- G. The monitoring report shall specify the USEPA analytical method used, the Method Detection Limit (MDL), and the reporting Level (RL) [the Minimum Level (ML) or the Reported Minimum Level (RML)] for each pollutant. The MLs are those published by the State Board in the *Policy for the Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California*, February 9, 2005, Appendix 4. The ML represents the lowest quantifiable concentration in a sample based on the proper application of all method-based analytical procedures and the absence of any matrix interference. When all specific analytical steps are followed and after appropriate application of method specific factors, the ML also represents the lowest standard in the calibration curve for that specific analytical technique. When there is deviation from the method analytical procedures, such as dilution or concentration of samples, other factors may be applied to the ML depending on the sample preparation. The resulting value is the reported minimum level.
- H. The Discharger shall select the analytical method that provides a ML lower than the permit limit established for a given parameter, unless the Discharger can demonstrate that a particular ML is not attainable, in accordance with procedures set forth in 40 CFR, Part 136, and obtains approval for a higher ML from the Executive Officer, as provided for in section J. below. If the effluent limitation is lower than all the MLs in Appendix 4, SIP, the Discharge must select the method with the lowest ML for compliance purposes. The Discharger shall include in the Annual Summary Report a list of the analytical methods employed for each test.
- I. The Discharger shall instruct its laboratories to establish calibration standards so that the ML (or its equivalent if there is differential treatment of samples relative to calibration standards) is the lowest calibration standard. At no time is the Discharger to use analytical data derived from extrapolation beyond the lowest point of the calibration curve. In accordance with section J. below, the Discharger’s laboratory may employ a calibration standard lower than the ML in Appendix 4 of the SIP.
- J. In accordance with Section 2.4.3 of the SIP, the Regional Water Board Executive Officer, in consultation with the State Water Board’s Quality Assurance Program Manager, may establish an ML that is not contained in Appendix 4 of the SIP to be included in the discharger’s permit in any of the following situations:
 - a. When the pollutant under consideration is not included in Appendix 4, SIP;
 - b. When the discharger and the Regional Water Board agree to include in the permit a test method that is more sensitive than those specified in 40 CFR, Part 136 (revised as of May 14, 1999);

- c. When a discharger agrees to use an ML that is lower than those listed in Appendix 4;
- d. When a discharger demonstrates that the calibration standard matrix is sufficiently different from that used to establish the ML in Appendix 4 and proposes an appropriate ML for the matrix; or,
- e. When the discharger uses a method, which quantification practices are not consistent with the definition of the ML. Examples of such methods are USEPA-approved method 1613 for dioxins, and furans, method 1624 for volatile organic substances, and method 1625 for semi-volatile organic substances. In such cases, the discharger, the Regional Water Board, and the State Water Resources Control Board shall agree on a lowest quantifiable limit and that limit will substitute for the ML for reporting and compliance determination purposes.

If there is any conflict between foregoing provisions and the State Implementation Policy (SIP), the provisions stated in the SIP (Section 2.4) shall prevail.

- K. If the Discharger samples and performs analyses (other than for process/operational control, startup, research, or equipment testing) on any influent, effluent, or receiving water constituent more frequently than required by this Program using approved analytical methods, the results of those analyses shall be included in the report. These results shall be reflected in the calculation of the average used in demonstrating compliance with average effluent, receiving water, etc., limitations.
- L. The Discharger shall develop and maintain a record of all spills or bypasses of raw or partially treated sewage from its collection system or treatment plant according to the requirements in the WDR section of this Order. This record shall be made available to the Regional Water Board upon request and a spill summary shall be included in the annual summary report.
- M. For all bacteriological analyses, sample dilutions should be performed so the expected range of values is bracketed (for example, with multiple tube fermentation method or membrane filtration method, 2 to 16,000 per 100 ml for total and fecal coliform, at a minimum, and 1 to 1000 per 100 ml for enterococcus). The detection methods used for each analysis shall be reported with the results of the analyses.
 - a. Detection methods used for coliforms (total and fecal) shall be those presented in Table 1A of 40 CFR, Part 136 (revised March 12, 2007), unless alternate methods have been approved in advance by the United State Environmental Protection Agency (USEPA) pursuant to 40 CFR Part 136.
 - b. Detection methods used for enterococcus shall be those presented in Table 1A of 40 CFR, Part 136 (revised March 12, 2007) or in the USEPA publication EPA 600/4-85/076, *Test Methods for Escherichia coli and Enterococci in Water By*

Membrane Filter Procedure, or any improved method determined by the Regional Water Board to be appropriate.

II. MONITORING LOCATIONS

The Discharger shall establish the following monitoring locations to demonstrate compliance with the effluent limitations, discharge specifications, and other requirements in this Order:

Table 1. Monitoring Station Locations

Discharge Point Name	Monitoring Location Name	Monitoring Location Description (include Latitude and Longitude when available)
Influent Monitoring Station		
Inf-001	Influent Pump Station	The sampling location (Lat. 34 ⁰ , 14'25.44" N; Long. 119 ⁰ , 15'25.53" W) is located in the main stream of the influent channel prior to the head work adjacent to Harbor Boulevard.
Effluent Monitoring Station		
M-001	Effluent Transfer Station (Point of Compliance)	The effluent sampling station (Lat. 34 ⁰ , 14'21.45" N; Long. 119 ⁰ , 15'31.26" W) is located downstream of all treated effluent passing through this station, including the final disinfection process.
Receiving Water Monitoring Station		
R-001	Receiving Water Sample Station	This sampling location (Lat. 34 ⁰ , 13'55.58" N; Long. 119 ⁰ , 15'27.59" W) is located at the upstream from the Santa Clara River Estuary.
R-002	Receiving Water Sample Station	This sampling location (Lat. 34 ⁰ , 13'47.37" N; Long. 119 ⁰ , 15'43.15" W) is located at the south shoreline of the Santa Clara River Estuary.
R-003	Receiving Water Sample Station	This sampling location (Variable at the mouth of the outlet) is located at the west shoreline of the Santa Clara River Estuary.
R-004	Receiving Water Sample Station	This sampling location (Lat. 34 ⁰ , 14'04.15" N; Long. 119 ⁰ , 15'54.19" W) is located at the northwest shoreline of the Santa Clara River Estuary.
R-005	Receiving Water Sample Station	This sampling location (Lat. 34 ⁰ , 14'01.63" N; Long. 119 ⁰ , 15'23.79" W) is located at the upstream from the Santa Clara River Estuary and at the Harbor Boulevard Bridge crossing.

III. INFLUENT MONITORING REQUIREMENTS

Influent monitoring is required to:

- Determine compliance with NPDES permit conditions.
- Assess treatment plant performance.
- Assess effectiveness of the Pretreatment Program.

A. Monitoring Location – Influent Pump Station (Inf-001)

1. The Discharger shall monitor influent to the facility at Influent Pump Station as follows:

Table 2. Influent Monitoring

Parameter	Units	Sample Type	Minimum Sampling Frequency	Required Analytical Test Method
Flow	mgd	recorder/totalizer	continuous ¹	1
Total suspended solids	mg/L	24-hour composite	weekly	2
BOD ₅ 20°C	mg/L	24-hour composite	weekly	2
Nitrogen compounds	mg/L	grab	quarterly	2
Copper	µg/L	grab	quarterly	2
Lead	µg/L	grab	quarterly	2
Mercury	µg/L	grab	quarterly	2
Silver	µg/L	grab	quarterly	2
Zinc	µg/L	grab	quarterly	2
Cyanide	µg/L	grab	quarterly	2
Chlorodibromomethane	µg/L	grab	quarterly	2
Dichlorobromomethane	µg/L	grab	quarterly	2
Bis(2-ethylhexyl)phthalate	µg/L	grab	quarterly	2
Remaining priority pollutants ³ excluding asbestos	µg/L	24-hour composite/grab for VOCs and Chromium VI	semiannually	2
Pesticides ⁴	µg/L	24-hour composite	semiannually	2

IV. EFFLUENT MONITORING REQUIREMENTS

Effluent monitoring is required to:

- Determine compliance with NPDES permit conditions and water quality standards.
- Assess plant performance, identify operational problems and improve plant performance.

A. Monitoring Location – Effluent Transfer Station (M-001)

¹ Total daily flow and instantaneous peak daily flow (24-hr basis). Actual monitored flow shall be reported (not the maximum flow, i.e., design capacity).

² Pollutants shall be analyzed using the analytical methods described in 40 CFR Part 136; for priority pollutants the methods must meet the lowest minimum levels (MLs) specified in Attachment 4 of the SIP, where no methods are specified for a given pollutant, by methods approved by this Regional Water Board or State Water Resources Control Board.

³ Priority pollutants as defined by the California Toxics Rule (CTR) defined in Finding II.I of the Limitations and Discharge Requirements of this Order, and included as Attachment.

⁴ Pesticides are, for purposes of this order, those six constituents referred to in 40 CFR, Part 125.58 (p) (methoxychlor, demeton, guthion, malathion, mirex, and parathion).

1. The Discharger shall monitor the discharge of tertiary-treated effluent at Effluent Transfer Station as follows. If more than one analytical test method is listed for a given parameter, the Discharger must select from the listed methods and corresponding Minimum Level:

Table 3. Effluent Monitoring

Parameter	Units	Sample Type	Minimum Sampling Frequency	Required Analytical Test Method and (Minimum Level, units), respectively
Total waste flow	MGD	recorder	continuous ⁵	⁶
Turbidity	NTU	recorder	Continuous ⁴	5
Total residual chlorine	mg/L	recorder	Continuous ^{4, 7, 8}	5
Total residual chlorine	mg/L	grab ⁹	daily ¹⁰	5
Total and fecal coliform	MPN/100 mL	grab	daily	5
Settleable solids	ml/L	grab	daily	5
BOD ₅ 20°C	mg/L	24-hr comp.	daily	5
Suspended solids	mg/L	24-hr comp.	daily	5
Dissolved oxygen	mg/L	grab	daily	5
Temperature	°F	grab	weekly	5
pH	pH units	grab	weekly	5
Oil and grease	mg/L	grab	weekly	5
Total dissolved solids	mg/L	24-hr comp.	monthly	5
Fluoride	mg/L	24-hr comp.	monthly	5
Phosphate as P	mg/L	24-hr comp.	monthly	5
Phosphorous	mg/L	24-hr comp.	monthly	5
Ammonia nitrogen	mg/L	24-hr comp.	monthly	5
Nitrate nitrogen	mg/L	24-hr comp.	monthly	5
Nitrite nitrogen	mg/L	24-hr comp.	monthly	5

⁵ Where continuous monitoring of a constituent is required, the following shall be reported:

Total waste flow – Total daily and peak daily flow (24-hr basis);

Total residual chlorine – Maximum daily value (24-hr basis);

Turbidity – Maximum daily value, total amount of time each day the turbidity exceeded five turbidity units, flow-proportioned average daily value

⁶ Pollutants shall be analyzed using the analytical methods described in 40 CFR Part 136; for priority pollutants the methods must meet the lowest minimum levels (MLs) specified in Attachment 4 of the SIP, where no methods are specified for a given pollutant, by methods approved by this Regional Water Board or State Water Resources Control Board

⁷ Total residual chlorine (TRC) shall be continuously recorded. The recorded charts shall be maintained by the Permittee for at least five years. The maximum daily peak, minimum daily peak, and daily average total residual chlorine shall be reported on the monthly monitoring reports.

⁸ Continuous monitoring of TRC at the current location shall serve as an internal trigger for increased TRC end of pipe grab sampling if either of the following occur, except as noted in footnote 7.c:

a. TRC concentration excursions of up to 0.3 mg/L lasting greater than 15 minutes; or

b. TRC concentration peaks in excess of 0.3 mg/L lasting greater than 1 minute.

c. Additional end of pipe grab samples need not be taken if it can be demonstrated that a stoichiometrically appropriate amount of dechlorination chemical has been added to effectively dechlorinate the effluent to 0.1 mg/L or less for peaks in excess of 0.3 mg/L lasting more than 1 minute, but not for more than five minutes.

⁹ Grab samples shall be collected at end of pipe during peak flow.

¹⁰ Daily grab samples shall be collected Monday through Friday only, except for holidays; and not on weekends.

Parameter	Units	Sample Type	Minimum Sampling Frequency	Required Analytical Test Method and (Minimum Level, units), respectively
Organic nitrogen	mg/L	24-hr comp.	monthly	5
Total Kjeldahl nitrogen	mg/L	24-hr comp.	monthly	5
Detergents (as MBAS)	mg/L	24-hr comp.	monthly	5
Chlorophyll <i>a</i>	mg/L	grab	monthly	5
Cyanide	µg/L	grab	monthly	5
Chronic toxicity	TUc	24-hr comp.	monthly	See Section V.B.2.a

Iron	µg/L	24-hr comp.	semiannually	5
Lead	µg/L	24-hr comp.	monthly	5
Mercury	µg/L	24-hr comp.	monthly	5
Molybdenum	µg/L	24-hr comp.	semiannually	5
Nickel	µg/L	24-hr comp.	semiannually	5
Selenium	µg/L	24-hr comp.	semiannually	5
Silver	µg/L	24-hr comp.	monthly	5
Thallium	µg/L	24-hr comp.	semiannually	5
Vanadium	µg/L	24-hr comp.	semiannually	5
Zinc	µg/L	24-hr comp.	monthly	5
Chlorodibromomethane	µg/L	grab	monthly	5
Dichlorobromomethane	µg/L	grab	monthly	5
Bis(2-ethylhexyl)phthalate	µg/L	grab	monthly	5
Acetone	µg/L	grab	semiannually	5
Total xylene	µg/L	24-hr comp.	semiannually	5
TCDD	µg/L	24-hr comp.	semiannually	11
Remaining priority pollutants (excluding asbestos)	µg/L	grab/24-hr comp. for	semiannually	5

¹¹ In accordance with the SIP, the Discharger shall conduct effluent monitoring for the seventeen 2,3,7,8-tetrachlorodibenzo-p-dioxin (2,3,7,8-TCDD or dioxin) congeners in the effluent and in the receiving water Station RSW-002, located downstream of the discharge point. The Discharger shall use the appropriate Toxicity Equivalence Factor (TEF) to determine Toxic Equivalence (TEQ). Where TEQ equals the product between each of the 17 individual congeners' (i) concentration analytical result (C_i) and their corresponding Toxicity Equivalence Factor (TEF_i), (i.e., TEQ_i = C_i x TEF_i). Compliance with the Dioxin limitation shall be determined by the summation of the seventeen individual TEQs, or the following equation:

$$\text{Dioxin concentration in effluent} = \sum_{i=1}^{17} (\text{TEQ}_i) = \sum_{i=1}^{17} (C_i)(\text{TEF}_i)$$

Parameter	Units	Sample Type	Minimum Sampling Frequency	Required Analytical Test Method and (Minimum Level, units), respectively
		VOC		
Pesticides ⁴	µg/L	24-hr comp.	semiannually	5
Radioactivity (Including gross alpha, gross beta, combined radium-226 and radium-228, tritium, strontium-90 and uranium)	µg/L	24-hr comp.	semiannually	12
Emerging chemicals ¹³	µg/L	24-hr comp.	biannually	13
Endocrine disrupting chemicals ¹⁴	µg/L	24-hr comp.	biannually	Approved by DHS

V. WHOLE EFFLUENT TOXICITY TESTING REQUIREMENTS

A. Acute Toxicity

1. Definition of Acute Toxicity

Acute toxicity is a measure of primarily lethal effects that occur over a 96-hour period. Acute toxicity shall be measured in percent survival measured in undiluted (100%) effluent.

- a. The average survival in the undiluted effluent for any three (3) consecutive 96-hour static or continuous flow bioassay tests shall be at least 90%, and
- b. No single test shall produce less than 70% survival.

2. Acute Toxicity Effluent Monitoring Program

- a. **Method.** The Discharger shall conduct acute toxicity tests on 100% effluent and receiving water grab samples by methods specified in 40 CFR Part 136, which cites USEPA's *Methods for Measuring the Acute Toxicity*

¹² Analyze these radiochemicals by the following USEPA methods: method 900.0 for gross alpha and gross beta, method 903.0 or 903.1 for radium-226, method 904.0 for radium-228, method 906.0 for tritium, method 905.0 for strontium-90, and method 908.0 for uranium.

Analysis for combined Radium-226 & 228 shall be conducted only if gross alpha results for the same sample exceed 15 pCi/L or beta greater than 50 pCi/L. If Radium-226 & 228 exceeds the stipulated criteria, analyze for Tritium, Strontium-90 and uranium.

¹³ Emerging chemicals include 1,4-dioxane (USEPA 8270c test method), perchlorate (USEPA 314 test method), 1,2,3-trichloropropane (USEPA 504.1 or 8260B test method), and methyl tert-butyl ether (USEPA 8260B test method). These chemicals need to be monitored in August.

¹⁴ Endocrine disrupting chemicals include ethinyl estradiol, 17-B estradiol, estrone, bisphenol A, nonylphenol and nonylphenol polyethoxylate, octylphenol and octylphenol polyethoxylate, and polybrominated diphenyl ethers. The analytical methods for these chemicals shall be approved by the DHS.

¹⁵ Pharmaceuticals include acetaminopen, amoxicillin, azithromycin, caffeine, carbamazepine, ciprofloxacin, ethylenediamine tetra-acetic acid (EDTA), gemfibrozil, ibuprofen, iodinated contrast media, lipitor, methadone, morphine, salicylic acid, and triclosan. The analytical methods for these chemicals shall be approved by the DHS. These chemicals need to be monitored in August.

of Effluents and Receiving Waters to Freshwater and Marine Organisms, October, 2002 (EPA-821-R-02-012) or a more recent edition to ensure compliance.

- b. **Test Species.** The fathead minnow, *Pimephales promelas*, shall be used as the test species for fresh water discharges and the topsmelt, *Atherinops affinis*, shall be used as the test species for brackish discharges. However, if the salinity of the receiving water is between 1 to 32 parts per thousand (ppt), the Discharger may have the option of using the inland silverside, *Menidia beryllina*, instead of the topsmelt. The method for topsmelt is found in USEPA's *Methods for Measuring the Acute Toxicity of Effluents and Receiving Waters to Freshwater and Marine Organisms*, October, 2002 (EPA-821-R-02-012).
- c. **Alternate Reporting.** In lieu of conducting the standard acute toxicity testing with the fathead minnow, the Discharger may elect to report the results or endpoint from the first 96 hours of the chronic toxicity test as the results of the acute toxicity test, but only if the Discharger uses USEPA's August 2002 Method (EPA-821-R-02-013) to conduct the chronic toxicity test.
- d. **Acute Toxicity Accelerated Monitoring.** If the effluent toxicity requirements in Section IV.A.1.h.i.(i) or IV.A.1.h.i.(ii) of this Order is not met, the Discharger shall conduct six additional tests, approximately every two weeks, over a 12-week period. The Discharger shall ensure that results of a failing acute toxicity test are received by the Discharger within 24 hours of completion of the test and the additional tests shall begin within 5 business days of receipt of the result. If the additional tests indicate compliance with acute toxicity limitation, the Discharger may resume regular testing.

However, if the extent of the acute toxicity of the receiving water upstream of the discharge is greater than the downstream and the results of the effluent acute toxicity test comply with acute toxicity limitation, the accelerated monitoring need not be implemented for the receiving water.

- e. **Toxicity Identification Evaluation (TIE).**
 - (1). If the results of any two of the six accelerated tests are less than 90% survival, then the Discharger shall begin a Toxicity Identification Evaluation (TIE). The TIE shall include all reasonable steps to identify the sources of toxicity. Once the sources are identified, the Discharger shall take all reasonable steps to reduce toxicity to meet the objective.
 - (2) If the initial test and any of the additional six acute toxicity bioassay tests results are less than 70% survival, the Discharger shall

immediately implement Initial Investigation Toxicity Reduction Evaluation (TRE) Workplan. Once the sources are identified the Discharger shall take all reasonable steps to reduce toxicity to meet the requirements.

B. Chronic Toxicity Testing

1. Definition of Chronic Toxicity

Chronic toxicity is a measure of adverse sub-lethal effects in plants, animals, or invertebrates in a long-term test. The effects measured may include lethality or decreases in fertilization, growth, and reproduction.

2. Chronic Toxicity Effluent Monitoring Program

a. **Test Methods.** The Discharger shall conduct critical life stage chronic toxicity tests on 24-hour composite 100 % effluent samples or receiving water grab samples in accordance with EPA's *Short Term Methods for Estimating the Chronic Toxicity of Effluents and Receiving Waters to Freshwater Organisms*, October 2002 (EPA-821-R-02-013) or EPA's *Short Term Methods for Estimating the Chronic Toxicity of Effluents and Receiving Waters to Marine and Estuarine Organisms*, October 2002 (EPA-821-R-02-014), or current version.

b. Frequency

(1). **Screening and Monitoring.** - The Discharger shall conduct the first chronic toxicity test screening for three consecutive months in 2007. The Discharger shall conduct short-term tests with the cladoceran, water flea (*Ceriodaphnia dubia* - survival and reproduction test), the fathead minnow (*Pimephales promelas* - larval survival and growth test), and the green alga (*Selenastrum capricornutum* - growth test) as an initial screening process for a minimum of three, but not to exceed, five suites of tests to account for potential variability of the effluent / receiving water. After this screening period, monitoring shall be conducted using the most sensitive species.

(2). **Re-screening** is required every 24 months. The Discharger shall re-screen with the three species listed above and continue to monitor with the most sensitive species. If the first suite of re-screening tests demonstrates that the same species is the most sensitive then the re-screening does not need to include more than one suite of tests. If a different species is the most sensitive or if there is ambiguity, then the Discharger shall proceed with suites of screening tests for a minimum of three, but not to exceed five suites.

(3). Regular toxicity tests - After the screening period, monitoring shall be conducted monthly using the most sensitive species.

c. **Toxicity Units.** The chronic toxicity of the effluent shall be expressed and reported in Chronic Toxic Units, TU_c, where,

$$TU_c = \frac{100}{NOEC}$$

The No Observable Effect Concentration (NOEC) is expressed as the maximum percent effluent concentration that causes no observable effect on test organisms, as determined by the results of a critical life stage toxicity test.

3. Accelerated Monitoring

If the chronic toxicity of the effluent or the receiving water downstream the discharge exceeds the monthly trigger median of 1.0 TU_c, the Discharger shall conduct six additional tests, approximately every two weeks, over a 12-week period. The samples shall be collected and the tests initiated no less than 7 days apart. The Discharger shall ensure that they receive results of a failing chronic toxicity test within 24 hours of the completion of the test and the additional tests shall begin within 5 business days of the receipt of the result. However, if the chronic toxicity of the receiving water upstream of the discharge is greater than the downstream and the TU_c of the effluent chronic toxicity test is less than or equal to a monthly median of 1 TU_c trigger, then accelerated monitoring need not be implemented for the receiving water.

- a. If any three out of the initial test and the six additional tests results exceed 1.0 TU_c the Discharger shall immediately implement the Initial Investigation of the TRE.
- b. If implementation of the initial investigation TRE Workplan indicates the source of toxicity (e.g., a temporary plant upset, etc.), then the Discharger shall return to the normal sampling frequency required in Table 3 and Table 4 of this MRP.
- c. If all of the six additional tests required above do not exceed 1 TU_c, then the Discharger may return to the normal sampling frequency.
- d. If a TRE/TIE is initiated prior to completion of the accelerated testing schedule required, then the accelerated testing schedule may be terminated, or used as necessary in performing the TRE/TIE, as determined by the Executive Officer.

C. Quality Assurance

1. Concurrent testing with a reference toxicant shall be conducted. Reference toxicant tests shall be conducted using the same test conditions as the effluent toxicity tests (e.g., same test duration, etc).

2. If either the reference toxicant test or effluent test does not meet all test acceptability criteria (TAC) as specified in the test methods manual (EPA-821-R-02-012 and/or EPA-821-R-02-013), then the Discharger must re-sample and re-test within 14 days.
3. Control and dilution water should be receiving water or laboratory water, as appropriate, as described in the manual. If the dilution water used is different from the culture water, a second control using culture water shall be used.

D. Preparation of an Initial Investigation TRE Workplan

The Discharger shall prepare and submit a copy of the Discharger's initial investigation Toxicity Reduction Evaluation (TRE) workplan to the Executive Officer of the Regional Water Board for approval within 90 days of the effective date of this permit. If the Executive Officer does not disapprove the workplan within 60 days, the workplan shall become effective. The Discharger shall use USEPA manual EPA/833B-99/002 (municipal) as guidance, or most current version. At a minimum, the TRE Workplan must contain the provisions in Attachment G. This workplan shall describe the steps the Discharger intends to follow if toxicity is detected, and should include, at a minimum:

1. A description of the investigation and evaluation techniques that will be used to identify potential causes and sources of toxicity, effluent variability, and treatment system efficiency.
2. A description of the facility's methods of maximizing in-house treatment efficiency and good housekeeping practices, and a list of all chemicals used in the operation of the facility; and,
3. If a toxicity identification evaluation (TIE) is necessary, an indication of the person who would conduct the TIEs (i.e., an in-house expert or an outside contractor). See MRP Section V.E.3. for guidance manuals.

E. Steps in Toxicity Reduction Evaluation (TRE) and Toxicity Identification Evaluation (TIE)

1. If results of the implementation of the facility's initial investigation TRE workplan indicate the need to continue the TRE/TIE, the Discharger shall expeditiously develop a more detailed TRE workplan for submittal to the Executive Officer within 15 days of completion of the initial investigation TRE. The detailed workplan shall include, but not be limited to:
 - a. Further actions to investigate and identify the cause of toxicity;
 - b. Actions the Discharger will take to mitigate the impact of the discharge and prevent the recurrence of toxicity; and,

- c. A schedule for these actions.
2. The following section summarizes the stepwise approach used in conducting the TRE:
 - a. Step 1 includes basic data collection.
 - b. Step 2 evaluates optimization of the treatment system operation, facility housekeeping, and selection and use of in-plant process chemicals.
 - c. If Steps 1 and 2 are unsuccessful, Step 3 implements a Toxicity Identification Evaluation (TIE) and employment of all reasonable efforts using currently available TIE methodologies. The objective of the TIE shall be to identify the substance or combination of substances causing the observed toxicity.
 - d. Assuming successful identification or characterization of the toxicant(s), Step 4 evaluates final effluent treatment options.
 - e. Step 5 evaluates in-plant treatment options.
 - f. Step 6 consists of confirmation once a toxicity control method has been implemented.

Many recommended TRE elements parallel source control, pollution prevention, and storm water control program best management practices (BMPs). To prevent duplication of efforts, evidence of compliance with those requirements may be sufficient to comply with TRE requirements. By requiring the first steps of a TRE to be accelerated testing and review of the facility's TRE workplan, a TRE may be ended in its early stages. All reasonable steps shall be taken to reduce toxicity to the required level. The TRE may be ended at any stage if monitoring indicates there are no longer toxicity violations.

3. The Discharger shall initiate a TIE as part of the TRE process to identify the cause(s) of toxicity. The Discharger shall use the USEPA acute manual, chronic manual, EPA/600/R-96-054 (Phase I), EPA/600/R-92/080 (Phase II), and EPA-600/R-92/081 (Phase III), as guidance.
4. If a TRE/TIE is initiated prior to completion of the accelerated testing required in Section V.D. of this program, then the accelerated testing schedule may be terminated, or used as necessary in performing the TRE/TIE, as determined by the Executive Officer .
5. Toxicity tests conducted as part of a TRE/TIE may also be used for compliance, if appropriate.

6. The Regional Water Board recognizes that toxicity may be episodic and identification of causes of and reduction of sources of toxicity may not be successful in all cases. Consideration of enforcement action by the Board will be based, in part, on the Discharger's actions and efforts to identify and control or reduce sources of consistent toxicity.
 - a. If all the results of the six additional tests are in compliance with the chronic toxicity limitation, the Discharger may resume regular monthly testing.
 - b. If the results of any of the six accelerated tests exceeds the limitation, the Discharger shall continue to monitor weekly until six consecutive weekly tests are in compliance. At that time, the Discharger may resume regular monthly testing.
 - c. If the results of two of the six tests, or any two tests in a six-week period, exceed the limitation, the Discharger shall initiate a TRE.
 - d. If implementation of the initial investigation TRE workplan (see item D.3, above) indicates the source of toxicity (e.g., a temporary plant upset, etc.), then the Discharger shall return to the regular testing frequency.

F. Ammonia Removal

1. Except with prior approval from the Executive Officer of the Regional Water Board, ammonia shall not be removed from bioassay samples. The Discharger must demonstrate the effluent toxicity is caused by ammonia *because of increasing test pH* when conducting the toxicity test. It is important to distinguish the potential toxic effects of ammonia from other pH sensitive chemicals, such as certain heavy metals, sulfide, and cyanide. The following may be steps to demonstrate that the toxicity is caused by ammonia and not other toxicants before the Executive Officer would allow for control of pH in the test.
 - a. There is consistent toxicity in the effluent and the maximum pH in the toxicity test is in the range to cause toxicity due to increased pH.
 - b. Chronic ammonia concentrations in the effluent are greater than 4 mg/L total ammonia.
 - c. Conduct graduated pH tests as specified in the toxicity identification evaluation methods. For example, mortality should be higher at pH 8 and lower at pH 6.
 - d. Treat the effluent with a zeolite column to remove ammonia. Mortality in the zeolite treated effluent should be lower than the non-zeolite treated effluent. Then add ammonia back to the zeolite-treated samples to confirm toxicity due to ammonia.

2. When it has been demonstrated that toxicity is due to ammonia because of increasing test pH, pH may be controlled using appropriate procedures which do not significantly alter the nature of the effluent, after submitting a written request to the Regional Water Board, and receiving written permission expressing approval from the Executive Officer of the Regional Water Board.

G. Reporting

The Discharger shall submit a full report of the toxicity test results, including any accelerated testing conducted during the month, as required by this permit. Test results shall be reported in Acute Toxicity Units (TU_a) or Chronic Toxicity Units (TU_c), as required, with the self-monitoring report (SMR) for the month in which the test is conducted. If an initial investigation indicates the source of toxicity and accelerated testing is unnecessary, pursuant to Section V.A.2.d. and V.B.3., then those results also shall be submitted with the SMR for the period in which the Investigation occurred.

1. The full report shall be received by the Regional Water Board by the 15th day of the second month following sampling.
2. The full report shall consist of (1) the results; (2) the dates of sample collection and initiation of each toxicity test; (3) the toxicity limit; and, (4) printout of the toxicity program (ToxCalc or CETIS).
3. Test results for toxicity tests also shall be reported according to the appropriate manual chapter on Report Preparation and shall be attached to the SMR. Routine reporting shall include, at a minimum, as applicable, for each test, as appropriate:
 - a. sample date(s)
 - a. test initiation date
 - c. test species
 - d. end point value(s) for each dilution (e.g. number of young, growth rate, percent survival)
 - e. NOEC values in percent effluent
 - f. TU_c value(s), where $TU_c = \frac{100}{NOEC}$
 - g. Mean percent mortality (+standard deviation) after 96 hours in 100% effluent (if applicable)

- h. NOEC and LOEC (Lowest Observable Effect Concentration) values for reference toxicant test(s)
 - i. Available water quality measurements for each test (e.g., pH, D.O., temperature, conductivity, hardness, salinity, ammonia).
4. The Discharger shall provide a compliance summary that includes a summary table of toxicity data from at least eleven of the most recent samples.
 5. The Discharger shall notify this Regional Water Board immediately of any toxicity exceedance and in writing 14 days after the receipt of the results of an effluent limit. The notification will describe actions the Discharger has taken or will take to investigate and correct the cause(s) of toxicity. It may also include a status report on any actions required by the permit, with a schedule for actions not yet completed. If no actions have been taken, the reasons shall be given.

VI. LAND DISCHARGE MONITORING REQUIREMENTS

Not applicable.

VII. RECLAMATION MONITORING REQUIREMENTS

Ventura Water Reclamation Facility is recycling wastewater under separate Water Recycling Requirements contained in Order No. 87-45.

VIII. RECEIVING WATER MONITORING REQUIREMENTS – SURFACE WATER

A. Monitoring Locations – R-003, R-004, and R-005 (See Attachment B)

1. The Discharger shall monitor receiving water at R003, R-004, and R-005 as follows:

Table 4a. Receiving Water Monitoring Requirements

Parameter	Units	Sample Type	Minimum Sampling Frequency	Required Analytical Test Method
Copper	µg/L	grab	monthly	5
Lead	µg/L	grab	monthly	5
Mercury	µg/L	grab	monthly	5
Silver	µg/L	grab	monthly	5
Zinc	µg/L	grab	monthly	5
Cyanide	µg/L	grab	monthly	5
Chlorodibromomethane	µg/L	grab	monthly	5
Dichlorobromomethane	µg/L	grab	monthly	5
Bis(2-ethylhexyl)phthalate	µg/L	grab	monthly	5
Dioxin	pg/L	grab	semiannually	11
Remaining priority pollutants excluding as asbestos	µg/L	grab	semiannually	5

Parameter	Units	Sample Type	Minimum Sampling Frequency	Required Analytical Test Method
Chronic toxicity	TUc	grab	monthly	See Section V.B.2.a
Acute toxicity ¹⁶	TUa	grab	annually	See Section V.A.2.a

B. Monitoring Locations – R-001 to R-005 (See Attachment B)

1. The Discharger shall monitor receiving water at R-001 through R-005 as follows:

Table 4b. Receiving Water Monitoring Requirements

Parameter	Units	Sample Type	Minimum Sampling Frequency	Required Analytical Test Method
Total and fecal coliform	MPN/100 mL	grab	weekly	5
Residual chlorine ¹⁷	mg/L	grab	weekly	5
Hardness	mg/L	grab	weekly	5
Salinity	ppt	field	weekly	5
pH	pH units	grab	weekly	5
Temperature	°F	field	weekly	5
Dissolved oxygen	mg/L	field	weekly	5
Total phosphorous as P	mg/L	grab	monthly	5
Ammonia nitrogen	mg/L	grab	monthly	5
Nitrate nitrogen	mg/L	grab	monthly	5
Nitrite nitrogen	mg/L	grab	monthly	5
Organic nitrogen	mg/L	grab	monthly	5
Total Kjeldahl nitrogen	mg/L	grab	monthly	5
Chlorophyll a	mg/L	grab	monthly	5

C. Observation – R-001 to R-004 (See Attachment B)

Table 4c. Receiving Water Monitoring Requirements

Parameter	Minimum Sampling Frequency
Sludge banks or deposits	weekly
Oil, grease, or slicks	weekly
Foam	weekly
Solids of waste origin	weekly

IX. OTHER MONITORING REQUIREMENTS

A. Reduced Flow Study Program

In order to detect any negative impacts from reduced maintenance flows to the Santa Clara Estuary, the Discharger has been required to provide a Work Plan (required by TSO No. R4-2006-0093), which will be used to determine the minimum

¹⁶ Acute toxicity test for the receiving water is conducted in Stations R-005 and R-003 only.

¹⁷ Residual chlorine test for the receiving water is conducted in Stations R-001 to R-004.

sustenance flow in the Estuary needed, if any, to protect the habitat of endangered species in the Estuary. The monitoring aspects of this Work Plan should cover the following:

1. The level of impact on the tidewater goby's population as a result of an incremental decrease in the discharge from the Facility of 1 mgd per year;
2. The population and number trends from the "Fish Survey";
3. The influences of groundwater on the Estuary; and,
4. Evaluations of different discharge volume scenarios, which may affect breaching frequency, groundwater influence, and water quality.

The monitoring frequency is based on that proposed in the Discharger's Work Plan. The results shall be reported with the regular annual reports.

B. Regional Monitoring Program

Pursuant of 40 CFR 122.41(j) and 122.48(b), the monitoring program for a Discharger receiving an NPDES Permit must determine compliance with NPDES permit terms and conditions, and demonstrate that water quality standards are met.

Compliance monitoring focuses only on the quality of the discharge, it is not designed to assess the impact of the discharge on the receiving water in combination with other point source discharges or with any other sources of pollution (e.g., non-point source runoff, aerial fallout). Likewise, it is not designed to evaluate the current status of important ecological resources on a regional basis. However, to support the Watershed Approach, a watershed-wide Regional Monitoring Program may be designed for the Santa Clara River Watershed, with input of stakeholders, to determine: compliance with receiving water objectives; trends in surface water quality; impacts to beneficial uses; and data needs for modeling contaminants of concern.

Once this Regional Monitoring Program has been designed, the Executive Officer may require the Discharger to participate in the Regional Program and/or revise the existing monitoring program.

X. REPORTING REQUIREMENTS

A. General Monitoring and Reporting Requirements

1. The Discharger shall comply with all Standard Provisions (Attachment D) related to monitoring, reporting, and recordkeeping.
2. If there is no discharge during any reporting period, the report shall so state.

3. Each monitoring report shall contain a separate section titled "Summary of Non-Compliance" which discusses the compliance record and the corrective actions taken or planned that may be needed to bring the discharge into full compliance with waste discharge requirements. This section shall clearly list all non-compliance with discharge requirements, as well as all excursions of effluent limitations.
4. The Discharger shall inform the Regional Water Board well in advance of any proposed construction activity that could potentially affect compliance with applicable requirements.

