mitigation action plan for this jurisdiction. Table 4-15 identifies the priority for each action. Table 4-16 summarizes the mitigation actions by hazard of concern and mitigation type.

Table 4-14. Hazard Mitigation Action Plan Matrix

Benefits New or Existing Assets	Objectives Met	Lead Agency	Support Agency	Estimated Cost	Sources of Funding	Timeline[a]
Action MPK-1—Where appropriate, support retrofitting, purchase or relocation of structures located in hazard areas, prioritizing those that have experienced repetitive losses and/or are located in high- or medium-risk hazard areas.						
Hazards Mitigated: Wildfire, Landslide, Earthquake, Dam Failure, Severe Weather, Severe Storms, Flooding						
Existing	2, 6, 9, 10, 11	City of Moorpark	N/A	High	Grant Funding-FEMA HMA (BRIC, FMA, HMGP)	Short-term
Action MPK-2—Integrate the hazard mitigation plan into other plans, ordinances and programs that dictate land use decisions in the community, including the City's Emergency Operations Plan and General Plan.						
Hazards Mitigated: Wildfire, Landslide, Flooding						
New & Existing	1, 2, 3, 4, 5, 7, 8, 9, 10, 11, 12, 13, 14, 15, 17, 19	City of Moorpark	N/A	Low	Staff Time, General Funds	Ongoing
Action MPK-3—Actively participate in the plan maintenance protocols outlined in Volume 1 of this hazard mitigation plan.						
Hazards Mitigated: Wildfire, Landslide, Earthquake, Dam Failure, Severe Weather, Severe Storms, Flooding, Drought						
New & Existing	1, 2, 4, 6, 7, 8, 9, 11, 12, 13, 14, 15	City of Moorpark	N/A	Low	Staff Time, General Funds	Short-term
Action MPK-4—Continue to maintain good standing and compliance under the NFIP through implementation of floodplain management programs that, at a minimum, meet the NFIP requirements: • Enforce the flood damage prevention ordinance. • Participate in floodplain identification and mapping updates. • Provide public assistance/information on floodplain requirements and impacts.						
Hazards Mitigated: Flooding, Dam Failure						
New & Existing	1, 2, 6, 7, 17	City of Moorpark	N/A	Low	Staff Time, General Funds	Ongoing
Action MPK-5—Identify and pursue strategies to increase adaptive capacity to climate change including but not limited to the following: • Climate Action Element of General Plan Update. • Consider a goal or policy to establish Reach Building Codes with the General Plan Update • Consider inclusion of a Climate Action Plan following the General Plan Update						
Hazards Mitigated: Severe Weather, Severe Storms, Wildfire, Flooding, Drought						
New & Existing	1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 19	City of Moorpark	N/A	Low	Staff Time, General Funds	Short-term
Action MPK-6—Purchase generators for critical facilities and infrastructure that lack adequate backup power.						
Hazards Mitigated: Dam Failure, Earthquake, Flooding, Landslide, Severe Weather, Wildfire, Severe Storms						
Existing	2, 6, 19	City of Moorpark	N/A	Medium	Grant Funding-FEMA HMA (BRIC, HMGP), Staff Time, General Funds	Short-term
Action MPK-7—Provide reliable back up power for the Police Service Facility.						
Hazards Mitigated: Wildfire, Landslide, Earthquake, Dam Failure, Severe Weather, Severe Storms, Flooding						
Existing	2, 6, 19	City of Moorpark	N/A	Medium	Grant Funding-FEMA HMA (BRIC, HMGP), Staff Time, General Funds	Short-term
Action MPK-8—Develop a public outreach program that informs property owners located in the dam and levee failure inundation areas about voluntary flood insurance.						
Hazards Mitigated: Flooding						
New & Existing	7, 17	City of Moorpark	N/A	Low	Staff Time, General Funds	Ongoing

Benefits New or Existing Assets	Objectives Met	Lead Agency	Support Agency	Estimated Cost	Sources of Funding	Timeline[a]
Action MPK-9—Maintain vegetation management program that provides vegetation management services to elderly, disabled, or low-income property owners who lack the resources to remove flammable vegetation from around their homes.						
Hazards Mitigated: Wildfire						
New & Existing	5, 10, 13, 17	City of Moorpark	VCFPD	Medium	Staff Time, General Funds	Ongoing
Action MPK-10—Proceed with construction of a storm drain to address flooding issues at Millard St. and Sherman Ave (CIP #504)						
Hazards Mitigated: Flooding						
Existing	2, 6, 8	City of Moorpark	Caltrans	Medium	Grant Funding-FEMA HMA (BRIC, FMA, HMGP), Staff Time, General Funds	Long-term

a. Short-term = Completion within 5 years; Long-term = Completion within 10 years; Ongoing= Continuing new or existing program with no completion date

Acronyms used here are defined at the beginning of this volume.

Table 4-15. Mitigation Action Priority

Action #	# of Objectives Met	Benefits	Costs	Do Benefits Equal or Exceed Cost?	Is Project Grant-Eligible?	Can Project Be Funded Under Existing Programs/ Budgets?	Implementation Priority[a]	Grant Pursuit Priority[a]
1	5	High	High	Yes	Yes	No	Medium	High
2	16	Medium	Low	Yes	No	Yes	High	Low

4.9 PUBLIC OUTREACH

Table 4-17 lists public outreach activities for this jurisdiction.

Table 4-17. Local Public Outreach

Local Outreach Activity	Date	Number of People Involved
Community Emergency Response Team	Ongoing	10-20

4.10 INFORMATION SOURCES USED FOR THIS ANNEX

The following technical reports, plans, and regulatory mechanisms were reviewed to provide information for this annex.

- **Moorpark Municipal Code**—The municipal code was reviewed for the full capability assessment and for identifying opportunities for action plan integration.
- **Moorpark Flood Damage Prevention Ordinance**—The flood damage prevention ordinance was reviewed for compliance with the National Flood Insurance Program.
- **Moorpark Emergency Operations Plan**—the Emergency Operations plan was examined for consistency with the County EOP and this Hazard Mitigation Plan.

The following outside resources and references were reviewed:

- **Hazard Mitigation Plan Annex Development Toolkit**—The toolkit was used to support the identification of past hazard events and noted vulnerabilities, the risk ranking, and the development of the mitigation action plan.

5. CITY OF OJAI

5.1 LOCAL HAZARD MITIGATION PLANNING TEAM

Primary Point of Contact
James Vega, City Manager
401 S. Ventura Street
Ojai, CA 93023
Telephone: (805) 646-5581 ext. 102
e-mail Address: james.vega@ojai.ca.gov

Alternate Point of Contact
Alma Quezada, Interim Public Works Director
408 S. Signal Street
Ojai, CA 93023
Telephone: (805) 646-5581 ext. 209
e-mail Address: alma.quezada@ojai.ca.gov

This annex was developed by the local hazard mitigation planning team, whose members are listed in Table 5-1.

Table 5-1. Local Mitigation Planning Team Members

Name	Title
James Vega	City Manager
Lucas Seibert	Community Development Director
Alma Quezada	Interim Public Works Director
Andrea Mackey	Management Analyst
James Hahn	Technical Support Specialist
Juan Morales	Interim Public Works Supervisor

5.2 JURISDICTION PROFILE

5.2.1 Location and Features

The City of Ojai is located in the Ojai Valley. The current boundaries generally extend from Villanova Road to Boardman Road, encompassing an area of 4.37 square miles.

Ojai is a small town that is a known as a tourist destination for its boutique hotels, recreation opportunities, hiking, and farmer's market of local organic agriculture. It is home to the annual Ojai Music Festival and the Ojai Tennis Tournament.

5.2.2 History

City of Ojai was incorporated in 1921. The town was originally named Nordhoff in 1874 but was later changed to Ojai in 1917. Edward Libbey of Libbey Glass Company built the Spanish-style downtown Arcade and park that exist today.

5.2.3 Governing Body Format

The City of Ojai is a Council-Manager form of government with five Council members elected by district. The City consists of five departments: Community Development, Finance, Public Works, Recreation, and the City Manager's office. The City Council assumes responsibility for the adoption of this plan; the City Manager will oversee its implementation.

5.3 CURRENT TRENDS

5.3.1 Population

According to the California Department of Finance, the population of the City of Ojai as of January 2020 was 7,450. Since 2010, the population has grown at an average annual rate of 0.13 percent.

5.3.2 Development

Anticipated future development for the City of Ojai is low to moderate. Recent development has been mostly infill. There has been a focus on accessory dwelling units. Future growth in the City will be managed as identified in the City's upcoming General Plan. City Actions such as those relating to land use, annexations, zoning, subdivision and design review, redevelopment, and capital improvements, must be consistent with the plan.

Table 5-2 summarizes development trends in the period since the preparation of the previous hazard mitigation plan, as well as expected future development trends.

5.4 CAPABILITY ASSESSMENT

This section describes an assessment of existing capabilities for implementing hazard mitigation strategies. The introduction at the beginning of this volume of the hazard mitigation plan describes the components included in the capability assessment and their significance for hazard mitigation planning.

Findings of the capability assessment were reviewed to identify opportunities to expand, initiate or integrate capabilities to further hazard mitigation goals and objectives. Where such opportunities were identified and determined to be feasible, they are included in the action plan. The "Analysis of Mitigation Actions" table in this annex identifies these as community capacity building mitigation actions.

Table 5-2. Recent and Expected Future Development Trends

Criterion	Response
Has your jurisdiction annexed any land since the preparation of the previous hazard mitigation plan?	No
Is your jurisdiction expected to annex any areas during the performance period of this plan?	No
Are any areas targeted for development or major redevelopment in the next five years? • **If yes, briefly describe, including whether any of the areas are in known hazard risk areas**	Yes Chaparral School site at 414 E. Ojai Avenue DESIGN CONCEPT Ojai Town Square development celebrates Ojai as the unique and special place that it is. The development responds to this character as a bookend to the Arcade and town center, enhancing the pedestrian neighborhood linked with outdoor spaces and surrounding public-oriented program uses. The architectural expression is inspired by historic structures on the site as well as the statement of theme defined by City Ordinance. The concept finds the balance of history and future in a way that is distinctly ‘‘of Ojai.” PROGRAM HIGHLIGHTS • Establish a ±200 room hotel. • Provide Residential Housing: Market Senior, Affordable. • Creating pedestrian-friendly gardens throughout the site. • Activate historic structures on Ojai Avenue for retail and restaurant use. • Provide ample parking to support the on-site activities. • Maintain the skate park as built • Provide additional community programming opportunities. • Maintain 35 height limit to new structures.
How many permits for new construction were issued in your jurisdiction since the preparation of the previous hazard mitigation plan?	**2016**: 437; **2017**: 419; **2018**: 438; **2019**: 432; **2020**: 23
Provide the number of new-construction permits for each hazard area or provide a qualitative description of where development has occurred.	One replacement single-family dwelling, 22 Accessory Dwelling Units, 2 by new construction, 7 by conversion, 13 legalized through the Compliance program.
Describe the level of buildout in the jurisdiction, based on your jurisdiction’s buildable lands inventory. If no such inventory exists, provide a qualitative description.	The City is largely built out within city limits. The remaining pockets of infill land development opportunities within city limits are sprinkled throughout the City and respective zoning districts with smaller lots, which typically present some level of developable challenges.

The findings of the capability assessment are presented as follows:

- Table 5-3 presents an assessment of planning and regulatory capabilities
- Table 5-4 presents development and permitting capabilities
- Table 5-5 presents an assessment of fiscal capabilities
- Table 5-6 presents an assessment of administrative and technical capabilities
- Table 5-7 presents an assessment of education and outreach capabilities
- Table 5-8 presents information on National Flood Insurance Program (NFIP) compliance
- Table 5-9 presents classifications under various community mitigation programs
- Table 5-10 presents the community’s adaptive capacity for the impacts of climate change

Table 5-4. Development and Permitting Capability

Criterion	Response
Does your jurisdiction issue development permits?	Yes
If no, who does? If yes, which department? Community Development Department	
Does your jurisdiction have the ability to track permits by hazard area?	Yes
Does your jurisdiction have a buildable lands inventory?	No

Table 5-5. Fiscal Capability

Financial Resource	Accessible or Eligible to Use?
Community Development Block Grants	Yes
Capital Improvements Project Funding	Yes
Authority to Levy Taxes for Specific Purposes	Yes
User Fees for Water, Sewer, Gas or Electric Service	No
Incur Debt through General Obligation Bonds	No
Incur Debt through Special Tax Bonds	No
Incur Debt through Private Activity Bonds	No
Withhold Public Expenditures in Hazard-Prone Areas	No
State-Sponsored Grant Programs	Yes
Development Impact Fees for Homebuyers or Developers	Yes

Table 5-6. Administrative and Technical Capability

Staff/Personnel Resource	Available?
Planners or engineers with knowledge of land development and land management practices ***If Yes, Department /Position:*** *Community Development Dept./ City Planner*	Yes
Engineers or professionals trained in building or infrastructure construction practices ***If Yes, Department /Position:*** *Community Development Dept./ Building Official*	Yes
Planners or engineers with an understanding of natural hazards ***If Yes, Department /Position:*** *Community Development Dept. / City Planner*	Yes
Staff with training in benefit-cost analysis ***If Yes, Department /Position:*** Finance Dept./ Finance Director	Yes
Surveyors	No
Personnel skilled or trained in GIS applications	No
Scientist familiar with natural hazards in local area	No
Emergency manager ***If Yes, Department /Position:*** City Manager's Office/ City Manager	Yes
Grant writers	No
Other ***If Yes, Department /Position:***	No

Table 5-7. Education and Outreach Capability

Criterion	Response
Do you have a public information officer or communications office?	No
Do you have personnel skilled or trained in website development?	No
Do you have hazard mitigation information available on your website? ***If yes, briefly describe:*** ojai.ca.gov › emergency-preparedness	Yes
Do you use social media for hazard mitigation education and outreach? ***If yes, briefly describe:*** Post pertinent information as required	Yes
Do you have any citizen boards or commissions that address issues related to hazard mitigation? ***If yes, briefly describe:*** The City of Ojai Disaster Council	Yes
Do you have any other programs in place that could be used to communicate hazard-related information? ***If yes, briefly describe:*** City Website, City smart phone App, government access TV channel, AM radio station	Yes
Do you have any established warning systems for hazard events? ***If yes, briefly describe:*** City Website, City smart phone App, government access TV channel, AM radio station	Yes

Table 5-8. National Flood Insurance Program Compliance

Criterion	Response
What local department is responsible for floodplain management?	Public Works Department
Who is your floodplain administrator? (department/position)	Public Works Dept. / Public Works Director
Are any certified floodplain managers on staff in your jurisdiction?	No
What is the date that your flood damage prevention ordinance was last amended?	3/24/2021
Does your floodplain management program meet or exceed minimum requirements?	Meet
When was the most recent Community Assistance Visit or Community Assistance Contact?	N/A

Criterion	Response
Does your jurisdiction have any outstanding NFIP compliance violations that need to be addressed?	No
Are any RiskMAP projects currently underway in your jurisdiction?	No
Do your flood hazard maps adequately address the flood risk within your jurisdiction?	Yes
Does your floodplain management staff need any assistance or training to support its floodplain management program? ***If so, what type of assistance/training is needed?*** Ongoing training	Yes
Does your jurisdiction participate in the Community Rating System (CRS)? ***If no, is your jurisdiction interested in joining the CRS program?*** Possibly	No
How many flood insurance policies are in force in your jurisdiction?[a] ***What is the insurance in force?*** $25,299,000 ***What is the premium in force?*** $41,007	79
How many total loss claims have been filed in your jurisdiction?[a] ***What were the total payments for losses?*** $223,301	43

a. According to FEMA statistics as of March 31, 2021

Table 5-9. Community Classifications

	Participating?	Classification	Date Classified
FIPS Code	Yes	0611153476	N/A
DUNS #	Yes	085921781	N/A
Community Rating System	No	N/A	N/A
Building Code Effectiveness Grading Schedule	No	N/A	N/A
Public Protection, contract with VCFPD	Yes	03/3X	12/21/2018
Storm Ready	No	N/A	N/A
Firewise	No	N/A	N/A
Tsunami Ready	No	N/A	N/A

Table 5-10. Adaptive Capacity for Climate Change

Criterion	Jurisdiction Rating[a]
Technical Capacity	
Jurisdiction-level understanding of potential climate change impacts ***Comment:*** *City is aware of current drought issues and potential wildfire issues*	High
Jurisdiction-level monitoring of climate change impacts ***Comment:***	Low
Technical resources to assess proposed strategies for feasibility and externalities ***Comment:***	Low
Jurisdiction-level capacity for development of greenhouse gas emissions inventory ***Comment:***	Low
Capital planning and land use decisions informed by potential climate impacts ***Comment:***	Low
Participation in regional groups addressing climate risks ***Comment:***	Low

Criterion	Jurisdiction Rating[a]
Implementation Capacity	
Clear authority/mandate to consider climate change impacts during public decision-making processes ***Comment:***	Low
Identified strategies for greenhouse gas mitigation efforts ***Comment:***	Low
Identified strategies for adaptation to impacts ***Comment:***	Low
Champions for climate action in local government departments ***Comment:***	Low
Political support for implementing climate change adaptation strategies ***Comment:***	Low
Financial resources devoted to climate change adaptation ***Comment:***	Low
Local authority over sectors likely to be negative impacted ***Comment:***	Low
Public Capacity	
Local residents' knowledge of and understanding of climate risk ***Comment:*** *Water use reduction due to drought*	High
Local residents' support of adaptation efforts ***Comment:*** *Installation and use of solar power*	High
Local residents' capacity to adapt to climate impacts ***Comment:*** *Water conservation*	High
Local economy current capacity to adapt to climate impacts ***Comment:***	Low
Local ecosystems capacity to adapt to climate impacts ***Comment:***	Unsure

a. High = Capacity exists and is in use; Medium = Capacity may exist, but is not used or could use some improvement; Low = Capacity does not exist or could use substantial improvement; Unsure= Not enough information is known to assign a rating.

5.5 INTEGRATION REVIEW

For hazard mitigation planning, "integration" means that hazard mitigation information is used in other relevant planning mechanisms, such as general planning and capital facilities planning, and that relevant information from those sources is used in hazard mitigation. This section identifies where such integration is already in place, and where there are opportunities for further integration in the future. Resources listed at the end of this annex were used to provide information on integration. The progress reporting process described in Volume 1 of the hazard mitigation plan will document the progress of hazard mitigation actions related to integration and identify new opportunities for integration.

5.5.1 Existing Integration

Some level of integration has already been established between local hazard mitigation planning and the following other local plans and programs:

- Building Code *9-1.102*
- Capital Improvement Plan—Includes projects that can help mitigate potential hazards.

5.5.2 Opportunities for Future Integration

The capability assessment in this annex indicates opportunities to integrate this mitigation plan with other jurisdictional planning/regulatory capabilities. Capabilities were identified as integration opportunities if they can support or enhance the actions identified in this plan or be supported or enhanced by components of this plan. The capability assessment identified the following plans and programs that do not currently integrate hazard mitigation information but provide opportunities to do so in the future:

- **General Plan**—Consider new update to the Housing Element
- **Emergency Operations Plan (EOP), 2013—**Assesses threats from natural hazards that could impact the City.

Taking action to integrate each of these programs with the hazard mitigation plan was considered as a mitigation action to include in the action plan in this annex.

5.6 RISK ASSESSMENT

5.6.1 Jurisdiction-Specific Natural Hazard Event History

Table 5-11 lists past occurrences of natural hazards for which specific damage was recorded in this jurisdiction Other hazard events that broadly affected the entire planning area, including this jurisdiction, are listed in the risk assessments in Volume 1 of this hazard mitigation plan.