B. Self Monitoring Reports (SMRs)

1. At any time during the term of this permit, the State or Regional Water Board may notify the Discharger to electronically submit Self-Monitoring Reports (SMRs) using the State Water Board's California Integrated Water Quality System (CIWQS) Program Web site (<http://www.waterboards.ca.gov/ciwqs/index.html>). Until such notification is given, the Discharger shall submit hard copy SMRs in accordance with the requirements described in subsection B.5 below. The CIWQS Web site will provide additional directions for SMR submittal in the event there will be service interruption for electronic submittal.
2. The Discharger shall report in the SMR the results for all monitoring specified in this MRP under sections III through IX. Additionally, the Discharger shall report in the SMR the results of any special studies (ex, the Work Plan specified in TSO R4-2006-0093), acute and chronic toxicity testing, TRE/TIE, PMP, and Pollution Prevention Plan required by Special Provisions – VI.C. of this Order. The Discharger shall submit monthly and annual SMRs including the results of all required monitoring using USEPA-approved test methods or other test methods specified in this Order. If the Discharger monitors any pollutant more frequently than required by this Order, the results of this monitoring shall be included in the calculations and reporting of the data submitted in the SMR.
3. Monitoring periods and reporting for all required monitoring shall be completed according to the following schedule:

Table 5. Monitoring Periods and Reporting Schedule

Sampling Frequency	Monitoring Period Begins On...	Monitoring Period	SMR Due Date
Continuous	Permit effective date	All	Submit with monthly SMR
Daily	Permit effective date	(Midnight through 11:59 PM) or any 24-hour period that reasonably represents a calendar day for purposes of sampling.	Submit with monthly SMR
Weekly	Sunday following permit effective date or on permit effective date if on a Sunday	Sunday through Saturday	Submit with monthly SMR

Monthly	First day of calendar month following permit effective date or on permit effective date if that date is first day of the month	1 st day of calendar month through last day of calendar month	By the 15 th day of the second month after the month of sampling
Quarterly	Closest of January 1, April 1, July 1, or October 1 following (or on) permit effective date	January 1 through March 31 April 1 through June 30 July 1 through September 30 October 1 through December 31	May 15 August 15 November 15 February 15
Semiannually	Closest of January 1 or July 1 following (or on) permit effective date	January 1 through June 30 July 1 through December 31	August 15 February 15
Annually	January 1 following (or on) permit effective date	January 1 through December 31	April 1

4. Reporting Protocols. The Discharger shall report with each sample result the applicable Reporting Level (RL) and the current Method Detection Limit (MDL), as determined by the procedure in Part 136.

The Discharger shall report the results of analytical determinations for the presence of chemical constituents in a sample using the following reporting protocols:

- a. Sample results greater than or equal to the RL shall be reported as measured by the laboratory (i.e., the measured chemical concentration in the sample).
- b. Sample results less than the RL, but greater than or equal to the laboratory's MDL, shall be reported as "Detected, but Not Quantified," or DNQ. The estimated chemical concentration of the sample shall also be reported.

For the purposes of data collection, the laboratory shall write the estimated chemical concentration next to DNQ as well as the words "Estimated Concentration" (may be shortened to "Est. Conc."). The laboratory may, if such information is available, include numerical estimates of the data quality for the reported result. Numerical estimates of data quality may be percent accuracy (\pm a percentage of the reported value), numerical ranges (low to high), or any other means considered appropriate by the laboratory.

- c. Sample results less than the laboratory's MDL shall be reported as "Not Detected," or ND.
- d. Dischargers are to instruct laboratories to establish calibration standards so that the ML value (or its equivalent if there is differential treatment of samples relative to calibration standards) is the lowest calibration standard. At no time is the Discharger to use analytical data derived from *extrapolation* beyond the lowest point of the calibration curve.

5. The Discharger shall submit hard copy SMRs (with an original signature) when required by subsection B.1 above in accordance with the following requirements:
 - a. The Discharger shall arrange all reported data in a tabular format. The data shall be summarized to clearly illustrate whether the facility is operating in compliance with interim and/or final effluent limitations. The Discharger is not required to duplicate the submittal of data that is entered in a tabular format within CIWQS. When electronic submittal of data is required and CIWQS does not provide for entry into a tabular format within the system, the Discharger shall electronically submit the data in a tabular format as an attachment.
 - b. The Discharger shall attach a cover letter to the SMR. The information contained in the cover letter shall clearly identify violations of the WDRs; discuss corrective actions taken or planned; and the proposed time schedule for corrective actions. Identified violations must include a description of the requirement that was violated and a description of the violation.
 - c. SMRs must be submitted to the Regional Water Board, signed and certified as required by the Standard Provisions (Attachment D), to the address listed below: (Reference the reports to Compliance File No. 1822 to facilitate routing to the appropriate staff and file.)

California Regional Water Quality Control Board
320 West 4th Street, Suite 200
Los Angeles, CA 90013
Attention: Information Technology Unit

C. Discharge Monitoring Reports (DMRs)

1. As described in Section X.B.1 above, at any time during the term of this permit, the State or Regional Water Board may notify the Discharger to electronically submit SMRs that will satisfy federal requirements for submittal of Discharge Monitoring Reports (DMRs). Until such notification is given, the Discharger shall submit DMRs in accordance with the requirements described below.
2. DMRs must be signed and certified as required by the standard provisions (Attachment D). The Discharge shall submit the original DMR and one copy of the DMR to the address listed below:

Standard Mail	FedEx/UPS/ Other Private Carriers
State Water Resources Control Board Division of Water Quality c/o DMR Processing Center PO Box 100 Sacramento, CA 95812-1000	State Water Resources Control Board Division of Water Quality c/o DMR Processing Center 1001 I Street, 15 th Floor Sacramento, CA 95814

3. All discharge monitoring results must be reported on the official USEPA pre-printed DMR forms (EPA Form 3320-1). Forms that are self-generated or modified cannot be accepted.

D. Other Reports

1. Annual Summary Report

By April 1 of each year, the Discharger shall submit an annual report containing a discussion of the previous year’s influent/effluent analytical results and receiving water bacterial monitoring data. The annual report shall contain graphical and tabular summaries of the monitoring analytical data. The annual report shall also contain an overview of any plans for upgrades to the treatment plant’s collection system, the treatment processes, or the outfall system. The Discharger shall submit a hard copy annual report to the Regional Water Board in accordance with the requirements described in subsection B.5 above.

Each annual monitoring report shall contain a separate section titled “Reasonable Potential Analysis” which discusses whether or not reasonable potential was triggered for pollutants which do not have a final effluent limitation in the NPDES permit. This section shall contain the following statement:” The analytical results for this sampling period did/ did not trigger reasonable potential.” If reasonable potential was triggered, then the following information should also be provided:

- a. A list of the pollutant(s) that triggered reasonable potential;
 - b. The Basin Plan or CTR criteria that was exceeded for each given pollutant;
 - c. The concentration of the pollutant(s);
 - d. The test method used to analyze the sample; and,
 - e. The date and time of sample collection.
2. The Discharger shall submit to the Regional Water Board, together with the first monitoring report required by this permit, a list of all chemicals and proprietary

additives which could affect this waste discharge, including quantities of each. Any subsequent changes in types and/or quantities shall be reported promptly.

3. The Regional Water Board requires the Discharger to file with the Regional Water Board, within 90 days after the effective date of this Order, a technical report on his preventive (failsafe) and contingency (cleanup) plans for controlling accidental discharges, and for minimizing the effect of such events. The technical report should:
 - a. Identify the possible sources of accidental loss, untreated waste bypass, and contaminated drainage. Loading and storage areas, power outage, waste treatment unit outage, and failure of process equipment, tanks, and pipes should be considered.
 - b. Evaluate the effectiveness of present facilities and procedures and state when they become operational.
 - c. Describe facilities and procedures needed for effective preventive and contingency plans.
 - d. Predict the effectiveness of the proposed facilities and procedures and provide an implementation schedule contingent interim and final dates when they will be constructed, implemented, or operational.

ATTACHMENT F – FACT SHEET

As described in section II of this Order, this Fact Sheet includes the legal requirements and technical rationale that serve as the basis for the requirements of this Order.

This Order has been prepared under a standardized format to accommodate a broad range of discharge requirements for Dischargers in California. Only those sections or subsections of this Order that are specifically identified as “not applicable” have been determined not to apply to this Discharger. Sections or subsections of this Order not specifically identified as “not applicable” are fully applicable to this Discharger.

I. PERMIT INFORMATION

The following Table summarizes administrative information related to the facility.

Table 1. Facility Information

WDID	4A560107001
Discharger	City of San Buenaventura
Name of Facility	Ventura Water Reclamation Facility, Ventura
Facility Address	1400 Spinnaker Drive
	Ventura, CA 93002-0099
	Ventura County
Facility Contact, Title and Phone	Donald Burt, Interim Wastewater Superintendent, (805) 677-4131
Authorized Person to Sign and Submit Reports	Donald Burt, Interim Wastewater Superintendent, (805) 677-4131
Mailing Address	P.O. Box 99, Ventura, CA 93002-0099
Billing Address	P.O. Box 99, Ventura, CA 93002-0099
Type of Facility	Publicly Owned Treatment Works
Major or Minor Facility	Major
Threat to Water Quality	1
Complexity	A
Pretreatment Program	Y
Reclamation Requirements	Producer
Facility Permitted Flow	14 million gallons per day
Facility Design Flow	14 million gallons per day
Watershed	Santa Clara River Watershed
Receiving Water	Santa Clara River Estuary
Receiving Water Type	Estuary

- A.** City of San Buenaventura (hereinafter Discharger) is the owner and operator of Ventura Water Reclamation Facility (hereinafter Facility), a Publicly Owned Treatment Works.

For the purposes of this Order, references to the “discharger” or “permittee” in applicable federal and state laws, regulations, plans, or policy are held to be equivalent to references to the Discharger herein.

The Water Quality Control Policy for the Enclosed Bays and Estuaries of California (Enclosed Bay and Estuaries Policy), adopted by the State Water Resources Control Board as Resolution No. 95-84 on November 16, 1995, states that:

“It is the policy of the State Board that the discharge of municipal wastewaters and industrial process waters (exclusive of cooling water discharges) to enclosed bays and estuaries, other than the San Francisco Bay-Delta system, shall be phased out at the earliest practicable date. Exceptions to this provision may be granted by a Regional Board only when the Regional Board finds that the wastewater in question would consistently be treated and discharged in such a manner that it would enhance the quality of receiving waters above that which would occur in the absence of the discharge.”

Section I.A. of Order No. 00-143 states that “The running 30-day average volume of treated wastewater discharged to the Santa Clara River Shall not be less than 5.6 mgd.” The minimal discharge of 5.6 mgd was based upon results of the 1976 Enhancement Study conducted by the Discharger and accepted by this Regional Water Board in 1977. However, there has not been a consensus among stakeholders of whether the treated wastewater discharge into the Estuary is beneficial and enhances the Estuary, or has adverse impacts to the Santa Clara River Estuary (Estuary). A Time Schedule Order (No. R4-2006-0093) adopted by the Regional Water Board on December 14, 2006, required the Discharger to evaluate the possible impact(s) on the Estuary through the studies of an increase in the reclamation program and an incremental decrease of discharge to the Estuary.

This NPDES renewal proposes to lift the requirement of maintenance flows of 5.6 mgd to the Estuary so that reclamation can be increased and discharges to the Estuary incrementally decreased by 1 mgd per year. Monitoring will ensure that endangered species residing in the Estuary are not adversely impacted by the incremental decrease in flow.

Regional Water Board staff met with the Discharger, Resource Agencies and other Interested Parties to review the results of the Updated Enhancement Study conducted by the Discharger (meetings held at the Facility on March 27, 2006 and June 12, 2006). The conclusions of the Study were largely inconclusive. However, there was concern expressed that a swift reduction in the volume of fresh wastewater to the Estuary could result in loss of habitat and adverse impacts on the Tidewater Goby. In addition, the resource agencies requested that the effluent should be monitored for emerging and pharmaceutical chemicals in order to determine the possible impact(s) of these chemicals on the aquatic life, particularly, the Tidewater Goby.

- B. The Facility discharges wastewater to the Estuary, a water of the United States, and is currently regulated by Order No. 00-143, which was adopted on October 12, 2000.
- C. The Discharger filed a report of waste discharge and submitted an application for renewal of its Waste Discharge Requirements (WDRs) and National Pollutant Discharge Elimination System (NPDES) permit on April 18, 2005. A site visit was conducted on February 1, 2007, to observe operations and collect additional data to develop permit limitations and conditions.

II. FACILITY DESCRIPTION

The Discharger owns and operates the Facility, a tertiary wastewater treatment facility located at 1400 Spinnaker Road, Ventura, California. Figure 1 shows the location of the Facility. Figure 1 shows the location of the Facility. The Facility currently receives wastewater generated from the City of San Buenaventura. The wastewater is a mixture of domestic, commercial, and industrial wastewater that is pre-treated pursuant to 40 CFR Part 403. The Facility has a design capacity of 14 mgd and serves an estimated population of 105,000 people.

A. Description of Wastewater and Biosolids Treatment or Controls

The treatment system consists of grit removal, primary sedimentation, flow equalization, roughing filters, activated sludge nitrification and denitrification¹, tertiary filters, chlorination and dechlorination, primary sludge thickener, dissolved air flotation (DAF) secondary sludge thickener, anaerobically digested, and dewatered (using filter presses). A portion of the dewatered sludge is composted (Class B), and hauled to various users in Ventura County. The remainder of the dewatered sludge is disposed of in the Simi Valley and Chiquita Canyon Landfills. The Facility is also responsible for 375 miles of sewer mains and 12 lift stations. Wastewater is discharged from Discharge Point No. 001 (Outfall) to a system of Wildlife Ponds with a combined capacity of 34 million gallons providing approximately 4 days of

¹ For the nitrification process, there are two steps for ammonia being oxidized into nitrate.

For the denitrification process, nitrate is through a redox reaction and becomes nitrogen.

The Facility currently does not have a full NDN process (full nitrification and partial denitrification). The effluent data between February 2003 and December 2006 did show the high effluent nitrate concentration (10.1 – 18.6 mg/L, average: 14.6 mg/L) and very low effluent nitrite concentration (always less than 0.4 mg/L, which is the detection limit). However, the nitrite effluent concentrations may exceed 1 mg/L of water quality objective specified in the Basin Plan based on the Best Professional Judgement, if the oxidation process of the nitrification is not complete. Therefore, a final nitrite limitation of 1 mg/L has been added to the Order No. R4-2007-XXXX and the Discharger may request to have interim nitrite effluent limitations in the future. In addition, once the full NDN is on line, the effluent nitrate concentration shall be further reduced.

detention, based on an average daily flow rate of 9.5 MGD and approximately 1.0 MGD of the treated wastewater percolating into groundwater from the Wildlife Ponds. This treated wastewater is then discharged to the Estuary, a water of the United States, within the Santa Clara River Watershed. Attachment B provides a map of the area surrounding the Facility. Attachment C provides a flow schematic of the Facility.

B. Discharge Points and Receiving Waters

1. The treated wastewater is discharged into the Estuary through the Wildlife Ponds with approximately 4-day retention, a water of the United State, at latitude 34° 14' 22.46", and longitude 119° 15' 54.84" (Discharge Serial No. 001).
2. The mouth of the Santa Clara River is sometimes closed off by a sand bar so that a shallow lagoon is created. However, at times when the sand bar is breached, either by floodwaters or by mechanical means, the lagoon empties directly into the Pacific Ocean.
3. The State of California Department of Parks and Recreation has declared McGrath State Beach and the surrounding 160 acres a natural preserve. The preserve includes the main channel of the Santa Clara River and adjacent natural lands of riparian shrub land and saltwater marsh. The purpose of the natural preserve is to protect and perpetuate the river ecosystem at the mouth of the Santa Clara River. Resource values of particular significance include: estuarine waters, which are used extensively by a wide variety of waterfowl and other water-associated birds; nesting habitat of the endangered California least tern; and riparian shrub land and saltwater marsh communities.
4. The effluent limits were derived based on the salinity of the receiving waters. The CTR specifies that fresh water criteria apply at locations where the salinity is 1 part per thousand (ppt) or less 95% or more of the time, and marine water criteria apply at locations where the salinity is 10 ppt or more 95% or more of the time. At locations where salinities fall between 1 and 10 ppt, the more stringent of either fresh or marine waters apply. The Santa Clara River Estuary typically experiences more tidal influence during winter and spring when the sand bar is open, while during the summer and fall the bar is closed and less tidal influence occurs. Data obtained from U.S. Fish and Wildlife Service demonstrate that the discharge point is classified as in-between freshwater and saltwater according to the definitions in the CTR. In this Order, the saltwater criteria were used to calculate the final effluent limits for CTR-based pollutants and ammonia.
5. A small portion of the treated wastewater is reused for turf and landscape irrigation. Approximately 1.0 MGD of the treated wastewater percolates into groundwater from three wildlife ponds on site at the treatment facility. The reuse of the treated wastewater and the percolation to groundwater are regulated under water reclamation requirements which are contained in a separate order (Order No. 87-45), adopted by this Board on April 27, 1987.

C. Summary of Existing Requirements and Self-Monitoring Report (SMR) Data

Effluent limitations contained in the existing Order for discharges from the Effluent Transfer Station and Outfall and representative monitoring data from the term of the previous Order are as follows:

Table 2. Historic Effluent Limitations and Monitoring Data

Parameter	Units	Effluent Limitation			Monitoring Data (February 2003 – December 2006)		
		Average Monthly	Average Weekly	Maximum Daily	Highest Average Monthly Discharge	Highest Average Weekly Discharge ²	Highest Daily Discharge
BOD ₅ 20°C	mg/L	20	30	45	5.1	3.8	8.6
Suspended solids	mg/L	15	40	45	2.7	6.1	7.2
Oil and Grease	mg/L	10	--	15	2.7	--	2.77
Settleable solids	ml/L	01	--	0.3	<0.1	--	<0.1
Residual chlorine	mg/L	--	--	0.1	--	--	<0.1
Arsenic	µg/L	29.4	--	59	1.9	--	1.9
Cadmium	µg/L	9.3	--	43	0.3	--	0.3
Chromium (VI)	µg/L	3.7	--	11	8.05	--	8.05
Copper	µg/L	2.0	--	2.9	17	--	17
Lead	µg/L	7.0	--	14	63	--	63
Mercury	µg/L	0.025	--	0.12	0.7	--	0.7
Nickel	µg/L	5.3	--	15.2	8	--	8
Selenium	µg/L	2.9	--	8.8	6.7	--	6.7
Silver	µg/L	--	--	2.3	9.3	--	9.3
Thallium	µg/L	6.3	--	6.3	0.6	--	0.6
Zinc	µg/L	38	--	95	239	--	239
Cyanide	µg/L	0.41	--	0.99	8	--	8
Dioxin	µg/L	1.4×10 ⁻⁸	--	2.8×10 ⁻⁸	<8.8×10 ⁻⁶	--	<8.8×10 ⁻⁶
Benzene	µg/L	--	--	71	<0.23	--	<0.23
Bromoform	µg/L	360	--	778	4.9	--	4.9
Carbon Tetrachloride	µg/L	--	--	4.4	<0.12	--	<0.12
Chlorodibromomethane	µg/L	34	--	82	43.3	--	43.3
Chlorofom	µg/L	--	--	470	122	--	122
Dichlorobromomethane	µg/L	--	--	22	91.9	--	91.9
Ethylbenzene	µg/L	29,000	--	58,290	<0.34	--	<0.34
Methylene Chloride	µg/L	1,600	--	3,216	<0.25	--	<0.25
Tetrachloroethylene	µg/L	--	--	8.9	<0.03	--	<0.03
Toluene	µg/L	200,000	--	402,000	<0.2	--	<0.2
Pentachlorophenol	µg/L	7.9	--	13	<3.6	--	<3.6
Phenol	µg/L	4,600,000	--	9,246,000	8.04	--	8.04
2,4,6-Trichlorophenol	µg/L	--	--	6.5	<2.7	--	<2.7

² The highest average weekly discharge concentration is reported for constituents that are monitored at weekly or more frequent intervals.

Parameter	Units	Effluent Limitation			Monitoring Data (February 2003 – December 2006)		
		Average Monthly	Average Weekly	Maximum Daily	Highest Average Monthly Discharge	Highest Average Weekly Discharge ²	Highest Daily Discharge
Benzidine	µg/L	0.00054	--	0.0011	<4.4	--	<4.4
Benzo(a)Anthracene	µg/L	0.049	--	0.098	<7.8	--	<7.8
Benzo(a)Pyrene	µg/L	0.049	--	0.098	<2.5	--	<2.5
Benzo(b)Fluoranthene	µg/L	0.049	--	0.098	<4.8	--	<4.8
Benzo(k)Fluoranthene	µg/L	0.049	--	0.098	<2.5	--	<2.5
Bis(2-Chloroethyl)Ether	µg/L	1.4	--	2.8	<5.7	--	<5.7

D. Compliance Summary

Data submitted revealed the following effluent limitation violations during the permit term. These violations had been reviewed and taken proper action.

Table 3. Summary of Compliance History

Date	Monitoring Period	Violation Type	Parameter	Reported Value	Permit Limit	Units	% Exceeded	Action Taken
11/8/2000	Nov-00	Monthly	Aldrin	0.168	0.00014	ug/L	119,900	NOV issued 2/2/04

E. Planned Changes to Treatment Systems

1. The City of Ventura installed temporary facilities for improved primary clarifier performance in the First Quarter of 2003. The addition of iron salt improved removal of copper (18.0 µg/L to 26.5 µg/L), nickel (9.7 µg/L to 7.1 µg/L), and zinc (69.0 µg/L to 57.1 µg/L) since November 2005. The effluent concentration of zinc (57.1 µg/L to 18.5 µg/L) was further reduced between February 2006 and August 2006. Neither copper (detection limit: 6 µg/L) nor nickel (detection limit: 10 µg/L) was detected between February 2006 and August 2006. Permanent facilities for iron salt addition will be completed in November 2007. The final effluent concentrations of these three metals are expected to be further reduced.
2. To date the City has invested \$29.5 million for the Upgrades and a new Influent Headworks Projects (Phase I) and the Capacity Upgrades (Phase II) projected budget is currently \$22 million. Phase II, which is expected to be completed in 2009, constructs an additional secondary treatment plant capacity up to 4 MGD in order to accommodate current and future flow to the Facility.

III. APPLICABLE PLANS, POLICIES, AND REGULATIONS

The requirements contained in the proposed Order are based on the requirements and authorities described in this section.

A. Legal Authorities

This Order is issued pursuant to section 402 of the federal Clean Water Act (CWA) and implementing regulations adopted by the U.S. Environmental Protection Agency (USEPA) and chapter 5.5, division 7 of the California Water Code (commencing with section 13370). It shall serve as an NPDES permit for point source discharges from this facility to surface waters. This Order also serves as Waste Discharge Requirements (WDRs) pursuant to article 4, chapter 4, division 7 of the Water Code (commencing with section 13260).

B. California Environmental Quality Act (CEQA)

Under Water Code section 13389, this action to adopt an NPDES permit is exempt from the provisions of CEQA, Public Resources Code sections 21100 through 21177.

C. State and Federal Regulations, Policies, and Plans

1. **Water Quality Control Plans.** The Regional Water Quality Control Board (Regional Water Board) adopted a Water Quality Control Plan for the Los Angeles Region (hereinafter Basin Plan) on June 13, 1994 that designates beneficial uses, establishes water quality objectives, and contains implementation programs and policies to achieve those objectives for all waters addressed through the plan. In addition, the Basin Plan implements State Water Resources Control Board (State Water Board) Resolution No. 88-63, which established state policy that all waters, with certain exceptions, should be considered suitable or potentially suitable for municipal or domestic supply. Beneficial uses applicable to the Estuary are as follows:

Table 4. Basin Plan Beneficial Uses

Discharge Point	Receiving Water Name	Beneficial Use(s)
002	Santa Clara River Estuary	<u>Existing:</u> Navigation (NAV), water contact recreation (REC-1), non-contact water recreation (REC-2), commercial and sport fishing (COMM), estuarine habitat (EST), marine habitat (MAR), wildlife habitat (WILD), rare, threatened, or endangered species (RARE), migration of aquatic organisms (MIGR), spawning, reproduction, and/or early development (SPWN), and wet land (WET).

Discharge Point	Receiving Water Name	Beneficial Use(s)
	Pacific Ocean, Nearshore ³	<p><u>Existing:</u> Industrial service supply (IND), navigation (NAV), water contact recreation (REC-1), non-contact water recreation (REC-2), commercial and sport fishing (COMM), marine habitat (MAR), wildlife habitat (WILD), Preservation of Biological Habitats (BIOL), rare, threatened, or endangered species (RARE), migration of aquatic organisms (MIGR), spawning, reproduction, and/or early development (SPWN), and shellfish harvesting (SHELL).</p>

Requirements of this Order implement the Basin Plan.

The 1994 Basin Plan provided water quality objectives for ammonia to protect aquatic life, in Tables 3-1 through Tables 3-4. However, those ammonia objectives were revised, based upon fresh and saltwater criteria.

- a. **Freshwater Ammonia Water Objective** – On April 25, 2002, the Regional Board adopted the Resolution No. 2002-011, *Amendment to the Water Quality Control Plan for the Los Angeles Region to Update the Ammonia Objectives for Inland Surface Waters (Including Enclosed Bays, Estuaries and Wetlands) with Beneficial Use Designations for Protection of Aquatic Life*. The ammonia Basin Plan amendment was approved by the State Water Board, the Office of Administrative Law, and USEPA on April 30, 2003, June 5, 2003, and June 19, 2003, respectively. Although the revised ammonia water quality objectives may be less stringent than those contained in the 1994 Basin Plan, they are still protective of aquatic life and are consistent with USEPA’s 1999 ammonia criteria update.

- b. **Saltwater Ammonia Water Objective** – On March 4, 2004, the Regional Water Board adopted the Resolution No. 2004-022, *Amendment to the Water Quality Control Plan for the Los Angeles Region to Update the Ammonia Objectives for Inland Surface Waters Not Characteristic of Freshwater (Including Enclosed Bays, Estuaries and Wetlands) with Beneficial Use Designations for Protection of Aquatic Life*. The ammonia Basin Plan amendment is consistent with the U.S. EPA "Ambient Water Quality Criteria for Ammonia (Saltwater)-1989." The amendment revised the regulatory provisions of the Basin Plan by adding language to Chapter 3 "Water Quality Objectives."

For inland surface waters not characteristic of freshwater (including enclosed bays, estuaries, and wetlands), the proposed objectives are a 4-day average concentration of unionized ammonia of 0.035 mg/L, and a one-hour average concentration of unionized ammonia of 0.233 mg/L. The proposed objectives

³ Nearshore is defined as the zone bounded by the shoreline and a line 1,000 feet from the shoreline or the 30-foot depth contours, whichever is further from the shoreline.

are fixed concentrations of unionized ammonia, independent of pH, temperature, or salinity. The proposed amendment includes an implementation procedure to convert un-ionized ammonia objectives to total ammonia effluent limits. The proposed amendment also simplifies the implementation procedures for translating ammonia objectives into effluent limits in situations where a mixing zone has been authorized by the Regional Water Board. Finally, the proposed amendment revises the implementation procedure for determining saltwater, brackish or freshwater conditions, to be consistent with the proposed objectives. The proposed objectives will apply only to inland surface waters not characteristic of freshwater (including enclosed bays, estuaries and wetlands) and do not impact the Ammonia Water Quality Objectives for ocean waters contained in the California Ocean Plan.

However, based on the beneficial uses of the Basin Plan, the freshwater ammonia water objective is not applicable in the Santa Clara River Estuary. Therefore, the saltwater ammonia water objective will be used to calculate the final ammonia effluent limitations for the Facility (See Section IV.C.2.i.(iii)(iv) in this Fact Sheet, and Attachment M).

The ammonia Basin Plan amendment was approved by the State Water Board, the Office of Administrative Law, and USEPA on July 22, 2004, September 14, 2004, and May 19, 2005, respectively.

The State Water Board adopted the *Water Quality Control Plan for Control of Temperature in the Coastal and Interstate Water and Enclosed Bays and Estuaries of California* (Thermal Plan) on May 18, 1972, and amended this plan on September 18, 1975. This plan contains temperature objectives for surface waters. Requirements of this Order implement the Thermal Plan.

The 2006 303(d) listings for the Estuary are Chem A based on an unknown source and coliform bacteria and toxaphene based on nonpoint sources. The Total Daily Maximum Loads (TMDLs) for these pollutants in the Estuary have not been established.

2. **Enclosed Bay and Estuaries Policy.** The Water Quality Control Policy for the Enclosed Bays and Estuaries of California (Enclosed Bays and Estuaries Policy), adopted by the State Water Resources Control Board as Resolution No. 95-84 on November 16, 1995, states that *"It is the policy of the State Board that the discharge of municipal wastewaters and industrial process waters (exclusive of cooling water discharges) to enclosed bays and estuaries, other than the San Francisco Bay-Delta system, shall be phased out at the earliest practicable date. Exceptions to this provision may be granted by a Regional Board only when the Regional Board finds that the wastewater in question would consistently be treated and discharged in such a manner that it would enhance the quality of receiving waters above that which would occur in the absence of the discharge."*

3. **Thermal Plan.** The State Water Board adopted the *Water Quality Control Plan for Control of Temperature in the Coastal and Interstate Water and Enclosed Bays and Estuaries of California* (Thermal Plan) on May 18, 1972, and amended this plan on September 18, 1975. This plan contains temperature objectives for surface waters. Requirements of this Order implement the Thermal Plan.
4. **National Toxics Rule (NTR) and California Toxics Rule (CTR).** USEPA adopted the NTR on December 22, 1992, and later amended it on May 4, 1995 and November 9, 1999. About forty criteria in the NTR applied in California. On May 18, 2000, USEPA adopted the CTR. The CTR promulgated new toxics criteria for California and, in addition, incorporated the previously adopted NTR criteria that were applicable in the state. The CTR was amended on February 13, 2001. These rules contain water quality criteria for priority pollutants.
5. **State Implementation Policy.** On March 2, 2000, the State Water Board adopted the *Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California* (State Implementation Policy or SIP). The SIP became effective on April 28, 2000 with respect to the priority pollutant criteria promulgated for California by the USEPA through the NTR and to the priority pollutant objectives established by the Regional Water Board in the Basin Plan. The SIP became effective on May 18, 2000 with respect to the priority pollutant criteria promulgated by the USEPA through the CTR. The State Water Board adopted amendments to the SIP on February 24, 2005 that became effective on July 13, 2005. The SIP establishes implementation provisions for priority pollutant criteria and objectives and provisions for chronic toxicity control. Requirements of this Order implement the SIP.
6. **Alaska Rule.** On March 30, 2000, USEPA revised its regulation that specifies when new and revised state and tribal water quality standards (WQS) become effective for CWA purposes (40 C.F.R. § 131.21, 65 Fed. Reg. 24641 (April 27, 2000)). Under the revised regulation (also known as the Alaska rule), new and revised standards submitted to USEPA after May 30, 2000, must be approved by USEPA before being used for CWA purposes. The final rule also provides that standards already in effect and submitted to USEPA by May 30, 2000, may be used for CWA purposes, whether or not approved by USEPA.
7. **Antidegradation Policy.** Section 131.12 requires that the state water quality standards include an antidegradation policy consistent with the federal policy. The State Water Board established California's antidegradation policy in State Water Board Resolution No. 68-16. Resolution No. 68-16 incorporates the federal antidegradation policy where the federal policy applies under federal law. Resolution No. 68-16 requires that existing water quality be maintained unless degradation is justified based on specific findings. The Regional Water Board's Basin Plan implements, and incorporates by reference, both the State and federal antidegradation policies. The permitted discharge must be

consistent with the antidegradation provision of section 131.12 and State Water Board Resolution No. 68-16.

8. **Anti-Backsliding Requirements.** Sections 402(o)(2) and 303(d)(4) of the CWA and federal regulations at title 40, Code of Federal Regulations⁴ section 122.44(l) prohibit backsliding in NPDES permits. These anti-backsliding provisions require that effluent limitations in a reissued permit must be as stringent as those in the previous permit, with some exceptions in which limitations may be relaxed.

D. Impaired Water Bodies on CWA 303(d) List

The 2006 303(d) list of impaired waters classifies the Santa Clara River Estuary as impaired by Chem A (unknown source), coliform bacteria and toxaphene (nonpoint source).

E. Other Plans, Policies and Regulations

1. **Secondary Treatment Regulations.** Section 133 of 40 CFR establishes the minimum levels of effluent quality to be achieved by secondary treatment. These limitations, established by USEPA, are incorporated into this Order, except where more stringent limitations are required by other applicable plans, policies, or regulations.
2. **Storm Water.** CWA section 402(p), as amended by the Water Quality Act of 1987, requires NPDES permits for storm water discharges. Pursuant to this requirement, in 1990, USEPA promulgated 40 CFR, Section 122.26 that established requirements for storm water discharges under an NPDES program. To facilitate compliance with federal regulations, on November 1991, the State Board issued a statewide general permit, *General NPDES Permit No. CAS000001 and Waste Discharge Requirements for Discharges of Storm Water Associated with Industrial Activities*. This permit was amended in September 1992 and reissued on April 17, 1997 in State Board Order No. 97-03-DWQ to regulate storm water discharges associated with industrial activity.

The Discharger developed and currently implements a Storm Water Pollution Prevention Plan (SWPPP), to comply with the State Water Board's (Order No. 97-03-DWQ).

3. **Sanitary Sewer Overflows.** The Clean Water Act prohibits the discharge of pollutants from point sources to surface waters of the United States unless authorized under an NPDES permit. (33 U.S.C. §§1311, 1342). The State Board adopted Statewide General Waste Discharge Requirements (WDRs) for Sanitary Sewer Systems, Water Quality Order No. 2006-0003 on May 2, 2006, to provide a consistent, statewide regulatory framework to address Sanitary

⁴ All further statutory references are to title 40 of the Code of Federal Regulations unless otherwise indicated.

Sewer Overflows (SSOs). The WDR requires public agencies that own or operate sanitary sewer systems to develop and implement sewer system management plans and report all SSOs to the State Water Board's online SSO database.

The requirements contained in this Order in Sections VI.C.3.b, VI.C.4, and VI.C.6. are intended to be consistent with the requirements in the SSO WDR. The Regional Water Board recognizes that there are areas of overlapping interest between the NPDES permit conditions and the SSO WDR requirements. The requirements of the SSO WDR are considered the minimum thresholds (see Finding 11 of WQ Order N0. 2006-0003). The Regional Water Board will accept the documentation prepared by the Permittee under the SSO WDR for compliance purposes, as satisfying the requirements in Sections .C.3.b, VI.C.4, and VI.C.6, provided for any more specific or stringent provisions enumerated in this Order, have also been addressed.

4. **Watershed Management.** This Regional Water Board has been implementing a Watershed Management Approach (WMA), to address water quality protection in the Los Angeles Region, as detailed in the Watershed Management Initiative (WMI). The WMI is designed to integrate various surface and ground water regulatory programs while promoting cooperative, collaborative efforts within a watershed. It is also designed to focus limited resources on key issues and use sound science. Information about the Santa Clara River Watershed and other watersheds in the region can be obtained from the Regional Water Board's web site at <http://www.waterboards.ca.gov/losangeles> and clicking on the word "Watersheds".

IV. RATIONALE FOR EFFLUENT LIMITATIONS AND DISCHARGE SPECIFICATIONS

The CWA requires point source dischargers to control the amount of conventional, non-conventional, and toxic pollutants that are discharged into the waters of the United States. The control of pollutants discharged is established through effluent limitations and other requirements in NPDES permits. There are two principal bases for effluent limitations in the Code of Federal Regulations: section 122.44(a) requires that permits include applicable technology-based limitations and standards; and section 122.44(d) requires that permits include water quality-based effluent limitations to attain and maintain applicable numeric and narrative water quality criteria to protect the beneficial uses of the receiving water.

A. Discharge Prohibitions

1. Effluent and receiving water limitations in this Board Order are based on the Federal Clean Water Act, Basin Plan, State Water Board 's plans and policies, U. S. Environmental Protection Agency guidance and regulations, and best practicable waste treatment technology. This order authorizes the discharge of

tertiary-treated wastewater through Discharge Points 001 and 002 only. It does not authorize any other types of discharges.

2. Pursuant to Chapter I, Part A of the Enclosed Bays and Estuaries Policy, the discharge of treated wastewater to the Estuary is prohibited after December 31, 2018, unless there has been a determination from responsible resource agencies that sustenance flow is required to support endangered species habitat.
3. The discharge to the Estuary must be removed as early as practicable, and to facilitate this, it is required that an incremental decrease of 1 mgd occurs per year, beginning in 2008.
4. Discharge of wastewater at a location different from that described in this Order is prohibited.
5. The bypass or overflow of untreated wastewater or wastes to surface waters or surface water drainage courses is prohibited, except as allowed in Standard Provision I.G. of Attachment D, Standard Provisions.
6. The maximum daily flow of influent from the collection system to the headworks of the Reclamation Facility shall not exceed the design capacity of 14 MGD.
7. The Discharger shall not cause degradation of any water supply.
8. The treatment or disposal of wastes from the facility shall not cause pollution or nuisance as defined in section 13050, subdivision (l) and (m) of the CWC.