Table 5-11. Past Natural Hazard Events

Type of Event	FEMA Disaster #	Date	Damage Assessment
COVID-19 Pandemic	DR-4482	1/20/2020 and continuing	$3-4 million in lost revenue
Thomas Fire	FM-5224	12/4/2017	No structures lost, City activated Emergency Operation Center, major impact to City
Pine Fire		6/30/2016	Unknown
Severe Storms, Flooding, Debris Flows, and Mudslides	DR-1577	1/9/2005	Impacted City. Daly park and surrounding homes in neighborhood affected by mud
Wolf Fire		6/1/2002	Unknown
Lightning Strike		4/18/2000	One residential home struck
Flood/Landslide		2/20/2000	Unknown
Ranch Fire		12/21/1999	Unknown

5.6.2 Hazard Risk Ranking

Table 5-12 presents a local ranking of all hazards of concern for which this hazard mitigation plan provides complete risk assessments. As described in detail in Volume 1, the ranking process involves an assessment of the likelihood of occurrence for each hazard, along with its potential impacts on people, property, and the economy. Mitigation actions primarily target hazards with high and medium rankings. The drought hazard has been increased from low to high to match Casitas Municipal Water District, City of Ojai's water purveyor, and to better reflect local knowledge. The City is vulnerable to drought as it is dependent on Lake Casitas for water. As of October 2021, Lake Casitas is at 33% capacity—a Stage 3 drought. If lake level is reduced to 30% or less, CMWD would implement Stage 4.

Table 5-12. Hazard Risk Ranking

Rank	Hazard	Risk Ranking Score	Risk Category
1	Landslide	33	High
2	Earthquake	32	High
3	Drought	30	High
4	Severe Storms	24	Medium
5	Severe Weather	24	Medium
6	Wildfire	18	Medium
7	Flooding	18	Medium
8	Dam Failure	12	Low

5.6.3 Jurisdiction-Specific Vulnerabilities

Volume 1 of this hazard mitigation plan provides complete risk assessments for each identified hazard of concern. This section provides information on a few key vulnerabilities for this jurisdiction. Available jurisdiction-specific risk maps of the hazards are provided at the end of this annex.

Repetitive Loss Properties

Repetitive loss records are as follows:

- Number of FEMA-identified Repetitive-Loss Properties: 0
- Number of FEMA-identified Severe-Repetitive-Loss Properties: 0
- Number of Repetitive-Loss or Severe-Repetitive-Loss Properties that have been mitigated: 0

Other Noted Vulnerabilities

The following jurisdiction-specific issues have been identified based on a review of the results of the risk assessment, public involvement strategy, and other available resources:

- The City Recreation Department is the only Cooling Center in the City. If there is a Public Safety Power Shut-off (PSPS) then a generator is necessary.
- Urban flooding with storm drain issues

Mitigation actions addressing these issues were prioritized for consideration in the action plan in this annex.

5.7 STATUS OF PREVIOUS PLAN ACTIONS

Table 5-13 summarizes the actions that were recommended in the previous version of the hazard mitigation plan and their implementation status at the time this update was prepared.

Table 5-13. Status of Previous Plan Actions

Action Item	Completed	Removed; No Longer Feasible	Carried Over to Plan Update	
			Check if Yes	Action # in Update
OA 10—Seismically retrofit or upgrade seismically deficient government facilities and pre-identified shelter facilities.			✓	OJC-1
Comment: No action. Lack of funding				
OA 11—Develop and implement plans to increase the building owner's general knowledge of and appreciation for the value of seismic upgrading of the building's structural and nonstructural elements.			✓	OJC-2
Comment: No action. Lack of staffing				
OA 14—Acquire, relocate, or elevate residential structures, in particular those that have been identified as RL properties, within the 100-year floodplain.			✓	OJC-1
Comment: No action. Lack of funding/staff				
OA 21—Maintain hazards fuel treatment program for areas that have been identified with overgrown/dead brush/trees to reduce the potential for tree-to-tree ignition. Ensure that a "maintenance now" component to provide continued fire resistance is part of the program.			✓	OJC-8
Comment: Ongoing tree and brush clearing for fire abatement				

5.8 HAZARD MITIGATION ACTION PLAN

Table 5-14 lists the identified actions, which make up the hazard mitigation action plan for this jurisdiction. Table 5-15 identifies the priority for each action. Table 5-16 summarizes the mitigation actions by hazard of concern and mitigation type.

Table 5-14. Hazard Mitigation Action Plan Matrix

Benefits New or Existing Assets	Objectives Met	Lead Agency	Support Agency	Estimated Cost	Sources of Funding	Timeline[a]
Action OJC-1—Where appropriate, support retrofitting, purchase or relocation of structures located in hazard areas, prioritizing those that have experienced repetitive losses and/or are located in high- or medium-risk hazard areas.						
Hazards Mitigated: Landslide, Earthquake, Severe Storms, Severe Weather, Wildfire, Flooding, Dam Failure						
Existing	1, 2, 4, 6, 9, 10, 11, 16	Community Development Dept	Public Works Dept	High	FEMA HMA (BRIC, FMA, PDM and HMGP)	Short-term
Action OJC-2—Develop and implement plans to increase the building owner's general knowledge of and appreciation for the value of seismic upgrading of the building's structural and nonstructural elements.						
Hazards Mitigated: Earthquake						
Existing	1, 9, 12, 16, 17	Community Development Dept	Public Works Dept	Low	Staff Time, General Funds	Short-term
Action OJC-3—Integrate the hazard mitigation plan into other plans, ordinances and programs that dictate land use decisions in the community, including General Plan Update, Emergency Action Plan						
Hazards Mitigated: Landslide, Earthquake, Severe Storms, Severe Weather, Wildfire, Flooding, Dam Failure						
New & Existing	1, 2, 3, 4, 5, 7, 8, 9, 10, 11, 12, 13, 14, 15, 17, 19	Community Development Dept	Public Works Dept	Low	Staff Time, General Funds	Ongoing

Benefits New or Existing Assets	Objectives Met	Lead Agency	Support Agency	Estimated Cost	Sources of Funding	Timeline[a]
Action OJC-4—Actively participate in the plan maintenance protocols outlined in Volume 1 of this hazard mitigation plan.						
Hazards Mitigated: Landslide, Earthquake, Severe Storms, Severe Weather, Wildfire, Flooding, Dam Failure, Drought						
New & Existing	1, 2, 4, 6, 7, 8, 9, 11, 12, 13, 14, 15	City of Ojai	Community Development Dept	Low	Staff Time, General Funds	Short-term
Action OJC-5—Continue to maintain good standing and compliance under the NFIP through implementation of floodplain management programs that, at a minimum, meet the NFIP requirements: • Enforce the flood damage prevention ordinance. • Participate in floodplain identification and mapping updates. • Provide public assistance/information on floodplain requirements and impacts.						
Hazards Mitigated: Flooding						
New & Existing	1, 2, 6, 7, 17	Public Works Dept		Low	Staff Time, General Funds	Ongoing
Action OJC-6—Identify and pursue strategies to increase adaptive capacity to climate change.						
Hazards Mitigated: Severe Storms, Severe Weather, Wildfire, Flooding, Drought						
New & Existing	1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 19	Enter Response	Enter Response	Low	FEMA HMA (BRIC, FMA, HMGP), Staff Time, General Funds	Short-term
Action OJC-7—Purchase generators for critical facilities and infrastructure that lack adequate backup power, including Public Works Dept. and Recreation Dept.						
Hazards Mitigated: Earthquake, Flooding, Landslide, Severe Weather, Wildfire						
Existing	2, 19	Public Works Dept	Enter Response	High	FEMA HMA (BRIC and HMGP), Staff Time, General Funds	Short-term
Action OJC-8—Maintain wildfire hazard fuel reduction program for areas that have been identified with overgrown or dead brush, trees and weeds to reduce the potential for tree-to-tree ignition. Ensure that a "maintenance now" component to provide continued fire resistance is part of the program. (Coordinates with VCFPD Action VFP-6)						
Hazards Mitigated: Wildfire						
New & Existing	2, 4, 5, 6, 8, 10, 11, 13, 14, 15, 18, 19	VCFPD	City of Ojai, CAL FIRE & USDA	Medium	FEMA HMA (BRIC, FMAP and HMGP), Staff Time & General Funds	Ongoing
Action OJC-9—Determine feasibility of the City of Ojai joining the Community Rating System (CRS) program to enhance public safety, reduce flood damage to property and infrastructure, and reduce flood insurance rates in the community.						
Hazards Mitigated: Flooding						
New & Existing	1, 2, 19	City of Ojai	None	Low	Staff Time & General Funds	Short-term

a. Short-term = Completion within 5 years; Long-term = Completion within 10 years; Ongoing= Continuing new or existing program with no completion date

Acronyms used here are defined at the beginning of this volume.

Table 5-15. Mitigation Action Priority

Action #	# of Objectives Met	Benefits	Costs	Do Benefits Equal or Exceed Cost?	Is Project Grant-Eligible?	Can Project Be Funded Under Existing Programs/ Budgets?	Implementation Priority[a]	Grant Pursuit Priority[a]

5.10 INFORMATION SOURCES USED FOR THIS ANNEX

The following technical reports, plans, and regulatory mechanisms were reviewed to provide information for this annex.

- **City of Ojai Municipal Code**—The municipal code was reviewed for the full capability assessment and for identifying opportunities for action plan integration.
- **City of Ojai Flood Damage Prevention Ordinance**—The flood damage prevention ordinance was reviewed for compliance with the National Flood Insurance Program.
- **Capital Improvement Projects Program**—The municipal code was reviewed for the full capability assessment.

The following outside resources and references were reviewed:

- **Hazard Mitigation Plan Annex Development Toolkit**—The toolkit was used to support the identification of past hazard events and noted vulnerabilities, the risk ranking, and the development of the mitigation action plan.

6. CITY OF OXNARD

6.1 LOCAL HAZARD MITIGATION PLANNING TEAM

Primary Point of Contact
Scott Brewer, Emergency Services Manager
360 West Second Street
Oxnard, CA 93030
Telephone: 805-385-7717
e-mail Address: scott.brewer@oxnard.org

Alternate Point of Contact
Alexander Hamilton, Fire Chief
360 West Second Street
Oxnard, CA 93030
Telephone: 805-385-7700
e-mail Address:
alexander.hamilton@oxnard.org

This annex was developed by the local hazard mitigation planning team, whose members are listed in Table 6-1.

Table 6-1. Local Mitigation Planning Team Members

Name	Title
Alexander Nguyen	City Manager
Jason Benites	Police Chief
Eric Sonstegard	Assistant Police Chief
Alexander Hamilton	Fire Chief
John Colamarino	Assistant Fire Chief
Brian Yanez	Assistant Public Works Director
Mike More	Risk Manager
Scott Kolwitz	Planning Manager
Betsy George	Chief Financial Officer
Terrel Harrison	Cultural/Community Services Director
Stephen Fischer	City Attorney
Tatiana Arnaout	City Engineer/Floodplain Manager
Mike Shaffer	GIS Manager
Katie Casey	Communications Manager
Kathleen Mallory	Planning & Sustainability Manager
Scott Brewer	Emergency Services Manager

6.2 JURISDICTION PROFILE

6.2.1 Location and Features

The City is located about 60 miles northwest of Los Angeles along a beautiful stretch of the Pacific Ocean coastline. The largest city within Ventura County, Oxnard is the center of a regional agricultural industry and a progressive business center while, at the same time, a relaxed seaside destination with a variety of neighborhoods and community services. Bordered by mountains and the Pacific Ocean, West Ventura County provides a seaside environment with expansive mountain views. Oxnard incorporates both of these attributes through its pattern of relatively compact urban development focused on the downtown, coastline and harbor, and the Highway 101 corridor. The moderate Mediterranean climate, fertile topsoil, and generally adequate groundwater supply lead to year-round agricultural production in the surrounding Oxnard Plain.

The City of Oxnard is located in the County of Ventura. The current boundaries generally extend from the Santa Clara River on the west to Del Norte Blvd on the east, as well as just north of the Highway 101 to the Pacific Ocean on the South, encompassing an area of 27.12 square miles.

6.2.2 History

Oxnard Incorporated: The City Oxnard was incorporated in 1903 by the Ventura County Board of Supervisors, who officially named the city after the Oxnard brothers. The city grew steadily into what is now the largest city in Ventura County, with a population of just over 207,000 residents.

Oxnard History: In 1896, local farmers began experimenting with sugar beets in addition to barley and lima beans. A prominent local farmer, Albert Maulhardt, visited Henry T. Oxnard and his three brothers' American Beet Sugar factory in Chino, which led him to plant sugar beets for shipment to the plant. Maulhardt's success persuaded other ranchers to switch from grain to sugar beets.

Encouraged by a pledge of 18,000 acres of sugar beets from local farmers, the Oxnard brothers completed construction of a sugar beet factory adjacent to the beet fields in 1898 on what was then known as Rancho Colonia. The massive brick factory, with its 150-foot smokestacks, was located a few blocks northeast of a town-site that, five years later, would become the City of Oxnard.

The sugar beet factory was responsible for another significant event—bringing a spur line of the Southern Pacific Railroad to the plant site and passenger service to the community.

6.2.3 Governing Body Format

The City of Oxnard was incorporated as a general law city on June 30, 1903 and operates under a council-manager form of government. The City Council consists of the Mayor and six other Councilmembers. The term of office is four years for all elected officials, with elections held every two years for three City Council seats at a time. All Councilmembers are elected by district except for the Mayor, who is elected at large during presidential election years. The City Treasurer, who is elected Citywide at the same time as the Mayor, invests idle cash and manages the City's investment portfolio. The City Clerk, also elected Citywide at the same time as the Mayor and City Treasurer, manages the City Council and Committee meeting agenda process, official records, and elections.

The Oxnard City Council assumes responsibility for the adoption of this plan; the Oxnard Fire Department along with designated City departments will oversee its implementation.

6.3 CURRENT TRENDS

6.3.1 Population

According to the United States Census Bureau, the population of the City of Oxnard as of January 2020 was 207,887. Since 2010, the population has grown at an average annual rate of 0.48 percent.

6.3.2 Development

The Planning Division coordinates the City's review of residential, commercial, office, and industrial development projects. This includes working with property owners, developers, business owners, and residents to ensure that their development proposals conform to City policies and guidelines.

Table 6-2 summarizes development trends in the period since the preparation of the previous hazard mitigation plan, as well as expected future development trends.

Table 6-2. Recent and Expected Future Development Trends

Criterion	Response
Has your jurisdiction annexed any land since the preparation of the previous hazard mitigation plan?	Yes
• ***If yes, give the estimated area annexed and estimated number of parcels or structures.***	Local Agency Formation Commission 18-07, Ocean View School District: 5.31 Acres, 1 Parcel Local Agency Formation Commission 16-01, City of Oxnard Reorganization: 0.77 Acres, 1 Parcel
Is your jurisdiction expected to annex any areas during the performance period of this plan?	Yes
• ***If yes, describe land areas and dominant uses.***	Teal Club Annexation—990 single and multifamily dwelling units, 132,000 square-feet of business park, 60,000 square-feet of commercial space, 17.76 acres of parks and open space. The project also includes annexation of 11.4 acres that is pre-zoned for light manufacturing uses. Rio Urbana Annexation—The Rio Urbana annexation would allow the construction of a new mixed-use development that includes 182 condominium residential units and a 15,000-square-foot office building containing the Rio School District administrative offices.
• ***If yes, who currently has permitting authority over these areas?***	The County of Ventura currently has permitting authority over the Teal Club area and the Rio Urbana project site.
Are any areas targeted for development or major redevelopment in the next five years?	Yes
• ***If yes, briefly describe, including whether any of the areas are in known hazard risk areas***	Downtown adding up to 2800 units, The Village Specific Plan buildout, Northshore Development, Riverpark Specific Plan buildout, continued industrial development in Sakioka Farms Specific Plan. All areas are within city limits and all areas are in the liquefaction zone. One annexation approval with 167 housing units is expected in 2021. One large specific plan annexation (Teal Club) with 990 units is under consideration.

Criterion	Response					
How many permits for new construction were issued in your jurisdiction since the preparation of the previous hazard mitigation plan?		**2016**	**2017**	**2018**	**2019**	**2020**
	Single Family	140	86	36	59	19
	Multi-Family	26	27	18	34	42
	Other (commercial, mixed use, etc.)	17	12	10	7	7
	Total	**183**	**125**	**64**	**100**	**68**
Provide the number of new-construction permits for each hazard area or provide a qualitative description of where development has occurred.	• Special Flood Hazard Areas: 0—Based on FEMA National Flood Hazard Layer (NFHL) downloaded June 9, 2021 Using zones A, A99 , AE, AH, AO, & VE as SFHA and excluding zones X & D • Landslide: 0—Based on Webservice of Seismic Hazard Zone Maps for Landslides produced by the Seismic Hazards Program, California Geological Survey, California Department of Conservation and downloaded from open data site on June 17, 2021 • High Liquefaction Areas: 540—Based on information contained hereon was obtained from California Department of Conservation, Division of Mines and Geology via the County of Ventura GIS • Tsunami Inundation Area: 51—Based on information contained hereon was obtained from California Department of Conservation, Division of Mines and Geology via the County of Ventura GIS • Wildfire Risk Areas: 0					
Describe the level of buildout in the jurisdiction, based on your jurisdiction's buildable lands inventory. If no such inventory exists, provide a qualitative description.	Almost entire city (26 sq miles) is first or second generation construction. About 500 acres of farming remain within city limits in areas zoned for industrial or housing but not yet built. Planning capacity for about 8,000 units and 8 million sf industrial/commercial remains under the 2030 General Plan.					

6.4 CAPABILITY ASSESSMENT

This section describes an assessment of existing capabilities for implementing hazard mitigation strategies. The introduction at the beginning of this volume of the hazard mitigation plan describes the components included in the capability assessment and their significance for hazard mitigation planning.

Findings of the capability assessment were reviewed to identify opportunities to expand, initiate or integrate capabilities to further hazard mitigation goals and objectives. Where such opportunities were identified and determined to be feasible, they are included in the action plan. The "Analysis of Mitigation Actions" table in this annex identifies these as community capacity building mitigation actions. The findings of the assessment are presented as follows:

- An assessment of planning and regulatory capabilities is presented in Table 6-3.
- Development and permitting capabilities are presented in Table 6-4.
- An assessment of fiscal capabilities is presented in Table 6-5.
- An assessment of administrative and technical capabilities is presented in Table 6-6.
- An assessment of education and outreach capabilities is presented in Table 6-7.
- Information on National Flood Insurance Program (NFIP) compliance is presented in Table 6-8.
- Classifications under various community mitigation programs are presented in Table 6-9.
- The community's adaptive capacity for the impacts of climate change is presented in Table 6-10.