B. Technology-Based Effluent Limitations

1. Scope and Authority

Section 301(b) of the CWA and implementing USEPA permit regulations at section 122.44, title 40 of the Code of Federal Regulations, require that permits include conditions meeting applicable technology-based requirements at a minimum, and any more stringent effluent limitations necessary to meet applicable water quality standards. The discharge authorized by this Order must meet minimum federal technology-based requirements based on Secondary Treatment Standards at Part 133.

2. Applicable Technology-Based Effluent Limitations

This facility is subject to the technology-based regulations for the minimum level of effluent quality attainable by secondary treatment in terms of BOD₅20°C, TSS, and pH as summarized in Table F-5. Previous Order No. 00-143 established technology-based effluent limits to meet applicable secondary treatment standards. These effluent limitations have been carried over from the previous

Order to avoid backsliding. Furthermore, mass-based effluent limitations based on a design flow rate of 14 MGD are also included. The following table summarizes the technology-based effluent limitations for the discharge from the Facility:

**Summary of Technology-based Effluent Limitations
 Effluent Transfer Station**

Table 5. Summary of Technology-based Effluent Limitations

Parameter	Units	Effluent Limitations				
		Average Monthly	Average Weekly	Maximum Daily	Instantaneous Minimum	Instantaneous Maximum
BOD ₅ 20°C	mg/L	20	30	45	--	--
	lbs/day	2,300	3,500	5,300	--	--
Total Suspended Solids (TSS)	mg/L	15	40	45	--	--
	lbs/day	1,800	4,700	5,300	--	--
pH	standard units	--	--	--	6.5	8.5
Removal Efficiency for BOD and TSS	%	85	--	--	--	--

C. Water Quality-Based Effluent Limitations (WQBELs)

1. Scope and Authority

Section 301(b) of the CWA and section 122.44(d) require that permits include limitations more stringent than applicable federal technology-based requirements where necessary to achieve applicable water quality standards. This Order contains requirements, expressed as a technology equivalence requirement, more stringent than secondary treatment requirements that are necessary to meet applicable water quality standards. The rationale for these requirements, which consist of tertiary treatment or equivalent requirements or other provisions, is discussed in the Section IV.C.2. of the Fact Sheet.

Section 122.44(d)(1)(i) mandates that permits include effluent limitations for all pollutants that are or may be discharged at levels that have the reasonable potential to cause or contribute to an exceedance of a water quality standard, including numeric and narrative objectives within a standard. Where reasonable potential has been established for a pollutant, but there is no numeric criterion or objective for the pollutant, water quality-based effluent limitations (WQBELs) must be established using: (1) USEPA criteria guidance under CWA section 304(a), supplemented where necessary by other relevant information; (2) an indicator parameter for the pollutant of concern; or (3) a calculated numeric water quality criterion, such as a proposed state criterion or policy interpreting the state's narrative criterion, supplemented with other relevant information, as provided in section 122.44(d)(1)(vi).

The process for determining reasonable potential and calculating WQBELs when necessary is intended to protect the designated uses of the receiving water as specified in the Basin Plan, and achieve applicable water quality objectives and criteria that are contained in other state plans and policies, or any applicable water quality criteria contained in the CTR and NTR.

2. **Applicable Beneficial Uses and Water Quality Criteria and Objectives**

The Regional Water Board adopted a Water Quality Control Plan for the Los Angeles River (hereinafter Basin Plan) that designates beneficial uses, establishes water quality objectives, and contains implementation programs and policies to achieve those objectives for all waters addressed through the Basin Plan. The beneficial uses applicable to the Santa Clara River Estuary are summarized in Section III.C.1. of this Fact Sheet. The Basin Plan includes both narrative and numeric water quality objectives applicable to the receiving water.

a. Biochemical Oxygen Demand (BOD) and Suspended solids

Biochemical oxygen demand (BOD) is a measure of the quantity of the organic matter in the water and, therefore, the water's potential for becoming depleted in dissolved oxygen. As organic degradation takes place, bacteria and other decomposers use the oxygen in the water for respiration. Unless there is a steady supply of oxygen to the system, the water will quickly become depleted of oxygen. Adequate dissolved oxygen levels are required to support aquatic life. Depressions of dissolved oxygen can lead to anaerobic conditions resulting in odors, or, in extreme cases, in fish kills.

40 CFR, Part 133 describes the minimum level of effluent quality attainable by secondary treatment, for BOD and suspended solids, as:

- i. the 30-day average shall not exceed 30 mg/L; and,
- ii. the 7-day average shall not exceed 45 mg/L.

The Ventura WRF provides tertiary treatment, as such, the limits in the permit being more stringent than secondary treatment requirements are based on Best Professional Judgment. The Facility achieves solids removal that are better than secondary-treated wastewater by adding chemical coagulants to enhance the precipitation of solids, and by filtering the effluent.

The monthly average, the weekly average, and the daily maximum limits cannot be removed because none of the antibacksliding exceptions apply. Those limits were all included in the previous permit (Order No. 00-143) and the Discharger has been able to meet all three limits (monthly average, the

weekly average, and the daily maximum), for both BOD and suspended solids.

In addition to having mass-based and concentration-based effluent limitations for BOD and suspended solids, the Facility also has a percent removal requirement for these two constituents. In accordance with 40 CFR, Sections 133.102(a)(3) and 133.102(b)(3), the 30-day (monthly) average percent removal shall not be less than 85 percent. Percent removal is defined as a percentage expression of the removal efficiency across a treatment plant for a given pollutant parameter, as determined from the 30-day (monthly) average values of the raw wastewater influent pollutant concentrations to the facility and the 30-day (monthly) average values of the effluent pollutant concentrations for a given time period

b. Settleable solids

Excessive deposition of sediments can destroy spawning habitat, blanket benthic (bottom dwelling) organisms, and abrade the gills of larval fish. The limits for settleable solids are based on the Basin Plan (page 3-16) narrative, "Waters shall not contain suspended or settleable material in concentrations that cause nuisance or adversely affect beneficial uses." The numeric limits are empirically based on results obtained from the settleable solids 1-hour test, using an Imhoff cone.

It is impracticable to use a 7-day average limitation, because short term spikes of settleable solid levels that would be permissible under a 7-day average scheme would not be adequately protective of all beneficial uses. The monthly average and the daily maximum limits cannot be removed because none of the antibacksliding exceptions apply. The monthly average and daily maximum limits were both included in the previous permit (Order No. 00-143) and the Discharger has been able to meet both limits.

c. Oil and grease

Oil and grease are not readily soluble in water and form a film on the water surface. Oily films can coat birds and aquatic organisms, impacting respiration and thermal regulation, and causing death. Oil and grease can also cause nuisance conditions (odors and taste), are aesthetically unpleasant, and can restrict a wide variety of beneficial uses. The limits for oil and grease are based on the Basin Plan (page 3-11) narrative, "Waters shall not contain oils, greases, waxes, or other materials in concentrations that result in a visible film or coating on the surface of the water or on objects in the water, that cause nuisance, or that otherwise adversely affect beneficial uses."

The numeric limits are empirically based on concentrations at which an oily sheen becomes visible in water. It is impracticable to use a 7-day

average limitation, because spikes that occur under a 7-day average scheme could cause visible oil sheen. A 7-day average scheme would not be sufficiently protective of beneficial uses. The monthly average and the daily maximum limits cannot be removed because none of the antibacksliding exceptions apply. Both limits were included in the previous permit (Order No. 00-143) and the Discharger has been able to meet both limits.

d. Residual chlorine

Disinfection of wastewaters with chlorine produces chlorine residual. Chlorine and its reaction products are toxic to aquatic life. The limit for residual chlorine is based on the Basin Plan (page 3-9) narrative, "Chlorine residual shall not be present in surface water discharges at concentrations that exceed 0.1 mg/L and shall not persist in receiving waters at any concentration that causes impairment of beneficial uses."

It is impracticable to use a 7-day average or a 30-day (monthly) average limitation, because it is not as protective as of beneficial uses as a daily maximum limitation is. Chlorine is very toxic to aquatic life and short-term exposures of chlorine may cause fish kills.

e. Total Dissolved Solids, Chloride, Sulfate, and Boron

The effluent discharge from the Facility flows into the Estuary. Page 3-12 of the Basin Plan indicates that there is no waterbody specific objectives for TDS, chloride, sulfate and boron.

f. Methylene Blue Activated Substances (MBAS)

The MBAS procedure tests for the presence of anionic surfactants (detergents) in surface and ground waters. Surfactants disturb the water surface tension, which affects insects and can affect gills in aquatic life. The MBAS can also impart an unpleasant soapy taste to water, as well as cause scum and foaming in waters, which impact the aesthetic quality of both surface and ground waters.

Given the nature of the facility (a POTW) which accepts domestic wastewater into the sewer system and treatment plant, and the characteristics of the wastes discharged, the discharge has reasonable potential to exceed both the numeric MBAS water quality objective (WQO) and the narrative WQO for prohibition of floating material such as foams and scums. Therefore an effluent limitation is required based upon Best Professional Judgement.

g. Total inorganic nitrogen ($NO_2 + NO_3$ as N)

Total inorganic nitrogen is the sum of Nitrate-nitrogen and Nitrite-nitrogen. High nitrate levels in drinking water can cause health problems in humans. Infants are particularly sensitive and can develop methemoglobinemia (blue-baby syndrome). Nitrogen is also considered a nutrient. Excessive amounts of nutrients can lead to other water quality impairments, ex. algae⁵.

Although there are no waterbody specific objectives for nitrogen in the Estuary, the discharge has reasonable potential to exceed the numeric Nitrate plus Nitrite as nitrogen 10 mg/L of water quality objective (WQO) specified in the Basin Plan page 3-11. An effluent limitation is required based upon Best Professional Judgement. Therefore, the Discharger will have to meet the 10 mg/L WQO at the end-of-pipe, since no dilution credit is appropriate at this time.

h. Nitrite as Nitrogen

Chapter 3 of the Basin Plan (page 3-11) contains the following water quality objective, "Waters shall not exceed the 10 mg/L nitrogen as nitrate-nitrogen plus nitrite-nitrogen ($NO_3-N + NO_2-N$), 45 mg/L as nitrate (NO_3), 10 mg/L as nitrate-nitrogen (NO_3-N), or 1 mg/L as nitrite-nitrogen (NO_2-N) or as otherwise designated in Table 3-8." The Discharger will have to meet the 1 mg/L WQO at the end-of-pipe, since no dilution credit is appropriate at this time. See the detailed explanation available in Footnote 1 on Page F-5.

i. Ammonia as Nitrogen

Ammonia is a pollutant routinely found in the wastewater effluent of Publicly Owned Treatment Works (POTWs), in landfill-leachate, as well as in run-off from agricultural fields where commercial fertilizers and animal manure are applied. Ammonia exists in two forms – un-ionized ammonia (NH_3) and the ammonium ion (NH_4^+). They are both toxic, but the neutral, un-ionized ammonia species (NH_3) is much more toxic, because it is able to diffuse across the epithelial membranes of aquatic organisms much more readily than the charged ammonium ion. The form of ammonia is primarily a function of pH, but it is also affected by temperature and other factors. Additional impacts can also occur as the oxidation of ammonia lowers the dissolved oxygen content of the water, further stressing aquatic organisms. Oxidation of ammonia to nitrate may lead to groundwater impacts in areas of recharge. There is no groundwater recharge in this reach. Ammonia also combines with chlorine (often both are present in

⁵ Excessive growth of algae and/or other aquatic plants can degrade water quality. Algal blooms sometimes occur naturally, but they are often the result of excess nutrients (i.e., nitrogen, phosphorus) from waste discharges or nonpoint sources. These algal blooms can lead to problems with tastes, odors, color, and increased turbidity and can depress the dissolved oxygen content of the water, leading to fish kills. Floating algal scum and algal mats are also an aesthetically unpleasant nuisance.

POTW treated effluent discharges) to form chloramines – persistent toxic compounds that extend the effects of ammonia and chlorine downstream.

The 1994 Basin Plan provided water quality objectives for ammonia to protect aquatic life, in Tables 3-1 through Tables 3-4. However, those ammonia objectives were revised on March 4, 2004, by the Regional Water Board with the adoption of Resolution No. 2004-022, *Amendment to the Water Quality Control Plan for the Los Angeles Region to Update the Ammonia Objectives for Inland Surface Waters Not Characteristic of Freshwater (Including Enclosed Bays, Estuaries and Wetlands) with Beneficial Use Designations for Protection of Aquatic Life*. The ammonia Basin Plan amendment is consistent with the U.S. EPA "Ambient Water Quality Criteria for Ammonia (Saltwater)-1989." The amendment revised the regulatory provisions of the Basin Plan by adding language to Chapter 3 "Water Quality Objectives."

For inland surface waters not characteristic of freshwater (including enclosed bays, estuaries, and wetlands), the proposed objectives are a 4-day average concentration of unionized ammonia of 0.035 mg/L, and a one-hour average concentration of unionized ammonia of 0.233 mg/L. The proposed objectives are fixed concentrations of unionized ammonia, independent of pH, temperature, or salinity. The proposed amendment includes an implementation procedure to convert un-ionized ammonia objectives to total ammonia effluent limits. The proposed amendment also simplifies the implementation procedures for translating ammonia objectives into effluent limits in situations where a mixing zone has been authorized by the Regional Water Board. Finally, the proposed amendment revises the implementation procedure for determining saltwater, brackish or freshwater conditions, to be consistent with the proposed objectives. The proposed objectives will apply only to inland surface waters not characteristic of freshwater (including enclosed bays, estuaries and wetlands) and do not impact the Ammonia Water Quality Objectives for ocean waters contained in the California Ocean Plan.

(i). Freshwater Ammonia Criteria Maximum Concentration (CMC)

The Facility discharges into a receiving waterbody that has "MIGR" beneficial use designation. It is assumed that salmonids may be present in waters designated in the Basin Plan as "MIGR" and that salmonids cannot be absent in water not designated in the Basin Plan as "MIGR," in the absence of additional information to the contrary. Since the receiving water has "MIGR" designation, it will be assumed that salmonids are present in the water.

The one-hour average objective according to the Basin Plan amendment will be set as the CMC or equivalent to the Maximum Daily Effluent Limitation (MDEL) for ammonia nitrogen in mg/L. For

waters not designated COLD and/or MIGR, the CMC or MDEL shall not exceed the values described in the equation below:

$$\text{One-hour Average Concentration} = \frac{0.411}{1 + 10^{7.204 - pH}} + \frac{58.4}{1 + 10^{pH - 7.204}}$$

(ii). Freshwater Ammonia Criteria Continuous Concentration (CCC)

The 30-day average objective according to the Basin Plan amendment Resolution No. 2002-011 will be set as the CCC or equivalent to the Average Monthly Effluent Limitation (AMEL) for ammonia nitrogen in mg/L. The Facility discharges into a receiving water that has a “SPWN” beneficial use designation. For freshwaters designated SPWN, the thirty-day average concentration of total ammonia as nitrogen (in mg/L) shall not exceed the values described in the equation below:

$$\text{30-day Average Concentration} = \left(\frac{0.0577}{1 + 10^{7.688 - pH}} + \frac{2.487}{1 + 10^{pH - 7.688}} \right) * \text{MIN} \left(2.85, 1.45 * 10^{0.028 * (25 - T)} \right)$$

Where T = temperature expressed in °C.

The 30-day average objective⁶ is dependent on pH and temperature. At lower temperatures, the 30-day average objective also is dependent on the presence or absence of early life stages of fish (ELS). Water bodies with Basin Plan designation of “SPWN” support high quality aquatic habitats suitable for reproduction and early development of fish and, therefore waterbodies are designated as ELS present waters.

However, based on the beneficial uses of the Basin Plan, the freshwater ammonia water objective is not applicable in the Santa Clara River Estuary. Therefore, the freshwater ammonia water objective will not be used to calculate the final ammonia effluent limitations for the Facility.

⁶ This is the current Basin Plan definition of the 30-day average objective, according to the Ammonia Basin Plan Amendment, Resolution No. 2002-011, *Amendment to the Water Quality Control Plan for the Los Angeles Region to Update the Ammonia Objectives for Inland Surface Waters (including enclosed bays, estuaries and wetlands) with Beneficial Use designations for protection of “Aquatic Life,”* adopted by the Los Angeles Regional Water Board on April 25, 2002. It will be superseded by Resolution No. 2005-014, adopted by the Regional Water Board on December 1, 2005, following State Water Board, and Office of Administrative Law approval of the Ammonia Basin Plan Amendment. This new Resolution will implement ELS Provision as described under “implementation”, subparagraph 3. Currently, the Discharger’s receiving waterbody is designated as ELS already. Whether the new Resolution No. 2005-014 would be approve or disapprove by EPA, the calculated effluent limitation based upon Resolution No. 2002-011 definition of the 30-day average objective will remain the same until the receiving water is reclassified as being “ELS Absent” condition.

(iii). Saltwater Ammonia Criteria Maximum Concentration (CMC)

$$\text{Total ammonia} = 0.233 + 0.233 \times 10^{(pK_a^S + 0.0324 \times (298 - T) + 0.0415 \times P/T - pH)}$$

Where: P = 1 atm
T = temperature ($^{\circ}$ K)
 $pK_a^S = 0.116 * I + 9.245$, the stoichiometric acid hydrolysis constant of ammonium ions in saltwater on i, $i = 19.9273 * S(1000 - 1.005109S)^{-1}$, the molal ionic strength of saltwater based on S, S = salinity

(iv). Saltwater Ammonia Criteria Continuous Concentration (CCC)

$$\text{Total ammonia} = 0.035 + 0.035 \times 10^{(pK_a^S + 0.0324 \times (298 - T) + 0.0415 \times P/T - pH)}$$

Where: P = 1 atm
T = temperature ($^{\circ}$ K)
 $pK_a^S = 0.116 * I + 9.245$, the stoichiometric acid hydrolysis constant of ammonium ions in saltwater on i, $i = 19.9273 * S(1000 - 1.005109S)^{-1}$, the molal ionic strength of saltwater based on S, S = salinity

Ammonia-N, other Nitrogen Species – Reasonable potential analysis (RPA) was conducted for Ammonia as nitrogen, Nitrate plus Nitrite as nitrogen, Nitrate as nitrogen, and Nitrite as nitrogen using the Discharger's effluent data from their self monitoring reports. The RPA compares the effluent data with the Basin Plan WQOs. The Discharger's effluent exceeded the Basin Plan WQOs for Ammonia as nitrogen, Nitrate as nitrogen, and Nitrate plus Nitrite as nitrogen during the last permit cycle. In addition, the Facility currently only has a full nitrification and a partial denitrification process. Once the full nitrification and denitrification process is on line, the effluent nitrate concentration shall be further reduced. However, the nitrite effluent concentrations may exceed 1 mg/L of water quality objective specified in the Basin Plan based on the Best Professional Judgement, if the oxidation process of the nitrification is not complete. Therefore, a final nitrite limitation of 1 mg/L has been added to the Order No. R4-2007-XXXX and the Discharger may request to have interim nitrite effluent limitations in the future.

Based on this information, the Regional Water Board has determined that there is a reasonable potential that the discharge will cause or contribute to an exceedance of the Basin Plan WQOs and, consistent with 40 CFR 122.44(d), the Order contains numeric effluent limitations for Ammonia as nitrogen, Nitrate as nitrogen, and Nitrate plus Nitrite as Nitrogen.

Ammonia saltwater criteria are salinity, pH, and temperature dependent. Because there is such a wide temperature fluctuation in the Estuary during summer and winter months (74.5°F vs. 52.2°F), seasonal ammonia effluent limitations have been placed into the Order. The summer and winter ammonia effluent limitations cover May to October and November to April, respectively. The lowest monthly average and daily maximum of total ammonia projected among receiving water quality monitoring stations (R-001 to R-005), based on three years of monthly receiving water data, were used as monthly average and daily maximum ammonia effluent concentrations in this Order. The calculations are available in Attachment M.

j. Coliform/Bacteria

Total and fecal coliform bacteria are used to indicate the likelihood of pathogenic bacteria in surface waters. Given the nature of the facility, a wastewater treatment plant, pathogens are likely to be present in the effluent in cases where the disinfection process is not operating adequately. As such, the permit contains the following:

i. Effluent Limitations:

- The 7 day median number of coliform organisms at some point in the treatment process must not exceed 2.2 Most Probable Number (MPN) per 100 milliliters;
- The number of coliform organisms must not exceed 23 MPN per 100 milliliters in more than one sample within any 30-day period; and,
- No sample shall exceed an MPN of 240 total coliform bacteria per 100 milliliters.

These disinfection-based effluent limitations for coliform are for human health protection and are consistent with requirements established by the Department of Health Services. These limits for coliform must be met at the point of the treatment train immediately following disinfection, as a measure of the effectiveness of the disinfection process.

ii. Receiving Water Limitation

- Geometric Mean Limits
 - * E.coli density shall not exceed 126/100 mL.
 - * Fecal coliform density shall not exceed 200/100 mL.

- Single Sample Limits
 - * E.coli density shall not exceed 235/100 mL.
 - * Fecal coliform density shall not exceed 400/100 mL.

These receiving water limitations are based on Resolution No. 01-018, Amendment to the Water Quality Control Plan for the Los Angeles Region to Update the Bacteria Objectives for Water Bodies Designated for Water Contact Recreation, adopted by the Regional Water Board on October 25, 2001. The Resolution was approved by State Water Board, OAL, and USEPA, on July 18, 2002, September 19, 2002, and September 25, 2002, respectively.

k. pH

The hydrogen ion activity of water (pH) is measured on a logarithmic scale, ranging from 0 to 14. While the pH of "pure" water at 25°C is 7.0, the pH of natural waters is usually slightly basic due to the solubility of carbon dioxide from the atmosphere. Minor changes from natural conditions can harm aquatic life. In accordance with 40 CFR section 133.102(c), the effluent values for pH shall be maintained within the limits of 6.0 to 9.0 unless the POTW demonstrates that: (1) Inorganic chemicals are not added to the waste stream as part of the treatment process; and (2) contributions from industrial sources do not cause the pH of the effluent to be less than 6.0 or greater than 9.0. The effluent limitation for pH in this permit requiring that the wastes discharged shall at all times be within the range of 6.5 to 8.5 is taken from the Basin Plan (page 3-15) which reads "the pH of inland surface waters shall not be depressed below 6.5 or raised above 8.5 as a result of waste discharge.

l. Temperature

The Basin Plan lists temperature requirements for the receiving waters and references the Thermal Plan. Based on the requirements of the Thermal Plan and a white paper developed by Regional Water Board staff and comments previously received from staff of California Department of Fish and Game entitled *Temperature and Dissolved Oxygen Impacts on Biota in Tidal Estuaries and Enclosed Bays in the Los Angeles Region*, a maximum effluent temperature limitation of 86 °F is included in the tentative Order. The temperature limit is consistent with the limits in other POTW permits in the region. The white paper evaluated the optimum temperatures for steelhead, topsmelt, ghost shrimp, brown rock crab, jackknife clam, and blue mussel. The new temperature effluent limitation is reflective of new information available that indicates that the 100°F temperature is not protective of aquatic organisms. A survey was completed for several kinds of fish and the 86°F temperature was found to be protective.

m. Turbidity

Turbidity is an expression of the optical property that causes light to be scattered in water due to particulate matter such as clay, silt, organic matter, and microscopic organisms. Turbidity can result in a variety of water quality impairments. The effluent limitation for turbidity which reads, "For the protection of the water contact recreation beneficial use, the wastes discharged to water courses shall have received adequate treatment, so that the turbidity of the wastewater does not exceed: (a) a daily average of 2 Nephelometric turbidity units (NTUs); and (b) 5 NTUs more than 5 percent of the time (72 minutes) during any 24 hour period," is based on the Basin Plan (page 3-17) and Section 60301.320 of Title 22, Chapter 3, "Filtered Wastewater" of the California Code of Regulations.

n. Radioactivity

Radioactive substances are generally present in natural waters in extremely low concentrations. Mining or industrial activities increase the amount of radioactive substances in waters to levels that are harmful to aquatic life, wildlife, or humans. The existing effluent limitation for radioactivity which reads, "Radionuclides shall not be present in concentrations that are deleterious to human, plant, animal, or aquatic life or that result in accumulation of radionuclides in the food web to an extent that presents a hazard to human, plant, animal, or aquatic life." is based on the *Radioactivity substances* specified in the Basin Plan in order to protect the surface water beneficial use and human health.

o. Biostimulatory Substances

Biostimulatory substances include excess nutrients (nitrogen, phosphorus) and other compounds that stimulate aquatic growth. In addition to being aesthetical unpleasant (causing taste, odor, or color problems), this excessive growth can also cause other water quality problems. The limits for biostimulatory substances are based on the Basin Plan (page 3-8) narrative, "Waters shall not contain biostimulatory substances in concentrations that promote aquatic growth to the extent that such growth causes nuisance or adversely affects beneficial uses."

p. CTR and SIP

Priority pollutant water quality criteria in the CTR are applicable to the Estuary. The CTR contains both saltwater and freshwater criteria. Because a distinct separation generally does not exist between freshwater and saltwater aquatic communities, the following apply in accordance with 40 CFR § 131.38(c)(3): freshwater criteria apply at salinities of 1 part per thousand (ppt) and below at locations where this condition occurs 95 percent or more of the time; saltwater criteria apply at salinities of 10 ppt

and above at locations where this occurs 95 percent or more of the time; and at salinities between 1 and 10 ppt the more stringent of the two apply. The CTR criteria for freshwater or human health for consumption of organisms, whichever is most stringent, are used to prescribe the effluent limitations in the tentative Order to protect the beneficial uses of the Estuary.

Some water quality criteria are hardness dependent. The Discharger provided hardness data collected from the Estuary. The receiving water hardness values ranged from 250 to 7500 mg/L. Since most of the receiving water hardness data are greater than 400 mg/L as CaCO₃, in accordance with the SIP/CTR procedures, the 400 mg/L hardness cap will be used in calculating metals criteria for evaluation of reasonable potential.

The following Table summarizes the applicable water quality criteria for priority pollutants reported in detectable concentrations in the effluent or receiving water. These criteria were used in conducting the Reasonable Potential Analysis for the tentative Order.

Table 6. Applicable Water Quality Criteria

CTR No.	Constituent	Most Stringent Criteria µg/L	CTR/NTR Water Quality Criteria					
			Freshwater		Saltwater		Human Health for Consumption of:	
			Acute	Chronic	Acute	Chronic	Water & Organisms	Organisms only
			µg/L	µg/L	µg/L	µg/L	µg/L	µg/L
6	Copper	3.7	52	31	5.8	3.7	--	--
7	Lead	8.5	476	19	221	8.5	--	--
8	Mercury	0.051	--	--	--	--	--	0.051
11	Silver	2.2	44	--	2.2	--	--	--
13	Zinc	86	388	388	95	86	--	--
14	Cyanide	1	22	5.2	1	1	--	220000
23	Chlorodibromomethane	34	--	--	--	--	--	34
27	Dichlorobromomethane	46	--	--	--	--	--	46
68	Bis(2-Ethylhexyl) Phthalate	5.9	--	--	--	--	--	5.9

3. Determining the Need for WQBELs

In accordance with Section 1.3 of the SIP, the Regional Water Board conducted a reasonable potential analysis for each priority pollutant with an applicable criterion or objective to determine if a WQBEL is required in the permit. The Regional Water Board analyzed effluent data to determine if a pollutant in a discharge has a reasonable potential to cause or contribute to an excursion above a state water quality standard. For all parameters that demonstrate reasonable potential, numeric WQBELs are required. The RPA considers water quality criteria from the CTR and NTR, and when applicable, water

quality objectives specified in the Basin Plan. To conduct the RPA, the Regional Water Board identified the MEC and maximum background concentration in the receiving water for each constituent, based on data provided by the Discharger.

Section 1.3 of the SIP provides the procedures for determining reasonable potential to exceed applicable water quality criteria and objectives. The SIP specifies three triggers to complete a RPA:

Trigger 1 – If the MEC is greater than or equal to the CTR water quality criteria or applicable objective (C), a limitation is needed.

Trigger 2 – If background water quality (B) > C and the pollutant is detected in the effluent, a limitation is needed.

Trigger 3 – If other related information such as CWA 303(d) listing for a pollutant, discharge type, compliance history, then best professional judgment is used to determine that a limit is needed.

Sufficient effluent and ambient data are needed to conduct a complete RPA. If data are not sufficient, the Discharger will be required to gather the appropriate data for the Regional Water Board to conduct the RPA. Upon review of the data, and if the Regional Water Board determines that WQBELs are needed to protect the beneficial uses, the permit will be reopened for appropriate modification.

In accordance with section 13267 of the CWC, the Regional Water Board required the Discharger to conduct an interim monitoring program of the effluent and the receiving water from January 2001 to April 2003 on a quarterly basis. At least nine data sets for effluent and receiving water monitoring for the period from January 2001 through April 2003 were available. In addition, samples for certain priority pollutants were collected as required by the existing MRP; these data were also used to complete the RPA.

The RPA was performed for the priority pollutants regulated in the CTR for which data are available. Based on the RPA, pollutants that demonstrate reasonable potential are copper, nickel, and bis(2-ethylhexyl)phthalate. Refer to Attachment J for a summary of the RPA and associated effluent limitation calculations.

Table 7. Summary of Reasonable Potential Analysis

CTR No.	Constituent	Applicable Water Quality Criteria (C) µg/L	Max Effluent Conc. (MEC) µg/L	Maximum Detected Receiving Water Conc.(B) µg/L	RPA Result - Need Limitation ?	Reason

4. WQBEL Calculations

- a. Water quality-based effluent limits (final) are based on monitoring results and following the calculation process outlined in Section 1.4 of the California Toxics Rule and the Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays and Estuaries of California. A table providing the calculation for all applicable WQBELs for this Order is provided in Attachment J of this Order.
- b. WQBELs Calculation Example

Using copper as an example, the following demonstrates how WQBELs based on human health criterion were established for this Order. The process for developing these limits is in accordance with Section 1.4 of the SIP. Attachment I summarizes the development and calculation of all WQBELs for this Order using the process described below.

Step 1: For each constituent requiring an effluent limit, identify the applicable water quality criteria or objective. For each criteria determine the effluent concentration allowance (ECA) using the following steady state equation:

the effluent concentration allowance (ECA) using the following steady state equation:

$$\begin{aligned}
 ECA &= C + D(C-B) && \text{when } C > B, \text{ and} \\
 ECA &= C && \text{when } C \leq B,
 \end{aligned}$$

where C = The priority pollutant criterion/objective, adjusted if necessary for hardness, pH and translators. In this Order a hardness value of 400 mg/L (as CaCO₃) was used for development of hardness-dependent criteria.

D = The dilution credit, and
 B = The ambient background concentration

For this Order, dilution was not allowed due to nature of the receiving water and quantity of the effluent, therefore:

$$ECA = C$$

For copper, the applicable saltwater quality criteria are:

$$ECA_{acute} = 5.78 \mu\text{g/L}$$

$$ECA_{chronic} = 3.73 \mu\text{g/L}$$

Step 2: For each ECA based on aquatic life criterion/objective, determine the long-term average discharge condition (LTA) by multiplying the ECA by a factor (multiplier). The multiplier is statistically based factor that adjusts the ECA to account for effluent variability. The value of the multiplier varies depending on the coefficient of variation (CV) of the data set and whether it is an acute or chronic criterion/objective. Table 1 of the SIP provides pre-calculated values for the multipliers based on the value of the CV. Equations to develop the multipliers in place of using values in the tables are provided in Section 1.4, Step 3 of the SIP and will not be repeated here.

$$LTA_{acute} = ECA_{acute} \times Multiplier_{acute}$$

$$LTA_{chronic} = ECA_{chronic} \times Multiplier_{chronic}$$

The CV for the data set must be determined before the multipliers can be selected and will vary depending on the number of samples and the standard deviation of a data set. If the data set is less than 10 samples, or at least 80% of the samples in the data set are reported non-detect, the CV shall be set equal to 0.6.

For copper, the following data was used to develop the acute and chronic LTA using Table 1 of the SIP:

<u>No. of Samples</u>	<u>CV</u>	<u>Multiplier_{acute}</u>	<u>Multiplier_{chronic}</u>
25	0.64	0.3026	0.5064

$$LTA_{acute} = 5.78 \mu\text{g/L} \times 0.3026 = 1.75 \mu\text{g/L}$$

$$LTA_{chronic} = 3.73 \mu\text{g/L} \times 0.5064 = 1.89 \mu\text{g/L}$$

Step 3: Select the most limiting (lowest) of the LTA.

$$LTA = \text{most limiting of } LTA_{acute} \text{ or } LTA_{chronic}$$

For copper, the most limiting LTA was the LTA_{acute}

$$LTA = 1.75 \mu\text{g/L}$$

Step 4: Calculate the WQBELs by multiplying the LTA by a factor (multiplier). WQBELs are expressed as Average Monthly Effluent Limitations (AMEL) and Maximum Daily Effluent Limitation (MDEL). The multiplier is statistically based factor that adjusts the LTA for the averaging periods and exceedance frequencies of the criteria/objectives and the effluent limitations. The value of the multiplier varies depending on the probability basis, the coefficient of variation (CV) of the data set, the number of samples (for AMEL) and whether it is monthly or daily limit. Table 2 of the SIP provides the pre-calculated values for the multipliers based on the value of the CV and the number of samples. Equations to develop the multipliers in place of using values in the tables are provided in Section 1.4, Step 5 of the SIP and will not be repeated here.

$$AMEL_{aquatic\ life} = LTA \times AMEL_{multiplier}$$

$$MDEL_{aquatic\ life} = LTA \times MDEL_{multiplier}$$

AMEL multipliers are based on 95th percentile occurrence probability, and the MDEL multipliers are based on the 99th percentile occurrence probability. If the number of samples is less than four (4), the default number of samples to be used is four (4).

For copper, the following data was used to develop the AMEL and MDEL for aquatic life using Table 2 of the SIP.

<u>No. of Samples</u>	<u>CV</u>	<u>Multiplier_{MDEL}</u>	<u>Multiplier_{AMEL}</u>
25	0.64	3.3044	1.5948

$$AMEL_{aquatic\ life} = 1.75 \times 1.5948 = 2.79 \mu\text{g/L}$$

$$MDEL_{aquatic\ life} = 1.75 \times 3.3044 = 5.78 \mu\text{g/L}$$

Step 5: For the ECA based on human health, set the AMEL equal to the $ECA_{human\ health}$

$$AMEL_{human\ health} = ECA_{human\ health}$$

For copper:

$$AMEL_{human\ health} = \text{NONE}$$

Step 6: Calculate the MDEL for human health by multiplying the AMEL by the ratio of the $Multiplier_{MDEL}$ to $Multiplier_{AMEL}$. Table 2 of the SIP provides

pre-calculated ratios to be used in this calculation based on the CV and the number of samples.

A copper $MDEL_{\text{human health}}$ could not be calculated because a copper $AMEL_{\text{human health}}$ was not available. However, for illustrative purposes, if a $AMEL_{\text{human health}}$ was available, the following data and equation would have been used to develop the $MDEL_{\text{human health}}$:

No. of Samples Per Month	CV	Multiplier _{MDEL}	Multiplier _{AMEL}	Ratio
25	0.64	3.3044	1.5948	2.0720

$$MDEL_{\text{human health}} = AMEL_{\text{human health}} \times \text{Multiplier}_{MDEL} / \text{Multiplier}_{AMEL}$$

Step 7: Select the lower of the AMEL and MDEL based on aquatic life and human health water quality based effluent limit for this Order.

For copper:

<u>AMEL_{aquatic life}</u>	<u>MDEL_{aquatic life}</u>	<u>AMEL_{human health}</u>	<u>MDEL_{human health}</u>
2.79 µg/L	5.78 µg/L	Not available	Not available

The lowest (most restrictive) effluent limits, those based on aquatic life criteria, were incorporated into this Order. Due to rounding of digits in the abovementioned calculation, the final limit for copper in this exercise is slightly different than the limit derived using the SIP spreadsheet, in which the numbers are not rounded off.

c. **Mass based limits**

40 CFR section 122.45(f)(1) requires that except under certain conditions, all permit limits, standards, or prohibitions be expressed in terms of mass units. 40 CFR section 122.45(f)(2) allows the permit writer, at its discretion, to express limits in additional units (e.g., concentration units). The regulations mandate that, where limits are expressed in more than one unit, the permittee must comply with both.

Generally, mass-based limits ensure that proper treatment, and not dilution, is employed to comply with the final effluent concentration limits. Concentration-based effluent limits, on the other hand, discourage the reduction in treatment efficiency during low-flow periods and require proper operation of the treatment units at all times. In the absence of concentration-based effluent limits, a permittee would be able to increase its effluent concentration (i.e., reduce its level of treatment) during low-flow periods and still meet its mass-based limits. To account for this, this permit includes mass and concentration limits for some constituents.

d. **Final WQBELs**

Summaries of the WQBELs required by this Order are described in Table 8 below. Mass-based effluent limitations are based on a design capacity of 14 MGD.

**Summary of Water Quality-based Effluent Limitations
 Effluent Transfer Station**

Table 8. Summary of Water Quality-based Effluent Limitations

Constituent	Units	Effluent Limitations	
		Average Monthly	Maximum Daily
Summer Ammonia Nitrogen (May – October)	mg/L	0.045	0.30
	lbs/day	5.3	35
Winter Ammonia Nitrogen (November to April)	mg/L	0.079	0.53
	lbs/day	9.3	62
Nitrite + Nitrate as Nitrogen	mg/L	10	--
	lbs/day	1,200	--
Nitrite as Nitrogen	mg/L	1	--
	lbs/day	120	--
Nitrate as Nitrogen	mg/L	10	--
	lbs/day	1,200	--
Copper	µg/L	2.8	5.8
	lbs/day	0.33	0.68
Lead	µg/L	4.3	14
	lbs/day	0.50	1.6
Mercury	µg/L	0.051	0.10
	lbs/day	0.0060	0.012
Silver	µg/L	0.74	2.2
	lbs/day	0.087	0.26
Zinc	µg/L	37	95
	lbs/day	4.3	11

Constituent	Units	Effluent Limitations	
		Average Monthly	Maximum Daily
Cyanide	µg/L	0.50	1.0
	lbs/day	0.059	0.12
Chlorodibromomethane	µg/L	34	93
	lbs/day	4.0	11
Dichlorobromomethane	µg/L	46	128
	lbs/day	5.4	15
Bis(2-Ethylhexyl)Phthalate	µg/L	5.9	12
	lbs/day	0.69	1.4

5. Whole Effluent Toxicity (WET)

Whole effluent toxicity (WET) protects the receiving water quality from the aggregate toxic effect of a mixture of pollutants in the effluent. WET tests measure the degree of response of exposed aquatic test organisms to an effluent. The WET approach allows for protection of the narrative “no toxics in toxic amounts” criterion while implementing numeric criteria for toxicity. There are two types of WET tests: acute and chronic. An acute toxicity test is conducted over a short time period and measures mortality. A chronic toxicity test is conducted over a longer period of time and may measure mortality, reproduction, and growth.

Because of the nature of industrial discharges into the POTW sewershed, it is possible that other toxic constituents could be present in the Facility’s effluent, or could have synergistic or additive effects. Also, because numeric limits for certain toxic constituents that did not show RP have been removed, the acute toxicity limit may provide a backstop to preventing the discharge of toxic pollutants in toxic amounts. In addition, 12 out of the 85 chronic toxicity tests conducted from January 2003 through December 2006 exceeded the monthly median chronic toxicity trigger of 1.0 TUc. Although all 4 acute toxicity testing results reported during the term of the previous Order exhibited 100% survival rates and thus did not exceed any acute toxicity requirements, Regional Water Board staff determined that, pursuant to the SIP, reasonable potential exists for chronic toxicity. As such, the permit contains effluent trigger limitations for chronic toxicity.

The toxicity numeric effluent limitations are based on:

- a. 40 CFR 122.44(d)(v) – limits on whole effluent toxicity are necessary when chemical-specific limits are not sufficient to attain and maintain applicable numeric or narrative water quality standards;
- b. 40 CFR 122.44(d)(vi)(A) – where a State has not developed a water quality criterion for a specific pollutant that is present in the effluent and has reasonable potential, the permitting authority can establish effluent

- limits using numeric water quality criterion;
- c. Basin Plan objectives and implementation provisions for toxicity;
 - d. Regions 9 & 10 Guidance for Implementing Whole Effluent Toxicity Programs Final May 31, 1996;
 - e. Whole Effluent Toxicity (WET) Control Policy July 1994; and,
 - f. Technical Support Document (several chapters and Appendix B).

However, the circumstances warranting a numeric chronic toxicity effluent limitation when there is reasonable potential were under review by the State Water Resources Control Board (State Water Board) in SWRCB/OCC Files A-1496 & A-1496(a) [Los Coyotes/Long Beach Petitions]. On September 16, 2003, at a public hearing, the State Water Board adopted Order No. 2003-0012 deferring the issue of numeric chronic toxicity effluent limitations until a subsequent Phase of the SIP is adopted. In the meantime, the State Water Board replaced the numeric chronic toxicity limit with a narrative effluent limitation and a 1 TU_c trigger, in the Long Beach and Los Coyotes WRP NPDES permits. This permit contains a similar chronic toxicity effluent limitation. This Order also contains a reopener to allow the Regional Water Board to modify the permit, if necessary, consistent with any new policy, law, or regulation.

a. Acute Toxicity Limitation:

The Dischargers may test for acute toxicity by using USEPA's *Methods for Measuring the Acute Toxicity of Effluents and Receiving Waters to Freshwater and Marine Organisms*, October 2002 (EPA-821-R-02-012). Acute toxicity provisions in the accompanying Order are derived from the Basin Plan's toxicity standards (Basin Plan 3-16 and 3-17). The provisions require the Discharger to accelerate acute toxicity monitoring and take further actions to identify the source of toxicity and to reduce acute toxicity.

b. Chronic Toxicity Limitation and Requirements:

Chronic toxicity provisions in the accompanying Order are derived from the Basin Plan's toxicity standards (Basin Plan 3-16 and 3-17). The provisions require the Discharger to accelerate chronic toxicity monitoring and take further actions to identify the source of toxicity and to reduce chronic toxicity. The monthly median trigger of 1.0 TU_c for chronic toxicity is based on *USEPA Regions 9 & 10 Guidance for Implementing Whole Effluent Toxicity (WET) Programs* Final May 31, 1996 (Chapter 2 – Developing WET Permitting Conditions, page 2-8). In cases where effluent receives no dilution or where mixing zones are not allowed, the 1.0 TU_c chronic criterion should be expressed as a monthly median. The “median” is defined as the middle value in a distribution, above which and below which

lie an equal number of values. For example, if the results of the WET testing for a month were 1.5, 1.0, and 1.0 TU_c, the median would be 1.0 TU_c.

The *USEPA Regions 9 & 10 Guidance for Implementing Whole Effluent Toxicity (WET) Programs* Final May 31, 1996 (Chapter 2 – Developing WET Permitting Conditions, page 2-8) recommends two alternatives for setting up maximum daily limit: using 2.0 TU_c as the maximum daily limit; or using a statistical approach outlined in the TSD to develop a maximum daily effluent limitation. In this permit, neither maximum daily limitation nor trigger for chronic toxicity is prescribed.

D. Final Effluent Limitations

1. Satisfaction of Anti-Backsliding Requirements

The effluent limitations in this Order are at least as stringent as the effluent limitations in the previous Order. The effluent limitations for 117 priority pollutants are deleted because they did not show reasonable potential to cause or contribute to an excursion above the respective water quality standards. The new average monthly effluent limitations for copper, mercury, and cyanide that are less stringent than those in the previous permit are derived from the calculation in the SIP. The new daily maximum effluent limitations for copper, chlorodibromomethane, dichlorobromomethane, and bis(2-ethylhexyl)phthalate that are less stringent than those in the previous permit are derived from the calculation in the SIP. This relaxation of effluent limitations is consistent with the anti-backsliding requirements of the CWA and federal regulations.

2. Satisfaction of Antidegradation Policy

On October 28, 1968, the State Board adopted Resolution No. 68-16, *Maintaining High Quality Water*, which established an antidegradation policy for State and Regional Water Boards. The State Board has, in State Board Order No. 86-17 and an October 7, 1987 guidance memorandum, interpreted Resolution No. 68-16 to be fully consistent with the federal antidegradation policy. Similarly, the CWA (section 304(d)(4)(B)) and USEPA regulations (40 CFR, Section 131.12) require that all permitting actions be consistent with the federal antidegradation policy. Together, the State and Federal policies are designed to ensure that a water body will not be degraded resulting from the permitted discharge. The provisions of this Order are consistent with the antidegradation policies.

3. Stringency of Requirements for Individual Pollutants

This Order contains both technology-based and water quality-based effluent limitations for individual pollutants. The technology-based effluent limitations consist of restrictions on BOD, TSS, pH, and percent removal of BOD and TSS.

Restrictions on BOD, TSS, pH are discussed in Section IV.B. of this Fact Sheet. This Order's technology-based pollutant restrictions implement the minimum, applicable federal technology-based requirements.

Water quality-based effluent limitations have been scientifically derived to implement water quality objectives that protect beneficial uses. Both the beneficial uses and the water quality objectives have been approved pursuant to federal law and are the applicable federal water quality standards. To the extent that toxic pollutant water quality-based effluent limitations were derived from the CTR, the CTR is the applicable standard pursuant to section 131.38. The scientific procedures for calculating the individual water quality-based effluent limitations for priority pollutants are based on the CTR-SIP, which was approved by USEPA on May 18, 2000. All beneficial uses and water quality objectives contained in the Basin Plan were approved under state law and submitted to and approved by USEPA prior to May 30, 2000. Any water quality objectives and beneficial uses submitted to USEPA prior to May 30, 2000, but not approved by USEPA before that date, are nonetheless "applicable water quality standards for purposes of the CWA" pursuant to section 131.21(c)(1). Collectively, this Order's restrictions on individual pollutants are no more stringent than required to implement the requirements of the CWA and the applicable water quality standards for purposes of the CWA.

**Summary of Final Effluent Limitations
 Effluent Transfer Station**

Table 9. Summary of Final Effluent Limitations

Parameter	Units	Effluent Limitations					Basis
		Average Monthly	Average Weekly	Maximum Daily	Instantaneous Minimum	Instantaneous Maximum	
BOD ₅ 20°C	mg/L	20	30	45	--	--	Existing
	lbs/day	2,300	3,500	5,300	--	--	
Total Suspended Solids (TSS)	mg/L	15	40	45	--	--	Existing
	lbs/day	1,800	4,700	5,300	--	--

	lbs/day	4.0	--	11	--	--	
Dichlorobromomethane	µg/L	46	--	128	--	--	CTR, SIP
	lbs/day	5.4	--	15	--	--	
Bis(2-ethylhexyl)phthalate	µg/L	5.9	--	12	--	--	CTR, SIP
	lbs/day	0.69	--	1.4	--	--	

E. Interim Effluent Limitations

Interim limits have been set as follows:

1. Copper, lead, mercury, silver, zinc, cyanide, chlorodibromomethane, dichlorobromomethane, and bis(2-ethylhexyl) phthalate have reasonable potential to exceed water quality criteria of these constituents. Therefore, final WQBELs are required. Based on effluent monitoring data submitted by the Discharger, a comparison between the MEC and calculated AMEL values shows that the Discharger may be unable to consistently comply with the AMEL established in this Order for copper, mercury, silver, zinc, cyanide, chlorodibromomethane, dichlorobromomethane, and bis(2-ethylhexyl)

phthalate. As a result, the tentative Order contains interim limitations for copper, mercury, silver, zinc, cyanide, chlorodibromomethane, dichlorobromomethane, and bis(2-ethylhexyl) phthalate.

2. Section 131.38(e) of 40 CFR provides conditions under which interim effluent limitations and compliance schedules may be issued. The SIP allows inclusion of an interim limitation with a specific compliance schedule included in an NPDES permit for priority pollutants if the limitation for the priority pollutant is CTR-based. Because the CTR-based effluent limitations for copper, mercury, silver, zinc, cyanide, chlorodibromomethane, dichlorobromomethane, and bis(2-ethylhexyl) phthalate appear infeasible for the Discharger to achieve at this time, interim limitations are contained in the tentative Order.
3. The SIP requires that the Regional Water Board establish other interim requirements such as requiring the discharger to develop a pollutant minimization plan and/or source control measures and participate in the activities necessary to achieve the final effluent limitations.
4. The Discharger may not be able to achieve immediate compliance with the new non-CTR-based limits for ammonia nitrogen prescribed in this Order. Based on effluent and receiving monitoring data submitted by the Discharger, a comparison between the MEC (3.6 mg/L) and calculated AMEL (0.045 mg/L for summer and 0.079 for winter) and MDEL (0.30 mg/L for summer and 0.53 for winter) values shows that the Discharger may not be able to consistently comply with the AMEL and MDEL established in this Order for ammonia nitrogen. For non-CTR-based limits based on Basin Plans WQO, for which the Discharger will not be able to meet immediately, interim limits and compliance dates are provided in the accompanying Time Schedule Order R4-2007-YYYY.
5. Based on effluent monitoring data submitted by the Discharger, a comparison between the MEC (18.6 mg/L) and the Basin Plan WQO for nitrate as nitrogen (10 mg/L), shows that the Discharger may be unable to comply with the Basin Plan WQO established in this Order for nitrate as nitrogen. For non-CTR-based limits based on Basin Plans WQO, for which the Discharger will not be able to meet immediately, interim limits and compliance dates are provided in the accompanying Time Schedule Order R4-2007-YYYY.
6. Based on effluent monitoring data submitted by the Discharger, a comparison between the MEC (18.8 mg/L) and the Basin Plan WQO for nitrate + nitrite as nitrogen (10 mg/L), shows that the Discharger may be unable to consistently comply with the Basin Plan WQO established in this Order for nitrate + nitrite as nitrogen. For non-CTR-based limits based on Basin Plans WQO, for which the Discharger will not be able to meet immediately, interim limits and compliance dates are provided in the accompanying Time Schedule Order R4-2007-YYYY.
7. The Discharger shall comply immediately with the following interim effluent limits until August 31, 2010. Thereafter, the Discharger shall comply with the

final limitations specified in Section IV.A.1.a. of this Order. The interim effluent limits were based upon effluent performance data, provided by the Discharger, collected between February 2003 and December 2006, and calculated by the *Minitab* program.

Table 10. Summary of Interim Effluent Limitations

Parameter	Units	Effluent Limitations			
		Average Monthly	Maximum Daily	Instantaneous Minimum	Instantaneous Maximum
Copper ⁸	µg/L	--	17 ⁹	--	--
	lbs/day			--	--
Mercury ⁷	µg/L	0.43 ¹⁰	0.69 ⁹	--	--
	lbs/day			--	--
Silver ⁷	µg/L	5.1 ¹¹	9.3 ¹⁰	--	--
	lbs/day			--	--
Zinc ¹²	µg/L	145 ¹³	183 ¹²	--	--
	lbs/day			--	--
Cyanide ⁷	µg/L	--	8 ¹⁴	--	--
	lbs/day			--	--
Chlorodibromomethane ⁷	µg/L	--	43.3 ¹⁵	--	--
	lbs/day			--	--
Dichlorobromomethane ⁷	µg/L	--	92 ¹⁶	--	--
	lbs/day			--	--

⁸ Effluent values are assumed to be lognormally distributed for data sets containing all detects and non-detects.
⁹ Interim effluent limits of 27 and 55 µg/L were derived statistically at 95% percentile for monthly average and at the 99% percentile for the daily maximum (See Attachment O). However, the MEC, 17 µg/L, is chosen as the interim daily maximum, which helps improve the situation of violation. No interim monthly average is available.
¹⁰ Interim effluent limits of 0.43 and 0.69 µg/L were derived statistically at 95% percentile for monthly average and at the 99% percentile for the daily maximum (See Attachment O).
¹¹ Interim effluent limits of 5.1 and 15 µg/L were derived statistically at 95% percentile for monthly average and at the 99% percentile for the daily maximum (See Attachment O). However, the MEC, 9.3 µg/L, is chosen as the interim daily maximum, which helps improve the situation of violation.
¹² Effluent values are assumed to be normally distributed for data sets containing all detects and non-detects.
¹³ Interim effluent limits of 145 and 183 µg/L were derived statistically at 95% percentile for monthly average and at the 99% percentile for the daily maximum (See Attachment O).
¹⁴ Interim effluent limits of 8.8 and 14 µg/L were derived statistically at 95% percentile for monthly average and at the 99% percentile for the daily maximum (See Attachment O). However, the MEC, 8 µg/L, is chosen as the interim daily maximum, which helps improve the situation of violation. No interim monthly average is available.
¹⁵ Interim effluent limits of 39 and 50 µg/L were derived statistically at 95% percentile for monthly average and at the 99% percentile for the daily maximum (See Attachment O). However, the MEC, 43.3 µg/L, is chosen as the interim daily maximum, which helps improve the situation of violation. No interim monthly average is available.
¹⁶ Interim effluent limits of 81 and 104 µg/L were derived statistically at 95% percentile for monthly average and at the 99% percentile for the daily maximum (See Attachment O). However, the MEC, 92 µg/L, is chosen as the interim daily maximum, which helps improve the situation of violation. No interim monthly average is available.

Parameter	Units	Effluent Limitations			
		Average Monthly	Maximum Daily	Instantaneous Minimum	Instantaneous Maximum
Bis(2-ethylhexyl)phthalate ⁷	µg/L	--	37 ¹⁷	--	--
	lbs/day			--	--

F. Land Discharge Specifications

Not Applicable.

G. Reclamation Specifications

The reuse of the reclaimed water is regulated under a separate Waste Discharge Requirements and Water Recycling Requirements for City of San Buenaventura, Order No. 87-45, CI No. 6190.

V. RATIONALE FOR RECEIVING WATER LIMITATIONS

A. Surface Water

The Basin Plan contains numeric and narrative water quality objectives applicable to all surface waters within the Los Angeles Region. Water quality objectives include an objective to maintain the high quality waters pursuant to federal regulations (40 CFR § 131.12) and State Water Board Resolution No. 68-16. Receiving water limitations in the tentative Order are included to ensure protection of beneficial uses of the receiving water.

B. Groundwater

Not Applicable.

VI. RATIONALE FOR MONITORING AND REPORTING REQUIREMENTS

Section 122.48 requires that all NPDES permits specify requirements for recording and reporting monitoring results. Water Code sections 13267 and 13383 authorize the Regional Water Board to require technical and monitoring reports. The Monitoring and Reporting Program (MRP), Attachment E of this Order, establishes monitoring and reporting requirements to implement federal and state requirements. The following provides the rationale for the monitoring and reporting requirements contained in the MRP for this Facility.

¹⁷ Interim effluent limits of 16 and 37 µg/L were derived statistically at 95% percentile for monthly average and at the 99% percentile for the daily maximum (See Attachment O). However, the MEC is also 37 µg/L, is chosen as the interim daily maximum, which helps improve the situation of violation. No interim monthly average is available.

A. Influent Monitoring

Influent monitoring is required to:

- Determine compliance with NPDES permit conditions.
- Assess treatment plant performance.
- Assess effectiveness of the Pretreatment Program

Influent monitoring in this Order follows the influent monitoring requirements in the previous Order with minor modification. The monitoring frequencies for parameters have been increased due to RP with those parameters.

B. Effluent Monitoring

The Discharger is required to conduct monitoring of the permitted discharges in order to evaluate compliance with permit conditions. Monitoring requirements are given in the proposed Monitoring and Reporting Program (Attachment E). This provision requires compliance with the Monitoring and Reporting Program, and is based on 40 CFR 122.44(i), 122.62, 122.63, and 124.5. The Monitoring and Reporting Program is a standard requirement in almost all NPDES permits (including the proposed Order) issued by the Regional Water Board. In addition to containing definition of terms, it specifies general sampling/analytical protocols and the requirements of reporting spills, violation, and routine monitoring data in accordance with NPDES regulations, the California Water Code, and Regional Water Board policies. The Monitoring and Reporting Program also contains sampling program specific for the Discharger's wastewater treatment plant. It defines the sampling stations and frequency, pollutants to be monitored, and additional reporting requirements. Pollutants to be monitored include all pollutants for which effluent limitations are specified. Further, in accordance with Section 1.3 of the SIP, a periodic monitoring is required for all priority pollutants defined by the CTR, for which criteria apply and for which no effluent limitations have been established, to evaluate reasonable potential to cause or contribute to an excursion above a water quality standard.

Monitoring for those pollutants expected to be present in the discharge from the facility, will be required as shown on the proposed Monitoring and Reporting Program (Attachment E) and as required in the SIP.

The effluent monitoring in this Order follows the effluent monitoring requirements in the existing Order. The changes are summarized in the following table.

Table 11. Effluent Monitoring Program Comparison Table

Parameter	Monitoring Frequency (2000 Permit)	Monitoring Frequency (2007 Permit)
Total residual chlorine	continuous	continuous ¹⁸
Total residual chlorine	--	5 days/week ¹⁹
Total waste flow	continuous	continuous ²⁰
Turbidity	continuous	Continuous ²⁰
Total and fecal coliform	daily	daily
Settleable solids	daily	daily
BOD ₅ 20°C	daily	daily
Suspended solids	daily	daily
Dissolved oxygen	daily	daily
Temperature	weekly	weekly
pH	weekly	weekly
Oil and grease	weekly	weekly
Total dissolved solids	monthly	monthly
Fluoride	monthly	monthly
Phosphate as P	monthly	monthly
Phosphorous	monthly	monthly
Ammonia nitrogen	monthly	monthly
Nitrate nitrogen	monthly	monthly
Nitrite nitrogen	monthly	monthly
Organic nitrogen	monthly	monthly
Total Kjeldahl nitrogen	monthly	monthly
Detergents (as MBAS)	monthly	monthly
Chlorophyll <i>a</i>	monthly	monthly
Cyanide	quarterly	monthly
Chronic toxicity	monthly	monthly
Acute toxicity	annually	annually
Aluminum	quarterly	semiannually
Antimony	quarterly	semiannually
Arsenic	quarterly	semiannually
Barium	quarterly	semiannually
Beryllium	quarterly	semiannually
Cadmium	quarterly	semiannually
Chromium VI	quarterly	semiannually

¹⁸ Total residual chlorine shall be continuously recorded. The recorded data shall be maintained by the Permittee for at least five years. The Permittee shall extract the maximum daily peak, minimum daily peak, and daily average from the recorded data and shall make available upon request of the Regional Water Board. The continuous monitoring data are not intended to be used for the compliance determination purposes.

¹⁹ Daily grab samples shall be collected at monitoring location M-001, Monday through Friday only, except for holidays. Analytical results of daily grab samples will be used to determine compliance with total residual chlorine effluent limitation. Furthermore, additional monitoring requirements as specified in section IV.A.2. shall be followed.

²⁰ Where continuous monitoring of a constituent is required, the following shall be reported:
 Total waste flow – Total daily and peak daily flow (24-hr basis);
 Turbidity – Maximum daily value, total amount of time each day the turbidity exceeded five turbidity units, flow-proportioned average daily value

Parameter	Monitoring Frequency (2000 Permit)	Monitoring Frequency (2007 Permit)
Cobalt	quarterly	semiannually
Copper	quarterly	monthly
Iron	quarterly	semiannually
Lead	quarterly	monthly
Mercury	quarterly	monthly
Molybdenum	quarterly	semiannually
Nickel	quarterly	semiannually
Selenium	quarterly	semiannually
Silver	quarterly	monthly
Thallium	quarterly	semiannually
Vanadium	quarterly	semiannually
Zinc	quarterly	monthly
Chlorodibromomethane	quarterly	monthly
Dichlorobromomethane	quarterly	monthly
Bis(2-ethylhexyl)phthalate	quarterly	monthly
Acetone	quarterly	semiannually
TCDD	semiannually	semiannually
Benzene	quarterly	semiannually
Bromoform	quarterly	semiannually
Carbon tetrachloride	quarterly	semiannually
Chloroform	quarterly	semiannually
Dichloromethane	quarterly	semiannually
Tetrachloroethylene	quarterly	semiannually
Phenols (chlorinated & non chlorinated)	quarterly	semiannually
PCBs	quarterly	semiannually
Aldrin	quarterly	semiannually
Dieldrin	quarterly	semiannually
Chlordane	quarterly	semiannually
Endrin	quarterly	semiannually
Heptachlor	quarterly	semiannually
Heptachlor epoxide	quarterly	semiannually
Endosulfan	quarterly	semiannually
Toxaphene	quarterly	semiannually
DDT	quarterly	semiannually
Total xylene	quarterly	semiannually
Remaining priority pollutants (excluding asbestos)	semiannually	semiannually
Pesticides ⁴	semiannually	semiannually
Radioactivity (Including gross alpha, gross beta, combined radium-226 and radium-228,	semiannually	semiannually

Parameter	Monitoring Frequency (2000 Permit)	Monitoring Frequency (2007 Permit)
tritium, strontium-90 and uranium)		
Emerging chemicals ²¹	--	biannually
Endocrine disrupting chemicals ²²	--	biannually

The reduction of monitoring frequencies for priority pollutants listed in the above table is based on the fact that previous monitoring data for these pollutants indicate that the discharge did not demonstrate reasonable potential to exceed water quality standards. However, monitoring frequency for priority pollutants with RP to exceed the WQOs is increased.

C. Whole Effluent Toxicity Testing Requirements

Whole effluent toxicity (WET) protects the receiving water quality from the aggregate toxic effect of a mixture of pollutants in the effluent. An acute toxicity test is conducted over a short time period and measures mortality. A chronic toxicity test is conducted over a longer period of time and may measure mortality, reproduction, and growth.

This requirement establishes conditions and protocol by which compliance with the Basin Plan narrative water quality objective for toxicity will be demonstrated and in accordance with Section 4.0 of the SIP. Conditions include required monitoring and evaluation of the effluent for acute and chronic toxicity and numerical values for chronic toxicity evaluation to be used as ‘triggers’ for initiating accelerated monitoring and toxicity reduction evaluation(s).

D. Receiving Water Monitoring

1. Surface Water

Receiving water monitoring is required to determine compliance with receiving water limitations and to characterize the water quality of the receiving water. Requirements are based on the Basin Plan. The receiving water monitoring program in this Order includes the following modifications to the existing receiving water monitoring program:

- a. Monitoring for priority pollutants and chronic toxicity in the previous Order No. 00-143 was at Stations R-001, R-003, and R-005. Monitoring for these constituents in the renewal MRP are Stations R-003, R-005, and Station R-004 replacing Station R-001.

²¹ Emerging chemicals include 1,4-dioxane (USEPA 8270c test method), perchlorate (USEPA 314 test method), 1,2,3-trichloropropane (USEPA 504.1 or 8260B test method), and methyl tert-butyl ether (USEPA 8260B test method). These chemicals need to be monitored in August.

²² Endocrine disrupting chemicals include ethinyl estradiol, 17-B estradiol, estrone, bisphenol A, nonylphenol and nonylphenol polyethoxylate, octylphenol and octylphenol polyethoxylate, and polybrominated diphenyl ethers. The analytical methods for these chemicals shall be approved by the DHS.

- b. The reduction of monitoring frequencies for priority pollutants listed in Table 12 is based on the fact that previous effluent monitoring data for these pollutants indicate that the discharge did not demonstrate reasonable potential to exceed water quality standards. However, monitoring frequency for priority pollutants and chronic toxicity with RP to exceed the WQOs is increased.

Table 12. Receiving Water Monitoring Program Comparison Table

Parameter	Monitoring Frequency (2000 Permit)	Monitoring Frequency (2007 Permit)
Copper	quarterly	monthly
Lead	quarterly	monthly
Mercury	quarterly	monthly
Silver	quarterly	monthly
Zinc	quarterly	monthly
Cyanide	quarterly	monthly
Chlorodibromomethane	quarterly	monthly
Dichlorobromomethane	quarterly	monthly
Bis(2-ethylhexyl)phthalate	quarterly	monthly
Remaining priority pollutants (excluding asbestos)	quarterly	semiannually
Chronic toxicity	quarterly	monthly

- c. Annual acute toxicity test is added at Stations R-005 and R-003 to fulfill Section V.A.14.d of Order.

2. Groundwater

Not Applicable.

E. Other Monitoring Requirements

1. Biosolids/Sludge Monitoring

This section establishes monitoring and reporting requirements for the storage, handling and disposal practices of sludge generated from the operation of this Facility.

VII. RATIONALE FOR PROVISIONS

A. Standard Provisions

Standard Provisions, which apply to all NPDES permits in accordance with section 122.41, and additional conditions applicable to specified categories of permits in accordance with section 122.42, are provided in Attachment D. The discharger must comply with all standard provisions and with those additional conditions that are applicable under section 122.42.

Section 122.41(a)(1) and (b) through (n) establish conditions that apply to all State-issued NPDES permits. These conditions must be incorporated into the permits either expressly or by reference. If incorporated by reference, a specific citation to the regulations must be included in the Order. Section 123.25(a)(12) allows the state to omit or modify conditions to impose more stringent requirements. In accordance with section 123.25, this Order omits federal conditions that address enforcement authority specified in sections 122.41(j)(5) and (k)(2) because the enforcement authority under the Water Code is more stringent. In lieu of these conditions, this Order incorporates by reference Water Code section 13387(e).

B. Special Provisions

1. Reopener Provisions

This provision is based on 40 CFR Part 123. The Regional Water Board may reopen the permit to modify permit conditions and requirements. Causes for modifications include the promulgation of new regulations, modification in sludge use or disposal practices, or adoption of new regulations by the State Water Board or Regional Water Board, including revisions to the Basin Plan.

2. Special Studies and Additional Monitoring Requirements

a. Toxicity Reduction Requirements

If the discharge consistently exceed an effluent limitation for toxicity, the Discharger needs to conduct TIE/TRE detailed in Section V of the MRP (Attachment E). The TRE will help the Discharger identify the possible source(s) of toxicity. Once the source(s) of toxicity is identified, the Discharger shall take all reasonable steps to reduce toxicity to the required level.

3. Best Management Practices and Pollution Prevention

a. Storm Water Pollution Prevention Plan (SWPPP)

CWA section 402(p), as amended by the Water Quality Act of 1987, requires NPDES permits for storm water discharges. Pursuant to this requirement, in 1990, USEPA promulgated 40 CFR 122.26 that established requirements for storm water discharges under an NPDES permit. To facilitate compliance with federal regulations, on November 1991, the State Board issued a statewide general permit, *General NPDES Permit No. CAS000001 and Waste Discharge Requirements for Discharges of Storm Water Associated with Industrial Activities*. This permit was amended in September 1992 and reissued on April 17, 1997 as State Board Order No. 97-03-DWQ. JWPCP is covered under this general permit and an updated SWPPP is required.

b. **Spill Contingency Plan (SCP)**

Since spill or overflow is a common event in the treatment plant service areas, this Order requires the Discharger to review and update, if necessary, SCP after each incident. The Discharger shall ensure that the up-to-date SPC is readily available to the sewage system personnel at all times and that the sewage personnel are familiar with it.

c. **Pollutant Minimization Program.**

This provision is based on the requirements of Section 2.4.5 of the SIP.

4. Construction, Operation, and Maintenance Specifications

This provision is based on the requirements of 40 CFR 122.41(e) and the previous Order.

5. Special Provisions for Municipal Facilities (POTWs Only)

a. **Biosolids Requirements.** To implement CWA Section 405(d), on February 19, 1993, USEPA promulgated 40 CFR 503 to regulate the use and disposal of municipal sewage sludge. This regulation was amended on September 3, 1999. The regulation requires that producers of sewage sludge meet certain reporting, handling, and disposal requirements. It is the responsibility of the Discharger to comply with said regulations that are enforceable by USEPA, because California has not been delegated the authority to implement this program. The Discharger is also responsible for compliance with WDRs and NPDES permits for the generation, transport and application of biosolids issued by the State Board, other Regional Water Boards, Arizona Department of Environmental Quality or USEPA, to whose jurisdiction the Facility's biosolids will be transported and applied.

b. **Pretreatment Requirements.** This permit contains pretreatment requirements consistent with applicable effluent limitations, national standards of performance, and toxic and performance effluent standards established pursuant to Sections 208(b), 301, 302, 303(d), 304, 306, 307, 403, 404, 405, and 501 of the CWA, and amendments thereto. This permit contains requirements for the implementation of an effective pretreatment program pursuant to Section 307 of the CWA; 40 CFR 35 and 403; and/or Section 2233, Title 23, California Code of Regulations.

c. **Spill Reporting Requirements.** This Order established a reporting protocol for how different types of spills, overflow or bypasses of raw or partially treated sewage from its collection system or treatment plant covered by this Order shall be reported to regulatory agencies.

The State Water Board issued General Waste Discharge Requirements for Sanitary Sewer Systems, Water Quality Order No. 2006-0003-DWQ (General Order) on May 2, 2006. The General Order requires public agencies that own or operate sanitary sewer systems with greater than one mile of pipes or sewer lines to enroll for coverage under the General Order. The General Order requires agencies to develop sanitary sewer management plans (SSMPs) and report all sanitary sewer overflows (SSOs), among other requirements and prohibitions.

Furthermore, the General Order contains requirements for operation and maintenance of collection systems and for reporting and mitigating sanitary sewer overflows. Inasmuch that the Discharger's collection system is part of the system that is subject to this Order, certain standard provisions are applicable as specified in Provisions, section VI.C.5. For instance, the 24-hour reporting requirements in this Order are not included in the General Order. The Discharger must comply with both the General Order and this Order. The Discharger and public agencies that are discharging wastewater into the facility were required to obtain enrollment for regulation under the General Order.

7. Compliance Schedules

- a. This Order establishes final effluent limitations for ammonia, nitrate plus nitrite as nitrogen, nitrite as nitrogen, copper, lead, mercury, silver, cyanide, chlorodibromomethane, dichlorobromomethane, and bis(2-ethylhexyl) phthalate. Interim limit for nickel is not necessary because the monitoring data indicate that discharger can consistently comply with the final effluent limitation. This Order contains interim effluent limitations and a compliance schedule for copper, mercury, silver, zinc, cyanide, chlorodibromomethane, dichlorobromomethane, and bis(2-ethylhexyl) phthalate that provides the Discharger time to bring their facility into compliance with the final effluent limit.

The provision for compliance schedule is based on Section 2.1 (Compliance Schedules) of the SIP. The proposed permit allows the Discharger until July 17, 2010, to be in compliance with the final effluent limitations for bis(2-ethylhexyl) phthalate. Based on Regional Water Board's best professional judgment, this schedule is sufficient for the Discharger to achieve the final effluent limitations for the pollutants. The Discharger is required to develop and submit a Compliance Plan. The Discharger is also required to develop and implement a pollution minimization plan to ensure the Discharger achieves compliance with the final limitations within a time specified in Section IV.A.1.a. of this Order. Annual status report is required to inform the Regional Water Board about the progress made by the Discharger to achieve compliance with the final effluent limitations within specified time. During the interim period the Discharger is required to meet the interim limitations.

- b. This Order established final effluent limitations for ammonia nitrogen and nitrate + nitrite as nitrogen that are new limits for the Facility. For the aforementioned non-CTR-based pollutants, the interim limits and compliance dates are provided in the accompanying Time Schedule Order No. R4-2007-YYYY.

VIII. PUBLIC PARTICIPATION

The California Regional Water Quality Control Board, Los Angeles Region (Regional Water Board) is considering the issuance of waste discharge requirements (WDRs) that will serve as a National Pollutant Discharge Elimination System (NPDES) permit for Ventura Water Reclamation Facility. As a step in the WDR adoption process, the Regional Water Board staff has developed tentative WDRs. The Regional Water Board encourages public participation in the WDR adoption process.

A. Notification of Interested Parties

The Regional Water Board has notified the Discharger and interested agencies and persons of its intent to prescribe waste discharge requirements for the discharge and has provided them with an opportunity to submit their written comments and recommendations. Notification was provided through the following newspapers: (Ventura County Star and date).

B. Written Comments

The staff determinations are tentative. Interested persons are invited to submit written comments concerning these tentative WDRs. Comments must be submitted either in person or by mail to the Executive Office at the Regional Water Board at the address above on the cover page of this Order.

To be fully responded to by staff and considered by the Regional Water Board, written comments must be received at the Regional Water Board offices by 5:00 p.m. on May 30, 2007.

C. Public Hearing

The Regional Water Board will hold a public hearing on the tentative WDRs during its regular Board meeting on the following date and time and at the following location:

Date: July 12, 2007
Time: 9:00 a.m.
Location: Metropolitan Water District of Southern California Board Room
700 North Alameda Street
Los Angeles, California

Interested persons are invited to attend. At the public hearing, the Regional Water Board will hear testimony, if any, pertinent to the discharge, WDRs, and permit. Oral

testimony will be heard; however, for accuracy of the record, important testimony should be in writing.

Please be aware that dates and venues may change. Our Web address is <http://www.waterboards.ca.gov/losangeles/> where you can access the current agenda for changes in dates and locations.

D. Waste Discharge Requirements Petitions

Any aggrieved person may petition the State Water Resources Control Board to review the decision of the Regional Water Board regarding the final WDRs. The petition must be submitted within 30 days of the Regional Water Board's action to the following address:

State Water Resources Control Board
Office of Chief Counsel
P.O. Box 100, 1001 I Street
Sacramento, CA 95812-0100

E. Information and Copying

The Report of Waste Discharge (RWD), related documents, tentative effluent limitations and special provisions, comments received, and other information are on file and may be inspected at the address above at any time between 8:30 a.m. and 4:45 p.m., Monday through Friday. Copying of documents may be arranged through the Regional Water Board by calling (213) 576-6600.

F. Register of Interested Persons

Any person interested in being placed on the mailing list for information regarding the WDRs and NPDES permit should contact the Regional Water Board, reference this facility, and provide a name, address, and phone number.

G. Additional Information

Requests for additional information or questions regarding this order should be directed to Don Tsai at (213) 576-6665.

**ORDER NO. R4-2008-0011
 NPDES NO. CA0053651**

**WASTE DISCHARGE REQUIREMENTS FOR THE
 CITY OF SAN BUENAVENTURA
 VENTURA WATER RECLAMATION FACILITY
 DISCHARGE TO THE SANTA CLARA RIVER ESTUARY VIA DISCHARGE OUTFALL NO. 001**

The following Discharger is subject to waste discharge requirements as set forth in this Order:

Table 1. Discharger Information

Discharger	City of San Buenaventura
Name of Facility	Ventura Water Reclamation Facility
Facility Address	1400 Spinnaker Drive
	Ventura, CA 93002-0099
	Ventura County
The U.S. Environmental Protection Agency (USEPA) and the Regional Water Quality Control Board have classified this discharge as a major discharge.	