Table 6-3. Planning and Regulatory Capability

	Local Authority	Other Jurisdiction Authority	State Mandated	Integration Opportunity?
Codes, Ordinances, & Requirements				
Building Code	Yes	No	Yes	No
Comment: *2019 California Building Code as adopted by the City of Oxnard Ordinance No. 2968*				
Zoning Code	Yes	No	Yes	No
Comment: *Chapter 16 (Inland Zoning Ordinance) and Chapter 17(Coastal Zoning Ordinance) of the Oxnard City Code (OCC) Pursuant to the California Coastal Act (Public Resources Code Division 20, Chapter 6, Article 1, 30500), the City shall prepare a Local Coastal Program for the portion of the coastal zone within its jurisdiction. The LCP is comprised of a Land Use Plan and a Local Implementation Plan which is the Coastal Zoning Ordinance.*				
Subdivisions	Yes	No	Yes	No
Comment: *Chapter 15 of the OCC regulates and control the design and improvement of subdivisions of land within the city and supplement the provisions of the Subdivision Map Act of the State of California set forth at Government Code Section 66410 et seq. concerning the design, improvement and survey data of subdivisions, the form and content of all maps provided for by the Subdivision Map Act, and the procedure to be followed in securing the official approval of the City regarding the maps.*				
Stormwater Management	Yes	No	No	Yes
Comment: *Chapter 22, Article 12 implements the Federal Water Pollution Control Act (the Clean Water Act), 33 U.S.C. Section 1251 et seq., as amended, and Division 7 of the California Water Code by prohibiting the discharge of any pollutant to navigable waters of the United States from a point source unless the discharge is authorized by a permit issued pursuant to the* **Metropolitan** *required by Clean Water Act Section 402 (33 U.S.C. Section 1342), and by prohibiting non-storm water discharges into the storm drain system.*				
Post-Disaster Recovery	Yes	No	Yes	Yes
Comment: *The City of Oxnard does not have a separate disaster recovery plan, guidance and direction for disaster recovery is provided in the Oxnard Emergency Operations Plan (EOP)*				
Real Estate Disclosure	No	Yes	Yes	Yes
Comment: *California State Civil Code 1102 requires full disclosure on natural hazard exposure of the sale/re-sale of any and all real property. To be implemented by sellers and realtors. City of Oxnard Ordinance 2383 requires that at the time of entering into an agreement of sale or exchange of any building, the owner or authorized representative shall obtain from the city a report of the building record showing the regularly authorized use, occupancy and zoning classification of such property.*				
Growth Management	Yes	No	Yes	Yes
Comment: *California state law requires that every county and city prepare and adopt a comprehensive long-range plan to serve as a guide for community development. The General Plan for the City of Oxnard was amended and adopted in July 2011. The General Plan contains 10 elements that address many aspects of the community including: land use, housing, parks and open space, community design, circulation, infrastructure, safety, sustainability and conservation of resources. The General Plan is the City's overarching policy document. All City policies and ordinances must be consistent with the General Plan. The Planning Division is responsible for maintaining the General Plan and preparing amendments to the document as directed by the City Council. The City is preparing a Climate Action and Adaptation Plan consistent with SB39.*				
Site Plan Review	Yes	No	No	No
Comment: *Chapter 15 of the OCC regulates the form and contents, submittal and approval of tentative tract maps for the subdivision of five (5) or more parcels and tentative parcel maps for the subdivision of four (4) or fewer parcels shall be governed by the provisions of this chapter. Chapters 16 and 17 of the OCC identify allowed uses and provide development standards that regulate development within the City.*				

	Local Authority	Other Jurisdiction Authority	State Mandated	Integration Opportunity?
Environmental Protection	Yes	No	Yes	Yes
Comment: *The California Environmental Quality Act (CEQA) requires state and local agencies to identify the significant environmental impacts of their actions and to avoid or mitigate those impacts, if feasible. On June 28, 2017, the City Council adopted Resolution 15,040 approving an update to the California Environmental Quality Act (CEQA) Guidelines.* *Chapter 22 ,Article 12 implements the Federal Water Pollution Control Act (the Clean Water Act), 33 U.S.C. Section 1251 et seq., as amended, and Division 7 of the California Water Code by prohibiting the discharge of any pollutant to navigable waters of the United States from a point source unless the discharge is authorized by a permit issued pursuant to the National Pollutant Discharge Elimination System required by the Clean Water Act Section 402 (33 U.S.C. Section 1342), and by prohibiting non-storm water discharges into the storm drain system.* *Chapter 18, Article 4 recently updated in December 2020 with the authority conferred by Cal. Gov't Code sections 65302, 65560 and 65800 to adopt regulations designed to promote the public health, safety, and general welfare.*				
Flood Damage Prevention	Yes	No	Yes	Yes
Comment: *Chapter 18, Article 4 recently updated in December 2020 with the authority conferred by Cal. Gov't Code sections 65302, 65560 and 65800 to adopt regulations designed to promote the public health, safety and general welfare.*				
Emergency Management	Yes	No	Yes	Yes
Comment: *Oxnard Emergency Operations Plan—City Ordinance No. 2916*				
Climate Change	Yes	No	Yes	Yes
Comment: *The City is currently preparing a Climate Action and Adaptation Plan which intends to be comprehensive, robust and innovative to help the City plan for future climate goals and develop vision for how sustainability should be implemented in the City. The Climate Action and Adaptation Plan is anticipated to culminate with adoption by the City Council in mid/late-2022.*				
Planning Documents				
General Plan	Yes	No	Yes	Yes
Is the plan compliant with Assembly Bill 2140? *Yes* ***Comment:*** *The City's current 2030 General Plan contains Safety Element that includes goals and policies that address liquefaction and subsidence risk; coastline and beach preservation; emergency preparedness; and hazardous materials and uses.*				
Capital Improvement Plan	Yes	No	Yes	Yes
How often is the plan updated? *Once a year* ***Comment:*** *The City Council adopts a 5-year Capital Improvement Plan with the City Council making amendments on an annual basis.*				
Disaster Debris Management Plan	Yes	Yes	Yes	Yes
Comment: *Ventura County Disaster Recovery Plan, Adopted by BOS in April 2019*				
Floodplain or Watershed Plan	Yes	No	Yes	No
Comment: *Chapter 18, Article 4 recently updated in December 2020 with the authority conferred by Cal. Gov't Code sections 65302, 65560 and 65800 to adopt regulations designed to promote the public health, safety and general welfare. The City participates in the National Flood Insurance Program (NFIP) Community Rating System (CRS)Class 7*				
Stormwater Plan	Yes	No	Yes	Yes
Comment: *The City is developing the Public Works Integrated Master Plan to develop long-term recommendations for policies, programs, and projects that successfully address and respond to immediate drought conditions while also planning for long-term water needs, reducing dependence upon costly imported water, addressing aging infrastructure and reliability concerns, pursuing aggressive goals for energy efficiency and sustainable solutions, maintaining compliance with changing regulatory requirements, and the ongoing loss of seasoned staff and personnel.*				

	Local Authority	Other Jurisdiction Authority	State Mandated	Integration Opportunity?
Urban Water Management Plan	Yes	No	Yes	Yes
Comment: *The City has an adopted Urban Water Management Plan. The plan details long-term resource planning to ensure that adequate water supplies are available to meet existing and future water needs. In conjunction with the Urban Water Management Plan, a separate Water Shortage Contingency Plan, is also being prepared. The Water Shortage Contingency Plan outlines how an urban water supplier will respond to various stages of a drought or a prolonged shortage caused by other events.*				
Habitat Conservation Plan	No	No	No	No
Comment: *Not applicable for the City of Oxnard*				
Economic Development Plan	Yes	No	Yes	No
Comment: *The City's 2030 General Plan contains an Economic Development Chapter within the Community Development Element. The City created a draft strategic plan which was presented to the Housing and Economic Development Committee and the Chamber of Commerce in 2020 before the pandemic. However, given that COVID significantly impacted the business landscape, staff will be working on a new strategic plan to emphasize business retention, workforce development, and site-based development.*				
Shoreline Management Plan	Yes	No	Yes	No
Comment: *The City of Oxnard is currently updating the City's Local Coastal Program to address Sea Level Rise and coastal hazards.*				
Community Wildfire Protection Plan	No	No	No	No
Comment: *Not applicable for the City of Oxnard*				
Forest Management Plan	No	Yes	No	Yes
Comment: *Not applicable for the City of Oxnard*				
Climate Action Plan	Yes	No	Yes	Yes
Comment: *The City is currently preparing a Climate Action and Adaptation Plan which intends to be comprehensive, robust and innovative to help the City plan for future climate goals and develop vision for how sustainability should be implemented in the City. The Climate Action and Adaptation Plan is anticipated to culminate with adoption by the City Council in mid 2022.*				
Emergency Operations Plan	Yes	No	Yes	Yes
Comment: *Oxnard Emergency Operations Plan*				
Threat & Hazard Identification & Risk Assessment (THIRA)	No	Yes	No	Yes
Comment: *We are currently evaluating the need to complete a THIRA for the City of Oxnard.*				
Post-Disaster Recovery Plan	Yes	No	Yes	Yes
Comment: *Disaster Recovery Operations are covered in the Oxnard Emergency Operations Plan*				
Continuity of Operations Plan	Yes	No	Yes	Yes
Comment: *Continuity of Government—Section within the Oxnard Emergency Operation Plan*				
Public Health Plan	No	Yes	Yes	Yes
Comment: *County of Ventura Health Care Agency Public Health Emergency Response Plan (ERP)*				
Other—Countywide Tsunami Plan	No	Yes	Yes	Yes
Comment: *The County of Ventura has an existing plan that describes each City's role and has been adopted locally. A revision of this document is required within the coming year.*				

Table 6-4. Development and Permitting Capability

Criterion	Response
Does your jurisdiction issue development permits?	Yes
If no, who does? If yes, which department? Building and Safety Division of the Community Development Department	
Does your jurisdiction have the ability to track permits by hazard area?	No The City does not currently track building permits issued by hazard area.
Does your jurisdiction have a buildable lands inventory?	No

Table 6-5. Fiscal Capability

Financial Resource	Accessible or Eligible to Use?
Community Development Block Grants	Yes
Capital Improvements Project Funding	Yes
Authority to Levy Taxes for Specific Purposes	No. Requires a vote of the people
User Fees for Water, Sewer, Gas or Electric Service ***If yes, specify:*** Water and Sewer	Yes
Incur Debt through General Obligation Bonds	No. Requires a vote of the people
Incur Debt through Special Tax Bonds	Yes
Incur Debt through Private Activity Bonds	Yes
Withhold Public Expenditures in Hazard-Prone Areas	Yes
State-Sponsored Grant Programs	Yes
Development Impact Fees for Homebuyers or Developers	Yes
Other ***If yes, specify:*** Federal-sponsored grant programs	Yes

Table 6-6. Administrative and Technical Capability

Staff/Personnel Resource		Available?
Planners or engineers with knowledge of land development and land management practices		Yes
If Yes, Department /Position:	Community Development, all Planners) Public Works—City Engineer; Supervising Civil Engineer	
Engineers or professionals trained in building or infrastructure construction practices		Yes
If Yes, Department /Position:	Public Works—City Engineer; Supervising Civil Engineer; Project Manager; Senior Civil Engineer; Construction Inspector; Project Coordinator; Engineering Tech	
Planners or engineers with an understanding of natural hazards		Yes
If Yes, Department /Position:	Public Works—City Engineer	
Staff with training in benefit-cost analysis		Yes
If Yes, Department /Position:	Public Works—Transportation Planner and Grants Coordinator	
Surveyors		Yes
If Yes, Department /Position:	Public Works (Consultant)	
Personnel skilled or trained in GIS applications		Yes
If Yes, Department /Position:	Information Technology—GIS Manager, GIS Technician III, GIS Systems Analyst, GIS Programmer Analyst	
Scientist familiar with natural hazards in local area		No
If Yes, Department /Position:	None	
Emergency manager		Yes
If Yes, Department /Position:	Fire Department—City Emergency Services Manager	
Grant writers		Yes
If Yes, Department /Position:	Public Works—Grants Coordinator and Transportation Planner	

Table 6-7. Education and Outreach Capability

Criterion	Response
Do you have a public information officer or communications office?	Yes
Do you have personnel skilled or trained in website development?	Yes
Do you have hazard mitigation information available on your website?	Yes
If yes, briefly describe: City website has disaster preparedness and fire prevention information in English and Spanish	
Do you use social media for hazard mitigation education and outreach?	Yes
If yes, briefly describe: We have in the past used social media to address specific hazard mitigation issues.	
Do you have any citizen boards or commissions that address issues related to hazard mitigation?	Yes
If yes, briefly describe: Yes, the Fire Chief has an advisory "Team" that address emergency preparedness and hazard reduction issues. Organized "Neighborhood Councils" are also used to disseminate emergency preparedness and hazard mitigation information.	
Do you have any other programs in place that could be used to communicate hazard-related information?	Yes
If yes, briefly describe: Community events such as: neighborhood fairs, emergency preparedness fairs, CERT training, neighborhood council meetings, homeowners' association meetings are all used to disseminate emergency preparedness and hazard mitigation information.	
Do you have any established warning systems for hazard events?	Yes
If yes, briefly describe: "Alert and Warning" procedures as described in the Oxnard Emergency Operations Plan and the VC Alert System	

Table 6-8. National Flood Insurance Program Compliance

Criterion	Response
What local department is responsible for floodplain management?	Public Works
Who is your floodplain administrator? (department/position)	City Engineer
Are any certified floodplain managers on staff in your jurisdiction?	No
What is the date that your flood damage prevention ordinance was last amended?	December 2020
Does your floodplain management program meet or exceed minimum requirements? ***If exceeds, in what ways?***	Meets
When was the most recent Community Assistance Visit or Community Assistance Contact?	2017 Community Assistance Visit
Does your jurisdiction have any outstanding NFIP compliance violations that need to be addressed? ***If so, state what they are.***	No
Are any RiskMAP projects currently underway in your jurisdiction? ***If so, state what they are.*** RiskMAP, Ventura County Levees	Yes
Do your flood hazard maps adequately address the flood risk within your jurisdiction? ***If no, state why.***	Yes
Does your floodplain management staff need any assistance or training to support its floodplain management program? ***If so, what type of assistance/training is needed?*** Admin training	Yes
Does your jurisdiction participate in the Community Rating System (CRS)? ***If yes, is your jurisdiction interested in improving its CRS Classification?*** No ***If no, is your jurisdiction interested in joining the CRS program?*** N/A	Yes, Class 7
How many flood insurance policies are in force in your jurisdiction?[a] ***What is the insurance in force?*** $166,210,700 ***What is the premium in force?*** $323,235	497
How many total loss claims have been filed in your jurisdiction?[a] ***What were the total payments for losses?*** $244,574	71

a. According to FEMA statistics as of March 31, 2021

Table 6-9. Community Classifications

	Participating?	Classification	Date Classified
FIPS Code	Yes	06-111-54652	N/A
DUNS #	Yes	081790214	N/A
Community Rating System	Yes	7	N/A
Building Code Effectiveness Grading Schedule	Yes	Residential: 3 Commercial Industrial: 2	2015/2016
Public Protection	Yes	02/2X	December 1, 2017
Storm Ready	Yes	N/A	July 2021
Firewise	No	N/A	N/A
Tsunami Ready	Yes	N/A	July 2021

Table 6-10. Adaptive Capacity for Climate Change

Criterion	Jurisdiction Ratings
Technical Capacity	
Jurisdiction-level understanding of potential climate change impacts	Medium
Comment: *The City is preparing a Climate Action and Adaptation Plan (CAAP). Community engagement has highlighted interest in and knowledge of climate impacts.*	
Jurisdiction-level monitoring of climate change impacts	Low
Comment: *The CAAP will establish programs and monitoring protocols.*	
Technical resources to assess proposed strategies for feasibility and externalities	Low
Comment: *Documentation prepared for CAAP and SLR and vulnerability study*	
Jurisdiction-level capacity for development of greenhouse gas emissions inventory	High
Comment: *Through the CAAP this has occurred.*	
Capital planning and land use decisions informed by potential climate impacts	Medium
Comment: *This will come out of the CAAP.*	
Participation in regional groups addressing climate risks	High
Comment: *Professional planner and focused position*	
Implementation Capacity	
Clear authority/mandate to consider climate change impacts during public decision-making processes	Medium
Comment: *This will come out of CAAP implementation.*	
Identified strategies for greenhouse gas mitigation efforts	High
Comment: *The CAAP includes this information including strategies*	
Identified strategies for adaptation to impacts	High
Comment: *The CAAP includes this information including strategies*	
Champions for climate action in local government departments	High
Comment: *The CAAP includes this information including strategies*	
Political support for implementing climate change adaptation strategies	High
Comment: *Financial support for CAAP study.*	
Financial resources devoted to climate change adaptation	Low
Comment: *The CAAP includes this information including strategies*	
Local authority over sectors likely to be negative impacted	Medium
Comment: *Addressed in CAAP engagement*	

Criterion	Jurisdiction Ratings
Public Capacity	
Local residents' knowledge of and understanding of climate risk ***Comment:*** *Addressed in CAAP engagement*	Medium
Local residents' support of adaptation efforts ***Comment:*** *Addressed through CAAP engagement*	Medium
Local residents' capacity to adapt to climate impacts ***Comment:*** *Input provided during sea level rise engagement and CAAP efforts*	Low
Local economy current capacity to adapt to climate impacts ***Comment:***	Low
Local ecosystems capacity to adapt to climate impacts ***Comment:***	**Low**

a. High = Capacity exists and is in use; Medium = Capacity may exist, but is not used or could use some improvement; Low = Capacity does not exist or could use substantial improvement; Unsure= Not enough information is known to assign a rating.

6.5 INTEGRATION REVIEW

For hazard mitigation planning, "integration" means that hazard mitigation information is used in other relevant planning mechanisms, such as general planning and capital facilities planning, and that relevant information from those sources is used in hazard mitigation. This section identifies where such integration is already in place, and where there are opportunities for further integration in the future. Resources listed at the end of this annex were used to provide information on integration. The progress reporting process described in Volume 1 of the hazard mitigation plan will document the progress of hazard mitigation actions related to integration and identify new opportunities for integration.

6.5.1 Existing Integration

Some level of integration has already been established between local hazard mitigation planning and the following other local plans and programs:

- **Oxnard Emergency Operations Plan (EOP)**—The Emergency Operations Plan addresses the City of Oxnard's planned response to extraordinary emergency situations associated with natural disasters, technological incidents, and national security emergencies.
- **Ventura County Mass Care and Shelter Plan**—This document is intended for use during the preparedness phase to help guide care and shelter planning. It provides all the planning information and guidelines that are relevant for government's consideration before opening disaster shelters. This document is intended to help cities plan for shelter operations, while also providing an overview of the complete scope of care and shelter services.
- **Ventura County Operational Area Emergency Operations Plan**—The County of Ventura Emergency Operations Plan (EOP) provides the structure and processes that all key partner agencies within the county use to respond to, and initially recover from, a major emergency or disaster event.
- **California Tsunami Evacuation Playbook (Ventura County, City of Oxnard)—**This playbook is designed to help the emergency managers with tsunami evacuation and

response activities. The goal is to protect the residents within the local Tsunami Inundation Zone by providing guidance for early warning and coordinated evacuations.

- **2030 City of Oxnard General Plan**—The General plan contains a Safety Element that includes goals and policies that address liquefaction and subsidence risk; coastline and beach preservation; emergency preparedness; and hazardous materials and uses.

6.5.2 Opportunities for Future Integration

The capability assessment in this annex indicates opportunities to integrate this mitigation plan with other jurisdictional planning/regulatory capabilities. Capabilities were identified as integration opportunities if they can support or enhance the actions identified in this plan or be supported or enhanced by components of this plan. The capability assessment identified the following plans and programs that do not currently integrate hazard mitigation information but provide opportunities to do so in the future:

- **2030 City of Oxnard General Plan**: The 2030 General Plan should be revised to address hazard mitigation plan elements as needed in the 2022 HMP program and consider integration opportunities by adopting relevant policies in future Safety Element. updates
- **Local Coastal Program (LCP) Update:** The City is in the process of a comprehensive LCP update. One of the goals of the City's LCP update is to consider and address Sea Level Rise (SLR) and to ensure that policies to implement adaptation options occur in a way that protects the City's coastal economic vitality, community character, public and private property, coastal resources and public safety.

Taking action to integrate each of these programs with the hazard mitigation plan was considered as a mitigation action to include in the action plan in this annex.

6.6 RISK ASSESSMENT

6.6.1 Jurisdiction-Specific Natural Hazard Event History

Table 6-11 lists past occurrences of natural hazards for which specific damage was recorded in this jurisdiction Other hazard events that broadly affected the entire planning area, including this jurisdiction, are listed in the risk assessments in Volume 1 of this hazard mitigation plan.