The discharge by the City of San Buenaventura from the discharge point identified below is subject to waste discharge requirements as set forth in this Order:

Table 2. Discharge Location

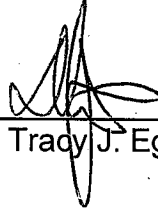

Discharge Point	Effluent Description	Discharge Point Latitude	Discharge Point Longitude	Receiving Water
001	Tertiary treated wastewater	34 °, 14', 22.46" N	119 °, 15', 58.84" W	Santa Clara River Estuary via Wildlife Ponds

Table 3. Administrative Information

This Order was adopted by the Regional Water Quality Control Board on:	March 6, 2008
This Order shall become effective on:	Immediately effective after adoption
This Order shall expire on:	February 10, 2013
The Discharger shall file a Report of Waste Discharge in accordance with title 23, California Code of Regulations, as application for issuance of new waste discharge requirements no later than:	180 days prior to the Order expiration date

IT IS HEREBY ORDERED, that Order No. 00-143 is rescinded upon the effective date of this Order except for enforcement purposes, and, in order to meet the provisions contained in division 7 of the Water Code (commencing with section 13000) and regulations adopted thereunder, and the provisions of the federal Clean Water Act (CWA) and regulations and guidelines adopted thereunder, the Discharger shall comply with the requirements in this Order.

I, Tracy J. Egoscue, Executive Officer, do hereby certify that this Order with all attachments is a full, true, and correct copy of an Order adopted by the California Regional Water Quality Control Board, Los Angeles Region, on March 6, 2008.

Chief Deputy E.O. for
Tracy J. Egoscue, Executive Officer

	Ventura County
Type of Facility	Publicly Owned Treatment Works
Facility Design Flow	14 Million Gallons per Day (MGD)

II. FINDINGS

The California Regional Water Quality Control Board, Los Angeles Region (hereinafter Regional Water Board), finds:

- A. Background.** The City of San Buenaventura (hereinafter Discharger) is currently discharging pursuant to Order No. 00-143 and National Pollutant Discharge Elimination System (hereinafter NPDES) Permit No. CA0053651. The Discharger submitted a Report of Waste Discharge (ROWD), dated April 18, 2005, and applied for an NPDES permit renewal to discharge up to 14 millions gallons per day (MGD) of tertiary treated wastewater from Ventura Water Reclamation Facility, hereinafter Facility. The application was deemed complete on March 14, 2007.

For the purposes of this Order, references to the “discharger” or “permittee” in applicable federal and state laws, regulations, plans, or policy are held to be equivalent to references to the Discharger herein.

The Water Quality Control Policy for the Enclosed Bays and Estuaries of California (Enclosed Bay and Estuaries Policy), originally adopted by the State Water Resources Control Board in 1974 and updated as Resolution No. 95-84 on November 16, 1995, states that:

“It is the policy of the State Board that the discharge of municipal wastewaters and industrial process waters (exclusive of cooling water discharges) to enclosed bays and estuaries, other than the San Francisco Bay-Delta system, shall be phased out at the earliest practicable date. Exceptions to this provision may be granted by a Regional Board only when the Regional Board finds that the wastewater in question would consistently be treated and discharged in such a manner that it would enhance the quality of receiving waters above that which would occur in the absence of the discharge.”

The Enclosed Bay and Estuaries Policy does not define what is meant by “enhancement”. That determination is left to the discretion of the Regional Board.

Section I.A. of Order No. 00-143 states that “The running 30-day average volume of treated wastewater discharged to the Santa Clara River Shall not be less than 5.6 mgd.” The minimal discharge of 5.6 mgd was based upon results of the 1976 Enhancement Study conducted by the Discharger and accepted by this Regional Water Board in 1977. However, there has not been a consensus among stakeholders of whether the treated wastewater discharge into the Santa Clara River Estuary (Estuary) is beneficial and enhances the Estuary, or has adverse impacts to the Estuary.

Between October 12, 2000 and December 14, 2006, the Regional Board issued seven individual Time Schedule Orders (TSOs) to the City. These TSOs provided time to address the issue of whether the saltwater or the fresh water California Toxic Rule Criteria (CTR) should be applied for the effluent limitation calculations. The City was required to conduct the Salinity Study in 2001. The result showed that the Estuary is more like a blackish environment. Therefore, the more stringent Saltwater CTR was chosen to calculate the final effluent limitations.

A second, more fundamental issue is whether the discharge from the Facility should be allowed to continue, in view of the Bays and Estuaries Policy. Specifically, the discharge may be allowed under the Policy if it enhances the receiving waters (i.e., the Estuary) and endangered species habitat.

Regional Water Board staff met with the Discharger, Resource Agencies and other Interested Parties to review the results of the Updated Enhancement Study (May 2005). This Study was performed by Nautilus Environmental hired by the Discharger (meetings held at the Facility on March 27, 2006 and June 12, 2006). The conclusions of the Study were largely inconclusive. However, concern was expressed that a swift reduction in the volume of fresh wastewater to the Estuary could result in loss of habitat and adverse impacts on the Tidewater Goby. In addition, the resource agencies requested that the effluent should be monitored for emerging, endocrine disrupting, and pharmaceutical chemicals. This monitoring effort could determine the possible impact(s) of these chemicals on the aquatic life, particularly, the Tidewater Goby.

During a stakeholder meeting on October 19, 2007, the possible impacts of maintaining and eliminating discharge to the Estuary were discussed. "Pros" and "cons" expressed, however, no consensus was reached on the issues discussed. Resource agencies, environmental groups, interested parties, and stakeholders, all had varying opinions. The Regional Board agrees that scientific disagreement exists, and most of the commentors' opinions may have technical merit.

In addition, while the Regional Board has previously determined that the discharge enhances the Estuary, the Regional Board presently has inadequate information with which to determine whether and to what extent the discharge that could be authorized by this permit continues to constitute an enhancement. The Board also presently lacks the information necessary to determine what if any negative impacts would occur to the Estuary if the discharge was prohibited, and therefore lacks the current information necessary dispute the previous enhancement finding. The Board has conflicting, yet credible opinions from a variety of experts about harm to endangered species, habitat, and recreation, among other uses of the Estuary and areas impacted by the discharge, both with and without the discharge. In view of the aforesaid, the Regional Board finds that the best approach at this time is to cap the allowable discharge at present levels (9 MGD, as an annual average) and to require a watershed-wide study and dialogue, to determine the best approach for the Estuary that considers at a minimum:

Limitations and Discharge Requirements

April 27, 2007; Revised October 23, 2007, November 8, 2007, January 7, 2008,
February 20, 2008, and March 6, 2008

1. A system-wide analysis that examines the biological, recreational, physical, chemical and hydrological relationships implicated in the watershed; and,
2. A Comprehensive Plan that addresses the function of the sub-watershed and Estuary as a single unit.

To ensure compliance with the Bays and Estuaries Policy, this study should be completed as soon as practicable.

At the stakeholder meeting held on January 29, 2008, the revised tentative Order (January 7, 2008), Watershed-wide Study, and Work Plan was discussed. At this meeting, the Discharger expressed interest in exploring construction of wetlands near the Facility to improve the receiving water quality. This order contains a requirement for the Discharger to submit a Wetlands Feasibility Study (See Section VI.C.2.a.iv of Order). Once the Feasibility Study has been reviewed by Regional Board staff, the permit will be reopened (see Reopener provision in section VI.C.1.k. of the Order) and a time frame will be established by the Regional Board for further action. It is anticipated that, if feasible, the City will pursue the activity, and will begin the planning and CEQA process in order to begin the project construction activities prior to the permit expiration date.

B. Facility Description. The Discharger owns and operates the Facility. The treatment system consists of screenings, grit removal, primary sedimentation, flow equalization, activated sludge nitrification and partial denitrification¹ (NDN), tertiary filters, ammonia addition², chlorination and dechlorination, primary sludge thickener,

¹ For the nitrification process, there are two steps for ammonia being oxidized into nitrate.

Step 1: Ammonia → Nitrite

Step 2: Nitrite → Nitrate

For the denitrification process, nitrate is through a redox reaction and becomes nitrogen.

Nitrate → Nitrogen

The Facility currently does not have a full NDN process (full nitrification and partial denitrification). The effluent data between February 2003 and December 2006 did show the high effluent nitrate concentration (10.1 – 18.6 mg/L, average: 14.6 mg/L) and very low effluent nitrite concentration (always less than 0.4 mg/L, which is the detection limit). However, the nitrite effluent concentrations may exceed 1 mg/L of water quality objective specified in the Basin Plan based on the Best Professional Judgement, if the oxidation process of the nitrification is not complete. Therefore, a final nitrite limitation of 1 mg/L has been added to the Order No. R4-2008-0012 and the Discharger may request to have interim nitrite effluent limitations in the future. In addition, once the full NDN is on line, the effluent nitrate concentration shall be further reduced.

² Ammonia (NH₃) has been added into chlorine contact basin since April 2004. Ammonia reacts with hypochlorous acid (HOCl) to form chloramine (NH₂Cl). Here is the reaction below:

dissolved air flotation (DAF) secondary sludge thickener, anaerobic digestion, and dewatering (using plate and frame filter presses). All of the Class B anaerobically digested sludge is dewatered and composted to Class A at Lost Hills, Kern County and then land applied to a cotton farm in Kings County. Screenings and grits are disposed of at the Toland Road landfill. The Facility is also responsible for 375 miles of sewer mains and 12 lift stations. Treated wastewater is discharged from Discharge Point No. 001 (Outfall) to a system of Wildlife Ponds³ with a combined capacity of 34 million gallons providing approximately 4 days of detention, based on an average daily flow rate of 9.5 MGD and approximately 1.0 MGD of the treated wastewater percolating into groundwater from the Wildlife Ponds. This treated wastewater is then discharged to the Estuary, a water of the United States, within the Santa Clara River Watershed. Attachment B provides a map of the area surrounding the Facility. Attachment C provides a flow schematic of the Facility.

The most problematic metals were copper, nickel, and zinc prior to improving primary clarifier performance. The City of Ventura installed temporary facilities for improved primary clarifier performance in the First Quarter of 2003. Prior to the addition of iron salt between October 2000 and December 2002, the average effluent concentrations of copper, nickel, and zinc were 18, 9.7, and 69 µg/L, respectively. The addition of iron salt greatly improved removal of copper, nickel, and zinc. Between August 2003 and August 2007, the average effluent concentrations of copper, nickel, and zinc were 7.2, 3.9, and 37 µg/L, respectively. Neither antimony (reported detection limit: 1.0 µg/L), arsenic (reported detection limit: 2.0 µg/L), beryllium (reported detection limit: 0.2 µg/L), cadmium (reported detection limit: 4.0 µg/L), lead (reported detection limit: 5.0 µg/L), mercury (reported detection limit: 0.2 µg/L), silver (reported detection limit: 0.2 µg/L), nor thallium (reported detection limit: 1.0 µg/L), was detected between February 2006 and August 2007. Chromium, copper, nickel, and selenium were detected for one time during this period; however, these metals except copper were all less than the CTR-based criteria. Zinc was all less than its CTR-based criteria since November 2004. Permanent facilities for iron salt addition were completed in November 2007. The final effluent concentrations of copper, nickel, and zinc are expected to be further reduced or non-detected. Due to the major upgrade on the primary clarifier in 2003 and consideration of the representative effluent data, the effluent data collected after July 2003 were used to calculate the final effluent limitations for metals.

Chloramine is used as a disinfectant in municipal water systems as an alternative to chlorination and also exhibits less tendency to convert organic materials into chlorocarbons such as chloroform, dichlorobromomethane, dibromochloromethane, and carbon tetrachloride.

³ Optimal water amounts for bird populations in the estuary probably include both a large open water surface area during California Least Tern nesting and exposed mudflats created when the estuary bar breaches during the fall in September. During the winter months the open water areas of the estuary and the wildlife ponds provide safe sleeping areas for ducks where they can't be reached by predators like the coyote. The above information was based upon the Ventura Audubon Society's February 3, 2008 comment letter for the January 7, 2008 tentative Ventura NPDES Permit.

Limitations and Discharge Requirements

April 27, 2007; Revised October 23, 2007, November 8, 2007, January 7, 2008,
February 20, 2008, and March 6, 2008

To date, the City has invested \$29.5 million for Upgrades (Phase I) and a new Influent Headworks. Upgrades (Phase II) will restore biological capacity decommissioned during Phase I, and add new nutrient removal facilities. Phase II is currently estimated at \$28 million with a final design and construction period of 36 to 48 months following the adoption of this Order.

The City of Ventura conducted the "Chloramine Disinfection Investigation" at the Facility between April 2 and June 30, 2004. The results indicated that chloramine resulting from ammonia reacting with hypochlorous acid greatly reduces the effluent concentrations of dibromochloromethane, and dichlorobromomethane. These compounds were all well below the CTR-based criteria or non-detected Between May 2004 and August 2007. The maximum effluent concentration and CTR-based criterion for dibromochloromethane are 5.5 µg/L and 34 µg/L, respectively. The maximum effluent concentration and CTR-based criterion for dichlorobromomethane are 8.6 µg/L and 46 µg/L, respectively.

- C. Legal Authorities.** This Order is issued pursuant to section 402 of the federal Clean Water Act (CWA) and implementing regulations adopted by the U.S. Environmental Protection Agency (USEPA) and chapter 5.5, division 7 of the California Water Code (commencing with section 13370). It shall serve as an NPDES permit for point source discharges from this facility to surface waters. This Order also serves as Waste Discharge Requirements (WDRs) pursuant to article 4, chapter 4, division 7 of the Water Code (commencing with section 13260).
- D. Background and Rationale for Requirements.** The Regional Water Board developed the requirements in this Order based on information submitted as part of the ROWD and application, through Monitoring and Reporting Programs, and other available information. The Fact Sheet (Attachment F), which contains background information and rationale for Order requirements, is hereby incorporated into this Order and constitutes part of the Findings for this Order. Attachments A through N are also incorporated into this Order.
- E. California Environmental Quality Act (CEQA).** Under Water Code section 13389, this action to adopt an NPDES permit is exempt from the provisions of CEQA, Public Resources Code sections 21100-21177.
- F. Technology-Based Effluent Limitations.** Section 301(b) of the CWA and implementing USEPA permit regulations at section 122.44, title 40 of the Code of Federal Regulations⁴, require that permits include conditions meeting applicable technology-based requirements at a minimum, and any more stringent effluent limitations necessary to meet applicable water quality standards. The discharge authorized by this Order must meet minimum federal technology-based requirements based on Secondary Treatment Standards at Part 133 and Best Professional Judgment (BPJ) in accordance with Part 125, section 125.3. A detailed

⁴ All further statutory references are to title 40 of the Code of Federal Regulations unless otherwise indicated.

discussion of the technology-based effluent limitations development is included in the Fact Sheet.

- G. Water Quality-Based Effluent Limitations.** Section 301(b) of the CWA and section 122.44(d) require that permits include limitations more stringent than applicable federal technology-based requirements where necessary to achieve applicable water quality standards. This Order contains requirements, expressed as a technology equivalence requirement, more stringent than secondary treatment requirements that are necessary to meet applicable water quality standards. The rationale for these requirements, which consist of tertiary treatment or equivalent requirements or other provisions, is discussed in Section IV.C.2 of the Fact Sheet.

Section 122.44(d)(1)(i) mandates that permits include effluent limitations for all pollutants that are or may be discharged at levels that have the reasonable potential to cause or contribute to an exceedance of a water quality standard, including numeric and narrative objectives within a standard. Where reasonable potential has been established for a pollutant, but there is no numeric criterion or objective for the pollutant, water quality-based effluent limitations (WQBELs) must be established using: (1) USEPA criteria guidance under CWA section 304(a), supplemented where necessary by other relevant information; (2) an indicator parameter for the pollutant of concern; or (3) a calculated numeric water quality criterion, such as a proposed state criterion or policy interpreting the state's narrative criterion, supplemented with other relevant information, as provided in section 122.44(d)(1)(vi).

- H. Water Quality Control Plans.** The Regional Water Board adopted a Water Quality Control Plan for the Los Angeles Region (hereinafter Basin Plan) on June 13, 1994 that designates beneficial uses, establishes water quality objectives, and contains implementation programs and policies to achieve those objectives for all waters addressed through the Basin Plan. In addition, the Basin Plan implements State Water Resources Control Board (State Water Board) Resolution No. 88-63, which established state policy that all waters, with certain exceptions, should be considered suitable or potentially suitable for municipal or domestic supply. Beneficial uses applicable to the Estuary are as follows:

Table 5. Basin Plan Beneficial Uses

Discharge Point	Receiving Water Name	Beneficial Use(s)
002	Santa Clara River Estuary	<u>Existing:</u> Navigation (NAV), water contact recreation (REC-1), non-contact water recreation (REC-2), commercial and sport fishing (COMM), estuarine habitat (EST), marine habitat (MAR), wildlife habitat (WILD), rare, threatened, or endangered species ⁵ (RARE), migration of aquatic organisms ⁶ (MIGR), spawning, reproduction, and/or early development ⁵ (SPWN), and wet land ⁷ (WET).
	Pacific Ocean, Nearshore ⁸	<u>Existing:</u> IND, NAV, REC-1, REC-2, COMM, MAR, WILD, Preservation of Biological Habitats ⁹ (BIOL), RARE ⁴ , MIGR ⁵ , SPWN ⁵ , and shellfish harvesting (SHELL).

Requirements of this Order specifically implement the Basin Plan.

The 1994 Basin Plan provided water quality objectives for ammonia to protect aquatic life, in Tables 3-1 through Tables 3-4. However, those ammonia objectives were revised, based upon freshwater and saltwater criteria.

1. **Freshwater Ammonia Water Objective** – On April 25, 2002, the Regional Water Board adopted the Resolution No. 2002-011, *Amendment to the Water Quality Control Plan for the Los Angeles Region to Update the Ammonia Objectives for Inland Surface Waters (Including Enclosed Bays, Estuaries and Wetlands) with Beneficial Use Designations for Protection of Aquatic Life*. The ammonia Basin Plan amendment was approved by the State Water Board, the Office of Administrative Law, and USEPA on April 30, 2003, June 5, 2003, and June 19, 2003, respectively. Although the revised ammonia water quality objectives may be less stringent than those contained in the 1994 Basin Plan, they are still protective of aquatic life and are consistent with USEPA’s 1999 ammonia criteria update.

2. **Saltwater Ammonia Water Objective** – On March 4, 2004, the Regional Water Board adopted the Resolution No. 2004-022, *Amendment to the Water Quality Control Plan for the Los Angeles Region to Update the Ammonia Objectives for Inland Surface Waters Not Charatistic of Freshwater (Including Enclosed Bays, Estuaries and Wetlands) with Beneficial Use Designations for*

⁵ One or more rare species utilize all ocean, bays, estuaries, and coastal wetlands for foraging and/or nesting.
⁶ Aquatic organisms utilize all bays, estuaries, lagoons and coastal wetlands, to a certain extent, for spawning and early development. This may include migration into areas, which are heavily influenced by freshwater inputs.
⁷ Waterbodies designated as WET may have wetlands habitat associated with only a portion of the waterbody. Any regulatory action would require a detailed analysis of the area.
⁸ Nearshore is defined as the zone bounded by the shoreline and a line 1,000 feet from the shoreline or the 30-foot depth contours, whichever is further from the shoreline.
⁹ Areas of Special Biological Significance (along coast from Latigo Point to Laguna Point) and Big Sycamore Canyon and Abalone Cove Ecological Reserves and Point Femin Marine Life Refuge.

Limitations and Discharge Requirements

April 27, 2007; Revised October 23, 2007, November 8, 2007, January 7, 2008,
 February 20, 2008, and March 6, 2008

Protection of Aquatic Life. The ammonia Basin Plan amendment is consistent with the U.S. EPA "Ambient Water Quality Criteria for Ammonia (Saltwater)-1989." The amendment revised the regulatory provisions of the Basin Plan by adding language to Chapter 3 "Water Quality Objectives."

For inland surface waters not characteristic of freshwater (including enclosed bays, estuaries, and wetlands), the proposed objectives are a 4-day average concentration of unionized ammonia of 0.035 mg/L, and a one-hour average concentration of unionized ammonia of 0.233 mg/L. The proposed objectives are fixed concentrations of unionized ammonia, independent of pH, temperature, or salinity. The proposed amendment includes an implementation procedure to convert un-ionized ammonia objectives to total ammonia effluent limits. The proposed amendment also simplifies the implementation procedures for translating ammonia objectives into effluent limits in situations where a mixing zone has been authorized by the Regional Water Board. Finally, the proposed amendment revises the implementation procedure for determining saltwater, brackish or freshwater conditions, to be consistent with the proposed objectives. The proposed objectives will apply only to inland surface waters not characteristic of freshwater (including enclosed bays, estuaries and wetlands) and do not impact the Ammonia Water Quality Objectives for ocean waters contained in the California Ocean Plan.

If salinity sampled at a particular receiving water station indicates brackish conditions, then the more stringent of the freshwater or saltwater objectives shall apply except where the Regional Water Board, by adoption of a resolution, approves the use of either freshwater or saltwater objectives per Implementation Provision 1(3)(a). However, based on the beneficial uses of the Basin Plan, the freshwater ammonia water objective is not applicable in the Santa Clara River Estuary. Therefore, the saltwater ammonia water objectives will be used to calculate the final ammonia effluent limitations for the Facility (See Section IV.C.2.i.(iii)(iv) in the accompanying Attachment F, and Attachment M).

The saltwater ammonia Basin Plan amendment was approved by the State Water Board, the Office of Administrative Law, and USEPA on July 22, 2004, September 14, 2004, and May 19, 2005, respectively.

The State Water Board adopted the *Water Quality Control Plan for Control of Temperature in the Coastal and Interstate Water and Enclosed Bays and Estuaries of California* (Thermal Plan) on May 18, 1972, and amended this plan on September 18, 1975. This plan contains temperature objectives for surface waters. Requirements of this Order implement the Thermal Plan.

The 2006 303(d) listings for the Estuary are Chem A based on an unknown source and coliform bacteria and toxaphene based on nonpoint sources. The Total Daily Maximum Loads (TMDLs) for these pollutants in the Estuary have not been established.

- I. National Toxics Rule (NTR) and California Toxics Rule (CTR).** USEPA adopted the NTR on December 22, 1992, and later amended it on May 4, 1995 and November 9, 1999. About forty criteria in the NTR applied in California. On May 18, 2000, USEPA adopted the CTR. The CTR promulgated new toxics criteria for California and, in addition, incorporated the previously adopted NTR criteria that were applicable in the state. The CTR was amended on February 13, 2001. These rules contain water quality criteria for priority pollutants.
- J. State Implementation Policy.** On March 2, 2000, the State Water Board adopted the *Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California* (State Implementation Policy or SIP). The SIP became effective on April 28, 2000 with respect to the priority pollutant criteria promulgated for California by the USEPA through the NTR and to the priority pollutant objectives established by the Regional Water Board in the Basin Plan. The SIP became effective on May 18, 2000 with respect to the priority pollutant criteria promulgated by the USEPA through the CTR. The State Water Board adopted amendments to the SIP on February 24, 2005 that became effective on July 13, 2005. The SIP establishes implementation provisions for priority pollutant criteria and objectives and provisions for chronic toxicity control. Requirements of this Order implement the SIP.
- K. Compliance Schedules and Interim Requirements.** Section 2.1 of the SIP provides that, based on a Discharger's request and demonstration that it is infeasible for an existing Discharger to achieve immediate compliance with an effluent limitation derived from a CTR criterion, compliance schedules may be allowed in an NPDES permit. Unless an exception has been granted under section 5.3 of the SIP, a compliance schedule may not exceed 5 years from the date that the permit is issued or reissued, nor may it extend beyond 10 years from the effective date of the SIP (or May 18, 2010) to establish and comply with CTR criterion-based effluent limitations. Where a compliance schedule for a final effluent limitation exceeds 1 year, the Order must include interim numeric limitations for that constituent or parameter. Where allowed by the Basin Plan, compliance schedules and interim effluent limitations or discharge specifications may also be granted to allow time to implement a new or revised water quality objective.
- L. Alaska Rule.** On March 30, 2000, USEPA revised its regulation that specifies when new and revised state and tribal water quality standards (WQS) become effective for CWA purposes. (40 C.F.R. § 131.21; 65 Fed. Reg. 24641 (April 27, 2000).) Under the revised regulation (also known as the Alaska rule), new and revised standards submitted to USEPA after May 30, 2000, must be approved by USEPA before being used for CWA purposes. The final rule also provides that standards already in effect and submitted to USEPA by May 30, 2000 may be used for CWA purposes, whether or not approved by USEPA.
- M. Stringency of Requirements for Individual Pollutants.** This Order contains both technology-based and water quality-based effluent limitations for individual

Limitations and Discharge Requirements

April 27, 2007; Revised October 23, 2007, November 8, 2007, January 7, 2008,
February 20, 2008, and March 6, 2008

pollutants. The technology-based effluent limitations consist of restrictions on Biochemical Oxygen Demand (BOD₅), Total Suspended Solids (TSS), and pH. Restrictions on BOD₅, TSS, and pH are discussed in the Fact Sheet. This Order's technology-based pollutant restrictions implement the minimum, applicable federal technology-based requirements.

This Order contains pollutant restrictions that are more stringent than applicable federal requirements and standards. Specifically, this Order includes effluent limitations for BOD and TSS that are more stringent than applicable federal standards, but that are nonetheless necessary to meet numeric objectives or protect beneficial uses. The rationale for including these limitations is explained in Section IV.B. of the Fact Sheet.

Water quality-based effluent limitations have been scientifically derived to implement water quality objectives that protect beneficial uses. Both the beneficial uses and the water quality objectives have been approved pursuant to federal law and are the applicable federal water quality standards. To the extent that toxic pollutant water quality-based effluent limitations were derived from the CTR, the CTR is the applicable standard pursuant to section 131.38. The scientific procedures for calculating the individual water quality-based effluent limitations for priority pollutants are based on the CTR-SIP, which was approved by USEPA on May 18, 2000. All beneficial uses and water quality objectives contained in the Basin Plan were approved under state law and submitted to and approved by USEPA prior to May 30, 2000. Any water quality objectives and beneficial uses submitted to USEPA prior to May 30, 2000, but not approved by USEPA before that date, are nonetheless "applicable water quality standards for purposes of the CWA" pursuant to section 131.21(c)(1).

N. Antidegradation Policy. Section 131.12 requires that the state water quality standards include an antidegradation policy consistent with the federal policy. The State Water Board established California's antidegradation policy in State Water Board Resolution No. 68-16. Resolution No. 68-16 incorporates the federal antidegradation policy where the federal policy applies under federal law. Resolution No. 68-16 requires that existing quality of waters be maintained unless degradation is justified based on specific findings. The Regional Water Board's Basin Plan implements, and incorporates by reference, both the state and federal antidegradation policies. As discussed in detail in the Fact Sheet the permitted discharge is consistent with the antidegradation provision of section 131.12 and State Water Board Resolution No. 68-16.

O. Anti-Backsliding Requirements. Sections 402(o)(2) and 303(d)(4) of the CWA and federal regulations at title 40, Code of Federal Regulations section 122.44(l) prohibit backsliding in NPDES permits. These anti-backsliding provisions require effluent limitations in a reissued permit to be as stringent as those in the previous permit, with some exceptions where limitations may be relaxed. Some effluent limitations in this Order are less stringent than those in the previous Order. As

discussed in detail in the Fact Sheet this relaxation of effluent limitations is consistent with the anti-backsliding requirements of the CWA and federal regulations.

- P. Endangered Species Act.** This Order does not authorize any act that results in the taking of a threatened or endangered species or any act that is now prohibited, or becomes prohibited in the future, under either the California Endangered Species Act (Fish and Game Code sections 2050 to 2097) or the Federal Endangered Species Act (16 U.S.C.A. sections 1531 to 1544). This Order requires compliance with effluent limits, receiving water limits, and other requirements to protect the beneficial uses of waters of the state. The discharger is responsible for ensuring that its activities do not result in an unlawful take of federally or state protected species.
- Q. Monitoring and Reporting.** Section 122.48 requires that all NPDES permits specify requirements for recording and reporting monitoring results. Water Code sections 13267 and 13383 authorizes the Regional Water Board to require technical and monitoring reports. The Monitoring and Reporting Program establishes monitoring and reporting requirements to implement federal and State requirements. This Monitoring and Reporting Program (MRP) is provided in Attachment E.

Time Schedule Order (TSO) No. R4-2006-0093 adopted on December 14, 2006 requested the Discharger to monitor the possible impacts of incrementally decreasing discharge on the ecosystem of the Estuary. This TSO expired on December 31, 2007. The Discharger is required to provide a Workplan (see Section IX. of MRP) to monitor the impacts of the discharge on the Santa Clara River Watershed.

- R. Standard and Special Provisions.** Standard Provisions, which apply to all NPDES permits in accordance with section 122.41, and additional conditions applicable to specified categories of permits in accordance with section 122.42, are provided in Attachment D. The discharger must comply with all standard provisions and with those additional conditions that are applicable under section 122.42. The Regional Water Board has also included in this Order special provisions applicable to the Discharger. A rationale for the special provisions contained in this Order is provided in the attached Fact Sheet.
- S. Provisions and Requirements Implementing State Law.** The provisions/requirements in subsections IV.B, IV.C, V.B, and VI.C of this Order are included to implement state law only. These provisions/requirements are not required or authorized under the federal CWA; consequently, violations of these provisions/requirements are not subject to the enforcement remedies that are available for NPDES violations.
- T. Notification of Interested Parties.** The Regional Water Board has notified the Discharger and interested agencies and persons of its intent to prescribe Waste Discharge Requirements for the discharge and has provided them with an

Limitations and Discharge Requirements

April 27, 2007; Revised October 23, 2007, November 8, 2007, January 7, 2008,
February 20, 2008, and March 6, 2008

opportunity to submit their written comments and recommendations. Details of notification are provided in the Fact Sheet of this Order.

- U. Consideration of Public Comment.** The Regional Water Board, in a public meeting, heard and considered all comments pertaining to the discharge. Details of the Public Hearing are provided in the Fact Sheet of this Order.

III. DISCHARGE PROHIBITIONS

- A. The discharge from the Facility may not exceed its current annual average of 9 MGD. This prohibition shall be in effect pending the results of studies specified in section VI.C.2.a.ii. of this order.
- B. Discharge of wastewater at a location different from that described in this Order is prohibited.
- C. The bypass or overflow of untreated wastewater or wastes to surface waters or surface water drainage courses is prohibited, except as allowed in Standard Provision I.G. of Attachment D, Standard Provisions.
- D. The maximum daily flow of influent from the collection system to the headworks of the Reclamation Facility shall not exceed the design capacity of 14 MGD. This prohibition is not applicable during wet weather storm events.
- E. The Discharger shall not cause degradation of any water supply.
- F. The treatment or disposal of wastes from the facility shall not cause pollution or nuisance as defined in section 13050, subdivision (l) and (m) of the CWC.
- G. The discharge of any substances in concentrations toxic to animal or plant is prohibited.
- H. The discharge of any radiological, chemical, or biological warfare agent or high level radiological waste is prohibited.

IV. EFFLUENT LIMITATIONS AND DISCHARGE SPECIFICATIONS

A. Effluent Limitations

1. Final Effluent Limitations – Effluent Transfer Station

- a. The Discharger shall maintain compliance with the following effluent limitations with compliance measured at the Effluent Transfer Station as described in the attached MRP:

Table 6. Effluent Limitations

Parameter	Units	Effluent Limitations				
		Average Monthly	Average Weekly	Maximum Daily	Instantaneous Minimum	Instantaneous Maximum
BOD ₅ 20°C	mg/L	20	30	45	--	--
	lbs/day ¹⁰	2,300	3,500	5,300	--	--
Total Suspended Solids (TSS)	mg/L	15	40	45	--	--
	lbs/day ¹⁰	1,800	4,700	5,300	--	--
pH	standard units	--	--	--	6.5	8.5
Oil and Grease	mg/L	10	--	15	--	--
	lbs/day ¹⁰	1,200	--	1,800	--	--
Settleable Solids	ml/L	0.1	--	0.3	--	--
Total Residual Chlorine	mg/L	0.1	--	--	--	--
	lbs/day ¹⁰	12	--	--	--	--
MBAS	mg/L	0.5	--	--	--	--
	lbs/day ¹⁰	59	--	--	--	--
Summer Ammonia Nitrogen (May – October)	mg/L	0.045	--	0.30	--	--
	lbs/day ¹⁰	5.3	--	35	--	--
Winter Ammonia Nitrogen (November to April)	mg/L	0.079	--	0.53	--	--
	lbs/day ¹⁰	9.3	--	62	--	--
Nitrate + Nitrite as Nitrogen	mg/L	10	--	--	--	--
	lbs/day ¹⁰	1,200	--	--	--	--
Nitrite as Nitrogen	mg/L	1	--	--	--	--
	lbs/day ¹⁰	120	--	--	--	--

¹⁰ The mass emission rates are based on the plant design flow rate of 14 mgd, and are calculated as follows: Flow (MGD) x Concentration (mg/L) x 8.37 (Lxbs/MGxmg) = lbs/day. During wet weather storm events in which the flow exceeds the design capacity, the mass discharge rate limitations shall not apply, and concentration limitations will provide the only applicable effluent limitations.

Parameter	Units	Effluent Limitations				
		Average Monthly	Average Weekly	Maximum Daily	Instantaneous Minimum	Instantaneous Maximum
Nitrate as Nitrogen	mg/L	10	--	--	--	--
	lbs/day ¹⁰	1,200	--	--	--	--
Copper	µg/L	4.2 ¹¹	--	8.8 ¹¹	--	--
	lbs/day ¹²	0.49	--	1.0	--	--
Mercury	µg/L	0.051	--	0.10	--	--
	lbs/day ¹²	0.0060	--	0.012	--	--
Silver	µg/L	0.71	--	2.2	--	--
	lbs/day ¹²	0.083	--	0.26	--	--
Zinc	µg/L	45 ¹³	--	107 ¹³	--	--
	lbs/day ¹²	5.3	--	13	--	--

- b. **Percent Removal:** The average monthly removal of BOD 5-day 20°C and total suspended solids shall not be less than 85 percent.
- c. The temperature of wastes discharged shall not exceed 86°F, except as a result of external ambient temperature.
- d. Radionuclides shall not be present in concentrations that are deleterious to human, plant, animal, or aquatic life or that result in accumulation of radionuclides in the food web to an extent that presents a hazard to human, plant, animal, or aquatic life.
- e. The wastes discharged to water courses shall at all times be adequately disinfected. For the purpose of this requirement, the wastes shall be considered adequately disinfected if the median number of coliform organisms at some point in the treatment process does not exceed 2.2 per 100 milliliters, and the number of coliform organisms does not exceed 23 per 100 milliliters in more than one sample within any 30-day period. The median value shall be determined from the bacteriological results of the last seven (7) days for which an analysis has been completed. Samples shall

¹¹ Based on the results of Copper Water Effect Ratio (WER) Study in the Updated Enhancement Study conducted by Nautilus Environmental and Metal Translator Factor (MTF) in the Metal Translator Study conducted by Entrix, WER of 1.58 and MTF of 0.86 were applied for copper final effluent limitations. This WER of 1.58 was the lowest one among 15 data.

¹² The mass emission rates are based on the plant design flow rate of 14 mgd, and are calculated as follows: Flow(MGD) x Concentration (µg/L) x 0.00837 (Lxlbs/MGxµg) = lbs/day. During wet-weather storm events in which the flow exceeds the design capacity, the mass discharge rate limitations shall not apply, and concentration limitations will provide the only applicable effluent limitations.

¹³ Based on the result of Metal Translator Factor (MTF) in the Metal Translator Study conducted by Entrix, MTF of 0.84 was applied for zinc final effluent limitations.

Limitations and Discharge Requirements

April 27, 2007; Revised October 23, 2007, November 8, 2007, January 7, 2008, February 20, 2008, and March 6, 2008

be collected at a time when wastewater flow and characteristics are most demanding on treatment facilities and disinfection processes.

- f. For the protection of the water contact recreation beneficial use, the wastes discharged to water courses shall have received adequate treatment, so that the turbidity of the wastewater does not exceed any of the following: (a) an average of 2 Nephelometric turbidity units (NTUs) within a 24-hour period; (b) 5 NTUs more than 5 percent of the time (72 minutes) within a 24-hour period; and (c) 10 NTU at any time.
- g. To protect the underlying ground water basins, pollutants shall not be present in the wastes discharged at concentrations that pose a threat to ground water quality.
- h. Acute Toxicity Limitation:
 - i. The acute toxicity of the effluent shall be such that:
 - (i). the average survival in the undiluted effluent for any three (3) consecutive 96-hour static or continuous flow bioassay tests shall be at least 90%, and,
 - (ii). no single test producing less than 70% survival.
 - ii. If either of the above requirements IV.A.1.h.i.(i) or IV.A.1.h.i.(ii) is not met, the Discharger shall conduct six additional tests, approximately every two weeks, over a 12-week period. The Discharger shall ensure that results of a failing acute toxicity test are received by the Discharger within 24 hours of completion of the test and the additional tests shall begin within 5 business days of receipt of the result. If the additional tests indicate compliance with acute toxicity limitation, the Discharger may resume regular testing. However, if the results of any two of the six accelerated tests are less than 90% survival, then the Discharger shall begin a Toxicity Identification Evaluation (TIE). The TIE shall include all reasonable steps to identify the sources of toxicity. Once the sources are identified, the Discharger shall take all reasonable steps to reduce toxicity to meet the objective.
 - iii. If the initial test and any of the additional six acute toxicity bioassay tests results are less than 70% survival, the Discharger shall immediately implement Initial Investigation Toxicity Reduction Evaluation (TRE) Workplan.
 - iv. The Discharger shall conduct acute toxicity monitoring as specified in Attachment E - Monitoring and Reporting Program (MRP).

Limitations and Discharge Requirements

April 27, 2007; Revised October 23, 2007, November 8, 2007, January 7, 2008,
February 20, 2008, and March 6, 2008

i. Chronic Toxicity Trigger and Requirements:

- i. The chronic toxicity of the effluent shall be expressed and reported in toxic units, where:

$$TU_c = \frac{100}{NOEC}$$

The No Observable Effect Concentration (NOEC) is expressed as the maximum percent effluent concentration that causes no observable effect on test organisms, as determined by the results of a critical life stage toxicity test.

- ii. There shall be no chronic toxicity in the effluent discharge.
- iii. If the chronic toxicity of the effluent exceeds the monthly trigger median of 1.0 TU_c, the Discharger shall immediately implement accelerated chronic toxicity testing according to Attachment E - MRP, Section V.B.3. If any three out of the initial test and the six accelerated tests results exceed 1.0 TU_c, the Discharger shall initiate a TIE and implement the Initial Investigation TRE Workplan, as specified in Attachment E – MRP, Section V.D.
- iv. The Discharger shall conduct chronic toxicity monitoring as specified in Attachment E – MRP.

2. Interim Effluent Limitations

Not applicable.

B. Land Discharge Specifications

Not Applicable.

C. Reclamation Specifications

The reuse of the reclaimed water is regulated under a separate Waste Discharge Requirements and Water Recycling Requirements for City of San Buenaventura, Order No. 87-45, CI No. 6190.

V. RECEIVING WATER LIMITATIONS

A. Surface Water Limitations

Receiving water limitations are based on water quality objectives contained in the Basin Plan and are a required part of this Order. The discharge shall not cause the following in the Estuary:

1. For waters designated with a warm freshwater habitat (WARM) beneficial use, the temperature of the receiving water at any time or place and within any given 24-hour period shall not be altered by more than 5⁰F above the natural temperature (or above 70⁰F if the ambient receiving water temperature is less than 60⁰F) due to the discharge of effluent at the receiving water station located downstream of the discharge. Natural conditions shall be determined on a case-by-case basis.
2. The pH of inland surface waters shall not be depressed below 6.5 or raised above 8.5 as a result of wastes discharged. Ambient pH levels shall not be changed more than 0.5 units from natural conditions as a result of wastes discharged. Natural conditions shall be determined on a case-by-case basis.
3. The dissolved oxygen in the receiving water shall not be depressed below 5 mg/L as a result of the wastes discharged.
4. The fecal coliform concentration in the receiving water shall not exceed the following, as a result of wastes discharged:
 - a. Geometric Mean Limits
 - i. E.coli density shall not exceed 126/100 mL.
 - ii. Fecal coliform density shall not exceed 200/100 mL.
 - b. Single Sample Limits
 - i. E.coli density shall not exceed 235/100 mL.
 - ii. Fecal coliform density shall not exceed 400/100 mL.
5. Waters shall be free of changes in turbidity that cause nuisance or adversely affect beneficial uses. Increases in natural turbidity attributable to controllable water quality factors shall not exceed the following limits, as a result of wastes discharged:
 - a. Where natural turbidity is between 0 and 50 NTU, increases shall not exceed 20%; and,

- b. Where natural turbidity is greater than 50 NTU, increases shall not exceed 10%.
6. The wastes discharged shall not produce concentrations of toxic substances in the receiving water that are toxic to or cause detrimental physiological responses in human, animal, or aquatic life.
7. The wastes discharged shall not cause concentrations of contaminants to occur at levels that are harmful to human health in waters which are existing or potential sources of drinking water.
8. The concentrations of toxic pollutants in the water column, sediments, or biota shall not adversely affect beneficial uses as a result of the wastes discharged.
9. The wastes discharged shall not contain substances that result in increases in BOD, which adversely affect the beneficial uses of the receiving waters.
10. Waters shall not contain biostimulatory substances in concentrations that promote aquatic growth to the extent that such growth causes nuisance or adversely affects beneficial uses.
11. The wastes discharged shall not cause the receiving waters to contain any substance in concentrations that adversely affect any designated beneficial use.
12. The wastes discharged shall not alter the natural taste, odor, and color of fish, shellfish, or other surface water resources used for human consumption.
13. The wastes discharged shall not result in problems due to breeding of mosquitoes, gnats, black flies, midges, or other pests.
14. The wastes discharged shall not result in visible floating particulates, foams, and oil and grease in the receiving waters.
15. The wastes discharged shall not alter the color of the receiving waters; create a visual contrast with the natural appearance of the water; nor cause aesthetically undesirable discoloration of the receiving waters.
16. The wastes discharged shall not contain any individual pesticide or combination of pesticides in concentrations that adversely affect beneficial uses of the receiving waters. There shall be no increase in pesticide concentrations found in bottom sediments or aquatic life as a result of the wastes discharged.
17. Acute Toxicity Receiving Water Quality Objective

- a. There shall be no acute toxicity in ambient waters as a result of wastes discharged.
- b. Receiving water and effluent toxicity testing shall be performed on the same day as close to concurrently as possible.
- c. The acute toxicity of the receiving water, at the Stations R-005 and R-003 located upstream and downstream, respectively, of the discharge, shall be such that: (i) the average survival in the undiluted receiving water for any three (3) consecutive 96-hour static, static-renewal, or continuous flow bioassay tests shall be at least 90%, and (ii) no single test producing less than 70% survival. Static-renewal bioassay tests may be used, as allowed by the most current USEPA test method for measuring acute toxicity.
- d. If the upstream acute toxicity of the receiving water is greater than the downstream acute toxicity but the effluent acute toxicity is in compliance, the acute toxicity accelerated monitoring in the receiving water specified in MRP Section V.A.2.d does not apply.

18. Chronic Toxicity Receiving Water Quality Objective

- a. There shall be no chronic toxicity in ambient waters as a result of wastes discharged.
- b. Receiving water and effluent toxicity testing shall be performed on the same day as close to concurrently as possible.
- c. If the chronic toxicity in the receiving water at the monitoring station(s) immediately downstream of the discharge, exceeds the monthly median of 1.0 TU_c trigger in a critical life stage test and the toxicity cannot be attributed to upstream toxicity, as assessed by the Discharger, then the Discharger shall immediately implement an accelerated chronic toxicity testing according to Monitoring and Reporting Program CI 1822, section V.B.3. If two of the six tests exceed a monthly median of 1.0 TU_c trigger, the Discharger shall initiate a TIE and implement the Initial Investigation TRE Workplan.
- d. If the chronic toxicity of the receiving water upstream of the discharge is greater than the downstream and the TU_c of the effluent chronic toxicity test is less than or equal to a monthly median of 1 TU_c trigger, then accelerated monitoring need not be implemented.

B. Groundwater Limitations

The discharge shall not cause the underlying groundwater to be degraded, to exceed water quality objectives, unreasonably affect beneficial uses, or cause a condition of pollution or nuisance.

VI. PROVISIONS

A. Standard Provisions

1. The Discharger shall comply with all Standard Provisions included in Attachment D of this Order.
2. The Discharger shall comply with the Regional Water Board-specific Standard Provisions as follows:
 - a. Neither the treatment nor the discharge of pollutants shall create a pollution, contamination, or nuisance as defined by Section 13050 of the California Water Code.
 - b. Odors, vectors, and other nuisances of sewage or sludge origin beyond the limits of the treatment plant site or the sewage collection system due to improper operation of facilities, as determined by the Regional Water Board, are prohibited.
 - c. All facilities used for collection, transport, treatment, or disposal of "wastes" shall be adequately protected against damage resulting from overflow, washout, or inundation from a storm or flood having a recurrence interval of once in 100 years.
 - d. Collection, treatment, and disposal systems shall be operated in a manner that precludes public contact with wastewater.
 - e. Collected screenings, sludges, and other solids removed from liquid wastes shall be disposed of in a manner approved by the Executive Officer of the Regional Water Board.
 - f. The provisions of this order are severable. If any provision of this order is found invalid, the remainder of this Order shall not be affected.
 - g. Nothing in this permit shall be construed to preclude the institution of any legal action or relieve the discharger from any responsibilities, liabilities or penalties established pursuant to any applicable State law or regulation under authority preserved by Section 510 of the CWA.
 - h. Nothing in this permit shall be construed to preclude the institution of any legal action or relieve the discharger from any responsibilities, liabilities or penalties to which the discharger is or may be subject to under Section 311 of the CWA.
 - i. The Discharger must comply with the lawful requirements of municipalities, counties, drainage districts, and other local agencies

Limitations and Discharge Requirements

April 27, 2007; Revised October 23, 2007, November 8, 2007, January 7, 2008,
February 20, 2008, and March 6, 2008

- regarding discharges of storm water to storm drain systems or other water courses under their jurisdiction; including applicable requirements in municipal storm water management program developed to comply with NPDES permits issued by the Regional Water Board to local agencies.
- j. Discharge of wastes to any point other than specifically described in this Order is prohibited, and constitutes a violation thereof.
 - k. The Discharger shall comply with all applicable effluent limitations, national standards of performance, toxic effluent standards, and all federal regulations established pursuant to Sections 301, 302, 303(d), 304, 306, 307, 316, 403, and 405 of the Federal CWA and amendments thereto.
 - l. These requirements do not exempt the operator of the waste disposal facility from compliance with any other laws, regulations, or ordinances which may be applicable; they do not legalize this waste disposal facility, and they leave unaffected any further restraints on the disposal of wastes at this site which may be contained in other statutes or required by other agencies.
 - m. Oil or oily material, chemicals, refuse, or other pollutionable materials shall not be stored or deposited in areas where they may be picked up by rainfall and carried off of the property and/or discharged to surface waters. Any such spill of such materials shall be contained and removed immediately.
 - n. A copy of these waste discharge specifications shall be maintained at the discharge facility so as to be available at all times to operating personnel.
 - o. If there is any storage of hazardous or toxic materials or hydrocarbons at this facility and if the facility is not manned at all times, a 24-hour emergency response telephone number shall be prominently posted where it can easily be read from the outside.
 - p. The Discharger shall file with the Regional Water Board a Report of Waste Discharge at least 120 days before making any material change or proposed change in the character, location or volume of the discharge.
 - q. In the event of any change in name, ownership, or control of these waste disposal facilities, the discharger shall notify the Regional Water Board of such change and shall notify the succeeding owner or operator of the existence of this Order by letter, copy of which shall be forwarded to the Regional Water Board.
 - r. The CWC provides that any person who violates a waste discharge requirement or a provision of the CWC is subject to civil penalties of up to

Limitations and Discharge Requirements

April 27, 2007; Revised October 23, 2007, November 8, 2007, January 7, 2008,
February 20, 2008, and March 6, 2008

\$5,000 per day, \$10,000 per day, or \$25,000 per day of violation, or when the violation involves the discharge of pollutants, is subject to civil penalties of up to \$10 per gallon per day or \$25 per gallon per day of violation; or some combination thereof, depending on the violation, or upon the combination of violations. Violation of any of the provisions of the NPDES program or of any of the provisions of this Order may subject the violator to any of the penalties described herein, or any combination thereof, at the discretion of the prosecuting authority; except that only one kind of penalty may be applied for each kind of violation.

- s. Under CWC 13387, any person who knowingly makes any false statement, representation, or certification in any record or other document submitted or required to be maintained under this order, including monitoring reports or reports of compliance or noncompliance, or who knowingly falsifies, tampers with, or renders inaccurate any monitoring device or method required to be maintained in this order and is subject to a fine of not more than \$25,000 or imprisonment of not more than two years, or both. For a second conviction, such a person shall be punished by a fine of not more than \$25,000 per day of violation, or by imprisonment of not more than four years, or by both.
- t. The discharge of any waste resulting from the combustion of toxic or hazardous wastes to any waste stream that ultimately discharges to waters of the United States is prohibited, unless specifically authorized elsewhere in this permit.
- u. The Discharger shall notify the Executive Officer in writing no later than 6 months prior to planned discharge of any chemical, other than the products previously reported to the Executive Officer, which may be toxic to aquatic life. Such notification shall include:
 - i. Name and general composition of the chemical;
 - ii. Frequency of use;
 - iii. Quantities to be used;
 - iv. Proposed discharge concentrations; and,
 - v. USEPA registration number, if applicable.
- v. In the event the Discharger does not comply or will be unable to comply for any reason, with any prohibition, maximum daily effluent limitation, or receiving water limitation of this Order, the Discharger shall notify David Hung at the Regional Water Board by telephone (213) 576-6664 within 24 hours of having knowledge of such noncompliance, and shall confirm this

Limitations and Discharge Requirements

notification in writing within five days, unless the Regional Water Board waives confirmation. The written notification shall state the nature, time, duration, and cause of noncompliance, and shall describe the measures being taken to remedy the current noncompliance and, prevent recurrence including, where applicable, a schedule of implementation. Other noncompliance requires written notification as above at the time of the normal monitoring report.

B. Monitoring and Reporting Program (MRP) Requirements

The Discharger shall comply with the MRP, and future revisions thereto, in Attachment E of this Order.

C. Special Provisions

1. Reopener Provisions

- a. This Order may be modified, revoked and reissued, or terminated for cause, including, but not limited to:
 - i. Violation of any term or condition contained in this Order;
 - ii. Obtaining this Order by misrepresentation, or by failure to disclose fully all relevant facts; and,
 - iii. A change in any condition that requires either a temporary or permanent reduction or elimination of the authorized discharge.

The filing of a request by the Discharger for an Order modification, revocation, and issuance or termination, or a notification of planned changes or anticipated noncompliances does not stay any condition of this Order.

- b. This Order may be reopened for modification, or revocation and reissuance, as a result of the detection of a reportable priority pollutant generated by special conditions included in this Order. These special conditions may be, but are not limited to, fish tissue sampling, whole effluent toxicity, monitoring requirements on internal waste stream(s), and monitoring for surrogate parameters. Additional requirements may be included in this Order as a result of the special condition monitoring data.
- c. This Order may be modified, in accordance with the provisions set forth in 40 CFR, Parts 122 and 124 to include requirements for the implementation of the watershed protection management approach.

- d. The Board may modify, or revoke and reissue this Order if present or future investigations demonstrate that the discharge(s) governed by this Order will cause, have the potential to cause, or will contribute to adverse impacts on water quality and/or beneficial uses of the receiving waters.
- e. This Order may also be modified, revoked, and reissued or terminated in accordance with the provisions of 40 CFR, Parts 122.44, 122.62 to 122.64, 125.62, and 125.64. Causes for taking such actions include, but are not limited to, failure to comply with any condition of this Order, endangerment to human health or the environment resulting from the permitted activity, or acquisition of newly obtained information which would have justified the application of different conditions if known at the time of Order adoption. The filing of a request by the District for an Order modification, revocation and issuance or termination, or a notification of planned changes or anticipated noncompliance does not stay any condition of this Order.
- f. This Order may be modified, in accordance with the provisions set forth in 40 CFR, Parts 122 to 124, to include new MLs.
- g. This Order may be reopened and modified, to revise effluent limitations as a result of future Basin Plan Amendments, such as an update of a water quality objective, or the adoption of a TMDL for the Santa Clara River Estuary.
- h. This Order may be reopened and modified, to revise effluent limitations as a result of the delisting of a pollutant from the 303(d) list.
- i. This Order may be reopened and modified to revise the chronic toxicity effluent limitation, to the extent necessary, to be consistent with State Board precedential decisions, new policies, new laws, or new regulations.
- j. This Order may be reopened to modify final effluent limits, if at the conclusion of necessary studies conducted by the Discharger, the Regional Water Board determines that dilution credits, attenuation factors, water effects ratio, or metal translators are warranted.
- k. This Order will be reopened upon completion of the Wetlands Feasibility Study specified in Section VI.C.2.a.iv. of this Order.

2. Special Studies, Technical Reports and Additional Monitoring Requirements

- a. **Special Studies** – Under the supervision of the Regional Board, and with ongoing input from, and in collaboration with the Regional Board, the City will prepare special studies on an integrated and coordinated basis as set forth in this section. All studies will be approved by the Executive Officer of the Regional Board.
- i. Several special studies have been conducted since 2001. These studies were all associated with the influences of the discharge on the Estuary and included the *Salinity study*, *Residence Species Study*, *Metal Translator Study*, *Updated Enhancement Study*, and the copper *Water Effect Ratio Study*.
- ii. **Estuary Subwatershed Study.** In order to optimize discharge conditions under the Bays and Estuaries Policy and to avoid negative impacts from the Facility's flows to the Estuary and to protect beneficial uses within the Estuary system and subwatershed, including those related to sensitive, endangered and threatened species as well as human recreation, the discharger shall submit a Work Plan within 6 months of the effective date of this Order, subject to the approval of the Executive Officer, to conduct a system-wide Estuary Subwatershed Study. The Regional Board will encourage participation in the development and implementation of this Work Plan by the U.S. Fish and Wildlife Service (USFWS), California Department of Fish and Game (CDFG), California Department of Parks and Recreation (CDPR), the National Marine Fisheries Service (NMFS), Heal the Bay, Audubon Society, other dischargers and water users, and other interested stakeholders in the Estuary subwatershed (collectively "Stakeholders"). The City will consider all input received from participating Stakeholders in preparing and implementing the Work Plan .This Work Plan must address the following:
- (a). An Estuary water balance study to:
- Quantify the average monthly, seasonal and annual flows to the Estuary from all quantifiable sources, including groundwater exfiltration, surface water runoff, Santa Clara River flows, and Facility discharges;
 - More specifically define the relationship between incoming flows and Estuary and habitat area, depth and volume; and,

- Identify alternatives for future discharge flows, volumes and practices and map spatial inundation characteristics correlated with each discharge alternative, including the inundation boundaries for the existing and proposed treatment wetlands, the Estuary and adjacent McGrath State Park areas, and the areas, depths and volumes for the Estuary and its habitats, including critical habitat areas for listed aquatic species and nesting and foraging habitat areas for birds such as the California least tern.
- (b). The function of the sub-watershed and Estuary as a single unit.
- (c). The following monitoring requirements:
- Continuation of the “Fish Survey” and “Macroinvertebrate Monitoring Plan” to assess population and number trends (An Index of Biological Integrity score should be calculated from annual macroinvertebrate surveys);
 - The influences of groundwater on the Estuary water volume and quality;
 - An evaluation of the breaching frequency and impacts on the water quality and endangered species of the Estuary, and subwatershed water quality, including impacts on beach water quality downshore;
 - The establishment of temporary receiving water monitoring station in a portion of the Estuary that temporally extends beyond the normal boundaries of the Estuary;
 - The influences of discharge on the McGrath State Park bird habitat areas;
 - An inventory of existing and potential bird nesting and foraging habitats within the Estuary, and a quarterly inventory of bird species and their numbers using the Estuary and wildlife/treatment ponds throughout the year, and the relationship of habitat types present and the success of California Least Tern and other sensitive avian species using the Estuary.
 - The potential for all impacts on the Tidewater Goby and all listed species, plant and animal and aquatic invertebrates that shorebirds depend on.

- An evaluation of dissolved oxygen (DO) conditions in the Estuary taking into account daily natural background DO levels and cycles within healthy, highly functioning Estuaries, including diurnal, or more frequent monitoring including predawn sampling within the Estuary for DO and preparation of a DO trend analysis based on existing data and new data obtained.
- (d). The Work Plan shall provide that the work products discussed in sections (a) and (b) above, and other related work products determined to be necessary and appropriate by the Executive Officer, shall be completed and submitted to the Regional Board no later than 3 years and from the effective date of this Order.
- iii. **Recycled Water Market Study.** Based on information in, and conclusions of the Estuary Subwatershed Study discussed in section ii above, and the Treatment Wetlands Study discussed in section iv below the City will develop and implement a work plan to identify, research and evaluate feasibility of alternatives for increasing water reuse throughout the City and other areas within five miles of the Waste Water Reclamation Facility (based on sufficient proximity to infrastructure and facilities locations).
- (a). The Study and Work Plan will be designed to determine the maximum volume of recycled water that should be planned for in order to meet the following goals:
- Optimize discharge flows, volume and practices for protection of beneficial uses, and environmental functions and values of the Estuary, including uses and functions related to provision of habitat for aquatic, terrestrial and avian sensitive, endangered, and threatened species;
 - Implement the best feasible configuration for treatment wetlands to further enhance surface flow water quality prior to discharge to the Estuary and subwatershed environmental functions and values; and,
 - Most appropriately conserve and recycle water, in light of the foregoing goals, and anticipated increases in influent, increases in water demand, and the potential for decreasing supplies.
- (b). A phased Work Plan for the Recycled Water Market Study shall be submitted on the date that is six months after the effective date of this Order. Phase 1 of the Recycled Water Market

Study shall address macro-level supply and demand issues and their impact on a local recycled water market, together with potential local recycled water supply that could potentially be generated and demand for local supply from both anticipated population growth and expansion of the City's service area. Phase 1 of the Recycled Water Study shall be completed within 2 years of the effective date of this Order.

Phase 2 of the Recycled Market Study shall commence on or before the date that is 3 years from the effective date of this Order, and shall address identify, research and evaluate feasibility of alternatives for increasing effluent reclamation and use of recycled water based on information in, and conclusions of the Estuary Water Balance Study, the Treatment/Wildlife Pond Study, and Phase 1 of the Recycled Market Study, in order to meet the goals set forth in this Permit and developed within the Study.

Phases 1 and 2 of the Recycled Water Study shall be completed prior to the expiration of the term of this Order.

iv. **Treatment Wetlands Feasibility Study.** The City will complete a Treatment Wetlands Feasibility Study within two years of the effective date of this Order. The Regional Board will encourage participation in the development and implementation of this study by the Stakeholders (the U.S. Fish and Wildlife Service (USFWS), California Department of Fish and Game (CDFG), California Department of Parks and Recreation (CDPR), the National Marine Fisheries Service (NMFS), Heal the Bay, Audubon Society, other dischargers and water users, and other interested stakeholders in the Estuary subwatershed). The City will consider all input received from participating Stakeholders in preparing and implementing the Work Plan.

(a). The Treatment Wetlands Feasibility Study will include:

- Identification of a preferred proposed wetland site location and preliminary, planning level design specifications for additional treatment wetlands;
- Preliminary planning level specifications and measures to maximize treatment for nutrients and to address other contaminants appropriate for wetlands treatment;
- Modeling to predict projected discharge-related pollutant loads and concentrations entering the treatment wetlands,

pollutant loads and concentrations leaving the treatment wetlands;

- Preliminary planning level design and operational specifications and measures that can enhance wildlife use of the treatment wetlands without adversely affecting or limiting treatment functions; and,
 - Preliminary construction, maintenance and operation cost estimates and the shortest realistic and practicable proposed schedule for environmental approval, permitting and construction of additional treatment wetlands.
- (b). At the conclusion of the Treatment Wetlands Study and upon concurrence of participating Stakeholders or the Executive Officer of the Regional Board with the recommended additional wetlands treatment project, the City will begin during the term of this Order to implement the environmental approval, permitting and construction processes for the additional treatment wetlands in accordance with the recommendations and schedules established by the Study. Accordingly, the City will undertake, without limitation, the following tasks:
- Preparation of documentation, and initiation of public review and hearing processes and other required activities related to incorporation of the recommended additional wetlands treatment project into the City's integrated long-range water resource plan;
 - Preparation of documentation, and initiation of public review and hearing processes and other required activities related to review and approval of the additional wetlands treatment project under the California Environmental Quality Act;
 - Preparation of permit applications, supporting plans and materials, and other activities related to incorporation of the recommended additional wetlands treatment project under local land use regulations and applicable state and federal environmental laws;
 - Preparation of design documents and construction plans for the additional wetlands treatment project; and,

- Upon receipt of all required permits, approvals and environmental clearances, construction activities related to implementation of the additional wetlands treatment project.

In the event the stakeholders do not concur, the Regional Board staff will consider the opinions submitted by all stakeholders. The EO will advise the City as to how to proceed, if she feels it is appropriate, may bring the matter to the Regional Board, and the permit may be reopened to consider such recommendations or other relevant matters.

- (c). The Regional Board shall reopen this Permit to consider revision of permit provisions to require implementation of the additional wetlands treatment project determined by the Wetlands Feasibility Study to be appropriate for implementation, and concurred with by the Regional Board and participating stakeholders. Any new or revised permit requirements considered or adopted pursuant to this re-opener shall be consistent with the approval, permitting, design and construction actions and schedules developed in the Treatment Wetlands Feasibility Study, and shall allow reasonable time frames for completion of identified activities. The re-opened permit, if adopted, shall be for a term of 5 years, and shall require during that term the completion of all approval, permitting, and design processes and commencement of construction activities. The new permit requirements shall further expressly acknowledge that permitting and approval processes are subject to the potential for delays that are not reasonably within the control of Discharger, and Discharger shall not be held in violation of the permit as revised for any failure to comply with its terms resulting from delays in those processes that are not reasonably within its control, including, by way of example, third party appeal or litigation of any required approvals or permits.

b. Toxicity Reduction Requirements

The Discharger shall prepare and submit a copy of the Discharger's initial investigation Toxicity Reduction Evaluation (TRE) workplan to the Executive Officer of the Regional Water Board for approval within 90 days of the effective date of this permit. If the Executive Officer does not disapprove the workplan within 60 days from the date in which it was received, the workplan shall become effective. The Discharger shall use USEPA manual EPA/833B-99/002 (municipal) as guidance, or most current version. At a minimum, the initial investigation TRE workplan must contain the provisions in Attachment E. This workplan shall describe the

steps the Discharger intends to follow if toxicity is detected, and should include, at a minimum:

- i. A description of the investigation and evaluation techniques that will be used to identify potential causes and sources of toxicity, effluent variability, and treatment system efficiency.
- ii. A description of the facility's methods of maximizing in-house treatment efficiency and good housekeeping practices, and a list of all chemicals used in the operation of the facility; and,
- iii. If a toxicity identification evaluation (TIE) is necessary, an indication of the person who would conduct the TIEs (i.e., an in-house expert or an outside contractor).

If the effluent toxicity test result exceeds the limitation, then the Discharger shall immediately implement accelerated toxicity testing that consists of six additional tests, approximately every two weeks, over a 12-week period. Effluent sampling for the first test of the six additional tests shall commence within 3 days of receipt of the test results exceeding the toxicity limitation.

If the results of any two of the six tests (any two tests in a 12-week period) exceed the limitation, the Discharger shall initiate a Toxicity Reduction Evaluation (TRE).

If results of the implementation of the facility's initial investigation TRE workplan (as described above) indicate the need to continue the TRE/TIE, the Discharger shall expeditiously develop a more detailed TRE workplan for submittal to the Executive Officer within 15 days of completion of the initial investigation TRE.

Detailed toxicity testing and reporting requirements are contained in Section V of the MRP, (Attachment E).

c. Treatment Plant Capacity

The Discharger shall submit a written report to the Executive Officer of the Regional Water Board within 90 days after the "30-day (monthly) average" daily dry-weather flow equals or exceeds 75 percent of the design capacity of waste treatment and/or disposal facilities. The Discharger's senior administrative officer shall sign a letter, which transmits that report and certifies that the discharger's policy-making body is adequately informed of the report's contents. The report shall include the following:

- i. The average daily flow for the month, the date on which the peak flow occurred, the rate of that peak flow, and the total flow for the day;
- ii. The best estimate of when the monthly average daily dry-weather flow rate will equal or exceed the design capacity of the facilities; and,
- iii. A schedule for studies, design, and other steps needed to provide additional capacity for waste treatment and/or disposal facilities before the waste flow rate equals the capacity of present units.

This requirement is applicable to those facilities which have not reached 75 percent of capacity as of the effective date of this Order. For those facilities that have reached 75 percent of capacity by that date but for which no such report has been previously submitted, such report shall be filed within 90 days of the issuance of this Order.

3. Best Management Practices and Pollution Prevention

a. Storm Water Pollution Prevention Plan (SWPPP)

Within 90 days of the effective date of this Order the Discharger shall submit an updated SWPPP that describes site-specific management practices for minimizing contamination of storm water runoff and for preventing contaminated storm water runoff from being discharged directly to waters of the State to the Regional Water Board. The SWPPP shall be developed in accordance with the requirements in *Storm Water Pollution Prevention Plan Requirements* (Attachment H). If all storm water is captured and treated on-site and no storm water is discharged or allowed to run off-site from the Facility, the Discharge shall provide certification with descriptions of on-site storm water management to the Regional Water Board.

b. Spill Contingency Plan (SCP)

Within ninety days, the Discharger is required to submit a Spill Clean-up Contingency Plan, which describes the activities and protocols, to address clean-up of spills, overflows, and bypasses of untreated or partially treated wastewater from the Discharger's collection system or treatment facilities, that reach water bodies, including dry channels and beach sands. At a minimum, the Plan shall include sections on spill clean-up and containment measures, public notification, and monitoring. The Discharger shall review and amend the Plan as appropriate after each spill from the facility or in the service area of the facility. The Discharger shall include a discussion in the annual summary report of any modifications to the Plan and the application of the Plan to all spills during the year.

c. Pollutant Minimization Program

Reporting protocols in the Monitoring and Reporting Program, Attachment E, Section X.B.4 describe sample results that are to be reported as Detected but Not Quantified (DNQ) or Not Detected (ND). Definitions for a Reported Minimum Level (RML) and Method Detection Limit (MDL) are provided in Attachment A. These reporting protocols and definitions are used in determining the need to conduct a Pollution Minimization Program (PMP) as follows:

The Discharger shall develop a Pollutant Minimization Program (PMP) as further described below when there is evidence (e.g., sample results reported as DNQ when the effluent limitation is less than the MDL, sample results from analytical methods more sensitive than those methods required by this Order, presence of whole effluent toxicity, health advisories for fish consumption, results of benthic or aquatic organism tissue sampling) that a priority pollutant is present in the effluent above an effluent limitation and either:

- (1). The concentration of the pollutant is reported as DNQ and the effluent limitation is less than the reported ML; or,
- (2). The concentration of the pollutant is reported as ND and the effluent limitation is less than the MDL.

The goal of the PMP shall be to reduce all potential sources of a pollutant through pollutant minimization (control) strategies, including pollution prevention measures as appropriate, to maintain the effluent concentration at or below the effluent limitation. Pollution prevention measures may be particularly appropriate for persistent bioaccumulative priority pollutants where there is evidence that beneficial uses are being impacted. The Regional Water Board may consider cost-effectiveness when establishing the requirements of a PMP. The completion and implementation of a Pollution Prevention Plan, if required pursuant to CWC Section 13263.3(d), shall be considered to fulfill the PMP requirements.

The PMP shall include, but not be limited to, the following actions and submittals acceptable to the Regional Water Board:

- (1). An annual review and semi-annual monitoring of potential sources of the reportable priority pollutant(s), which may include fish tissue monitoring and other bio-uptake sampling;
- (2). Quarterly monitoring for the reportable priority pollutant(s) in the influent to the wastewater treatment system;
- (3). Submittal of a control strategy designed to proceed toward the goal of maintaining concentrations of the reportable priority pollutant(s) in the effluent at or below the effluent limitation;

- (4). Implementation of appropriate cost-effective control measures for the reportable priority pollutant(s), consistent with the control strategy; and,
- (5). An annual status report that shall be sent to the Regional Water Board including:
 - i. All PMP monitoring results for the previous year;
 - ii. A list of potential sources of the reportable priority pollutant(s);
 - iii. A summary of all actions undertaken pursuant to the control strategy; and,
 - iv. A description of actions to be taken in the following year.

4. Construction, Operation and Maintenance Specifications

- a. Wastewater treatment facilities subject to this Order shall be supervised and operated by persons possessing certificates of appropriate grade pursuant to Chapter 3, Subchapter 14, Title 23 of the California Code of Regulations (Section 13625 of the California Water Code).
- b. The Discharger shall maintain in good working order a sufficient alternate power source for operating the wastewater treatment and disposal facilities. All equipment shall be located to minimize failure due to moisture, liquid spray, flooding, and other physical phenomena. The alternate power source shall be designed to permit inspection and maintenance and shall provide for periodic testing. If such alternate power source is not in existence, the discharger shall halt, reduce, or otherwise control all discharges upon the reduction, loss, or failure of the primary source of power.

5. Special Provisions for Municipal Facilities (POTWs Only)

a. Sludge Disposal Requirements

- (1) All sludge generated at the wastewater treatment plant will be disposed of, treat, or applied to land in accordance with Federal Regulations 40 CFR Part 503. These requirements are enforceable by USEPA.
- (2) The Discharger shall ensure compliance with the requirements in SWRCB Order No. 2004-10-DWQ, General Waste Discharge Requirements for the Discharge of Biosolids to Land for Use as a Soil Amendment in Agricultural, Silvicultural, Horticultural and Land Reclamation Activities” for those sites receiving the Discharger’s

biosolids which a Regional Water Quality Control Board has placed under this general order, and with the requirements in individual Waste Discharge Requirements (WDRs) issued by a Regional Water Board for sites receiving the Discharger's biosolids.

- (3) The Discharger shall comply, if applicable, with WDRs issued by other Regional Water Boards to which jurisdiction the biosolids are transported and applied.
- (4) The Discharger shall furnish this Regional Water Board with a copy of any report submitted to USEPA, State Board or other Regional Water Board, with respect to municipal sludge or biosolids.

b. Pretreatment Requirements

- (1) This Order includes the Discharger's Pretreatment Program as previously submitted to this Regional Water Board. Any change to the Program shall be reported to the Regional Water Board in writing and shall not become effective until approved by the Executive Officer in accordance with procedures established in 40 CFR, 403.18.
- (2) The Discharger shall enforce the requirements promulgated under Sections 307(b), 307(c), 307(d), and 402(b) of the Federal Clean Water Act with timely, appropriate, and effective enforcement actions. The Discharger shall require industrial users to comply with Federal Categorical Standards and shall initiate enforcement actions against those users who do not comply with the standards. The Discharger shall require industrial users subject to the Federal Categorical Standards to achieve compliance no later than the date specified in those requirements or, in the case of a new industrial user, upon commencement of the discharge.
- (3) The Discharger shall perform the pretreatment functions as required in Federal Regulations 40 CFR, Part 403 including, but not limited to:
 - i. Implement the necessary legal authorities as provided in 40 CFR 403.8(f)(1);
 - ii. Enforce the pretreatment requirements under 40 CFR 403.5 and 403.6;
 - iii. Implement the programmatic functions as provided in 40 CFR 403.8(f)(2); and,
 - iv. Provide the requisite funding of personnel to implement the Pretreatment Program as provided in 40 CFR 403.8(f)(3).

Limitations and Discharge Requirements

April 27, 2007; Revised October 23, 2007, November 8, 2007, January 7, 2008,
February 20, 2008, and March 6, 2008

- (4) The Discharger shall submit semiannual and annual reports to the Regional Water Board, with copies to the State Board, and USEPA Region 9, describing the Discharger's pretreatment activities over the period. The annual and semiannual reports shall contain, but not be limited to, the information required in the attached *Pretreatment Reporting Requirements* (Attachment P), or an approved revised version thereof. If the Discharger is not in compliance with any conditions or requirements of this Order, the Discharger shall include the reasons for noncompliance and shall state how and when the Discharger will comply with such conditions and requirements.
 - (5) The Discharger shall be responsible and liable for the performance of all control authority pretreatment requirements contained in 40 CFR, Part 403, including subsequent regulatory revisions thereof. Where Part 403 or subsequent revision places mandatory actions upon the Discharger as Control Authority but does not specify a timetable for completion of the actions, the Discharger shall complete the required actions within six months from the effective date of this Order or the effective date of Part 403 revisions, whichever comes later. For violations of pretreatment requirements, the Discharger shall be subject to enforcement actions, penalties, fines, and other remedies by the Regional Water Board, USEPA, or other appropriate parties, as provided in the Federal Clean Water Act. The Regional Water Board or USEPA may initiate enforcement action against an industrial user for noncompliance with acceptable standards and requirements as provided in the Federal Clean Water Act and/or the California Water Code.
- c. The Discharger's collection system is part of the system that is subject to this Order. As such, the Discharger must properly operate and maintain its collection system (40 C.F.R. § 122.41(e)). The Discharger must report any non-compliance (40 C.F.R. § 122.41(l)(6) and (7)) and mitigate any discharge from the collection system in violation of this Order (40 C.F.R. § 122.41(d)). See the Order at Attachment D, subsections I.D, V.E, V.H, and I.C.

6. Spill Reporting Requirements

- a. **Notification** – For certain spills, overflows and bypasses, the Discharger shall make notifications as required below:
 - (1). For any spills or overflows of any volume, discharged where they are, or will probably be discharged, to waters of the State, the Discharger shall immediately notify the local health agency in accordance with the California Health and Safety Code section 5411.5. This

notification shall occur no later than two hours after the knowledge of the incident.