6.6.2 Hazard Risk Ranking

Table 6-12 presents a local ranking of all hazards of concern for which this hazard mitigation plan provides complete risk assessments. As described in detail in Volume 1, the ranking process involves an assessment of the likelihood of occurrence for each hazard, along with its potential impacts on people, property, and the economy. Mitigation actions primarily target hazards with high and medium rankings.

Table 6-11. Past Natural Hazard Events

Type of Event	FEMA Disaster #	Date	Damage Assessment
Rain and High Wind Event		January 19, 2021	Trees down, road closures, power outages, damage to structures
Pandemic Influenza COVID-19	4482-DR-CA	January 20, 2020 Continuing	Ongoing
Atmospheric River Storm System	CA Disaster 109	January/February 2019	Local stream and street flooding, trees down, power outages
Wildfires, Flooding, Mudflows, and Debris Flows	DR-4353	December 4, 2017- January 31, 2018	Post Thomas Fire debris flows in local rivers, large deposits of debris on local beaches, road closures
Thomas Fire	4224-DR-CA	December 4, 2017	Public Health issues due to smoke, power outages, sewage spill due to power outage
February Winter Storm	CA Disaster 77.1	February 2017	Local stream and street flooding, trees down, power outages, debris deposits in local stream and on beaches
January Winter Storm	CA Disaster 77	January 2017	Local stream and street flooding, trees down, power outages, debris deposits in local stream and on beaches
Extreme Windstorm		February 2016	Trees down, power outages, street closures, damage to structures, debris
Erratic Weather (frost, heat, drought)		Winter 2013	Damage to crops, economic loss
Tsunami (7.1 earthquake in Japan)		March 11, 2011	Damage to local harbors, marinas and docks
Tsunami (8.8 Quake in Chile)		February 27, 2010	Damage to local harbors, marinas and docks
Storm and Flood		January 18 – 22, 2010.	Local stream and street flooding, trees down, power outages
Wildfires, Flooding, Mudflows, and Debris Flows	DR-1731	October 21 – March 31, 2008	Post burn, flooding, debris and mud flows.
Severe Storm	DR-1267	January 7 – 11, 2005	Flooding and debris flows
"El Nino" Storm and Flood		February 1998	Street and stream flooding, debris flows
Storms and Floods		January and March, 1995	Unknown
Northridge Earthquake	DR-1008	January 17 – November 30, 1994	Power and communications disruptions, damage to structures
Storm and Flood		February 10-15, 1992	Street and stream flooding, debris flows
Earthquake (Whittier Narrows Earthquake)		October 1, 1987	Unknown
Storm and Flood		February 25-March 3, 1983	Street and stream flooding, debris flows
Storm and Flood		February 13-22, 1980	Street and stream flooding, debris flows
Sespe Creek Flood		March 4, 1978	Street and stream flooding, debris flows
Storms and Floods (Calleguas Creek Flood)		February 28-March 5, 1978	Street and stream flooding, debris flows
St Francis Dam Disaster		March 12, 1928	$7 Million (1928)—Inundation of nearly the entire city, flooding, debris flows, destruction of infrastructure, high loss of life

Table 6-12. Hazard Risk Ranking

Rank	Hazard	Risk Ranking Score	Risk Category
1	Dam Failure	36	High
2	Earthquake	32	Medium
3	Severe Storm	24	Medium
4	Severe Weather	24	Medium
5	Flooding	18	Medium
6	Landslide	18	Medium
7	Sea Level Rise	18	Medium
8	Tsunami	12	Low
9	Drought	9	Low
10	Wildfire	0	Low

6.6.3 Jurisdiction-Specific Vulnerabilities

Volume 1 of this hazard mitigation plan provides complete risk assessments for each identified hazard of concern. This section provides information on a few key vulnerabilities for this jurisdiction. Available jurisdiction-specific risk maps of the hazards are provided at the end of this annex.

Repetitive Loss Properties

Repetitive loss records are as follows:

- Number of FEMA-identified Repetitive-Loss Properties: 7
- Number of FEMA-identified Severe-Repetitive-Loss Properties: N/A
- Number of Repetitive-Loss or Severe-Repetitive-Loss Properties that have been mitigated: N/A

Other Noted Vulnerabilities

The following jurisdiction-specific issues have been identified based on a review of the results of the risk assessment, public involvement strategy, and other available resources:

- **Unreinforced Masonry and Soft Story Structures**—Oxnard has numerous unreinforced masonry and soft story buildings within the city limits. These buildings are subject to severe damage or structural collapse during a moderate to severe earthquake.
- **Homeless Population—**A significant number of persons commonly defined as “Homeless” live in the Santa Clara River and other undeveloped areas. During wildland fires, storms and flooding these individuals are at great risk.
- **Street and Urban Flooding**—There are numerous areas of the city that flood to varying degrees during periods of high rain. The effects of this flooding range from street closures to damage to property, vehicles and buildings.
- **Power Outages/Emergency Power**—Local power outages have resulted from high winds and storm conditions as well as from the effects of wildland fire in the region. Many key city buildings including the Main City Hall and Council Chambers buildings have no back-up power or emergency generators.

- **Debris Flows—**Following heavy rains and winter storms, substantial debris flows have occurred in the Santa Clara River as well as other local streams and culverts. Debris flows following wildland fires are particularly bad and can require removal of material from streams, streets, culverts and beaches.
- **Liquefaction Potential—**Nearly the entire City of Oxnard is located in a "Liquefaction Zone". The effects and damage caused by seismic activities can be amplified resulting in increased damage to buildings and infrastructure.
- **Tsunami Awareness and Notification**—Oxnard has a large visitor and tourist population who may not be aware of the tsunami risk.
- **Sea Level Rise (SLR)—**SLR is an identified flooding threat to the future of the City of Oxnard. Therefore, planning for local adaptation and resiliency is an identified City Council priority and part of the Local Coastal Program update. It is a complex and difficult issue that will require strong coordination at the federal, State, and local level over the long term to effectively plan for and adapt to changing variables over time. Adaptation strategies are based upon various SLR projections anticipated to occur in years 2030, 2060, and 2100.
- **Drought**—Much of California, Ventura County and the City of Oxnard has been experiencing a multiyear drought. Continued drought can directly impact land use, development options, as well as economic development in the city. This includes negatively impacting business development, including expansion and retention and support for agricultural resources and industries. More prolonged and severe drought conditions could potentially impact potable water supplies to the point of creating a public health and safety emergency.
    - For background: The City of Oxnard purchases 40-50% of its total water supply from Calleguas Municipal Water District. This water is State Water Project water supplied by Metropolitan Water District. In addition to State water, the City of Oxnard supplements its remaining water needs from groundwater that is pumped by the City (20-30%) and by the United Water Conservation District (20-30%). According to the 2021 Groundwater Sustainability Plan (GSP), the Oxnard Subbasin water has experienced drier than average conditions since 2015 and anticipates little change to the water elevation level due to the current drought. The subbasin is currently at a level categorized as being in overdraft per the GSP.

Mitigation actions addressing these issues were prioritized for consideration in the action plan in this annex.

6.7 STATUS OF PREVIOUS PLAN ACTIONS

The following table summarizes the actions that were recommended in the previous version of the hazard mitigation plan and their implementation status at the time this update was prepared.

Table 6-13. Status of Previous Plan Actions

Action Item	Completed	Removed; No Longer Feasible	Carried Over to Plan Update	
			Check if Yes	Action # in Update
OX 3—Increase participation in the NFIP by maintaining a CRS rating Class 9, which through enhanced floodplain management activities would allow property owners to receive a discount on their flood insurance.	✓			
Comment: Increased participation by upgrading CRS rating from Class 9 to Class 7. The City will continue to maintain CRS rating Class 7.				
OX 4—Develop a tool to collect and analyze post-flood disaster risk assessment information to allow the City of Oxnard to analyze the effects of the flood and implement future mitigation projects. Information to be collected will include: number and location of structures, including RL properties, flooded; identification of flooded areas outside of the SFHA and floodwater heights at these locations; number and location of failed gages; etc.			✓	OXN-19
Comment: Information is being collected as required by CRS program. The tool is to be developed once funding is available. Funding was requested in FY 21-22 for this purpose				
OX 5—Continue to participate in the NWS TsunamiReady Program through continued implementation of Guideline 4: Community Preparedness measures, including public outreach material and curriculum.			✓	OXN-10
Comment: Oxnard continues to participate in the TsunamiReady Program and will be updating and renewing its application again this year. This is an ongoing program.				
OX 6—Evaluate Santa Clara Levees 1, 2 and 3 for upgrade and construction.	✓			
Comment: Evaluations have been completed by the County of Ventura. Levees are County-owned.				
OX 7—Construct a Mandalay Beach storm drainage system to the Channel Islands Harbor. During rain events, stormwater accumulation along Mandalay Beach Road is caused by wind and sand blocking the drainage to the ocean outfall.			✓	OXN-20
Comment: This is currently being mitigated with a dedicated portable pump that is deployed and turned on during storm events. Pump station construction is estimated at $30M+ and has not been completed due to lack of funding.				
OX 8—Construct a permanent lift station for Ventura Road @ Wagon Wheel Road. Water in the low point in the roadway must be manually pumped with each rain event.	✓			
Comment: The improvements are currently in the design phase. Wagon Wheel Development conditioned to construct.				
OX 9—Construct a stormwater lift station at Perkins Road. Flooding occurs at the point in Perkins Road which is caused by an undersized sump pump. The proposed stormwater lift system will transport stormwater to the Advanced Water Purification Facility and recycle the storm water for agricultural use along Hueneme Road.			✓	OXN-20
Comment: Currently being mitigated with a portable pump that is turned on during storm events. Pump station has not been completed due to lack of funding. The discharge location may change so discharge location is not included in the updated action plan.				
OX 10—Construct a permanent flood protection pump station at Dodge Road. Flooding occurs at the low point in Dodge Road at the intersection with Maulhardt Road.			✓	OXN-20
Comment: Currently being mitigated with a portable pump that is turned on during storm events. Pump station has not been completed due to lack of funding.				

Action Item	Completed	Removed; No Longer Feasible	Carried Over to Plan Update	
			Check if Yes	Action # in Update
OX 11—As part of the Memorandum of Agreement / Memorandum of Understanding with The Nature Conservancy (TNC): continue to partner with TNC on acquisition, restoration and mitigation planning processes; partner on grant proposals; participate in negotiations with land use owners; carry-out restoration projects; hold titles to floodplain properties as appropriate; and hold or co-hold with TNC multipurpose easements.			✓	OXN-21
Comment: In 2016, the California State Coastal Conservancy, City of Oxnard, and The Nature Conservancy (collectively known as the Ormond Beach Partners) entered into a Memorandum of Understanding to actively coordinate and collaborate across the Ormond Beach Partners' respective properties that total over 630 acres in order to protect, manage, and restore the Ormond Beach Area. The Project Partners are leading the Ormond Beach Restoration and Public Access Plan (OBRAP), with the goals of restoring the natural ecosystem and habitats and improving public access and enjoyment of Ormond Beach while protecting nature. The Ormond Beach Partners have held two public outreach meetings soliciting public input on the OBRAP in 2017 and 2019. The Ormond Beach Partners will conduct a public outreach meeting in 2021 to highlight the Preferred Alternative and Preliminary Design. The next phases of the OBRAP will be the environmental review, gap assessment, final design, permitting, funding and construction.				

6.8 HAZARD MITIGATION ACTION PLAN

Table 6-14 lists the identified actions, which make up the hazard mitigation action plan for this jurisdiction. Table 6-15 identifies the priority for each action. Table 6-16 summarizes the mitigation actions by hazard of concern and mitigation type.

Table 6-14. Hazard Mitigation Action Plan Matrix

Benefits New or Existing Assets	Objectives Met	Lead Agency	Support Agency	Estimated Cost	Sources of Funding	Timeline
Action OXN-1—Where appropriate, support retrofitting, purchase or relocation of structures located in hazard areas, prioritizing those that have experienced repetitive losses and/or are located in high- or medium-risk hazard areas.						
Hazards Mitigated: Dam Failure, Earthquake, Flooding, Landslide, Sea Level Rise, Tsunami						
Existing	2, 6, 9, 10, 11	Public Works.	Community Development	High	HMGP, PDM, FMA	Short-term
Action OXN-2—Amend General Plan Safety and Hazard Element text and as needed hazard maps, to reflect updated mapping of hazard areas identified by this Hazard Mitigation Plan, FEMA, Cal Fire, or the CA Seismic Hazard Mapping Program, in addition to background data associated with Local Coastal Plan update and background work associated with the City's Climate Action and Adaptation Plan (CAAP)						
Hazards Mitigated: Dam Failure, Drought, Earthquake, Flooding, Sea Level Rise, Severe Weather, Tsunami, Wildfire						
New & Existing	1, 2, 3, 4, 5, 7, 8, 9, 10, 11, 12, 13, 14, 15, 17, 19	Community Development	Public Works	$500,000	Staff Time, General Fund, Grant Funding, FEMA HMA, BRICK, Pre and Post Disaster Mitigation Grant Funding	Short-term
Action OXN-3—Actively participate in the plan maintenance protocols outlined in Volume 1 of this Hazard Mitigation Plan.						
Hazards Mitigated: Dam Failure, Drought, Earthquake, Flooding, Sea Level Rise, Severe Weather, Tsunami, Wildfire						
New & Existing	1, 2, 4, 6, 7, 8, 9, 11, 12, 13, 14, 15	Public Works	Community Development	Low	Staff Time, General Funds	Short-term

Benefits New or Existing Assets	Objectives Met	Lead Agency	Support Agency	Estimated Cost	Sources of Funding	Timeline
Action OXN-4—Continue to maintain good standing and compliance under the National Flood Insurance Program (NFIP) through implementation of floodplain management programs that, at a minimum, meet the NFIP requirements: ● Enforce the flood damage prevention ordinance. ● Participate in floodplain identification and mapping updates. ● Provide public assistance/information on floodplain requirements and impacts. *Hazards Mitigated:* Dam Failure, Severe Storm, Severe Weather, Flooding						
New & Existing	1, 2, 6, 7, 17	Public Works	Community Development	Low	Staff Time, General Funds	Short term and ongoing
Action OXN-5—Develop, approve, and implement the City's Climate Action and Adaptation Plan (CAAP); including adaptive strategies to address hazards. *Hazards Mitigated:* Sea Level Rise, Flooding, Wildfire, Severe Storms, Severe Weather, Drought						
New & Existing	1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 19	Community Development	Public Works	High	Staff Time, General Funds	Short-term and on going
Action OXN-6—Purchase generators for critical facilities and infrastructure that lack adequate backup power, & as recommended by the City's CAAP . *Hazards Mitigated:* Dam Failure, Earthquake, Flooding, Landslide, Severe Weather, Tsunami, Wildfire						
New & Existing	2, 19	Public Works	Community Development	Estimated: $500,000 per generator (avg.)	Staff Time, General Funds, Enterprise Funds, HMGP, PDM	Short-term
Action OXN-7—Retrofit existing Seawalls at Mandalay Bay in order to withstand seismic events per the latest provisions in the California Building Code (CBC, 2019) *Hazards Mitigated:* Earthquake						
Existing	2, 4, 6, 9, 11, 19	Public Works	Community Development	Estimated: $200,000,000	Staff Time, General Funds, HMGP, PDM, FMA	Short-term
Action OXN-8—Replace existing 45-inch diameter water transmission main that is critical as a lifeline for residents, industry, and national defense, including the region's military base. This project will prevent seismic-related failure of the transmission line of State Water Project water that provides potable water to a population of approximately 245,000. This pipeline supplies 60% of the City of Oxnard's water and 50% of the City of Port Hueneme's water which is then purveyed to Naval Base Ventura County's Point Mugu and Port Hueneme installations. *Hazards Mitigated:* Earthquake						
Existing	2, 4, 6, 9, 11, 19	City of Oxnard	City of Port Hueneme	Estimated: $50,000,000	Staff Time, Enterprise Funds, HMGP, PDM, FMA	Short-term
Action OXN-9—Develop a comprehensive Sea Level Rise (SLR) Adaptation Plan to be implemented in the four identified coastal planning areas located within the City's coastal zone to adopt long term adaptation policies and strategies to identify, manage, and reduce SLR impacts on coastal resources, private property and critical City facilities. The SLR adaptation policies and strategies included in the Local Coastal Program update would also be coordinated with the Climate Action and Adaptation Plan to address SLR vulnerabilities. *Hazards Mitigated:* Sea Level Rise						
New & Existing	Enter Response 1, 2, 4, 5, 6, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19	Public Works	Community Development; County of Ventura and Harbor Department; City of Port Hueneme; U.S. Department of Defense (Navy)	High	Grant State Federal	Long Term

Benefits New or Existing Assets	Objectives Met	Lead Agency	Support Agency	Estimated Cost	Sources of Funding	Timeline
Action OXN-10—Continue to participate in the NWS TsunamiReady Program through continued implementation of Guidelines for Community Preparedness measures, including public outreach material and curriculum. In 2021 Oxnard updated its application and has received approval from the NWS as a TsunamiReady Community. This is an ongoing program *Hazards Mitigated:* Tsunami						
New & Existing	1, 2, 6, 7, 8, 12, 17, 18, 19	Emergency Services Manager	Oxnard Fire and Public Works Departments	Low	Staff Time, Enterprise Funds, EMPG, DHS	Ongoing
Action OXN-11—Construction of Aquifer Storage and Recovery (ASR) wells in order to ensure future reliable and affordable supply of high-quality water for the Oxnard Plain. *Hazards Mitigated:* Drought						
Existing	2, 4, 6, 9, 11, 19	City of Oxnard	State Division of Drinking Water	High	Staff Time, Enterprise Funds, HMGP, PDM, FMA	Short-term
Action OXN-12—Develop and implement a resident and visitor tsunami awareness and safety public education and outreach program. Provide tsunami awareness, hazard, safety, and evacuation information at visitor locations including hotels, vacation rentals, campgrounds and day use recreational areas. Program would include signs, posters, handouts and public presentations. *Hazards Mitigated:* Tsunami						
New	1, 2, 7, 8, 10, 12, 17, 18, 19	Oxnard Police and Fire Departments	Oxnard Community Development	Low	Staff Time, Enterprise Funds, EMPG, DHS	Short-term
Action OXN-13—Engage in a study to determine the best methods and strategies to communicate hazards and warnings to the city's homeless population, particularly those living in undeveloped areas such as fields, creeks and riverbeds. Warnings would include notification of impending or immediate dangers. *Hazards Mitigated:* Dam Failure, Earthquake, Flooding, Landslide, Severe Weather, Tsunami, Wildfire						
New	1, 2, 7, 8, 10, 12, 17, 18, 19	City of Oxnard		High	Grant Funding-FEMA HMA (BRIC, FMA, HMGP), Staff Time, Enterprise Funds	Short-Term
Action OXN-14—Engage in a feasibility study to determine if Oxnard Fire Station 6 can be retrofitted, replaced or relocated due to seismic and tsunami hazards. *Hazards Mitigated:* Earthquake, Tsunami						
Existing	1, 2, 6, 7, 8, 9, 18, 19	Oxnard Fire Department	City Planning Department	High	Grant Funding-FEMA HMA (BRIC, HMGP), Staff Time, Enterprise Funds	Short-Term
Action OXN-15—Engage in a feasibility study to determine if Oxnard Fire Stations 2, 3, 4 & 5 can be retrofitted, replaced or relocated due to seismic hazards. *Hazards Mitigated:* Earthquake						
Existing	1, 2, 6, 7, 8, 9, 18, 19	Oxnard Fire Department	City Planning Department	High	Grant Funding-FEMA HMA (BRIC, HMGP), Staff Time, Enterprise Funds	Short-Term
Action OXN-16—Implement the findings of the feasibility studies with retrofits to, relocation of, or replacement of existing City Fire Stations including, Stations # 2, 3, 4, 5, 6. These stations were built between 1954 and 1978 prior to current building standards. Damage to these stations could seriously impact fire, rescue and EMS service within the City. *Hazards Mitigated:* Earthquake, Tsunami						
Existing	1, 2, 6, 7, 8, 9, 18, 19	Oxnard Fire Department	City Planning Department	High	Grant Funding-FEMA HMA (BRIC, HMGP), Staff Time, Enterprise Funds	Short-Term