- (2). For any spills or overflows of 1000 gallons or more discharged where they are, or probably be discharged to waters of the State, the Discharger shall immediately notify the State Office of Emergency Services pursuant to Water Code section 13271. This notification shall occur no later than two hours after the knowledge of the incident.
 - (3). For spills, overflows or bypasses of any volume that flowed to receiving waters or entered a shallow ground water aquifer or has public exposure, the Discharger shall notify such spills to the Regional Water Board, by telephone or electronically as soon as possible but not later than two hours of knowledge of the incident. The following information shall be included in the initial notification: location; date and time of spill; volume and nature of the spill; cause(s) of the spill; mitigation measures implemented, if known at time.
- b. **Monitoring** – For certain spills, overflows and bypasses, the Discharger shall monitor as required below:
- (1). To define the geographical extent of spill's impact the Discharger shall obtain grab samples for spills, overflows or bypasses of any volume that reach receiving waters. The Discharger shall analyze the samples for total and fecal coliforms or E. coli, and enterococcus, and relevant pollutants of concern, upstream and downstream of the point of entry of the spill (if feasible, accessible and safe). This monitoring shall be done on a daily basis from time the spill is known until the results of two consecutive sets of bacteriological monitoring indicate the return to the background level or the County Department of Health Services authorizes cessation of monitoring.
 - (2). The Discharger shall obtain a grab sample for spills, overflows or bypasses of any volume that flowed to receiving waters or entered a shallow ground water aquifer, and all spills, overflows and bypasses of 1,000 gallons or more. The Discharger shall analyze the sample for total and fecal coliforms or E. coli, and enterococcus, and relevant pollutants of concern depending on the area and nature of spills or overflows if feasible, accessible and safe.
- c. **Reporting** – The Regional Water Board initial notification shall be followed by:

- (1). A written preliminary report five working days after disclosure of the incident. Within 30 days after submitting the preliminary report, the Discharger shall submit the final written report to this Regional Water Board. (A copy of the final written report, for a given incident, already submitted pursuant to a Statewide General Waste Discharge Requirements for Wastewater Collection System Agencies, may be submitted to the Regional Water Board to satisfy this requirement.) The written report shall document the information required in paragraph D. below, monitoring results and any other information required in provisions of the Standard Provisions document including corrective measures implemented or proposed to be implemented to prevent/minimize future occurrences. The Executive Officer for just cause can grant an extension for submittal of the final written report.
 - (2). The Discharger shall include a certification in the annual summary report (due according to the schedule in the Monitoring and Reporting Program) that states—the sewer system emergency equipment, including alarm systems, backup pumps, standby power generators, and other critical emergency pump station components were maintained and tested in accordance with the Discharger's Preventative Maintenance Plan. Any deviations from or modifications to the Plan shall be discussed.
- d. **Records** – The Discharger shall develop and maintain a record of all spills, overflows or bypasses of raw or partially treated sewage from its collection system or treatment plant. This record shall be made available to the Regional Water Board upon request and a spill summary shall be included in the annual summary report. The records shall contain:
- (1). the date and time of each spill, overflow or bypass;
 - (2). the location of each spill, overflow or bypass;
 - (3). the estimated volume of each spill, overflow or bypass including gross volume, amount recovered and amount not recovered, monitoring results;
 - (4). the cause of each spill, overflow or bypass;
 - (5). whether each spill, overflow or bypass entered a receiving water and, if so, the name of the water body and whether it entered via storm drains or other man-made conveyances;
 - (6). mitigation measures implemented; and,

- (7). corrective measures implemented or proposed to be implemented to prevent/minimize future occurrences.
- e. **Activities Coordination** – In addition, Regional Water Board expects that the municipal departments that have responsibilities to implement: (i) this NPDES permit, including the Pretreatment Program, (ii) a MS4 NPDES permit that may contain spill prevention, sewer maintenance, reporting requirements and (iii) the SSO WDR will coordinate their compliance activities for consistency and efficiency.
- f. **Consistency with Sanitary Sewer Overflows WDRs** – The Clean Water Act prohibits the discharge of pollutants from point sources to surface waters of the United States unless authorized under a NPDES permit. (33 U.S.C. §§1311, 1342). The State Board adopted General Waste Discharge Requirements (WDRs) for Sanitary Sewer Systems, (WQ Order No. 2006-0003) on May 2, 2006, to provide a consistent, statewide regulatory approach to address Sanitary Sewer Overflows (SSOs). The SSOs WDR requires public agencies that own or operate sanitary sewer systems to develop and implement sewer system management plans and report all SSOs to the State Water Board's online SSO database.

The requirements contained in this Order in Sections VI.C.3.b. (Spill Contingency Plan Section), VI.C.4. (Construction, Operation and Maintenance Specifications Section), and VI.C.6. (Spill Reporting Requirements) are intended to be consistent with the requirements of the SSO WDR. The Regional Board recognizes that there may be some overlap between the NPDES permit provisions and SSO WDR requirements. The requirements of the SSO WDR are considered the minimum thresholds (see Finding 11 of WQ Order No. 2006-0003). The Regional Board will accept the documentation prepared by the Permittees under the SSO WDR for compliance purposes, as satisfying the requirements in Sections VI.C.3.b., VI.C.4., and VI.C.6. provided any more specific or stringent provisions enumerated in this Order, have also been addressed.

- g. The Discharger shall provide standby or emergency power facilities and/or storage capacity or other means so that in the event of plant upset or outage due to power failure or other cause, discharge of raw or inadequately treated sewage does not occur.

7. Compliance Schedules

The compliance provisions for ammonia as nitrogen, nitrate as nitrogen, and nitrite plus nitrate as nitrogen are contained in the accompanying Time Schedule Order No. R4-2008-0012, because the final effluent limitations for these constituents are not CTR-based.

Limitations and Discharge Requirements

April 27, 2007; Revised October 23, 2007, November 8, 2007, January 7, 2008,
February 20, 2008, and March 6, 2008

VII. COMPLIANCE DETERMINATION

Compliance with the effluent limitations contained in section IV of this Order will be determined as specified below:

A. General.

Compliance with effluent limitations for priority pollutants shall be determined using sample reporting protocols defined in the MRP and Attachment A of this Order. For purposes of reporting and administrative enforcement by the Regional and State Water Boards, the Discharger shall be deemed out of compliance with effluent limitations if the concentration of the priority pollutant in the monitoring sample is greater than the effluent limitation and greater than or equal to the reporting level (RL).

B. Multiple Sample Data.

When determining compliance with an AMEL, for priority pollutants and more than one sample result is available, the Discharger shall compute the arithmetic mean unless the data set contains one or more reported determinations of "Detected, but Not Quantified" (DNQ) or "Not Detected" (ND). In those cases, the Discharger shall compute the median in place of the arithmetic mean in accordance with the following procedure:

1. The data set shall be ranked from low to high, ranking the reported ND determinations lowest, DNQ determinations next, followed by quantified values (if any). The order of the individual ND or DNQ determinations is unimportant.
2. The median value of the data set shall be determined. If the data set has an odd number of data points, then the median is the middle value. If the data set has an even number of data points, then the median is the average of the two values around the middle unless one or both of the points are ND or DNQ, in which case the median value shall be the lower of the two data points where DNQ is lower than a value and ND is lower than DNQ.

C. Average Monthly Effluent Limitation (AMEL).

If the average (or when applicable, the median determined by subsection B above for multiple sample data) of daily discharges over a calendar month exceeds the AMEL for a given parameter, this will represent a single violation, though the Discharger may be considered out of compliance for each day of that month for that parameter (e.g., resulting in 31 days of non-compliance in a 31-day month). If only a single sample is taken during the calendar month and the analytical result for that sample exceeds the AMEL, the Discharger will be considered out of compliance for that calendar month. The Discharger will only be considered out of compliance for days when the discharge occurs. For any one calendar month during which no

sample (daily discharge) is taken, no compliance determination can be made for that calendar month

If the analytical result of a single sample, monitored monthly, quarterly, semiannually, or annually, does not exceed the AMEL for a given parameter, the Discharger will have demonstrated compliance with the AMEL for each day of that month for that parameter.

If the analytical result of any single sample, monitored monthly, quarterly, semiannually, or annually, exceeds the AMEL for any parameter, the Discharger shall collect up to four additional samples within the same calendar month. All analytical results shall be reported in the monitoring report for that month. The concentration of pollutant (an arithmetic mean or a median) in these samples estimated from the "Multiple Sample Data Reduction" Section above, will be used for compliance determination.

In the event of noncompliance with an AMEL, the sampling frequency for that parameter shall be increased to weekly and shall continue at this level until compliance with the AMEL has been demonstrated

D. Average Weekly Effluent Limitation (AWEL).

If the average (or when applicable, the median determined by subsection B above for multiple sample data) of daily discharges over a calendar week exceeds the AWEL for a given parameter, this will represent a single violation, though the Discharger may be considered out of compliance for each day of that week for that parameter, resulting in 7 days of non-compliance. If only a single sample is taken during the calendar week and the analytical result for that sample exceeds the AWEL, the Discharger will be considered out of compliance for that calendar week. The Discharger will only be considered out of compliance for days when the discharge occurs. For any one calendar week during which no sample (daily discharge) is taken, no compliance determination can be made for that calendar week.

E. Maximum Daily Effluent Limitation (MDEL).

If a daily discharge exceeds the MDEL for a given parameter, the Discharger may be considered out of compliance for that parameter for that 1 day only within the reporting period. For any 1 day during which no sample is taken, no compliance determination can be made for that day.

F. Instantaneous Minimum Effluent Limitation.

If the analytical result of a single grab sample is lower than the instantaneous minimum effluent limitation for a parameter, the Discharger may be considered out of compliance for that parameter for that single sample. Non-compliance for each

sample will be considered separately (e.g., the results of two grab samples taken within a calendar day that both are lower than the instantaneous minimum effluent limitation would result in two instances of non-compliance with the instantaneous minimum effluent limitation).

G. Instantaneous Maximum Effluent Limitation.

If the analytical result of a single grab sample is higher than the instantaneous maximum effluent limitation for a parameter, the Discharger may be considered out of compliance for that parameter for that single sample. Non-compliance for each sample will be considered separately (e.g., the results of two grab samples taken within a calendar day that both exceed the instantaneous maximum effluent limitation would result in two instances of non-compliance with the instantaneous maximum effluent limitation).

H. Percent Removal.

The average monthly percent removal is the removal efficiency expressed in percentage across a treatment plant for a given pollutant parameter, as determined from the 30-day average values of pollutant concentrations (C in mg/L) of influent and effluent samples collected at about the same time using the following equation:

$$\text{Percent Removal (\%)} = [1 - (\text{CEffluent}/\text{CInfluent})] \times 100 \%$$

When preferred, the Discharger may substitute mass loadings and mass emissions for the concentrations.

I. Mass and Concentration Limitations

Compliance with mass and concentration effluent limitations for the same parameter shall be determined separately with their respective limitations. When the concentration of a constituent in an effluent sample is determined to be ND or DNQ, the corresponding mass emission rate determined from that sample concentration shall also be reported as ND or DNQ.

J. Compliance with Single Constituent Effluent Limitations

Dischargers may be considered out of compliance with the effluent limitation if the concentration of the pollutant (see Section B "Multiple Sample Data Reduction" above) in the monitoring sample is greater than the effluent limitation and greater than or equal to the Reporting Level (RL).

K. Compliance with Effluent Limitations Expressed as a Sum of Several Constituents

Dischargers may be considered out of compliance with an effluent limitation which applies to the sum of a group of chemicals (e.g., PCB's) if the sum of the individual pollutant concentrations is greater than the effluent limitation. Individual pollutants of the group will be considered to have a concentration of zero if the constituent is reported as ND or DNQ.

L. Mass Emission Rate.

The mass emission rate shall be obtained from the following calculation for any calendar day:

$$\text{Mass emission rate (lb/day)} = \frac{8.34}{N} \sum_{i=1}^N Q_i C_i$$

$$\text{Mass emission rate (kg/day)} = \frac{3.79}{N} \sum_{i=1}^N Q_i C_i$$

in which 'N' is the number of samples analyzed in any calendar day. 'Qi' and 'Ci' are the flow rate (MGD) and the constituent concentration (mg/L), respectively, which are associated with each of the 'N' grab samples, which may be taken in any calendar day. If a composite sample is taken, 'Ci' is the concentration measured in the composite sample and 'Qi' is the average flow rate occurring during the period over which samples are composited.

The daily concentration of all constituents shall be determined from the flow-weighted average of the same constituents in the combined waste streams as follows:

$$\text{Daily concentration} = \frac{1}{Q_t} \sum_{i=1}^N Q_i C_i$$

in which 'N' is the number of component waste streams. 'Qi' and 'Ci' are the flow rate (MGD) and the constituent concentration (mg/L), respectively, which are associated with each of the 'N' waste streams. 'Qt' is the total flow rate of the combined waste streams.

M. Bacterial Standards and Analysis.

1. The geometric mean used for determining compliance with bacterial standards is calculated with the following equation:

$$\text{Geometric Mean} = (C_1 \times C_2 \times \dots \times C_n)^{1/n}$$

where n is the number of days samples were collected during the period and C is the concentration of bacteria (MPN/100 mL or CFU/100 mL) found on each day of sampling.

2. For bacterial analyses, sample dilutions should be performed so the expected range of values is bracketed (for example, with multiple tube fermentation method or membrane filtration method, 2 to 16,000 per 100 ml for total and fecal coliform, at a minimum, and 1 to 1000 per 100 ml for enterococcus). The detection methods used for each analysis shall be reported with the results of the analyses.
3. Detection methods used for coliforms (total and fecal) shall be those presented in Table 1A of 40 CFR 136 (revised March 12, 2007), unless alternate methods have been approved by USEPA pursuant to 40 CFR 136, or improved methods have been determined by the Executive Officer and/or USEPA.
4. Detection methods used for enterococcus shall be those presented in the USEPA publication EPA 600/4-85/076, *Test Methods for Escherichia coli and Enterococci in Water By Membrane Filter Procedure* or any improved method determined by the Executive Officer and/or USEPA to be appropriate.

N. Single Operational Upset

A single operational upset (SOU) that leads to simultaneous violations of more than one pollutant parameter shall be treated as a single violation and limits the Discharger's liability in accordance with the following conditions:

1. A single operational upset is broadly defined as a single unusual event that temporarily disrupts the usually satisfactory operation of a system in such a way that it results in violation of multiple pollutant parameters.
2. A Discharger may assert SOU to limit liability only for those violations which the Discharger submitted notice of the upset as required in Provision V.E.2(b) of Attachment D – Standard Provisions.
3. For purpose outside of CWC Section 13385 (h) and (i), determination of compliance and civil liability (including any more specific definition of SOU, the requirements for Dischargers to assert the SOU limitation of liability, and the manner of counting violations) shall be in accordance with USEPA Memorandum "Issuance of Guidance Interpreting Single Operational Upset" (September 27, 1989).
4. For purpose of CWC Section 13385 (h) and (i), determination of compliance and civil liability (including any more specific definition of SOU, the

Limitations and Discharge Requirements

April 27, 2007; Revised October 23, 2007, November 8, 2007, January 7, 2008,
February 20, 2008, and March 6, 2008

requirements for Dischargers to assert the SOU limitation of liability, and the manner of counting violations) shall be in accordance with CWC Section 13385 (f)(2).

ATTACHMENT A – DEFINITIONS

Arithmetic Mean (μ), also called the average, is the sum of measured values divided by the number of samples. For ambient water concentrations, the arithmetic mean is calculated as follows:

Arithmetic mean = $\mu = \Sigma x / n$ where: Σx is the sum of the measured ambient water concentrations, and n is the number of samples.

Average Monthly Effluent Limitation (AMEL): the highest allowable average of daily discharges over a calendar month, calculated as the sum of all daily discharges measured during a calendar month divided by the number of daily discharges measured during that month.

Average Weekly Effluent Limitation (AWEL): the highest allowable average of daily discharges over a calendar week (Sunday through Saturday), calculated as the sum of all daily discharges measured during a calendar week divided by the number of daily discharges measured during that week.

Bioaccumulative pollutants are those substances taken up by an organism from its surrounding medium through gill membranes, epithelial tissue, or from food and subsequently concentrated and retained in the body of the organism.

Carcinogenic pollutants are substances that are known to cause cancer in living organisms.

Coefficient of Variation (CV) is a measure of the data variability and is calculated as the estimated standard deviation divided by the arithmetic mean of the observed values.

Daily Discharge: Daily Discharge is defined as either: (1) the total mass of the constituent discharged over the calendar day (12:00 am through 11:59 pm) or any 24-hour period that reasonably represents a calendar day for purposes of sampling (as specified in the permit), for a constituent with limitations expressed in units of mass or; (2) the unweighted arithmetic mean measurement of the constituent over the day for a constituent with limitations expressed in other units of measurement (e.g., concentration).

The daily discharge may be determined by the analytical results of a composite sample taken over the course of one day (a calendar day or other 24-hour period defined as a day) or by the arithmetic mean of analytical results from one or more grab samples taken over the course of the day.

For composite sampling, if 1 day is defined as a 24-hour period other than a calendar day, the analytical result for the 24-hour period will be considered as the result for the calendar day in which the 24-hour period ends.

Detected, but Not Quantified (DNQ) are those sample results less than the RL, but greater than or equal to the laboratory's MDL.

Dilution Credit is the amount of dilution granted to a discharge in the calculation of a water quality-based effluent limitation, based on the allowance of a specified mixing zone. It is calculated from the dilution ratio or determined through conducting a mixing zone study or modeling of the discharge and receiving water.

Effluent Concentration Allowance (ECA) is a value derived from the water quality criterion/objective, dilution credit, and ambient background concentration that is used, in conjunction with the coefficient of variation for the effluent monitoring data, to calculate a long-term average (LTA) discharge concentration. The ECA has the same meaning as waste load allocation (WLA) as used in USEPA guidance (Technical Support Document For Water Quality-based Toxics Control, March 1991, second printing, EPA/505/2-90-001).

Enclosed Bays means indentations along the coast that enclose an area of oceanic water within distinct headlands or harbor works. Enclosed bays include all bays where the narrowest distance between the headlands or outermost harbor works is less than 75 percent of the greatest dimension of the enclosed portion of the bay. Enclosed bays include, but are not limited to, Humboldt Bay, Bodega Harbor, Tomales Bay, Drake's Estero, San Francisco Bay, Morro Bay, Los Angeles-Long Beach Harbor, Upper and Lower Newport Bay, Mission Bay, and San Diego Bay. Enclosed bays do not include inland surface waters or ocean waters.

Estimated Chemical Concentration is the estimated chemical concentration that results from the confirmed detection of the substance by the analytical method below the ML value.

Estuaries means waters, including coastal lagoons, located at the mouths of streams that serve as areas of mixing for fresh and ocean waters. Coastal lagoons and mouths of streams that are temporarily separated from the ocean by sandbars shall be considered estuaries. Estuarine waters shall be considered to extend from a bay or the open ocean to a point upstream where there is no significant mixing of fresh water and seawater. Estuarine waters included, but are not limited to, the Sacramento-San Joaquin Delta, as defined in Water Code section 12220, Suisun Bay, Carquinez Strait downstream to the Carquinez Bridge, and appropriate areas of the Smith, Mad, Eel, Noyo, Russian, Klamath, San Diego, and Otay rivers. Estuaries do not include inland surface waters or ocean waters.

Inland Surface Waters are all surface waters of the State that do not include the ocean, enclosed bays, or estuaries.

Instantaneous Maximum Effluent Limitation: the highest allowable value for any single grab sample or aliquot (i.e., each grab sample or aliquot is independently compared to the instantaneous maximum limitation).

Instantaneous Minimum Effluent Limitation: the lowest allowable value for any single grab sample or aliquot (i.e., each grab sample or aliquot is independently compared to the instantaneous minimum limitation).

Attachment A – Definitions

April 27, 2007; Revised October 23, 2007, November 8, 2007, January 7, 2008,
February 20, 2008, and March 6, 2008

Maximum Daily Effluent Limitation (MDEL) means the highest allowable daily discharge of a pollutant, over a calendar day (or 24-hour period). For pollutants with limitations expressed in units of mass, the daily discharge is calculated as the total mass of the pollutant discharged over the day. For pollutants with limitations expressed in other units of measurement, the daily discharge is calculated as the arithmetic mean measurement of the pollutant over the day.

Median is the middle measurement in a set of data. The median of a set of data is found by first arranging the measurements in order of magnitude (either increasing or decreasing order). If the number of measurements (n) is odd, then the median = $X_{(n+1)/2}$. If n is even, then the median = $(X_{n/2} + X_{(n/2)+1})/2$ (i.e., the midpoint between the $n/2$ and $n/2+1$).

Method Detection Limit (MDL) is the minimum concentration of a substance that can be measured and reported with 99 percent confidence that the analyte concentration is greater than zero, as defined in title 40 of the Code of Federal Regulations, Part 136, Attachment B, revised as of July 3, 1999.

Minimum Level (ML) is the concentration at which the entire analytical system must give a recognizable signal and acceptable calibration point. The ML is the concentration in a sample that is equivalent to the concentration of the lowest calibration standard analyzed by a specific analytical procedure, assuming that all the method specified sample weights, volumes, and processing steps have been followed.

Mixing Zone is a limited volume of receiving water that is allocated for mixing with a wastewater discharge where water quality criteria can be exceeded without causing adverse effects to the overall water body.

Not Detected (ND) are those sample results less than the laboratory's MDL.

Ocean Waters are the territorial marine waters of the State as defined by California law to the extent these waters are outside of enclosed bays, estuaries, and coastal lagoons. Discharges to ocean waters are regulated in accordance with the State Water Board's California Ocean Plan.

Persistent pollutants are substances for which degradation or decomposition in the environment is nonexistent or very slow.

Pollutant Minimization Program (PMP) means waste minimization and pollution prevention actions that include, but are not limited to, product substitution, waste stream recycling, alternative waste management methods, and education of the public and businesses. The goal of the PMP shall be to reduce all potential sources of a priority pollutant(s) through pollutant minimization (control) strategies, including pollution prevention measures as appropriate, to maintain the effluent concentration at or below the water quality-based effluent limitation. Pollution prevention measures may be particularly appropriate for persistent bioaccumulative priority pollutants where there is evidence that beneficial uses are being impacted. The Regional Water Board may consider cost effectiveness when establishing the requirements of a PMP. The completion and implementation of a Pollution Prevention Plan, if

Attachment A – Definitions

April 27, 2007; Revised October 23, 2007, November 8, 2007, January 7, 2008,
February 20, 2008, and March 6, 2008

A-3

required pursuant to Water Code section 13263.3(d), shall be considered to fulfill the PMP requirements.

Pollution Prevention means any action that causes a net reduction in the use or generation of a hazardous substance or other pollutant that is discharged into water and includes, but is not limited to, input change, operational improvement, production process change, and product reformulation (as defined in Water Code section 13263.3). Pollution prevention does not include actions that merely shift a pollutant in wastewater from one environmental medium to another environmental medium, unless clear environmental benefits of such an approach are identified to the satisfaction of the State or Regional Water Board.

Reporting Level (RL) is the ML (and its associated analytical method) chosen by the Discharger for reporting and compliance determination from the MLs included in this Order. The MLs included in this Order correspond to approved analytical methods for reporting a sample result that are selected by the Regional Water Board either from Appendix 4 of the SIP in accordance with section 2.4.2 of the SIP or established in accordance with section 2.4.3 of the SIP. The ML is based on the proper application of method-based analytical procedures for sample preparation and the absence of any matrix interferences. Other factors may be applied to the ML depending on the specific sample preparation steps employed. For example, the treatment typically applied in cases where there are matrix-effects is to dilute the sample or sample aliquot by a factor of ten. In such cases, this additional factor must be applied to the ML in the computation of the RL.

Satellite Collection System is the portion, if any, of a sanitary sewer system owned or operated by a different public agency than the agency that owns and operates the wastewater treatment facility that a sanitary sewer system is tributary to.

Source of Drinking Water is any water designated as municipal or domestic supply (MUN) in a Regional Water Board Basin Plan.

Standard Deviation (σ) is a measure of variability that is calculated as follows:

$$\sigma = (\sum[(x - \mu)^2]/(n - 1))^{0.5}$$

where:

x is the observed value;

μ is the arithmetic mean of the observed values; and

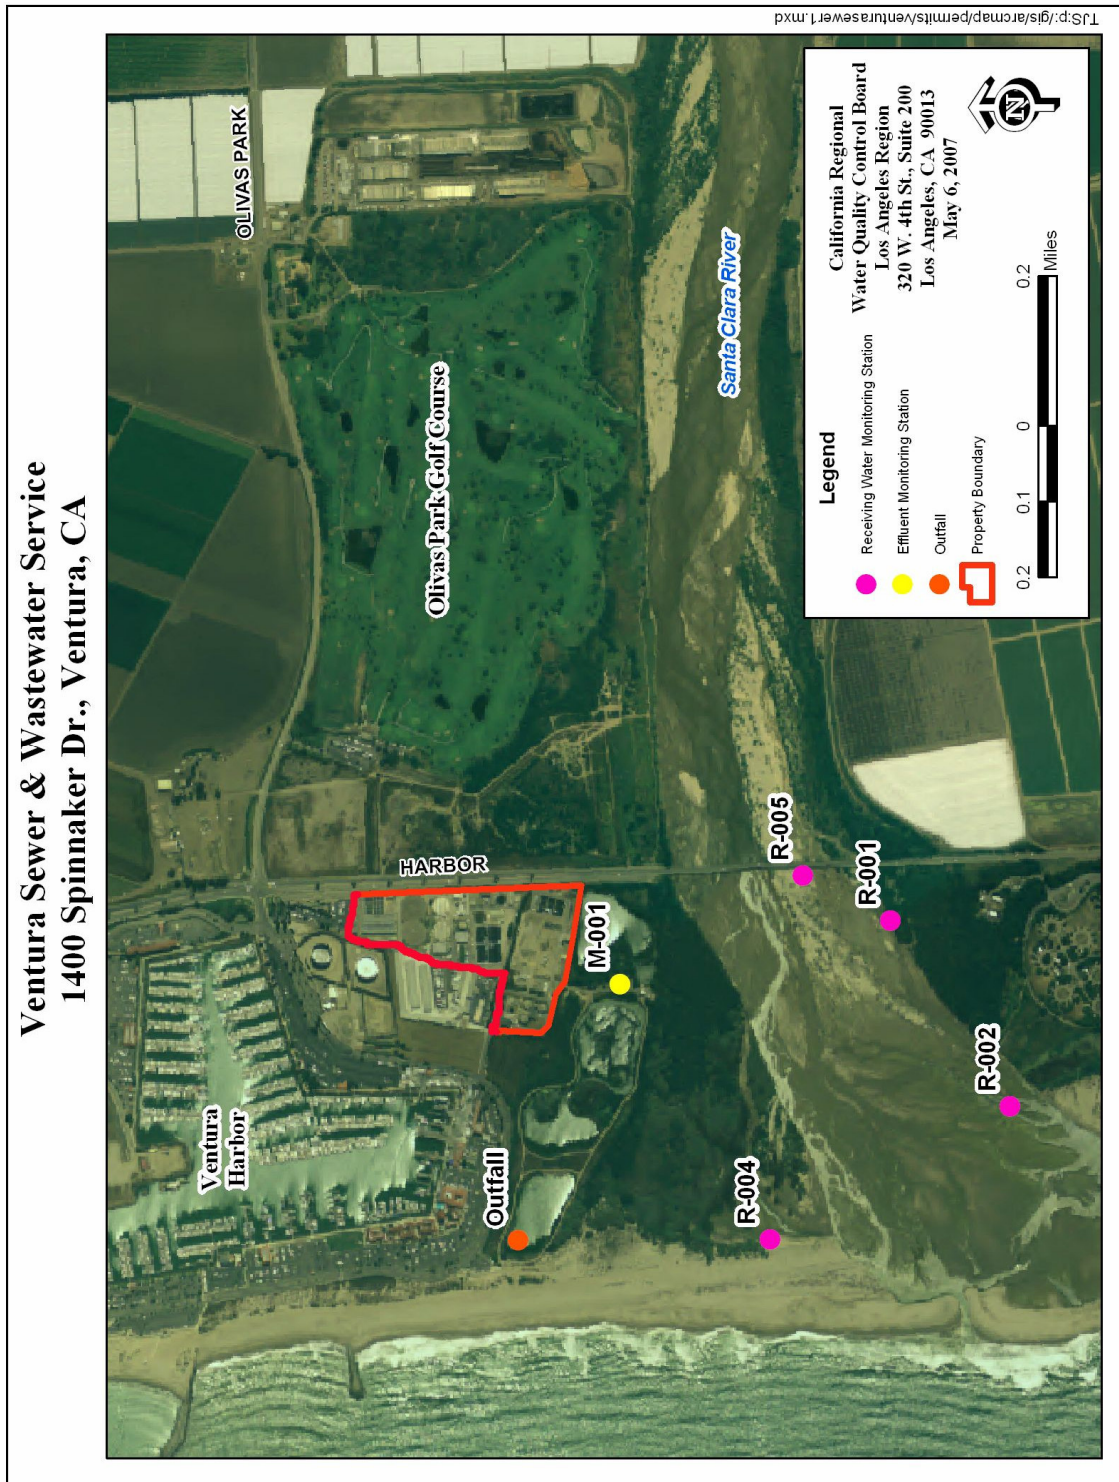

n is the number of samples.

Toxicity Reduction Evaluation (TRE) is a study conducted in a step-wise process designed to identify the causative agents of effluent or ambient toxicity, isolate the sources of toxicity, evaluate the effectiveness of toxicity control options, and then confirm the reduction in toxicity. The first steps of the TRE consist of the collection of data relevant to the toxicity, including additional toxicity testing, and an evaluation of facility operations and maintenance practices, and best management practices. A Toxicity Identification Evaluation (TIE) may be required as part of the TRE, if appropriate. (A TIE is a set of procedures to identify the specific chemical(s)

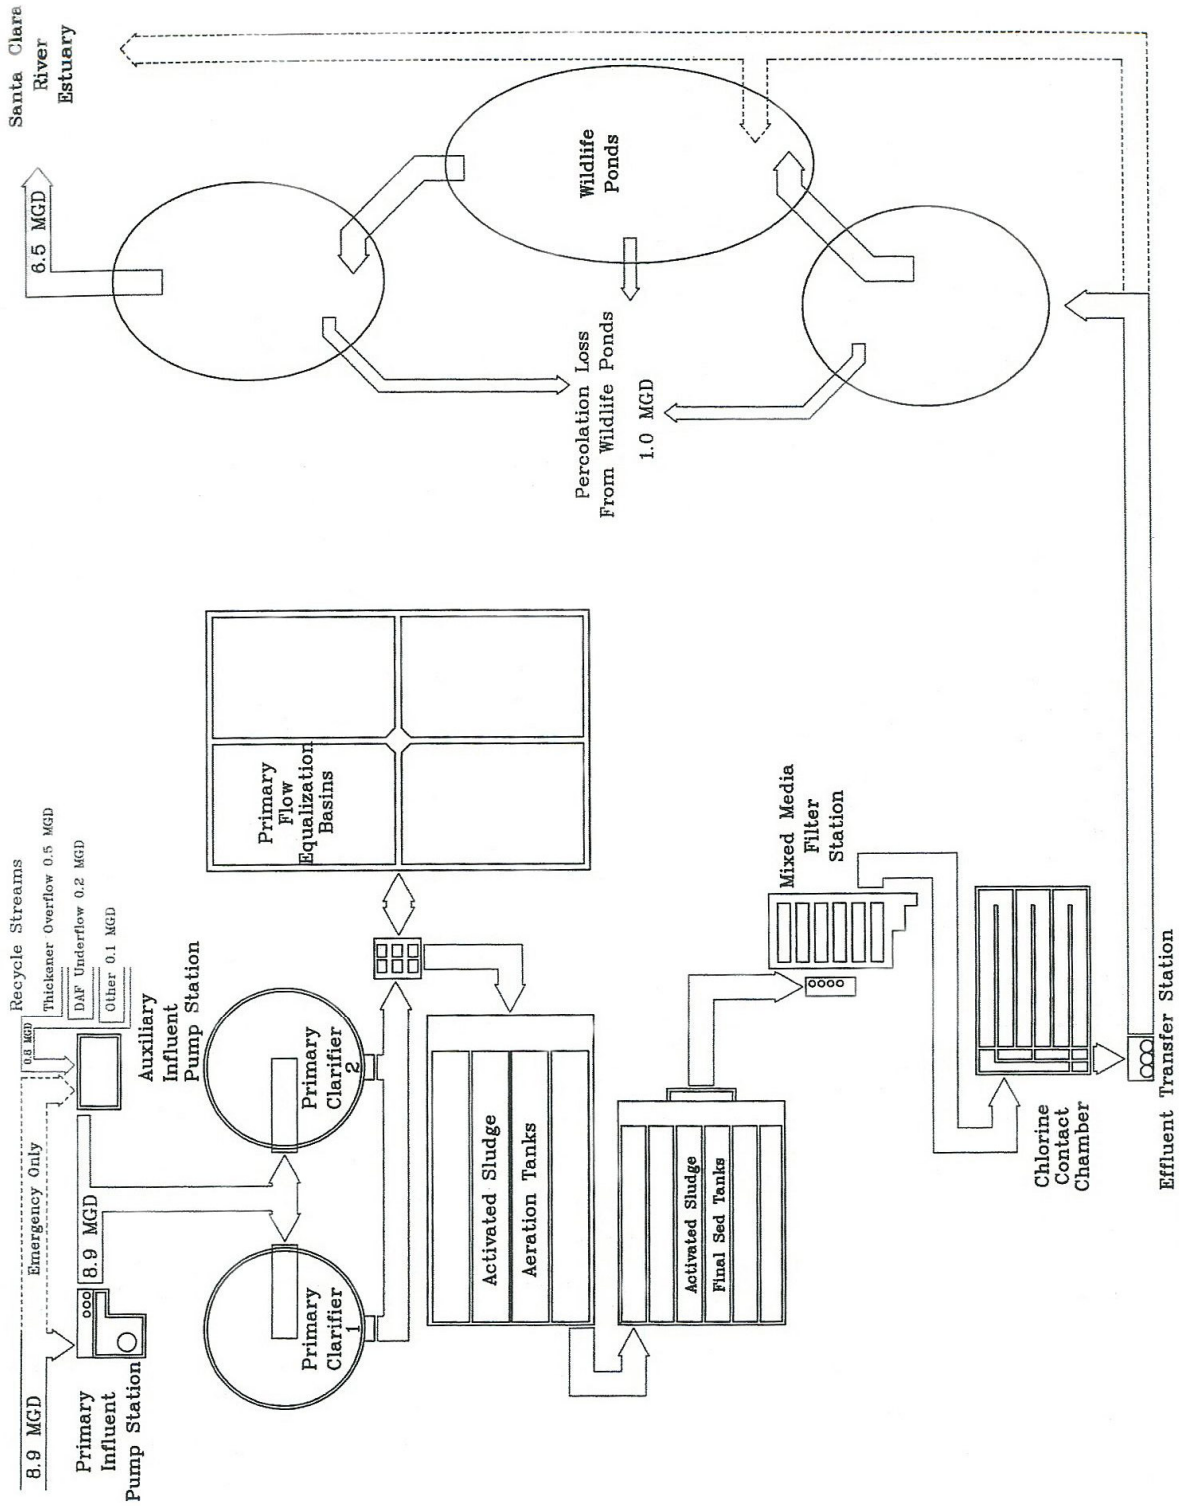

responsible for toxicity. These procedures are performed in three phases (characterization, identification, and confirmation) using aquatic organism toxicity tests.)

Water Effect Ratio (WER) is a criteria adjustment factor accounting for the effect of site-specific water characteristics for certain metals from national and state aquatic life criteria that were originally developed using laboratory toxicity data. These aquatic life criteria for metals are intended to protect the aquatic life in most, but not all, surface waters. In some cases, such a criterion might not adequately protect the aquatic life at a given site. More commonly, though, these criteria are overprotective because most surface waters have greater hardness and often higher pH than the laboratory water which was used in toxicity tests which formed the basis for the standard.

ATTACHMENT B – MAP

ATTACHMENT C – FLOW SCHEMATIC

ATTACHMENT D –STANDARD PROVISIONS

I. STANDARD PROVISIONS – PERMIT COMPLIANCE

A. Duty to Comply

1. The Discharger must comply with all of the conditions of this Order. Any noncompliance constitutes a violation of the Clean Water Act (CWA) and the California Water Code and is grounds for enforcement action, for permit termination, revocation and reissuance, or modification; or denial of a permit renewal application. (40 C.F.R. § 122.41(a).)
2. The Discharger shall comply with effluent standards or prohibitions established under Section 307(a) of the CWA for toxic pollutants and with standards for sewage sludge use or disposal established under Section 405(d) of the CWA within the time provided in the regulations that establish these standards or prohibitions, even if this Order has not yet been modified to incorporate the requirement. (40 C.F.R. § 122.41(a)(1).)

B. Need to Halt or Reduce Activity Not a Defense

It shall not be a defense for a Discharger in an enforcement action that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of this Order. (40 C.F.R. § 122.41(c).)