Benefits New or Existing Assets	Objectives Met	Lead Agency	Support Agency	Estimated Cost	Sources of Funding	Timeline
Action OXN-17—Engage in a feasibility study to determine if the Oxnard Police Headquarters building, including the Dispatch facilility, can be retrofitted or should be replaced due to seismic hazards.						
Hazards Mitigated: Earthquake						
New	1, 2, 7, 8, 10, 12, 17, 18, 19	City of Oxnard	Oxnard Police Department	High	Grant Funding-FEMA HMA (BRIC,HMGP), Staff Time, Enterprise Funds	Short-Term
Action OXN-18—Implement the findings of the feasibility study by retrofitting or replacing Oxnard Police Headquarters building. This will include expansion of the Dispatch facility to accommodate equipment for the radio and data traffic needed to support disaster response communications.						
Hazards Mitigated: Earthquake, Tsunami, Severe Storms, Dam Failure, Wildfires, Flooding						
Existing	1, 2, 6, 7, 8, 9, 18, 19	Oxnard Police Department	Oxnard Fire Department	High	Grant Funding-FEMA HMA (BRIC, HMGP), Staff Time, Enterprise Funds	Short-Term
Action OXN-19—Develop a tool to collect and analyze post-flood disaster risk assessment information to allow the City of Oxnard to analyze the effects of the flood and implement future mitigation projects. Information to be collected will include: number and location of structures, including RL properties, flooded; identification of flooded areas outside of the SFHA and floodwater heights at these locations; number and location of failed gages; etc.						
Hazards Mitigated: Flooding						
New & Existing	1, 2, 17	City of Oxnard		High	Grant Funding-FEMA HMA (BRIC, FMA, HMGP), Staff Time, Enterprise Funds	Short-Term
Action OXN-20—Construct pump stations for roadway areas affected by chronic flooding including, but not limited to: • Mandalay Beach storm drainage system to the Channel Islands Harbor. During rain events, stormwater accumulation along Mandalay Beach Road is caused by wind and sand blocking the drainage to the ocean outfall. • Construct a stormwater lift station at Perkins Road. Flooding occurs at the point in Perkins Road which is caused by an undersized sump pump. • Construct a permanent flood protection pump station at Dodge Road. Flooding occurs at the low point in Dodge Road at the intersection with Maulhardt Road.						
Hazards Mitigated: Flooding, Severe Storms						
Existing	2, 6, 10, 11	Public Works		High	Grant Funding-FEMA HMA (BRIC, FMA, HMGP), Staff Time, Enterprise Funds	Short-Term

Benefits New or Existing Assets	Objectives Met	Lead Agency	Support Agency	Estimated Cost	Sources of Funding	Timeline
Action OXN-21—As part of the Memorandum of Agreement / Memorandum of Understanding with The Nature Conservancy (TNC): • Continue to partner with TNC on acquisition, restoration and mitigation planning processes • Partner on grant proposals • Participate in negotiations with land use owners • Carry-out restoration projects • Hold titles to floodplain properties as appropriate • Hold or co-hold with TNC multipurpose easements. Secure a Consolidated Coastal Development Permit to cover conservation and preservation activities over the next five years (2021-2026) that consist of the following: • Nesting shorebird protection activities • Invasive plant removal activities • Access road and trail maintenance activities • Field data collection and research. Collaborate with Ventura County Public Works Agency-Watershed Protection, TNC, and State Coastal Conservancy to advance planning, design, and implementation of the Ormond Beach Restoration and Access Plan (OBRAP), particularly those components alleviating flooding along the Ormond Lagoon Waterway and creating public access along tšumaš Creek. This supports the VCPWA-WP Action VCPWA-13. *Hazards Mitigated:* Drought, Flood, Severe Weather, Severe Storms, Sea Level Rise, Tsunami						
Existing and New	1, 2, 3, 9, 12, 13, 14, 15, 17, 18, 19	City of Oxnard	VCPWA-WP	Medium	Staff Time, Enterprise Funds, FEMA Grants (BRIC), CDFG	Ongoing

a. Short-term = Completion within 5 years; Long-term = Completion within 10 years; Ongoing= Continuing new or existing program with no completion date

Acronyms used here are defined at the beginning of this volume.

a. See the introduction to this volume for an explanation of mitigation types.

6.9 PUBLIC OUTREACH

Table 6-17 lists public outreach activities for this jurisdiction.

Table 6-17. Local Public Outreach

Local Outreach Activity	Date	Number of People Involved
Virtual Emergency Preparedness Worship	September 16, 2021	70
Adaptation Plan, outreach		
Sea Level Rise Vulnerability Assessment Report Results and Adaptation Strategies Workshop	August 9, 2017	Approximately 25
Sea Level Rise Adaptation Strategy Results & Conceptual Policies	March 14, 2018	Approximately 25

6.10 INFORMATION SOURCES USED FOR THIS ANNEX

The following technical reports, plans, and regulatory mechanisms were reviewed to provide information for this annex.

- **City of Oxnard Municipal Code**—The municipal code was reviewed for the full capability assessment and for identifying opportunities for action plan integration.
- **City of Oxnard Flood Damage Prevention Ordinance**—The flood damage prevention ordinance was reviewed for compliance with the National Flood Insurance Program.
- **City of Oxnard 2021-2026 Five Year Capital Improvement Program (CIP)**—The CIP was reviewed for identifying opportunities for action plan integration.
- **Flood Info Community Rating System Website (Ventura County):** https://www.vcfloodinfo.com/programs/flooding-and-flood-risk/vc-flood-history
- **City of Oxnard Sea Level Rise Atlas:** As required by the adopted California Coastal Commission Sea Level Rise Guidance Policy, a risk and vulnerability assessment using the best-available information and science regarding coastal erosion, flooding, wave impacts, tidal inundation and tsunamis is needed to identify potential physical impacts in the City's coastal zone. In this way, the City can determine what areas are vulnerable to impacts from these five coastal hazards individually and combined, and with projected sea level rise. https://www.oxnard.org/wp-content/uploads/2021/06/OXNARD-FINAL-LCP-Sea-Level-Rise-Map-Atlas-Task-2.pdf
- **Sea Level Rise Vulnerability Assessment and Fiscal Impact Report:** This study included a cost-benefit analysis of the adaptation strategies to allow comparison. The aim of the economic analysis was to provide a common metric against which the trade-offs between the costs and benefits of each adaptation strategy may be evaluated. The analysis accounts for the physical changes, economic benefits, and damages associated with each adaptation strategy, including th
- **City of Oxnard Emergency Operations Plan (EOP)—**The EOP was used to obtain the listing of official natural hazards that can impact the City, reference materials such as tsunami and dam inundation maps as well emergency management priorities, and public alert and warning procedures.

The following outside resources and references were reviewed:

- **Hazard Mitigation Plan Annex Development Toolkit**—The toolkit was used to support the identification of past hazard events and noted vulnerabilities, the risk ranking, and the development of the mitigation action plan.

6.11 FUTURE NEEDS TO BETTER UNDERSTAND RISK/VULNERABILITY

The City of Oxnard Fire Department is currently developing a Strategic Plan composed of numerous elements including a community risk analysis, infrastructure assessment, and community planning prioritization process. These elements are being created with significant input from key stakeholders including Fire Department personnel, City departments, external agencies, and the residential and business communities. It is anticipated that the Department's Strategic Plan, anticipated for release in 2022, will strengthen the City's understanding of risk and vulnerabilities and serve as a foundation for additional hazard mitigation project development during the next planning cycle.

7. CITY OF PORT HUENEME

7.1 LOCAL HAZARD MITIGATION PLANNING TEAM

Primary Point of Contact
Brad Conners, City Manager
250 N. Ventura Road
Port Hueneme, CA 93041
Telephone: 805-986-6501
e-mail Address: BConners@ci.port-hueneme.ca.us

Alternate Point of Contact
Charles Peretz, Deputy City Manager
250 N. Ventura Road
Port Hueneme, CA 93041
Telephone: 805-986-6501
e-mail Address: CPeretz@ci.port-hueneme.ca.us

This annex was developed by the local hazard mitigation planning team, whose members are listed in Table 7-1.

Table 7-1. Local Mitigation Planning Team Members

Name	Title
Don Villafana	Public Works Director
Lupe Acero	Deputy Finance Director
Andrew Salinas	Chief of Police
Tony Stewart	Director of Community Development
Scott Matalon	Emergency Preparedness Manager
Brad Conners	City Manager
Charles Peretz	Deputy City Manager

7.2 JURISDICTION PROFILE

7.2.1 Location and Features

Port Hueneme is a small coastal town located in Ventura County, just south of the City of Oxnard and east of Channel Islands Harbor. The City is home to Naval Base Ventura County (NBVC) and the Port of Hueneme and about five miles to the south is Naval Air Station Point Mugu. Port Hueneme is primarily built out and has a total land area of 4.5 square miles with a population of 23,647 people. Regional access to the City is provided by Highway 101 and State Route 1. The City also includes beach front properties, parks, and public beaches visited from residents and non-residents alike.

7.2.2 History

The City of Port Hueneme was incorporated on March 24, 1948. The City of Port Hueneme (pronounced “Why-nee-mee”) is a unique community along Ventura County’s Gold Coast just south of the City of Oxnard and Channel Islands Harbor. Port Hueneme is unique because of its rich history, culture, and traditions, dating back to the Chumash Indians who made their home here for centuries and because of its long-established, close relationship with the U.S. Navy’s Port Hueneme and Point Mugu naval facilities.

7.2.3 Governing Body Format

The City of Port Hueneme is governed by a five-member city council. The City consists of six departments: Finance, Housing and Facilities, Community Development, Public Works, Police, and the City Manager’s Office. The City has 2 commissions which report to the City Council. The City currently employs a total of 170 employees (full-time equivalent).

The City Council assumes responsibility for the adoption of this plan; the City Manager will oversee its implementation.

7.3 CURRENT TRENDS

7.3.1 Population

According to the California Department of Finance, the population of the City of Port Hueneme as of January 2020 was 23,607. Since 2010, the population has grown at an average annual rate of 0.85 percent.

7.3.2 Development

Anticipated future development for Port Hueneme includes creating and sustaining a strong, viable economic base for the City. The City encourages development of diversified housing types that will meet our community’s needs. This includes establishing a mix of housing types in local neighborhoods to avoid economic stratification and enhance community diversity. Future growth in the City will be managed as identified in the City’s 2045 general plan. City actions, such as those relating to land use, annexations, zoning, subdivision and design review, redevelopment, and capital improvements, must be consistent with the plan.

Table 7-2 summarizes development trends in the period since the preparation of the previous hazard mitigation plan, as well as expected future development trends.

7.4 CAPABILITY ASSESSMENT

This section describes an assessment of existing capabilities for implementing hazard mitigation strategies. The introduction at the beginning of this volume of the hazard mitigation plan describes the components included in the capability assessment and their significance for hazard mitigation planning.

Findings of the capability assessment were reviewed to identify opportunities to expand, initiate or integrate capabilities to further hazard mitigation goals and objectives. Where such opportunities were

identified and determined to be feasible, they are included in the action plan. The "Analysis of Mitigation Actions" table in this annex identifies these as community capacity building mitigation actions.

Table 7-2. Recent and Expected Future Development Trends

Criterion	Response					
Has your jurisdiction annexed any land since the preparation of the previous hazard mitigation plan?	No					
Is your jurisdiction expected to annex any areas during the performance period of this plan?	No					
Are any areas targeted for development or major redevelopment in the next five years? • **If yes, briefly describe, including whether any of the areas are in known hazard risk areas**	Yes Parcel located Victoria and Channel Islands, not in hazard area.					
How many permits for new construction were issued in your jurisdiction since the preparation of the previous hazard mitigation plan?		**2016**	**2017**	**2018**	**2019**	**2020**
	Single Family	0	0	0	0	0
	Multi-Family	0	0	0	0	0
	Other (commercial, mixed use, etc.)	0	0	0	0	0
	Total	**0**	**0**	**0**	**0**	**0**
Provide the number of new-construction permits for each hazard area or provide a qualitative description of where development has occurred.	From 2016 to current, there have been zero new permits issued as the City of Port Hueneme is built out to capacity.					
Describe the level of buildout in the jurisdiction, based on your jurisdiction's buildable lands inventory. If no such inventory exists, provide a qualitative description.	99.5%					

The findings of the assessment are presented as follows:

- An assessment of planning and regulatory capabilities is presented in Table 7-3.
- Development and permitting capabilities are presented in Table 7-4.
- An assessment of fiscal capabilities is presented in Table 7-5.
- An assessment of administrative and technical capabilities is presented in Table 7-6.
- An assessment of education and outreach capabilities is presented in Table 7-7.
- Information on National Flood Insurance Program (NFIP) compliance is presented in Table 7-8.
- Classifications under various community mitigation programs are presented in Table 7-9.
- The community's adaptive capacity for the impacts of climate change is presented in Table 7-10.

Comment: *The County of Ventura has an existing plan that describes each City role and has been adopted locally. A revision of this document is required within the coming year 2022.*				

Table 7-4. Development and Permitting Capability

Criterion	Response
Does your jurisdiction issue development permits?	Yes
If no, who does? If yes, which department? Community Development	
Does your jurisdiction have the ability to track permits by hazard area?	No
Does your jurisdiction have a buildable lands inventory?	Yes

Table 7-5. Fiscal Capability

Financial Resource	Accessible or Eligible to Use?
Community Development Block Grants	Yes
Capital Improvements Project Funding	Yes
Authority to Levy Taxes for Specific Purposes	Yes
User Fees for Water, Sewer, Gas or Electric Service ***If yes, specify:*** Water/Sewer	Yes
Incur Debt through General Obligation Bonds	Yes
Incur Debt through Special Tax Bonds	No
Incur Debt through Private Activity Bonds	No
Withhold Public Expenditures in Hazard-Prone Areas	No
State-Sponsored Grant Programs	Yes
Development Impact Fees for Homebuyers or Developers	No

Table 7-6. Administrative and Technical Capability

Staff/Personnel Resource	Available?
Planners or engineers with knowledge of land development and land management practices ***If Yes, Department /Position:*** Community Development	Yes
Engineers or professionals trained in building or infrastructure construction practices ***If Yes, Department /Position:*** Public Works, Charles Cable, Don Villafana	Yes
Planners or engineers with an understanding of natural hazards ***If Yes, Department /Position:*** Community Development and Don Villafana	Yes
Staff with training in benefit-cost analysis ***If Yes, Department /Position:*** City Contractor	Yes
Surveyors	No
Personnel skilled or trained in GIS applications	No
Scientist familiar with natural hazards in local area	No
Emergency manager ***If Yes, Department /Position:*** Emergency and Communications Manager, Police Department	Yes
Grant writers	No

Table 7-7. Education and Outreach Capability

Criterion	Response
Do you have a public information officer or communications office?	Yes
Do you have personnel skilled or trained in website development?	Yes
Do you have hazard mitigation information available on your website?	No
Do you use social media for hazard mitigation education and outreach? ***If yes, briefly describe:*** Facebook Postings	Yes
Do you have any citizen boards or commissions that address issues related to hazard mitigation? ***If yes, briefly describe:*** Currently re-developing our CERT team.	Yes
Do you have any other programs in place that could be used to communicate hazard-related information? ***If yes, briefly describe:*** VC Alert, Everbridge, email, Door Knocking, Website	Yes
Do you have any established warning systems for hazard events? ***If yes, briefly describe:*** VC Alert	Yes

Table 7-8. National Flood Insurance Program Compliance

Criterion	Response
What local department is responsible for floodplain management?	Community Dev, PW
Who is your floodplain administrator? (department/position)	Tony Stewart, Charles Cable
Are any certified floodplain managers on staff in your jurisdiction?	No
What is the date that your flood damage prevention ordinance was last amended?	1/21
Does your floodplain management program meet or exceed minimum requirements?	Meets
When was the most recent Community Assistance Visit or Community Assistance Contact?	Not had one
Does your jurisdiction have any outstanding NFIP compliance violations that need to be addressed?	No
Are any RiskMAP projects currently underway in your jurisdiction?	No
Do your flood hazard maps adequately address the flood risk within your jurisdiction? ***If no, state why.***	Yes
Does your floodplain management staff need any assistance or training to support its floodplain management program?	No
Does your jurisdiction participate in the Community Rating System (CRS)? ***If no, is your jurisdiction interested in joining the CRS program?*** Yes	No
How many flood insurance policies are in force in your jurisdiction?[a] ***What is the insurance in force?*** $17,732,000 ***What is the premium in force?*** $37,235	57
How many total loss claims have been filed in your jurisdiction?[a] ***What were the total payments for losses?*** $846	7

a. According to FEMA statistics as of March 31, 2021

Table 7-9. Community Classifications

	Participating?	Classification	Date Classified
FIPS Code	Yes	0611158296	N/A
DUNS #	Yes	157675430	N/A
Community Rating System	No	N/A	N/A
Building Code Effectiveness Grading Schedule	No	N/A	N/A
Public Protection	Yes	03/3X	12/21/2018
Storm Ready	Yes	N/A	N/A
Firewise	No	N/A	N/A
Tsunami Ready	Yes	N/A	N/A

Table 7-10. Adaptive Capacity for Climate Change

Criterion	Jurisdiction Rating[a]
Technical Capacity	
Jurisdiction-level understanding of potential climate change impacts ***Comment:*** *Addressed in 2045 Plan*	Low
Jurisdiction-level monitoring of climate change impacts ***Comment:*** *No current ability / Port of Hueneme itself conducts studies and publishes results to public*	Low
Technical resources to assess proposed strategies for feasibility and externalities ***Comment:*** *No resources identified at this time.*	Low
Jurisdiction-level capacity for development of greenhouse gas emissions inventory ***Comment:*** *None available at this time*	Low
Capital planning and land use decisions informed by potential climate impacts ***Comment:*** *Community Development/Public Works*	Medium
Participation in regional groups addressing climate risks ***Comment:*** *Public Works / Environmental Sustainability*	Low
Implementation Capacity	
Clear authority/mandate to consider climate change impacts during public decision-making processes ***Comment:*** *Considerations outlined in General Plan*	Low
Identified strategies for greenhouse gas mitigation efforts ***Comment:*** *Continued research for adoption is needed for General Plan*	Low
Identified strategies for adaptation to impacts ***Comment:*** *The current update to the General plan has addressed strategies for adaptation to impacts.*	High
Champions for climate action in local government departments ***Comment:*** *Local non-profits and groups address issues*	Low
Political support for implementing climate change adaptation strategies ***Comment:*** *City Council is supportive as well as many local organizations*	Medium
Financial resources devoted to climate change adaptation ***Comment:*** *Non identified, however grants could be looked into*	Low
Local authority over sectors likely to be negative impacted ***Comment:*** *None that we are aware of at this time*	Low
Public Capacity	
Local residents' knowledge of and understanding of climate risk ***Comment:*** *Many environmentalists in our community who monitor and report*	Low
Local residents' support of adaptation efforts ***Comment:*** *Local residences are concerned with issues and are generally supportive*	Low
Local residents' capacity to adapt to climate impacts ***Comment:*** *High likelihood to adapt based on our environmental position*	Medium
Local economy current capacity to adapt to climate impacts ***Comment:*** *None seen.*	Low
Local ecosystems capacity to adapt to climate impacts ***Comment:*** *Not a lot of ecosystems*	Medium

a. High = Capacity exists and is in use; Medium = Capacity may exist, but is not used or could use some improvement; Low = Capacity does not exist or could use substantial improvement; Unsure= Not enough information is known to assign a rating.

7.5 INTEGRATION REVIEW

For hazard mitigation planning, “integration” means that hazard mitigation information is used in other relevant planning mechanisms, such as general planning and capital facilities planning, and that relevant information from those sources is used in hazard mitigation. This section identifies where such integration is already in place, and where there are opportunities for further integration in the future. Resources listed at the end of this annex were used to provide information on integration. The progress reporting process described in Volume 1 of the hazard mitigation plan will document the progress of hazard mitigation actions related to integration and identify new opportunities for integration.

7.5.1 Existing Integration

Some level of integration has already been established between local hazard mitigation planning and the following other local plans and programs:

- **City of Port Hueneme:** General Plan
- **City of Port Hueneme:** Emergency Operations Plan (EOP)
- **Ventura County:** Operational Area Emergency Operations Plan

7.5.2 Opportunities for Future Integration

The capability assessment in this annex indicates opportunities to integrate this mitigation plan with other jurisdictional planning/regulatory capabilities. Capabilities were identified as integration opportunities if they can support or enhance the actions identified in this plan or be supported or enhanced by components of this plan. The capability assessment identified the following plans and programs that do not currently integrate hazard mitigation information but provide opportunities to do so in the future:

- **City of Port Hueneme: General Plan—**This comprehensive effort is underway and will be integrated into this effort to be compliant with AB2140.
- **City of Port Hueneme: Citizen Emergency Response Team (CERT)**—This effort will be a collaboration between the following: CERT volunteers, City staff, community-based organizations, with the existing CERT team manual.

Taking action to integrate each of these programs with the hazard mitigation plan was considered as a mitigation action to include in the action plan in this annex.

7.6 RISK ASSESSMENT

7.6.1 Jurisdiction-Specific Natural Hazard Event History

Table 7-11 lists past occurrences of natural hazards for which specific damage was recorded in this jurisdiction Other hazard events that broadly affected the entire planning area, including this jurisdiction, are listed in the risk assessments in Volume 1 of this hazard mitigation plan.

Table 7-11. Past Natural Hazard Events

Type of Event	FEMA Disaster #	Date	Damage Assessment
Erosion Events	N/A	Biennially, 2021 most recent	Every two years 2 million cubic yards of sand is dredged from the Port of Hueneme and deposited onto the east side of the Port. This erosion is ongoing and threatens roads and other infrastructure and leads to habitat disruption of local species of birds.
Pandemic COVID-19	4482-DR	January 20, 2020 Continuing	Ongoing
High Wind	N/A	2020	Strong surface high pressure in the Great Basin along with strong north to northeast flow aloft generated strong Santa Ana winds across Ventura and Los Angeles counties. North to northeast wind gusts up to 83 mph were reported in the mountains while gusts to 59 mph were reported across the coastal plain.
Wind Event	N/A	2018	Strong surface high pressure building in the Great Basin generated strong and gusty Santa Ana winds across sections of Ventura and Los Angeles counties.
Winter Storm	N/A	2018	Strong surface high pressure in the Great Basin helped to generate a moderate Santa Ana wind event across Southern California. Strong northeast winds were reported across the mountains and valleys of Ventura and Los Angeles Counties.
Tornado	N/A	2018	A powerful winter storm brought significant rain, snow and wind to the area. Rainfall totals ranged from 1 to 2 inches across coastal and valleys areas with 2 to 4 inches in the foothills and mountains. With snow levels dropping to between 2500 and 3500 feet, significant snowfall was reported in the mountains (up to 1 to 2 feet) and even the Antelope Valley (4 to 8 inches). Numerous road closures due to winter storm conditions were reported, including Interstate 5 through the Grapevine as well as Highways 14 and 138. Additionally, thunderstorms generated a waterspout over the coastal waters as well as a very weak tornado over Ventura Harbor.
Flash Flood	N/A	2018	High pressure over the four-corners region resulted in an extended monsoonal flow pattern across Southern California. For several days, strong thunderstorms produced heavy rain, flash flooding and large hail across parts of Southern California.
Debris Flow	N/A	2018	A powerful early-season winter storm moves across Southwestern California on Halloween night. The storm produced some significant rainfall with amounts in the coastal areas ranging from 0.25 to 1.50 while the mountains received up to 2.00. In the Camarillo area, near the Springs burn scar, a mud/debris flow occurred. Otherwise just some minor nuisance flooding was reported.
Thunderstorm	N/A	2017	A powerful winter storm brought heavy rain and snow, flash flooding and gusty winds to the area. Rainfall totals from this storm generally ranged between 2 and 6 inches with locally higher amounts in some foothill areas. With such rainfall amounts, there was significant snowfall totals in the local mountains with up to 28 inches of snow reported at the resort level. Additionally, the heavy rain did generate several flash flooding events including several mud and debris flows.
High Surf	N/A	4/2014	High tides and strong surf damaged the pier, beach and local streets causing road damage, pipe damage and damage to the pier.
Tsunami		March 11, 2011	7.1 earthquake in Japan. Damage to local harbors, marinas and docks
Tsunami		February 27, 2010	8.8 Quake in Chile. Damage to local harbors, marinas and docks
Northridge Earthquake	DR-1008	January 17 – November 30, 1994	Power and communications disruptions, damage to structures
St Francis Dam Disaster		March 12, 1928	$7 Million (1928)—Inundation of nearly the entire city, flooding, debris flows, destruction of infrastructure, high loss of life

7.6.2 Hazard Risk Ranking

Table 7-12 presents a local ranking of all hazards of concern for which this hazard mitigation plan provides complete risk assessments. As described in detail in Volume 1, the ranking process involves an assessment of the likelihood of occurrence for each hazard, along with its potential impacts on people, property, and the economy. Mitigation actions primarily target hazards with high and medium rankings.

Table 7-12. Hazard Risk Ranking

Rank	Hazard	Risk Ranking Score	Risk Category
1	Dam Failure	36	High
2	Earthquake	32	Medium
3	Severe Storms	24	Medium
4	Severe Weather	24	Medium
5	Landslide	18	Medium
6	Flooding	15	Low
7	Tsunami	14	Low
8	Drought	9	Low
9	Sea Level Rise	6	Low

7.6.3 Jurisdiction-Specific Vulnerabilities

Volume 1 of this hazard mitigation plan provides complete risk assessments for each identified hazard of concern. This section provides information on a few key vulnerabilities for this jurisdiction. Available jurisdiction-specific risk maps of the hazards are provided at the end of this annex.

Repetitive Loss Properties

Repetitive loss records are as follows:

- Number of FEMA-identified Repetitive-Loss Properties: 0
- Number of FEMA-identified Severe-Repetitive-Loss Properties: 0
- Number of Repetitive-Loss Properties or Severe-Repetitive-Loss Properties that have been mitigated: 0

Other Noted Vulnerabilities

The following jurisdiction-specific issues have been identified based on a review of the results of the risk assessment, public involvement strategy, and other available resources:

- **Street and Urban Flooding**—There are numerous areas of the city that flood to varying degrees during periods of high rain. The effects of this flooding range from street closures to damage to property, vehicles and buildings.
- **Power Outages/Emergency Power**—Local power outages have resulted from high winds and storm conditions as well as from the effects of wildland fire in the region. Many key city buildings including the Main City Hall and Council Chambers buildings have no backup power or emergency generators.

- **Debris Flows-** Following heavy rains and winter storms, substantial debris flows have occurred in the Santa Clara River, Ventura River, as well as local streams and culverts. Debris flows following wildland fires are particularly bad and can require removal of material from streams, streets, culverts and beaches.
- **Liquefaction Potential—**Nearly the entire City of Port Hueneme is in a "Liquefaction Zone". The effects and damage caused by seismic activities can be amplified resulting in increased damage to buildings and infrastructure.
- **Homeless Population-** A significant number of persons commonly defined as "Homeless" live on and around our local beach. During high tides and significant tidal pushes, the homeless are at greater risk.
- **Tsunami Awareness and Notification—**Port Hueneme has many visitors to its beach who may not be aware of the tsunami risk. The City does not have tsunami warning sirens.
- **Wildfire Smoke—**During wildfire events in the region the air quality in the City can become hazardous, especially when the Santa Ana winds push wildfire smoke toward the coast. Wildfire can trigger PSPS events, which amplify the hazard when city buildings lacking backup power cannot operate air conditioning systems.

Actions addressing these issues were prioritized for consideration in the action plan in this annex.

7.7 STATUS OF PREVIOUS PLAN ACTIONS

Table 7-13 summarizes the actions that were recommended in the previous version of the hazard mitigation plan and their implementation status at the time this update was prepared.

Table 7-13. Status of Previous Plan Actions

Action Item	Completed	Removed; No Longer Feasible	Carried Over to Plan Update	
			Check if Yes	Action # in Update
OA 6—Develop a public outreach program that informs property owners located in the dam and levee failure inundation areas about voluntary flood insurance. **Comment:** *Action status unknown due to staff turnover*			✓	PHE-7
OA 10—Seismically retrofit or upgrade seismically deficient government facilities and pre-identified shelter facilities. **Comment:** *Not completed due to lack of funding and staff capacity*			✓	PHE-1
OA 11—Develop and implement plans to increase the building owner's general knowledge of and appreciation for the value of seismic upgrading of the building's structural and nonstructural elements. **Comment:** *Action status unknown due to staff turnover*			✓	PHE-9
OA 13—Reinforce roads/bridges from flooding through protection activities, including elevating the roads/bridges and installing/widening culverts beneath the roads/bridges or upgrading storm drains. **Comment:** *City does not have bridges but storm drain upgrades are in process in the location of the beach. Continued work needs to continue on other parts of the city.*			✓	PHE-10
OA 18—Continue to participate in the NWS TsunamiReady Program through continued implementation of Guideline 4: Community Preparedness measures, including public outreach material and curriculum. **Comment:** *Continued participation in the program*			✓	PHE-11

7.8 HAZARD MITIGATION ACTION PLAN

Table 7-14 lists the identified actions, which make up the hazard mitigation action plan for this jurisdiction. Table 7-15 identifies the priority for each action. Table 7-16 summarizes the mitigation actions by hazard of concern and mitigation type.

Table 7-14. Hazard Mitigation Action Plan Matrix

Benefits New or Existing Assets	Objectives Met	Lead Agency	Support Agency	Estimated Cost	Sources of Funding	Timeline[a]
Action PHE-1—Mitigate beach erosion to protect shoreline roads, properties, harbor facilities, and the natural habitat, including endangered species.						
Hazards Mitigated: Flooding, Sea Level Rise, Tsunami, Severe Storms						
New & Existing	2, 13, 14, 18	USACE	Public Works	Medium	General Funds, FEMA HMA (BRIC, FMA, HMGP)	Ongoing
Action PHE-2—Where appropriate, support retrofitting, purchase or relocation of structures located in hazard areas, prioritizing those that have experienced repetitive losses and/or are located in high- or medium-risk hazard areas.						
Hazards Mitigated: Landslide, Earthquake, Severe Storms, Severe Weather, Flooding, Wildfire, Dam Failure, Sea Level Rise, Tsunami						
Existing	1, 4, 6, 9, 10, 11, 16	Public Works	Community Development	High	FEMA HMA (BRIC, FMA, HMGP)	Short-term
Action PHE-3—Integrate the hazard mitigation plan into other plans, ordinances and programs that dictate land use decisions in the community, including shoreline development.						
Hazards Mitigated: Landslide, Earthquake, Severe Storms, Severe Weather, Flooding, Wildfire, Dam Failure, Sea Level Rise, Tsunami, Drought						
New & Existing	1, 2, 10, 11, 12, 15, 16, 19	Community Development	Public Works	Low	Staff Time, General Funds	Ongoing
Action PHE-4—Actively participate in the plan maintenance protocols outlined in Volume 1 of this hazard mitigation plan.						
Hazards Mitigated: Landslide, Severe Storms, Severe Weather, Flooding, Wildfire, Dam Failure, Sea Level Rise, Tsunami, Drought						
New & Existing	1, 2, 3, 4, 6, 10, 15, 17, 19	Community Development	Public Works	Low	Staff Time, General Funds	Short-term
Action PHE-5—Continue to maintain good standing and compliance under the NFIP through implementation of floodplain management programs that, at a minimum, meet the NFIP requirements: • Enforce the flood damage prevention ordinance. • Participate in floodplain identification and mapping updates. • Provide public assistance/information on floodplain requirements and impacts.						
Hazards Mitigated: Severe Storms, Severe Weather, Flooding, Dam Failure, Sea Level Rise, Tsunami						
New & Existing	1, 2, 4, 6, 9, 10, 11, 13, 14, 15, 17, 18, 19	Public Works		Low	Staff Time, General Funds	Ongoing
Action PHE-6—Identify and pursue strategies to increase adaptive capacity to climate change including but not limited to the following: • Adopt a Climate Action Plan to reflect new State legislation, changing priorities, and environmental sustainability and greenhouse gas (GHG) reduction policies and goals. • Adopt modifications to existing plans and procedures to meet climate change issues and impacts.						
Hazards Mitigated: Landslide, Severe Storms, Severe Weather, Flooding, Wildfire, Dam Failure, Sea Level Rise, Tsunami, Drought						
New & Existing	1, 3, 4, 9, 10, 13, 14, 15, 16, 17, 19	Community Development	Public Works	Low	Staff Time, General Funds	Short-term
Action PHE-7—Purchase generators for critical facilities and infrastructure that lack adequate backup power, including the Emergency Operations Center and other critical facilities throughout the city.						
Hazards Mitigated: Dam Failure, Earthquake, Flooding, Landslide, Severe Weather, Tsunami, Wildfire						
Existing	1, 2, 7, 10	Public Works	City Manager	Medium	General Funds, FEMA HMA (BRIC, HMGP)	Long-term

Benefits New or Existing Assets	Objectives Met	Lead Agency	Support Agency	Estimated Cost	Sources of Funding	Timeline[a]
Action PHE-8—Develop a public outreach program that informs property owners located in the dam and levee failure inundation areas about voluntary flood insurance.						
Hazards Mitigated: Severe Storms, Severe Weather, Flooding, Dam Failure, Sea Level Rise, Tsunami						
Existing	1, 2, 7, 10, 17, 19	Community Development		Low	Staff Time/ General Funds	Short-Term
Action PHE-9-- Develop and implement plans to increase the building owner's general knowledge of and appreciation for the value of seismic upgrading of the building's structural and nonstructural elements.						
Hazards Mitigated: Earthquake						
Existing	1, 2, 7, 10, 17, 19	Community Development	Public Works	Low	Staff Time / General Fund	Short-Term
Action PHE-10—Reinforce roads from flooding through protection activities, including elevating the roads and installing/widening culverts beneath the roads/bridges or upgrading storm drains.						
Hazards Mitigated: Severe Storms, Severe Weather, Flood, Sea Level Rise, Tsunami						
Existing	2, 4, 6, 9, 11	Public Works		Medium	FEMA HMA (BRIC, FMA, HMGP)	Long-Term
Action PHE-11—Continue to participate in the NWS TsunamiReady and StormReady Programs through continued implementation of Guideline 4: Community Preparedness measures, including public outreach material and curriculum.						
Hazards Mitigated: Severe Storms, Severe Weather, Flood, Sea Level Rise, Tsunami						
New & Existing	1, 2, 6, 7, 8, 12, 17, 18, 19	Public Works		Low	General Funds	Ongoing
Action PHE-12—Install City tsunami warning siren network.						
Hazards Mitigated: Tsunami						
New & Existing	1, 2, 7	Public Works		Medium	FEMA HMA (BRIC, FMA, HMGP)	Short-Term

a. Short-term = Completion within 5 years; Long-term = Completion within 10 years; Ongoing= Continuing new or existing program with no completion date

Acronyms used here are defined at the beginning of this volume.

Table 7-15. Mitigation Action Priority

Action #	# of Objectives Met	Benefits	Costs	Do Benefits Equal or Exceed Cost?	Is Project Grant-Eligible?	Can Project Be Funded Under Existing Programs/ Budgets?	Implementation Priority[a]	Grant Pursuit Priority[a]
1	4	High	Medium	Yes	Yes	Yes	High	High
2	7	High	High	Yes	Yes	No	Medium	High
3	8	Medium	Low	Yes	No	Yes	High	Low
4	9	Medium	Low	Yes	No	Yes	High	Low
5	13	Medium	Low	Yes	No	Yes	High	Low
6	11	Medium	Low	Yes	No	Yes	High	Medium

Flooding	PHE-5	PHE-2, 10	PHE-8	PHE-1	PHE-7	PHE-10	PHE-6	PHE-3, 4, 6, 11
Tsunami	PHE-5, 12	PHE-2, 10	PHE-8, 12	PHE-1	PHE-7, 12	PHE-10	PHE-6	PHE-3, 4, 6, 11
Drought		PHE-2					PHE-6	PHE-3, 4, 6
Sea Level Rise	PHE-5	PHE-2, 10	PHE-8	PHE-1			PHE-6	PHE-3, 4, 6, 11

a. See the introduction to this volume for explanation of mitigation types.

7.9 PUBLIC OUTREACH

Table 7-17 lists public outreach activities for this jurisdiction.

Table 7-17. Local Public Outreach

Local Outreach Activity	Date	Number of People Involved
Social media and website (in coordination with General Plan)	9-02	45

7.10 INFORMATION SOURCES USED FOR THIS ANNEX

The following technical reports, plans, and regulatory mechanisms were reviewed to provide information for this annex.

- **City of Port Hueneme Municipal Code**—The municipal code was reviewed for the full capability assessment and for identifying opportunities for action plan integration.
- **City of Port Hueneme General Plan—**The General Plan is under revision and had been aligned to be compliant with AB2140. It was reviewed for the capability assessment and action plan development.

The following outside resources and references were reviewed:

Hazard Mitigation Plan Annex Development Toolkit—The toolkit was used to support the identification of past hazard events and noted vulnerabilities, the risk ranking, and the development of the mitigation action plan.

8. CITY OF SANTA PAULA

8.1 LOCAL HAZARD MITIGATION PLANNING TEAM

Primary Point of Contact
Scott Varner, Support Services Commander
214 S. 10th Street
Santa Paula, CA 93060
805-525-4474 ext. 105
svarner@spcity.org

Alternate Point of Contact
Kate Bader, CSO
214 S. 10th Street
Santa Paula, CA 93060
805-525-4474 ext. 113
kbader@spcity.org

This annex was developed by the local hazard mitigation planning team, whose members are listed in Table 8-1.

Table 8-1. Local Mitigation Planning Team Members

Name	Title
Dan Singer	City Manager
James Mason	Community & Economic Development Director
Jeff Mitchem	Planning Manager
Tom Tarantino	Associate Planner
Alexander Wallsten	Administrative Analyst

8.2 JURISDICTION PROFILE

8.2.1 Location and Features

The City of Santa Paula is in Ventura County, California, United States.

The current boundaries generally extend out from 34.3542° N, 119.0593° W, encompassing an area of 5.69 square miles.

The City of Santa Paula, California is located 65 miles northwest of Los Angeles and 14 miles east of Ventura and the coastline of the Pacific Ocean. Santa Paula is near the geographical center of Ventura County, situated in the rich agricultural Santa Clara River Valley. The City is surrounded by rolling hills and rugged mountain peaks in addition to orange, lemon, and avocado groves. In fact, Santa Paula is referred to as the “Citrus Capital of the World.”

8.2.2 History

The city of Santa Paula was incorporated in 1902. The original community that has become known as Santa Paula was established by the Chumash Indians as the villages of Mupu and Srswa. The land was later given away as part of a Spanish land grant to Rancho Santa Paula and Saticoy in 1840. In the 1860s the area was subdivided into small farms. In 1880, oil was discovered in Santa Paula leading to the formation of the Union Oil Company in 1890. The City of Santa Paula was incorporated on April 22, 1902. In the early 1900s Santa Paula was considered the pre-Hollywood film capital, the “Queen of the Silver Screen.” Even today, Santa Paula is noted for its movie personalities (silent and sound) who resided in and adjacent to the city and a TV or movie crew is not an unusual sight in the community.

8.2.3 Governing Body Format

The City of Santa Paula assumes responsibility for the adoption of this plan; the City Manager will oversee its implementation.

The City of Santa Paula is governed by a five-member city council. The City consists of eight departments: Administration, City Clerk, Community and Economic Development, Finance, Human Resources, Parks & Recreation, Police, and Public Works. The city has 10 commissions and task forces, which report to the City Council. The City currently employs a total of 126 employees, 98 of which are full-time.

8.3 CURRENT TRENDS

8.3.1 Population

According to the California Department of Finance, the population of the Santa Paula as of January 2020 was 30,389. Since 2010, the population has grown at an average annual rate of 0.27 percent.

8.3.2 Development

Development interest in Santa Paula has greatly increased in recent years, particularly since construction began on the highly visible East Area 1 / Harvest at Limoneira project. As Santa Paula is surrounded by a mix of greenbelt and urban curb restrictions, the majority of development proposals are for infill and adaptive reuse projects—areas where Santa Paula offers numerous opportunities. Recent legislation aimed at streamlining the entitlement process for housing projects has also generated a great deal of interest from developers.

Table 8-2 summarizes development trends in the period since the preparation of the previous hazard mitigation plan, as well as expected future development trends.

Table 8-2. Recent and Expected Future Development Trends

Criterion	Response
Has your jurisdiction annexed any land since the preparation of the previous hazard mitigation plan?	No
Is your jurisdiction expected to annex any areas during the performance period of this plan? ***If yes, describe land areas and dominant uses.***	Yes, Santa Paula West Business Park The Santa Paula West Business Park is located on 53 acres of agricultural land, currently zoned AE-40 (Agricultural Exclusive, 40 acre minimum parcel size) in the County of Ventura, on the southwestern boundary of the City of Santa Paula. It is bound to the north by Telegraph Road and residential property (zoned MHP and R-2), to the east by existing industrial and commercial development (zoned CG and C-LI), to the south by agriculture (zoned AE 40 in the County of Ventura) and to the west by the Adams Creek and agriculture (zoned AE-40 in the County of Ventura). The area is identified as SP-6, West Area 2 in the City of Santa Paula's General Plan. It is within the Sphere of Influence and the city urban restriction boundary of the City of Santa Paula with frontage along State Route 126 and Telegraph Road and is bisected by the railroad right-of-way. While it is just west of the Santa Paula City limits, the area is outside of the Santa Paula -Ventura Greenbelt. Annexation of the Santa Paula West Business Park into the City of Santa Paula has been approved by the City Council, and is currently under review by Ventura County LAFCo. County of Ventura
Are any areas targeted for development or major redevelopment in the next five years? ***If yes, briefly describe, including whether any of the areas are in known hazard risk areas***	Yes Santa Paula West Business Park (SP-6/West Area 2), see above. East Area 1 / Harvest at Limoneira—500-acres on eastern end of the City. Remaining 1,100 homes (of approved 1,500) to be constructed under adopted Specific Plan, along with commercial areas and park facilities. Hazard mitigation included in EA1 Specific Plan (SP-3)/EIR.
How many permits for new construction were issued in your jurisdiction since the preparation of the previous hazard mitigation plan?	

	2016	2017	2018	2019	2020
Single Family	4	10	2	41	174
Multi-Family	8	0	11	0	0
Other (commercial, mixed use, etc.)	1	2	1	1	0
Total	**13**	**12**	**14**	**42**	**174**

Provide the number of new-construction permits for each hazard area or provide a qualitative description of where development has occurred.	Hillside residences along northerly city boundary are either within or abutting high-fire risk areas as defined by CAL FIRE/VCFPD. Residences and businesses, including a portion of those in the new East Area 1/Harvest at Limoneira development, on the east end of the city are within FEMA flood hazard areas of Santa Paula Creek and/or Santa Clara River. These flood/liquefaction hazards have been mitigated by requirements of applicable Specific Plan(s) or development conditions.
Describe the level of buildout in the jurisdiction, based on your jurisdiction's buildable lands inventory. If no such inventory exists, provide a qualitative description.	Santa Paula is largely built-out within city limits. Remaining pockets of developable land within city limits are situated near the southeast and southwest corners. These areas either have development proposals (with hazard mitigation) under review, or an adopted Specific Plan (also including hazard mitigation).

8.4 CAPABILITY ASSESSMENT

This section describes an assessment of existing capabilities for implementing hazard mitigation strategies. The introduction at the beginning of this volume of the hazard mitigation plan describes the components included in the capability assessment and their significance for hazard mitigation planning.

Findings of the capability assessment were reviewed to identify opportunities to expand, initiate or integrate capabilities to further hazard mitigation goals and objectives. Where such opportunities were identified and determined to be feasible, they are included in the action plan. The "Analysis of Mitigation Actions" table in this annex identifies these as community capacity building mitigation actions. The findings of the assessment are presented as follows:

- An assessment of planning and regulatory capabilities is presented in Table 8-3.
- Development and permitting capabilities are presented in Table 8-4.
- An assessment of fiscal capabilities is presented in Table 8-5.
- An assessment of administrative and technical capabilities is presented in Table 8-6.
- An assessment of education and outreach capabilities is presented in Table 8-7.
- Information on National Flood Insurance Program (NFIP) compliance is presented in Table 8-8.
- Classifications under various community mitigation programs are presented in Table 8-9.
- The community's adaptive capacity for the impacts of climate change is presented in Table 8-10.

Table 8-4. Development and Permitting Capability

Criterion	Response
Does your jurisdiction issue development permits? ***If no, who does? If yes, which department?*** *Building and Safety*	Yes
Does your jurisdiction have the ability to track permits by hazard area?	Yes
Does your jurisdiction have a buildable lands inventory?	Currently being developed

Table 8-5. Fiscal Capability

Financial Resource	Accessible or Eligible to Use?
Community Development Block Grants	Yes
Capital Improvements Project Funding	Yes
Authority to Levy Taxes for Specific Purposes	Yes
User Fees for Water, Sewer, Gas or Electric Service ***If yes, specify:*** Water and Sewer	Yes
Incur Debt through General Obligation Bonds	Yes
Incur Debt through Special Tax Bonds	Yes
Incur Debt through Private Activity Bonds	No
Withhold Public Expenditures in Hazard-Prone Areas	No
State-Sponsored Grant Programs	Yes
Development Impact Fees for Homebuyers or Developers	Yes

Table 8-6. Administrative and Technical Capability

Staff/Personnel Resource	Available?
Planners or engineers with knowledge of land development and land management practices ***If Yes, Department /Position:*** Public Works/Assistant City Engineer/Community Development /Director & Manager	Yes
Engineers or professionals trained in building or infrastructure construction practices ***If Yes, Department /Position:*** Public Works/City Engineer	Yes
Planners or engineers with an understanding of natural hazards	No
Staff with training in benefit-cost analysis	No
Surveyors	No
Personnel skilled or trained in GIS applications ***If Yes, Department /Position:*** *Planning Department / Associate Planner*	Yes
Scientist familiar with natural hazards in local area	No
Emergency manager ***If Yes, Department /Position:*** Scott Varner, Commander, Santa Paula PD	Yes
Grant writers	No

Table 8-7. Education and Outreach Capability

Criterion	Response
Do you have a public information officer or communications office?	Yes
Do you have personnel skilled or trained in website development?	Yes
Do you have hazard mitigation information available on your website? ***If yes, briefly describe:*** Will be in development	No
Do you use social media for hazard mitigation education and outreach? ***If yes, briefly describe:*** In process of developing education	Yes
Do you have any citizen boards or commissions that address issues related to hazard mitigation? ***If yes, briefly describe:*** Although not a decision making body, the Citizen Corp meets monthly	Yes
Do you have any other programs in place that could be used to communicate hazard-related information? ***If yes, briefly describe:*** Social Media, Nixle	Yes
Do you have any established warning systems for hazard events? ***If yes, briefly describe:*** 1610 AM, Social Media, County reverse 911, Nixle	Yes

Table 8-8. National Flood Insurance Program Compliance

Criterion	Response
What local department is responsible for floodplain management?	Public Works
Who is your floodplain administrator? (department/position)	Public Works/Public Works Director
Are any certified floodplain managers on staff in your jurisdiction?	No
What is the date that your flood damage prevention ordinance was last amended?	May 4, 2009
Does your floodplain management program meet or exceed minimum requirements? ***If exceeds, in what ways?*** Enter Response	Meets
When was the most recent Community Assistance Visit or Community Assistance Contact?	June 18, 2018
Does your jurisdiction have any outstanding NFIP compliance violations that need to be addressed? ***If so, state what they are.*** Enter Response	No
Are any RiskMAP projects currently underway in your jurisdiction? ***If so, state what they are.*** Enter Response	No
Do your flood hazard maps adequately address the flood risk within your jurisdiction? ***If no, state why.*** The current FIRM's received from FEMA are being appealed for a variety of reasons, including significant A99 zones within the City's jurisdictional boundary. The City will be conducting its own flood study in the coming months.	No
Does your floodplain management staff need any assistance or training to support its floodplain management program? ***If so, what type of assistance/training is needed?*** Enter Response	No
Does your jurisdiction participate in the Community Rating System (CRS)? ***If no, is your jurisdiction interested in joining the CRS program?*** Yes	No
How many flood insurance policies are in force in your jurisdiction?[a] ***What is the insurance in force?*** $306,954,400 ***What is the premium in force?*** $604,233	1,021
How many total loss claims have been filed in your jurisdiction?[a] ***What were the total payments for losses?*** $134,387	63

a. According to FEMA statistics as of March 31, 2021

Table 8-9. Community Classifications

	Participating?	Classification	Date Classified
FIPS Code	Yes	0611170042	N/A
DUNS #	Yes	085937027	N/A
Community Rating System	No	N/A	N/A
Building Code Effectiveness Grading Schedule	Yes	Unknown	Unknown
Public Protection	Yes	03/3X	12/21/2018
Storm Ready	N/A	N/A	N/A
Firewise	N/A	N/A	N/A
Tsunami Ready	N/A	N/A	N/A

Table 8-10. Adaptive Capacity for Climate Change

Criterion	Jurisdiction Rating[a]
Technical Capacity	
Jurisdiction-level understanding of potential climate change impacts	Medium
Comment: *City's General Plan acknowledges understanding of potential climate change impacts. The City does not currently have an adaptation plan. However, per the General Plan, the City has policies and procedures that will be in force for future developments, entailing strict rules that will not allow for development or construction in high risk wildfire and flood areas, respectively (HPS 2.1 & 3.1). The City's Storm Drain Master Plan was also created to address deficiencies in existing drainage systems and identify proposed facilities needed to address deficiencies. The City also participates in the National Flood Insurance Program (HPS 2.2) which covers over 1,000 residences and has CIPs addressing potential climate change hazards such as the Water Recycling Facility Floodwall, project #9039, funded through SB1.*	
Jurisdiction-level monitoring of climate change impacts	Low
Comment: *City itself does not have a committee or task force that monitors climate change impacts. The City does however make informed decisions based on risk zones identified by external sources, such as FEMA, CAL Fire, Ventura County Fire, and USGS. The City updates risk zones as new data is supplied by these external sources and applies the updated information to future decision-making and land use.*	
Technical resources to assess proposed strategies for feasibility and externalities	Low
Comment: *City does not have any resources specifically dedicated to climate change impacts. City works in collaboration with Ventura County Watershed Protection to protect watercourses, public highways, life, and property from damage or destruction from floodwaters, and Ventura County Fire District in efforts to mitigate future fire risks as guided by the Ventura County Unit Strategic Fire Plan.*	
Jurisdiction-level capacity for development of greenhouse gas emissions inventory	Low
Comment: *City does not have resources dedicated to greenhouse gas inventory. City would cooperate with Ventura County Air Pollution Control District under guidelines imposed by AB 617 to develop and implement emissions reporting, monitoring, and reduction plans and measures.*	
Capital planning and land use decisions informed by potential climate impacts	Medium
Comment: *City's General Plan outlines policies and procedures that will be in force for future development that bars construction in designated high risk zones, and for other developments outside those zones requires current Federal, State, and City parameters be met during construction (HPS 2.1 & 3.1). The City has been informed of risk zones as have been identified in FEMA's Flood Hazard Zones map (2018), Ventura County's Countywide Dam Failure Inundation Areas map (2014), Santa Paula Safety Element Fire History map (2015) detailing Wildland Fire History, and CAL Fire's Wildland Fire Hazard Areas (2020) detailing fire risk zones in the Santa Paula area.*	
Participation in regional groups addressing climate risks	Low
Comment: *City complies with Ventura County ordinances and participates in the Ventura County Watershed Protection Program to protect watercourses and property from damage or destruction from floodwaters and the Ventura County Unit Strategic Fire Plan to mitigate future fire risks.*	

Criterion	Jurisdiction Rating[a]
Implementation Capacity	
Clear authority/mandate to consider climate change impacts during public decision-making processes	Low
Comment: *City does not have a direct mandate that states decision-making must consider climate change impacts. Notwithstanding, the City's General Plan outlines policies and procedures for future development and CIPs that take into account and seek to mitigate climate change hazards. City Council meets every other week and is open to the public to vote on city budgetary and CIP related issues. The Public Works Director is present to provide and inform Council and the public of climate related information as it pertains to project proposals and budge dispensations.*	
Identified strategies for greenhouse gas mitigation efforts	Low
Comment: *City is in the process of exploring EV technology options and allowing third party alternative energy companies licenses to operate to install and maintain EV charging stations and solar panels.*	
Identified strategies for adaptation to impacts	Medium
Comment: *City General Plan outlines risk zones and policies for development going forward. Land use policies outlined will bar new development in areas deemed high risk flood zones or high risk wildfire zones (HPS 2.1 & 3.1). The General Plan outlines CIPs to be developed and funded that address climate induced hazards related to flooding (HPS 2.c), programs to be .*	
Champions for climate action in local government departments	Low
Comment: *City does not have a dedicated department or staff to climate action initiatives. Although there are no direct committees dedicated to this task, Public Works is focused on complying with federal, state, and county regulations. PW has developed a General Plan that acknowledges and plans around known risk zones with the goal of mitigating future hazards and restricting further development into high risk zones.*	
Political support for implementing climate change adaptation strategies	Medium
Comment: *City Council is on board with climate change adaptation projects if they are projects that would reduce energy usage and increase energy efficiency. An Energy Efficiency Program will go before Council in Dec 2021 to vote on energy programs to implement. Council members are supportive of projects and initiatives if they will provide the community with a measurable return value or if they will directly aid further development of the city.*	
Financial resources devoted to climate change adaptation	Low
Comment: *City does not allocate resources specifically to climate change adaptation projects. Portions of the budget may be spent on future CIPs related to climate change adaptation.*	
Local authority over sectors likely to be negative impacted	Medium
Comment: *City has emergency shelters in place that have basic resources that have been used in the recent past during the Thomas Fire. Santa Paula Police have developed evacuation protocols that are enacted when necessary and in coordination with Ventura County Office of Emergency Services and Ventura County Human Services Agency.*	
Public Capacity	
Local residents' knowledge of and understanding of climate risk	Medium
Comment: *The City does not currently send out informational media content related to climate risks. City residents pay into the National Flood Insurance Program and are aware of the potential flood risks in their area.*	
Local residents' support of adaptation efforts	Medium
Comment: *Residents are supportive of adaptation efforts that directly benefit them. Residents may not be as supportive if these adaptation efforts were to take funding from projects that would impact them in a short term time frame, such as repaving of streets that are in a state of disrepair.*	
Local residents' capacity to adapt to climate impacts	Low
Comment: *The City's per capita income is 68% of the national, and the poverty rate is greater than the national average at 14.2% (Census Bureau). Residents have a limited capacity for adaptation and are reliant upon the city to make preparations and fund projects that would mitigate climate induced hazards such as floods or wildfires.*	
Local economy current capacity to adapt to climate impacts	Low
Comment: *Scope of climate impact will dictate the economy's capacity to adapt. Based on FEMA's updated Ventura County flood maps for communities along Santa Clara River the base floodplain level has risen and portions of the city south of Hwy 126 now exist in a FEMA identified base floodplain zone. Significant portions of the city to the west and east of Santa Paula Creek as well as to the north of Hwy 126 fall within a federally protected A99 zone having met specific requirements. The breaking of the one of four dams located northeast of the city could incur significant cost damages. Also the breaking of a levee could incur damages and rebuilding of said levee would require significant public funding that may not be readily reallocated.*	

Criterion	Jurisdiction Rating[a]
Local ecosystems capacity to adapt to climate impacts	Low
Comment: *The local ecosystem consists largely of the Santa Clara River watershed which is protected in cooperation with Ventura County Watershed Protection. Wildfires have burned through the foothills to the north and east of the city, including the Thomas Fire (2017) and Simi Fire (2003), respectively. Extensive research and study has not been conducted to ascertain the long-term ecosystem damage or recovery of the region.*	

a. High = Capacity exists and is in use; Medium = Capacity may exist, but is not used or could use some improvement; Low = Capacity does not exist or could use substantial improvement; Unsure= Not enough information is known to assign a rating.

8.5 INTEGRATION REVIEW

For hazard mitigation planning, "integration" means that hazard mitigation information is used in other relevant planning mechanisms, such as general planning and capital facilities planning, and that relevant information from those sources is used in hazard mitigation. This section identifies where such integration is already in place, and where there are opportunities for further integration in the future. Resources listed at the end of this annex were used to provide information on integration. The progress reporting process described in Volume 1 of the hazard mitigation plan will document the progress of hazard mitigation actions related to integration and identify new opportunities for integration.

8.5.1 Existing Integration

Some level of integration has already been established between local hazard mitigation planning and the following other local plans and programs:

- **2040 General Plan—**four-year update process recently completed (late 2021).
- **Draft Urban Water Management Plan (UWMP) and Water Shortage Contingency Plan—** updated documents in final stages of review.

8.5.2 Opportunities for Future Integration

The capability assessment in this annex indicates opportunities to integrate this mitigation plan with other jurisdictional planning/regulatory capabilities. Capabilities were identified as integration opportunities if they can support or enhance the actions identified in this plan or be supported or enhanced by components of this plan. The capability assessment identified the following plans and programs that do not currently integrate hazard mitigation information but provide opportunities to do so in the future:

- **2029 Housing Element—**draft HE Update currently under review w/CA HCD

Taking action to integrate each of these programs with the hazard mitigation plan was considered as a mitigation action to include in the action plan in this annex.

8.6 RISK ASSESSMENT

8.6.1 Jurisdiction-Specific Natural Hazard Event History

Table 8-11 lists past occurrences of natural hazards for which specific damage was recorded in this jurisdiction Other hazard events that broadly affected the entire planning area, including this jurisdiction, are listed in the risk assessments in Volume 1 of this hazard mitigation plan.

Table 8-11. Past Natural Hazard Events

Type of Event	FEMA Disaster #	Date	Damage Assessment
Thomas Fire	FM-5224	2017	281,893 acres burned over the course of 38 days across the Santa Barbara and Ventura Counties. 280 structures were damaged and 1,063 structures were destroyed. Residents were evacuated and significant smoke covered the area. A hazard shelter was set up with basic resources in Santa Paula for evacuees.
Simi Fire	N/A	2003	108,204 acres burned over the course of 10 days in the Simi Valley. Significant smoke billowed over the valley.11 structures were damaged, 315 structures destroyed, 21 injuries. No property damages in Santa Paula.
Maria Fire	FM-5302	November 1, 2019	9,999 acres burned over 5 days. 4 structures were destroyed. Residents were evacuated and diverted by Santa Paula PD. Significant smoke lingering causing respiratory irritation.
Flash Flood	N/A	January 4, 2008	Rainfall totals between January 4th and 6th ranged from 5 to 11 inches in the foothills and mountains. The total amount of rainfall, combined with rainfall rates around 1 inch per hour, produced numerous reports of flooding as well as mud and debris flows.
SC River Flood/SP Airport	DR-1585	2005	Flooding closed all ingress and egress from the city. Santa Paula airport was closed for several months due to flood damage to the runway--southern portion of the airport and runway was washed away by flood waters.
Flash Flood	N/A	November 30, 2002	An intense thunderstorm produced heavy rain and flash flooding near the community of Santa Paula. Law enforcement officials reported the intersection of Foothill Boulevard and Briggs Road as well as the intersection of Telegraph Road and Briggs Road were inundated with over 2 feet of water.
Wildfire	N/A	December 25, 2000	Gusty Santa Ana winds fueled a wildfire in the hills between the cities of Santa Paula and Somis. The fire, which burned over 360 acres, was started by downed power lines.
Northridge Earthquake	DR-1008	1994	6.7 magnitude earthquake centered in Northridge. 57 fatalities reported during caused by earthquake with injuries over the thousands. Damages caused were over $20 billion in costs with double that in economic loss. Marked the costliest earthquake in U.S. history.
SC River Flood	DR-253	1969	13 reported deaths. 5 bridge crossings destroyed. Property damage was estimated at $60 million.
St. Francis Dam Flood	N/A	1928	Countywide, more than 530 people died; bridges, orchards, farms, homes all eradicated in flood's path down the Santa Clara river valley to the Pacific Ocean.

8.6.2 Hazard Risk Ranking

Table 8-12 presents a local ranking of all hazards of concern for which this hazard mitigation plan provides complete risk assessments. As described in detail in Volume 1, the ranking process involves an assessment of the likelihood of occurrence for each hazard, along with its potential impacts on people, property, and the economy. Mitigation actions primarily target hazards with high and medium rankings.

Table 8-12. Hazard Risk Ranking

Rank	Hazard	Risk Ranking Score	Risk Category
1	Flooding	48	High
2	Dam Failure	36	High
3	Earthquake	32	Medium
4	Severe Storms	24	Medium
5	Severe Weather	24	Medium
6	Landslide	18	Medium
7	Wildfire	12	Low
8	Drought	9	Low

8.6.3 Jurisdiction-Specific Vulnerabilities

Volume 1 of this hazard mitigation plan provides complete risk assessments for each identified hazard of concern. This section provides information on a few key vulnerabilities for this jurisdiction. Available jurisdiction-specific risk maps of the hazards are provided at the end of this annex.

Repetitive Loss Properties

Repetitive loss records are as follows:

- Number of FEMA-identified Repetitive-Loss Properties: 3
- Number of FEMA-identified Severe-Repetitive-Loss Properties: 0
- Number of Repetitive-Loss Properties or Severe-Repetitive-Loss Properties that have been mitigated: 0

Other Noted Vulnerabilities

No jurisdiction-specific issues were identified by the results of the risk assessment, public involvement strategy, or other available resources.

8.7 STATUS OF PREVIOUS PLAN ACTIONS

Table 8-13 summarizes the actions that were recommended in the previous version of the hazard mitigation plan and their implementation status at the time this update was prepared.

8.8 HAZARD MITIGATION ACTION PLAN

Table 8-14 lists the identified actions, which make up the hazard mitigation action plan for this jurisdiction. Table 8-15 identifies the priority for each action. Table 8-16 summarizes the mitigation actions by hazard of concern and mitigation type.

Table 8-13. Status of Previous Plan Actions

Action Item	Completed	Removed; No Longer Feasible	Carried Over to Plan Update: Check if Yes	Carried Over to Plan Update: Action # in Update
OA 6—Develop a public outreach program that informs property owners located in the dam and levee failure inundation areas about voluntary flood insurance.			✓	SP-4
Comment: Ongoing initiative, Public Works				
OA 7—Develop a water conservation public outreach program to increase awareness about the drought, fines and penalties for overuse and solutions for conserving water.			✓	SP-11
Comment: Ongoing initiative, Public Works				
OA 11—Develop and implement plans to increase the building owner's general knowledge of and appreciation for the value of seismic upgrading of the building's structural and nonstructural elements.			✓	SP-1
Comment: Ongoing initiative, Building & Safety / Public Works				
OA 14—Acquire, relocate, or elevate residential structures, in particular those that have been identified as RL properties, within the 100-year floodplain.			✓	SP-1
Comment: Ongoing initiative, Public Works				

Table 8-14. Hazard Mitigation Action Plan Matrix

Benefits New or Existing Assets	Objectives Met	Lead Agency	Support Agency	Estimated Cost	Sources of Funding	Timeline[a]
Action SP-1—Where appropriate, support retrofitting, purchase or relocation of structures located in hazard areas, prioritizing those that have experienced repetitive losses and/or are located in high- or medium-risk hazard areas.						
Hazards Mitigated: Flooding, Dam Failure, Earthquake, Severe Storms, Severe Weather, Landslide, Wildfire						
Existing	2, 6, 9, 10, 11	City of Santa Paula	None	High	FEMA HMA (BRIC, FMA, PDM and HMGP)	Short-term
Action SP-2—Integrate the hazard mitigation plan into other plans, ordinances and programs that dictate land use decisions in the community, including the East Area 1 development.						
Hazards Mitigated: Flooding, Dam Failure, Earthquake, Severe Storms, Severe Weather, Landslide, Wildfire, Drought						
New & Existing	1, 2, 3, 4, 5, 7, 8, 9, 10, 11, 12, 13, 14, 15, 17, 19	City of Santa Paula	None	Low	Staff Time, General Funds	Ongoing
Action SP-3—Actively participate in the plan maintenance protocols outlined in Volume 1 of this hazard mitigation plan.						
Hazards Mitigated: Flooding, Dam Failure, Earthquake, Severe Storms, Severe Weather, Landslide, Wildfire, Drought						
New & Existing	1, 2, 4, 6, 7, 8, 9, 11, 12, 13, 14, 15	City of Santa Paula	None	Low	Staff Time, General Funds	Short-term
Action SP-4—Continue to maintain good standing and compliance under the NFIP through implementation of floodplain management programs that, at a minimum, meet the NFIP requirements: • Enforce the flood damage prevention ordinance. • Participate in floodplain identification and mapping updates. • Provide public assistance/information on floodplain requirements and impacts.						
Hazards Mitigated: Flooding						
New & Existing	1, 2, 6, 7, 17	City of Santa Paula	None	Low	Staff Time, General Funds	Ongoing

Benefits New or Existing Assets	Objectives Met	Lead Agency	Support Agency	Estimated Cost	Sources of Funding	Timeline[a]
Action SP-5—Identify and pursue strategies to increase adaptive capacity to climate change including but not limited to the following: • Outlining floodplains and identifying areas under threat of liquefaction and subsidence that border the Santa Clara River *Hazards Mitigated:* Flooding, Severe Storms, Severe Weather, Wildfire, Drought						
New & Existing	1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 19	City of Santa Paula	VCPWA-WP	Low	FEMA HMA (BRIC, FMA, HMGP), Staff Time, General Funds	Short-term
Action SP-6—Purchase generators for critical facilities and infrastructure that lack adequate backup power, including City Hall, Police Station, Community Center, City facilities yards, water pumping stations, sewer lift stations. *Hazards Mitigated:* Dam Failure, Earthquake, Flooding, Landslide, Severe Storms, Severe Weather, Wildfire						
Existing	2, 19	City of Santa Paula		High	FEMA HMA (BRIC and HMGP), Staff Time, General Funds	Short-term
Action SP-7—Policies and procedures (HPS 1.1-4 & HPS 1.a-i) to reduce severity and damage caused by geologic hazards, including seismic upgrade of unreinforced masonry buildings as required by State regulations, annual review of building codes to ensure State codes are used in reviewing development proposals, establishing of geotechnical investigation standards and requirements to be followed by development applicants *Hazards Mitigated:* Earthquake						
New & Existing	1, 2, 4, 6, 9, 10, 11, 12, 16	City of Santa Paula	None	Medium	FEMA HMA (BRIC, HMGP), Staff Time & General Funds	Ongoing
Action SP-8—Policies and procedures (HPS 2.1-6 & HPS 2.a-f) to address dam failure and storm water flood hazards, including but not limited to flood hazard mitigation planning that locates development areas where such risk can be mitigated to acceptable levels, locating development for any new public or emergency facilities outside flood hazard zones, participation in the National Flood Insurance Program and the Community Rating System to ensure the city is incentivized to reduce risk of damage from flooding and improve flood preparedness, support of flood control projects on the Santa Clara River, Santa Paula Creek, and other waterways, inter-agency cooperation with Army Corps of Engineers and VCPWA-WP *Hazards Mitigated:* Flooding, Dam Failure						
New & Existing	1, 2, 4, 6, 9, 10, 11, 12, 16	City of Santa Paula	VCPWA-WP	Medium	FEMA HMA (BRIC, FMA, HMGP), Staff Time & General Funds	Ongoing
Action SP-9—Policies and procedures (HPS 3.1-4 & HPS 3.a-i) to address risk of wildland fire including but not limited to locating development in areas where wildland fire risks can be mitigated to an acceptable level, locating new public and emergency facilities outside high fire hazard zones, enforcement of new State fire safe and defensible space regulations and standards (Public Resource Code Sec. 4290-4291 and Government Code Sec. 51182), ensuring adequate water supply for firefighting is available in all new development, consideration of a future fire station along the urban wildland interface along State Route 150, identification of effective methods to establish buffer zones separating residential development in foothills from chaparral and other native vegetation. *Hazards Mitigated:* Wildfire						
New & Existing	1, 2, 4, 5, 6, 9, 10, 11, 12, 16	City of Santa Paula	Ventura County	Medium	FEMA HMA (BRIC, FMAP and HMGP), Staff Time & General Funds	Ongoing
Action SP-10—Maintain wildfire hazard fuel reduction program for areas that have been identified with overgrown or dead brush, trees and weeds to reduce the potential for tree-to-tree ignition. Ensure that a "maintenance now" component to provide continued fire resistance is part of the program. (Coordinates with VCFPD Action VFP-6) *Hazards Mitigated:* Wildfire						
New & Existing	2, 4, 5, 6, 8, 10, 11, 13, 14, 15, 18, 19	VCFPD	City of Santa Paula, CAL FIRE & USDA	Medium	FEMA HMA (BRIC, FMAP and HMGP), Staff Time & General Funds	Ongoing

Benefits New or Existing Assets	Objectives Met	Lead Agency	Support Agency	Estimated Cost	Sources of Funding	Timeline[a]
Action SP-11—Continue developing the water conservation public outreach program to increase awareness about the drought, fines and penalties for overuse and solutions for conserving water.						
Hazards Mitigated: Drought						
New & Existing	2, 12, 14, 16, 17	City of Santa Paula	None	Low	Staff Time & General Funds	Ongoing
Action SP-12—Determine feasibility of the City of Santa Paula joining the Community Rating System (CRS) program to enhance public safety, reduce flood damage to property and infrastructure, and reduce flood insurance rates in the community.						
Hazards Mitigated: Flooding						
New & Existing	1, 2, 19	City of Santa Paula	None	Low	Staff Time & General Funds	Short-term
Action SP-13—Water Recycling Facility Floodwall. Construct a Floodwall to protect the Water Recycling Facility, as required by FEMA. The project will cost an estimated $550,000 with funds fully secured from the Sewer budget.						
Hazards Mitigated: Flooding						
Existing	2, 6, 11	City of Santa Paula	None	High	FEMA HMA (BRIC, FMA, HMGP), Staff Time & General Funds	Short-term
Action SP-14—Water Main Replacement Program. Replace water mains deficient in capacity and not up to current seismic standards, as outlined in the City's Potable Water System Master Plan.						
Hazards Mitigated: Earthquake, Flooding, Severe Storms						
Existing	2, 6, 9, 11, 19	City of Santa Paula	None	Low	Sewer Budget, FEMA HMA (BRIC, FMA, HMGP)	Ongoing
Action SP-15—Construct an Advanced Reverse Osmosis Treatment Facility. The project is part of a mandate by the Los Angeles Area Regional Water Quality Board to construct a recycled water delivery system to be completed no later than May 1, 2022. A Water Discharge Permit was issued to the city Feb. 8, 2019, covering a 10-year period with mandated milestones. The City completed infrastructure design, CEQA/Permitting, and additional Administrative/Financing in the amount of $1,490,000 in FY 2019/2020 for the proposed transmission line, as required by the LARWQCB in the Waste Discharge Requirements and Cease and Desist Order. Funding partially (43%) secured through Sewer budget.						
Hazards Mitigated: Drought						
New & Existing	2, 3, 8, 14	City of Santa Paula	None	Medium	Sewer Budget, FEMA HMA (BRIC, FMA, HMGP)	Short-term
Action SP-16—Well Rehabilitation Program. Rehabilitate groundwater wells [18, 11, 12, 13, 14] as recommended by the City's Potable Water System Master Plan. The Decant Pump will require rebuilding or replacement of one well per year. Funding is fully secured through Water Department budget from FY 2021/2022 to FY 2025/2026.						
Hazards Mitigated: Drought						
Existing	2, 3, 14, 19	City of Santa Paula	None	Low	Sewer Budget, FEMA HMA (BRIC, FMA, HMGP)	Short-term
Action SP-17—Water Recycling Facility Capital Expenditures. Replacement of or plant improvements to critical equipment for the Water Recycling Facility. Past emergency events have identified a need to upgrade and raise elevation of the motor control center and improve water pump and wastewater processing operation sustainability during emergency events and power outage. Funding is fully secured through Sewer budget.						
Hazards Mitigated: Flooding, Drought						
Existing	2, 3, 11, 14	City of Santa Paula	None	Low	Sewer Budget, FEMA HMA (BRIC, FMA, HMGP)	Ongoing

Benefits New or Existing Assets	Objectives Met	Lead Agency	Support Agency	Estimated Cost	Sources of Funding	Timeline[a]
Action SP-18—FEMA Floodplain Restudy. Develop alternative floodplain study with associated hydrologic and hydraulic analysis to address deficiencies in current FEMA study in key areas of the City. This project will take 6 months to complete and will provide specific detail that builds upon the more general countywide study that was performed by Ventura County.						
Hazards Mitigated: Flooding						
New & Existing	1, 8, 19	City of Santa Paula	None	High	FEMA HMA (BRIC, FMA, HMGP), Staff Time & General Funds	Short-term
Action SP-19—Foothill/Cameron Drainage Improvements. Construct drainage and retaining wall improvements to address safety issues at intersection. Construct: approximately 75' of a 6' maximum height retaining wall to match existing adjacent wall along Foothill Dr; debris inlet and associated piping to address drainage and debris flows from steep adjacent agricultural property. Remove existing concrete barrier from roadway and restore two-way vehicular travel. This area has been identified as a critically affected area during flooding events.						
Hazards Mitigated: Flooding						
Existing	6, 11, 14, 18	City of Santa Paula	None	Low	FEMA HMA (BRIC, FMA, HMGP), Staff Time & General Funds	Short-term

a. Short-term = Completion within 5 years; Long-term = Completion within 10 years; Ongoing= Continuing new or existing program with no completion date

Acronyms used here are defined at the beginning of this volume.

Table 8-15. Mitigation Action Priority

Action #	# of Objectives Met	Benefits	Costs	Do Benefits Equal or Exceed Cost?	Is Project Grant-Eligible?	Can Project Be Funded Under Existing Programs/ Budgets?	Implementation Priority[a]	Grant Pursuit Priority[a]
1	5	High	High	Yes	Yes	No	Medium	High
2	16	Medium	Low	Yes	No	Yes	High	Low
3	12	Low	Low	Yes	No	Yes	High	Low
4	5	Medium	Low	Yes	No	Yes	High	Low

a. See the introduction to this volume for explanation of priorities.

Table 8-16. Analysis of Mitigation Actions

Hazard Type	Action Addressing Hazard, by Mitigation Type[a]							
	Prevention	Property Protection	Public Education & Awareness	Natural Resource Protection	Emergency Services	Structural Projects	Climate Resilience	Community Capacity Building
High-Risk Hazards								
Flooding	SP-2, 4, 8	SP-1, 8, 17			SP-6	SP-8, 13, 14, 19	SP-5, 17	SP-3, 12, 18
Dam Failure	SP-2, 8	SP-1, 8			SP-6	SP-8		SP-3
Medium-Risk Hazards								
Earthquake	SP-2, 7	SP-1, 7			SP-6	SP-14		SP-3
Severe Storms	SP-2	SP-1			SP-6	SP-14	SP-5	SP-3
Severe Weather	SP-2	SP-1			SP-6		SP-5	SP-3
Landslide	SP-2	SP-1			SP-6			SP-3
Low-Risk Hazards								
Wildfire	SP-2, 9	SP-1		SP-9, 10	SP-6		SP-5	SP-3
Drought	SP-2		SP-11			SP-15	SP-5, 15, 16, 17	SP-3

a. See the introduction to this volume for explanation of mitigation types.

8.9 PUBLIC OUTREACH

Table 8-17 lists public outreach activities for this jurisdiction.

Table 8-17. Local Public Outreach

Local Outreach Activity	Date	Number of People Involved
Seismic Upgrade Handouts/Guides, Building & Safety	Ongoing	Citywide
Water Conservation Handouts/Guides, Building & Safety	Ongoing	Citywide
Participant, California State 'Save Our Water' Program	Ongoing	Citywide

8.10 INFORMATION SOURCES USED FOR THIS ANNEX

The following technical reports, plans, and regulatory mechanisms were reviewed to provide information for this annex.

- **City of Santa Paula Municipal Code**—The municipal code was reviewed for the full capability assessment and for identifying opportunities for action plan integration.
- **City of Santa Paula Flood Damage Prevention Ordinance**—The flood damage prevention ordinance was reviewed for compliance with the National Flood Insurance Program.
- **City of Santa Paula 2040 General Plan**—The 2040 General Plan (focusing on Section 5, Hazards & Public Safety Element) was reviewed for opportunities for action plan integration. 2040-General-Plan-Section-5---Hazards-and-Public-Safety-Element (spcity.org)
- **City of Santa Paula Fiscal Year 2021/2022 & 2022/2023 Proposed Budget**—The budget was reviewed for capability assessment and for identifying opportunities for action plan integration.

The following outside resources and references were reviewed:

- **Hazard Mitigation Plan Annex Development Toolkit**—The toolkit was used to support the identification of past hazard events and noted vulnerabilities, the risk ranking, and the development of the mitigation action plan.
- **Census Bureau, Santa Paula** U.S. Census Bureau QuickFacts: United States
- **CAL FIRE Incidents** Welcome to Stats & Events (ca.gov)
- **Department of Conservation** Northridge Earthquake, January 17, 1994 (ca.gov)
- **Ventura County Public Works** Santa Clara River, Ventura County Public Works Agency (vcpublicworks.org)
- **Ventura County Flood Info** VC Flood History (vcfloodinfo.com)
- **Ventura County Community Air Protection AB 617, 2020 Annual Report** Ventura County Air Pollution Control District Community Air Protection (AB 617)
- **Tetra Tech Loss Matrix—**risk assessment spreadsheet provided by consultant.