C. Duty to Mitigate

The Discharger shall take all reasonable steps to minimize or prevent any discharge or sludge use or disposal in violation of this Order that has a reasonable likelihood of adversely affecting human health or the environment. (40 C.F.R. § 122.41(d).)

D. Proper Operation and Maintenance

The Discharger shall at all times properly operate and maintain all facilities and systems of treatment and control (and related appurtenances) which are installed or used by the Discharger to achieve compliance with the conditions of this Order. Proper operation and maintenance also includes adequate laboratory controls and appropriate quality assurance procedures. This provision requires the operation of backup or auxiliary facilities or similar systems that are installed by a Discharger only when necessary to achieve compliance with the conditions of this Order. (40 C.F.R. § 122.41(e).)

E. Property Rights

1. This Order does not convey any property rights of any sort or any exclusive privileges. (40 C.F.R. § 122.41(g).)

2. The issuance of this Order does not authorize any injury to persons or property or invasion of other private rights, or any infringement of state or local law or regulations. (40 C.F.R. § 122.5(c).)

F. Inspection and Entry

The Discharger shall allow the Regional Water Board, State Water Board, United States Environmental Protection Agency (USEPA), and/or their authorized representatives (including an authorized contractor acting as their representative), upon the presentation of credentials and other documents, as may be required by law, to (40 C.F.R. § 122.41(i); Wat. Code, § 13383):

1. Enter upon the Discharger's premises where a regulated facility or activity is located or conducted, or where records are kept under the conditions of this Order (40 C.F.R. § 122.41(i)(1));
2. Have access to and copy, at reasonable times, any records that must be kept under the conditions of this Order (40 C.F.R. § 122.41(i)(2));
3. Inspect and photograph, at reasonable times, any facilities, equipment (including monitoring and control equipment), practices, or operations regulated or required under this Order (40 C.F.R. § 122.41(i)(3)); and
4. Sample or monitor, at reasonable times, for the purposes of assuring Order compliance or as otherwise authorized by the CWA or the Water Code, any substances or parameters at any location. (40 C.F.R. § 122.41(i)(4).)

G. Bypass

1. Definitions
 - a. "Bypass" means the intentional diversion of waste streams from any portion of a treatment facility. (40 C.F.R. § 122.41(m)(1)(i).)
 - b. "Severe property damage" means substantial physical damage to property, damage to the treatment facilities, which causes them to become inoperable, or substantial and permanent loss of natural resources that can reasonably be expected to occur in the absence of a bypass. Severe property damage does not mean economic loss caused by delays in production. (40 C.F.R. § 122.41(m)(1)(ii).)
2. Bypass not exceeding limitations. The Discharger may allow any bypass to occur which does not cause exceedances of effluent limitations, but only if it is for essential maintenance to assure efficient operation. These bypasses are

- not subject to the provisions listed in Standard Provisions – Permit Compliance I.G.3, I.G.4, and I.G.5 below. (40 C.F.R. § 122.41(m)(2).)
3. Prohibition of bypass. Bypass is prohibited, and the Regional Water Board may take enforcement action against a Discharger for bypass, unless (40 C.F.R. § 122.41(m)(4)(i)):
 - a. Bypass was unavoidable to prevent loss of life, personal injury, or severe property damage (40 C.F.R. § 122.41(m)(4)(i)(A));
 - b. There were no feasible alternatives to the bypass, such as the use of auxiliary treatment facilities, retention of untreated wastes, or maintenance during normal periods of equipment downtime. This condition is not satisfied if adequate back-up equipment should have been installed in the exercise of reasonable engineering judgment to prevent a bypass that occurred during normal periods of equipment downtime or preventive maintenance (40 C.F.R. § 122.41(m)(4)(i)(B)); and
 - c. The Discharger submitted notice to the Regional Water Board as required under Standard Provisions – Permit Compliance I.G.5 below. (40 C.F.R. § 122.41(m)(4)(i)(C).)
 4. The Regional Water Board may approve an anticipated bypass, after considering its adverse effects, if the Regional Water Board determines that it will meet the three conditions listed in Standard Provisions – Permit Compliance I.G.3 above. (40 C.F.R. § 122.41(m)(4)(ii).)
 5. Notice
 - a. Anticipated bypass. If the Discharger knows in advance of the need for a bypass, it shall submit a notice, if possible at least 10 days before the date of the bypass. (40 C.F.R. § 122.41(m)(3)(i).)
 - b. Unanticipated bypass. The Discharger shall submit notice of an unanticipated bypass as required in Standard Provisions - Reporting V.E below (24-hour notice). (40 C.F.R. § 122.41(m)(3)(ii).)

H. Upset

Upset means an exceptional incident in which there is unintentional and temporary noncompliance with technology based permit effluent limitations because of factors beyond the reasonable control of the Discharger. An upset does not include noncompliance to the extent caused by operational error, improperly designed treatment facilities, inadequate treatment facilities, lack of preventive maintenance, or careless or improper operation. (40 C.F.R. § 122.41(n)(1).)

1. Effect of an upset. An upset constitutes an affirmative defense to an action brought for noncompliance with such technology based permit effluent limitations if the requirements of Standard Provisions – Permit Compliance I.H.2 below are met. No determination made during administrative review of claims that noncompliance was caused by upset, and before an action for noncompliance, is final administrative action subject to judicial review. (40 C.F.R. § 122.41(n)(2).)
2. Conditions necessary for a demonstration of upset. A Discharger who wishes to establish the affirmative defense of upset shall demonstrate, through properly signed, contemporaneous operating logs or other relevant evidence that (40 C.F.R. § 122.41(n)(3)):
 - a. An upset occurred and that the Discharger can identify the cause(s) of the upset (40 C.F.R. § 122.41(n)(3)(i));
 - b. The permitted facility was, at the time, being properly operated (40 C.F.R. § 122.41(n)(3)(ii));
 - c. The Discharger submitted notice of the upset as required in Standard Provisions – Reporting V.E.2.b below (24-hour notice) (40 C.F.R. § 122.41(n)(3)(iii)); and
 - d. The Discharger complied with any remedial measures required under Standard Provisions – Permit Compliance I.C above. (40 C.F.R. § 122.41(n)(3)(iv).)
3. Burden of proof. In any enforcement proceeding, the Discharger seeking to establish the occurrence of an upset has the burden of proof. (40 C.F.R. § 122.41(n)(4).)

II. STANDARD PROVISIONS – PERMIT ACTION

A. General

This Order may be modified, revoked and reissued, or terminated for cause. The filing of a request by the Discharger for modification, revocation and reissuance, or termination, or a notification of planned changes or anticipated noncompliance does not stay any Order condition. (40 C.F.R. § 122.41(f).)

B. Duty to Reapply

If the Discharger wishes to continue an activity regulated by this Order after the expiration date of this Order, the Discharger must apply for and obtain a new permit. (40 C.F.R. § 122.41(b).)

C. Transfers

This Order is not transferable to any person except after notice to the Regional Water Board. The Regional Water Board may require modification or revocation and reissuance of the Order to change the name of the Discharger and incorporate such other requirements as may be necessary under the CWA and the Water Code. (40 C.F.R. § 122.41(l)(3); § 122.61.)

III. STANDARD PROVISIONS – MONITORING

- A.** Samples and measurements taken for the purpose of monitoring shall be representative of the monitored activity. (40 C.F.R. § 122.41(j)(1).)
- B.** Monitoring results must be conducted according to test procedures under Part 136 or, in the case of sludge use or disposal, approved under Part 136 unless otherwise specified in Part 503 unless other test procedures have been specified in this Order. (40 C.F.R. § 122.41(j)(4); § 122.44(i)(1)(iv).)

IV. STANDARD PROVISIONS – RECORDS

- A.** Except for records of monitoring information required by this Order related to the Discharger's sewage sludge use and disposal activities, which shall be retained for a period of at least five years (or longer as required by Part 503), the Discharger shall retain records of all monitoring information, including all calibration and maintenance records and all original strip chart recordings for continuous monitoring instrumentation, copies of all reports required by this Order, and records of all data used to complete the application for this Order, for a period of at least three (3) years from the date of the sample, measurement, report or application. This period may be extended by request of the Regional Water Board Executive Officer at any time. (40 C.F.R. § 122.41(j)(2).)

B. Records of monitoring information shall include:

1. The date, exact place, and time of sampling or measurements (40 C.F.R. § 122.41(j)(3)(i));
2. The individual(s) who performed the sampling or measurements (40 C.F.R. § 122.41(j)(3)(ii));
3. The date(s) analyses were performed (40 C.F.R. § 122.41(j)(3)(iii));
4. The individual(s) who performed the analyses (40 C.F.R. § 122.41(j)(3)(iv));
5. The analytical techniques or methods used (40 C.F.R. § 122.41(j)(3)(v)); and
6. The results of such analyses. (40 C.F.R. § 122.41(j)(3)(vi).)

C. Claims of confidentiality for the following information will be denied (40 C.F.R. § 122.7(b)):

1. The name and address of any permit applicant or Discharger (40 C.F.R. § 122.7(b)(1)); and
2. Permit applications and attachments, permits and effluent data. (40 C.F.R. § 122.7(b)(2).)

V. STANDARD PROVISIONS – REPORTING

A. Duty to Provide Information

The Discharger shall furnish to the Regional Water Board, State Water Board, or USEPA within a reasonable time, any information which the Regional Water Board, State Water Board, or USEPA may request to determine whether cause exists for modifying, revoking and reissuing, or terminating this Order or to determine compliance with this Order. Upon request, the Discharger shall also furnish to the Regional Water Board, State Water Board, or USEPA copies of records required to be kept by this Order. (40 C.F.R. § 122.41(h); Wat. Code, § 13267.)

B. Signatory and Certification Requirements

1. All applications, reports, or information submitted to the Regional Water Board, State Water Board, and/or USEPA shall be signed and certified in accordance with Standard Provisions – Reporting V.B.2, V.B.3, V.B.4, and V.B.5 below. (40 C.F.R. § 122.41(k).)
2. All permit applications shall be signed by either a principal executive officer or ranking elected official. For purposes of this provision, a principal executive officer of a federal agency includes: (i) the chief executive officer of the agency, or (ii) a senior executive officer having responsibility for the overall operations of a principal geographic unit of the agency (e.g., Regional Administrators of USEPA). (40 C.F.R. § 122.22(a)(3).)
3. All reports required by this Order and other information requested by the Regional Water Board, State Water Board, or USEPA shall be signed by a person described in Standard Provisions – Reporting V.B.2 above, or by a duly authorized representative of that person. A person is a duly authorized representative only if:
 - a. The authorization is made in writing by a person described in Standard Provisions – Reporting V.B.2 above (40 C.F.R. § 122.22(b)(1));
 - b. The authorization specifies either an individual or a position having responsibility for the overall operation of the regulated facility or activity

such as the position of plant manager, operator of a well or a well field, superintendent, position of equivalent responsibility, or an individual or position having overall responsibility for environmental matters for the company. (A duly authorized representative may thus be either a named individual or any individual occupying a named position.) (40 C.F.R. § 122.22(b)(2)); and

- c. The written authorization is submitted to the Regional Water Board and State Water Board. (40 C.F.R. § 122.22(b)(3).)
4. If an authorization under Standard Provisions – Reporting V.B.3 above is no longer accurate because a different individual or position has responsibility for the overall operation of the facility, a new authorization satisfying the requirements of Standard Provisions – Reporting V.B.3 above must be submitted to the Regional Water Board and State Water Board prior to or together with any reports, information, or applications, to be signed by an authorized representative. (40 C.F.R. § 122.22(c).)
5. Any person signing a document under Standard Provisions – Reporting V.B.2 or V.B.3 above shall make the following certification:

“I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.” (40 C.F.R. § 122.22(d).)

C. Monitoring Reports

1. Monitoring results shall be reported at the intervals specified in the Monitoring and Reporting Program (Attachment E) in this Order. (40 C.F.R. § 122.22(l)(4).)
2. Monitoring results must be reported on a Discharge Monitoring Report (DMR) form or forms provided or specified by the Regional Water Board or State Water Board for reporting results of monitoring of sludge use or disposal practices. (40 C.F.R. § 122.41(l)(4)(i).)
3. If the Discharger monitors any pollutant more frequently than required by this Order using test procedures approved under Part 136 or, in the case of sludge use or disposal, approved under Part 136 unless otherwise specified in Part 503, or as specified in this Order, the results of this monitoring shall be included

in the calculation and reporting of the data submitted in the DMR or sludge reporting form specified by the Regional Water Board. (40 C.F.R. § 122.41(l)(4)(ii).)

4. Calculations for all limitations, which require averaging of measurements, shall utilize an arithmetic mean unless otherwise specified in this Order. (40 C.F.R. § 122.41(l)(4)(iii).)

D. Compliance Schedules

Reports of compliance or noncompliance with, or any progress reports on, interim and final requirements contained in any compliance schedule of this Order, shall be submitted no later than 14 days following each schedule date. (40 C.F.R. § 122.41(l)(5).)

E. Twenty-Four Hour Reporting

1. The Discharger shall report any noncompliance that may endanger health or the environment. Any information shall be provided orally within 24 hours from the time the Discharger becomes aware of the circumstances. A written submission shall also be provided within five (5) days of the time the Discharger becomes aware of the circumstances. The written submission shall contain a description of the noncompliance and its cause; the period of noncompliance, including exact dates and times, and if the noncompliance has not been corrected, the anticipated time it is expected to continue; and steps taken or planned to reduce, eliminate, and prevent reoccurrence of the noncompliance. (40 C.F.R. § 122.41(l)(6)(i).)
2. The following shall be included as information that must be reported within 24 hours under this paragraph (40 C.F.R. § 122.41(l)(6)(ii)):
 - a. Any unanticipated bypass that exceeds any effluent limitation in this Order. (40 C.F.R. § 122.41(l)(6)(ii)(A).)
 - b. Any upset that exceeds any effluent limitation in this Order. (40 C.F.R. § 122.41(l)(6)(ii)(B).)
3. The Regional Water Board may waive the above-required written report under this provision on a case-by-case basis if an oral report has been received within 24 hours. (40 C.F.R. § 122.41(l)(6)(iii).)

F. Planned Changes

The Discharger shall give notice to the Regional Water Board as soon as possible of any planned physical alterations or additions to the permitted facility. Notice is required under this provision only when (40 C.F.R. § 122.41(l)(1)):

1. The alteration or addition to a permitted facility may meet one of the criteria for determining whether a facility is a new source in section 122.29(b) (40 C.F.R. § 122.41(l)(1)(i)); or
2. The alteration or addition could significantly change the nature or increase the quantity of pollutants discharged. This notification applies to pollutants that are not subject to effluent limitations in this Order. (40 C.F.R. § 122.41(l)(1)(ii).)
3. The alteration or addition results in a significant change in the Discharger's sludge use or disposal practices, and such alteration, addition, or change may justify the application of permit conditions that are different from or absent in the existing permit, including notification of additional use or disposal sites not reported during the permit application process or not reported pursuant to an approved land application plan. (40 C.F.R. § 122.41(l)(1)(iii).)

G. Anticipated Noncompliance

The Discharger shall give advance notice to the Regional Water Board or State Water Board of any planned changes in the permitted facility or activity that may result in noncompliance with General Order requirements. (40 C.F.R. § 122.41(l)(2).)

H. Other Noncompliance

The Discharger shall report all instances of noncompliance not reported under Standard Provisions – Reporting V.C, V.D, and V.E above at the time monitoring reports are submitted. The reports shall contain the information listed in Standard Provision – Reporting V.E above. (40 C.F.R. § 122.41(l)(7).)

I. Other Information

When the Discharger becomes aware that it failed to submit any relevant facts in a permit application, or submitted incorrect information in a permit application or in any report to the Regional Water Board, State Water Board, or USEPA, the Discharger shall promptly submit such facts or information. (40 C.F.R. § 122.41(l)(8).)

VI. STANDARD PROVISIONS – ENFORCEMENT

The Regional Water Board is authorized to enforce the terms of this permit under several provisions of the Water Code, including, but not limited to, sections 13385, 13386, and 13387.

VII. ADDITIONAL PROVISIONS – NOTIFICATION LEVELS

A. Publicly-Owned Treatment Works (POTWs)

All POTWs shall provide adequate notice to the Regional Water Board of the following (40 C.F.R. § 122.42(b)):

1. Any new introduction of pollutants into the POTW from an indirect discharger that would be subject to sections 301 or 306 of the CWA if it were directly discharging those pollutants (40 C.F.R. § 122.42(b)(1)); and,
2. Any substantial change in the volume or character of pollutants being introduced into that POTW by a source introducing pollutants into the POTW at the time of adoption of the Order. (40 C.F.R. § 122.42(b)(2).)
3. Adequate notice shall include information on the quality and quantity of effluent introduced into the POTW as well as any anticipated impact of the change on the quantity or quality of effluent to be discharged from the POTW. (40 C.F.R. § 122.42(b)(3).)

ATTACHMENT E – MONITORING AND REPORTING PROGRAM (MRP)

The Code of Federal Regulations section 122.48 requires that all NPDES permits specify monitoring and reporting requirements. Water Code Sections 13267 and 13383 also authorize the Regional Water Quality Control Board (Regional Water Board) to require technical and monitoring reports. This MRP establishes monitoring and reporting requirements, which implement the federal and California regulations.

I. GENERAL MONITORING PROVISIONS

- A. All samples shall be representative of the waste discharge under conditions of peak load. Quarterly effluent analyses shall be performed during the months of February, May, August, and November. Semiannual analyses shall be performed during the months of February and August. Annual analyses shall be performed during the month of August. Should there be instances when monitoring could not be done during these specified months, the Discharger must notify the Regional Board, state the reason why monitoring could not be conducted, and obtain approval from the Executive Officer for an alternate schedule. Results of quarterly, semiannual, and annual analyses shall be reported in the monthly monitoring report following the analysis.
- B. Pollutants shall be analyzed using the analytical methods described in 40 CFR, Part 136.3, 136.4, and 136.5 (revised March 12, 2007); or where no methods are specified for a given pollutant, by methods approved by this Regional Water Board or the State Water Board. Laboratories analyzing effluent samples and receiving water samples shall be certified by the California Department of Health Services Environmental Laboratory Accreditation Program (ELAP) or approved by the Executive Officer and must include quality assurance/quality control (QA/QC) data in their reports. A copy of the laboratory certification shall be provided each time a new certification and/or renewal of the certification is obtained from ELAP.
- C. Water/wastewater samples must be analyzed within allowable holding time limits as specified in 40 CFR, Part 136.3 (revised March 12, 2007). All QA/QC analyses must be run on the same dates that samples are actually analyzed. The Discharger shall retain the QA/QC documentation in its files and make available for inspection and/or submit them when requested by the Regional Water Board. Proper chain of custody procedures must be followed and a copy of that documentation shall be submitted with the monthly report.
- D. The Discharger shall calibrate and perform maintenance procedures on all monitoring instruments and to insure accuracy of measurements, or shall insure that both equipment activities will be conducted.
- E. For any analyses performed for which no procedure is specified in the USEPA guidelines, or in the MRP, the constituent or parameter analyzed and the method or procedure used must be specified in the monitoring report.

Attachment E – MRP

April 27, 2007; Revised October 23, 2007, November 8, 2007, January 7, 2008,
February 20, 2008, and March 6, 2008

E-2

- F. Each monitoring report must affirm in writing that “all analyses were conducted at a laboratory certified for such analyses by the Department of Health Services or approved by the Executive Officer and in accordance with current USEPA guideline procedures or as specified in this MRP.”
- G. The monitoring report shall specify the USEPA analytical method used, the Method Detection Limit (MDL), and the reporting Level (RL) [the Minimum Level (ML) or the Reported Minimum Level (RML)] for each pollutant. The MLs are those published by the State Board in the *Policy for the Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California*, February 9, 2005, Appendix 4. The ML represents the lowest quantifiable concentration in a sample based on the proper application of all method-based analytical procedures and the absence of any matrix interference. When all specific analytical steps are followed and after appropriate application of method specific factors, the ML also represents the lowest standard in the calibration curve for that specific analytical technique. When there is deviation from the method analytical procedures, such as dilution or concentration of samples, other factors may be applied to the ML depending on the sample preparation. The resulting value is the reported minimum level.
- H. The Discharger shall select the analytical method that provides a ML lower than the permit limit established for a given parameter, unless the Discharger can demonstrate that a particular ML is not attainable, in accordance with procedures set forth in 40 CFR, Part 136, and obtains approval for a higher ML from the Executive Officer, as provided for in section J. below. If the effluent limitation is lower than all the MLs in Appendix 4, SIP, the Discharge must select the method with the lowest ML for compliance purposes. The Discharger shall include in the Annual Summary Report a list of the analytical methods employed for each test.
- I. The Discharger shall instruct its laboratories to establish calibration standards so that the ML (or its equivalent if there is differential treatment of samples relative to calibration standards) is the lowest calibration standard. At no time is the Discharger to use analytical data derived from extrapolation beyond the lowest point of the calibration curve. In accordance with section J. below, the Discharger’s laboratory may employ a calibration standard lower than the ML in Appendix 4 of the SIP.
- J. In accordance with Section 2.4.3 of the SIP, the Regional Water Board Executive Officer, in consultation with the State Water Board’s Quality Assurance Program Manager, may establish an ML that is not contained in Appendix 4 of the SIP to be included in the discharger’s permit in any of the following situations:
 - a. When the pollutant under consideration is not included in Appendix 4, SIP;
 - b. When the discharger and the Regional Water Board agree to include in the permit a test method that is more sensitive than those specified in 40 CFR, Part 136 (revised as of May 14, 1999);

- c. When a discharger agrees to use an ML that is lower than those listed in Appendix 4;
- d. When a discharger demonstrates that the calibration standard matrix is sufficiently different from that used to establish the ML in Appendix 4 and proposes an appropriate ML for the matrix; or,
- e. When the discharger uses a method, which quantification practices are not consistent with the definition of the ML. Examples of such methods are USEPA-approved method 1613 for dioxins, and furans, method 1624 for volatile organic substances, and method 1625 for semi-volatile organic substances. In such cases, the discharger, the Regional Water Board, and the State Water Resources Control Board shall agree on a lowest quantifiable limit and that limit will substitute for the ML for reporting and compliance determination purposes.

If there is any conflict between foregoing provisions and the State Implementation Policy (SIP), the provisions stated in the SIP (Section 2.4) shall prevail.

- K. If the Discharger samples and performs analyses (other than for process/operational control, startup, research, or equipment testing) on any influent, effluent, or receiving water constituent more frequently than required by this Program using approved analytical methods, the results of those analyses shall be included in the report. These results shall be reflected in the calculation of the average used in demonstrating compliance with average effluent, receiving water, etc., limitations.
- L. The Discharger shall develop and maintain a record of all spills or bypasses of raw or partially treated sewage from its collection system or treatment plant according to the requirements in the WDR section of this Order. This record shall be made available to the Regional Water Board upon request and a spill summary shall be included in the annual summary report.
- M. For all bacteriological analyses, sample dilutions should be performed so the expected range of values is bracketed (for example, with multiple tube fermentation method or membrane filtration method, 2 to 16,000 per 100 ml for total and fecal coliform, at a minimum, and 1 to 1000 per 100 ml for enterococcus). The detection methods used for each analysis shall be reported with the results of the analyses.
 - a. Detection methods used for coliforms (total and fecal) shall be those presented in Table 1A of 40 CFR, Part 136 (revised March 12, 2007), unless alternate methods have been approved in advance by the United State Environmental Protection Agency (USEPA) pursuant to 40 CFR Part 136.
 - b. Detection methods used for enterococcus shall be those presented in Table 1A of 40 CFR, Part 136 (revised March 12, 2007) or in the USEPA publication EPA 600/4-85/076, *Test Methods for Escherichia coli and Enterococci in Water By*

Membrane Filter Procedure, or any improved method determined by the Regional Water Board to be appropriate.

II. MONITORING LOCATIONS

The Discharger shall establish the following monitoring locations to demonstrate compliance with the effluent limitations, discharge specifications, and other requirements in this Order:

Table 1. Monitoring Station Locations

Discharge Point Name	Monitoring Location Name	Monitoring Location Description (include Latitude and Longitude when available)
Influent Monitoring Station		
Inf-001	Influent Pump Station	The sampling location (Lat. 34 ⁰ , 14'25.44" N; Long. 119 ⁰ , 15'25.53" W) is located in the main stream of the influent channel prior to the head work adjacent to Harbor Boulevard.
Effluent Monitoring Station		
M-001	Effluent Transfer Station (Point of Compliance)	The effluent sampling station (Lat. 34 ⁰ , 14'21.45" N; Long. 119 ⁰ , 15'31.26" W) is located downstream of all treated effluent passing through this station, including the final disinfection process.
Receiving Water Monitoring Station		
R-001	Receiving Water Sample Station	This sampling location (Lat. 34 ⁰ , 13'55.58" N; Long. 119 ⁰ , 15'27.59" W) is located at the upstream from the Santa Clara River Estuary.
R-002	Receiving Water Sample Station	This sampling location (Lat. 34 ⁰ , 13'47.37" N; Long. 119 ⁰ , 15'43.15" W) is located at the south shoreline of the Santa Clara River Estuary.
R-003	Receiving Water Sample Station	This sampling location (Variable at the mouth of the outlet) is located at the west shoreline of the Santa Clara River Estuary.
R-004	Receiving Water Sample Station	This sampling location (Lat. 34 ⁰ , 14'04.15" N; Long. 119 ⁰ , 15'54.19" W) is located at the northwest shoreline of the Santa Clara River Estuary.
R-005	Receiving Water Sample Station	This sampling location (Lat. 34 ⁰ , 14'01.63" N; Long. 119 ⁰ , 15'23.79" W) is located at the upstream from the Santa Clara River Estuary and at the Harbor Boulevard Bridge crossing. R-005 was labeled as Station L-5 in the previous permit.

III. INFLUENT MONITORING REQUIREMENTS

Influent monitoring is required to:

- Determine compliance with NPDES permit conditions.
- Assess treatment plant performance.
- Assess effectiveness of the Pretreatment Program.

A. Monitoring Location – Influent Pump Station (Inf-001)

1. The Discharger shall monitor influent to the facility at Influent Pump Station as follows:

Table 2. Influent Monitoring

Parameter	Units	Sample Type	Minimum Sampling Frequency	Required Analytical Test Method
Flow	mgd	recorder/totalizer	continuous ¹	1
Total suspended solids	mg/L	24-hour composite	weekly	2
BOD ₅ 20°C	mg/L	24-hour composite	weekly	2
Nitrogen compounds	mg/L	grab	quarterly	2
Copper	µg/L	grab	quarterly	2
Mercury	µg/L	grab	quarterly	2
Silver	µg/L	grab	quarterly	2
Zinc	µg/L	grab	quarterly	2
Cyanide	µg/L	grab	semiannually ³	2
Chlorodibromomethane	µg/L	grab	semiannually ³	2
Dichlorobromomethane	µg/L	grab	semiannually ³	2
Bis(2-ethylhexyl)phthalate	µg/L	grab	semiannually ³	2
Remaining priority pollutants ⁴ excluding asbestos	µg/L	24-hour composite/grab for VOCs and Chromium VI	semiannually	2
Pesticides ⁵	µg/L	24-hour composite	semiannually	2

IV. EFFLUENT MONITORING REQUIREMENTS

Effluent monitoring is required to:

- Determine compliance with NPDES permit conditions and water quality standards.
- Assess plant performance, identify operational problems and improve plant performance.

¹ Total daily flow and instantaneous peak daily flow (24-hr basis). Actual monitored flow shall be reported (not the maximum flow, i.e., design capacity).

² Pollutants shall be analyzed using the analytical methods described in 40 CFR Part 136; for priority pollutants the methods must meet the lowest minimum levels (MLs) specified in Attachment 4 of the SIP, where no methods are specified for a given pollutant, by methods approved by this Regional Water Board or State Water Resources Control Board.

³ If any effluent result of this chemical exceeds the CTR-based criteria after the effective date of this Order, the influent monitoring frequency of this chemical shall be increased from semiannually to quarterly.

⁴ Priority pollutants as defined by the California Toxics Rule (CTR) defined in Finding II.I of the Limitations and Discharge Requirements of this Order, and included as Attachment.

⁵ Pesticides are, for purposes of this order, those six constituents referred to in 40 CFR, Part 125.58 (p) (methoxychlor, demeton, guthion, malathion, mirex, and parathion).

A. Monitoring Location – Effluent Transfer Station (M-001)

1. The Discharger shall monitor the discharge of tertiary-treated effluent at Effluent Transfer Station as follows. If more than one analytical test method is listed for a given parameter, the Discharger must select from the listed methods and corresponding Minimum Level:

Table 3. Effluent Monitoring

Parameter	Units	Sample Type	Minimum Sampling Frequency	Required Analytical Test Method and (Minimum Level, units), respectively
Total waste flow	MGD	recorder	continuous ^{6,7}	1
Turbidity	NTU	recorder	continuous ⁶	5
Total residual chlorine	mg/L	recorder	continuous ^{6,8,9}	2
Total residual chlorine	mg/L	grab ¹⁰	daily ¹¹	2
Total and fecal coliform	MPN/100 mL	grab	daily	2
Settleable solids	ml/L	grab	daily	2
BOD ₅ 20°C	mg/L	24-hr comp.	daily	2
Suspended solids	mg/L	24-hr comp.	daily	2
Dissolved oxygen	mg/L	grab	daily	2
Temperature	°F	grab	weekly	2
pH	pH units	grab	weekly	2
Oil and grease	mg/L	grab	weekly	2

⁶ Where continuous monitoring of a constituent is required, the following shall be reported:
 Total waste flow – Total daily and peak daily flow (24-hr basis);
 Total residual chlorine – Maximum daily value (24-hr basis);
 Turbidity – Maximum daily value, total amount of time each day the turbidity exceeded five turbidity units, flow-proportioned average daily value

⁷ The City can temporarily use the existing total flow meter, located after tertiary filters and before chlorination, to monitor the total waste flow. By December 31, 2009, the total waste flow device must be installed and function properly at the Effluent Transfer Station.

⁸ Total residual chlorine (TRC) shall be continuously recorded. The recorded charts shall be maintained by the Permittee for at least five years. The maximum daily peak, minimum daily peak, and daily average total residual chlorine shall be reported on the monthly monitoring reports. The City can temporarily use the existing chlorine sensor, located at Chlorine Contact Chamber, to monitor the total residual chlorine (TRC). By December 31, 2009, the chlorine sensor must be installed and function properly at the Effluent Transfer Station. Prior to the completion of the chlorine sensor installed at the Effluent Transfer Station, a daily grab sample of TRC shall be collected at the Effluent Transfer Station and analyzed for the purpose of reconfirming the TRC results analyzed at the Outfall, or see footnote 9.c.

⁹ Continuous monitoring of TRC at the current location shall serve as an internal trigger for increased TRC end of pipe grab sampling if either of the following occur, except as noted in footnote 9.c:
 a. TRC concentration excursions of up to 0.3 mg/L lasting greater than 15 minutes; or
 b. TRC concentration peaks in excess of 0.3 mg/L lasting greater than 1 minute.
 c. Additional end of pipe grab samples need not be taken if it can be demonstrated that a stoichiometrically appropriate amount of dechlorination chemical has been added to effectively dechlorinate the effluent to 0.1 mg/L or less for peaks in excess of 0.3 mg/L lasting more than 1 minute, but not for more than five minutes.

¹⁰ Grab samples shall be collected at end of pipe during peak flow.

¹¹ Daily grab samples shall be collected Monday through Friday only, except for holidays; and not on weekends.

V. WHOLE EFFLUENT TOXICITY TESTING REQUIREMENTS

A. Acute Toxicity

1. Definition of Acute Toxicity

¹³ In accordance with the SIP, the Discharger shall conduct effluent monitoring for the seventeen 2,3,7,8-tetrachlorodibenzo-p-dioxin (2,3,7,8-TCDD or dioxin) congeners in the effluent and in the receiving water Station RSW-002, located downstream of the discharge point. The Discharger shall use the appropriate Toxicity Equivalence Factor (TEF) to determine Toxic Equivalence (TEQ). Where TEQ equals the product between each of the 17 individual congeners' (i) concentration analytical result (C_i) and their corresponding Toxicity Equivalence Factor (TEF_i), (i.e., TEQ_i = C_i x TEF_i). Compliance with the Dioxin limitation shall be determined by the summation of the seventeen individual TEQs, or the following equation:

$$\text{Dioxin concentration in effluent} = \sum_{i=1}^{17} (\text{TEQ}_i) = \sum_{i=1}^{17} (C_i)(\text{TEF}_i)$$

¹⁴ Analyze these radiochemicals by the following USEPA methods: method 900.0 for gross alpha and gross beta, method 903.0 or 903.1 for radium-226, method 904.0 for radium-228, method 906.0 for tritium, method 905.0 for strontium-90, and method 908.0 for uranium.

Analysis for combined Radium-226 & 228 shall be conducted only if gross alpha results for the same sample exceed 15 pCi/L or beta greater than 50 pCi/L. If Radium-226 & 228 exceeds the stipulated criteria, analyze for Tritium, Strontium-90 and uranium.

¹⁵ Emerging chemicals include 1,4-dioxane (USEPA 8270c test method), perchlorate (USEPA 314 test method), 1,2,3-trichloropropane (USEPA 504.1 or 8260B test method), and methyl tert-butyl ether (USEPA 8260B test method). These chemicals need to be monitored in August.

¹⁶ Endocrine disrupting chemicals include ethinyl estradiol, 17-B estradiol, estrone, bisphenol A, nonylphenol and nonylphenol polyethoxylate, octylphenol and octylphenol polyethoxylate, and polybrominated diphenyl ethers. These chemicals need to be monitored, only when the analytical methods for these chemicals are applicable and approved by the CDPH. These chemicals need to be monitored during August.

¹⁷ Pharmaceuticals include acetaminopen, amoxicillin, azithromycin, caffeine, carbamazepine, ciprofloxacin, ethylenediamine tetra-acetic acid (EDTA), gemfibrozil, ibuprofen, iodinated contrast media, lipitor, methadone, morphine, salicylic acid, and triclosan. These chemicals need to be monitored, only when the analytical methods for these chemicals are applicable and approved by the CDPH. These chemicals need to be monitored in August.

Attachment E – MRP

April 27, 2007; Revised October 23, 2007, November 8, 2007, January 7, 2008,
 February 20, 2008, and March 6, 2008

Acute toxicity is a measure of primarily lethal effects that occur over a 96-hour period. Acute toxicity shall be measured in percent survival measured in undiluted (100%) effluent.

- a. The average survival in the undiluted effluent for any three (3) consecutive 96-hour static or continuous flow bioassay tests shall be at least 90%, and
- b. No single test shall produce less than 70% survival.

2. Acute Toxicity Effluent Monitoring Program

- a. **Method.** The Discharger shall conduct acute toxicity tests on 100% effluent and receiving water grab samples by methods specified in 40 CFR Part 136, which cites USEPA's *Methods for Measuring the Acute Toxicity of Effluents and Receiving Waters to Freshwater and Marine Organisms*, October, 2002 (EPA-821-R-02-012) or a more recent edition to ensure compliance.
- b. **Test Species.** The fathead minnow, *Pimephales promelas*, shall be used as the test species for fresh water discharges and the topsmelt, *Atherinops affinis*, shall be used as the test species for brackish discharges. However, if the salinity of the receiving water is between 1 to 32 parts per thousand (ppt), the Discharger may have the option of using the inland silverside, *Menidia beryllina*, instead of the topsmelt. The method for topsmelt is found in USEPA's *Methods for Measuring the Acute Toxicity of Effluents and Receiving Waters to Freshwater and Marine Organisms*, October, 2002 (EPA-821-R-02-012).
- c. **Alternate Reporting.** In lieu of conducting the standard acute toxicity testing with the fathead minnow, the Discharger may elect to report the results or endpoint from the first 96 hours of the chronic toxicity test as the results of the acute toxicity test, but only if the Discharger uses USEPA's August 2002 Method (EPA-821-R-02-013) to conduct the chronic toxicity test.
- d. **Acute Toxicity Accelerated Monitoring.** If the effluent toxicity requirements in Section IV.A.1.h.i.(i) or IV.A.1.h.i.(ii) of this Order is not met, the Discharger shall conduct six additional tests, approximately every two weeks, over a 12-week period. The Discharger shall ensure that results of a failing acute toxicity test are received by the Discharger within 24 hours of completion of the test and the additional tests shall begin within 5 business days of receipt of the result. If the additional tests indicate compliance with acute toxicity limitation, the Discharger may resume regular testing.

However, if the extent of the acute toxicity of the receiving water upstream of the discharge is greater than the downstream and the results of the effluent acute toxicity test comply with acute toxicity limitation, the accelerated monitoring need not be implemented for the receiving water.

e. **Toxicity Identification Evaluation (TIE).**

- (1). If the results of any two of the six accelerated tests are less than 90% survival, then the Discharger shall begin a Toxicity Identification Evaluation (TIE). The TIE shall include all reasonable steps to identify the sources of toxicity. Once the sources are identified, the Discharger shall take all reasonable steps to reduce toxicity to meet the objective.
- (2) If the initial test and any of the additional six acute toxicity bioassay tests results are less than 70% survival, the Discharger shall immediately implement Initial Investigation Toxicity Reduction Evaluation (TRE) Workplan. Once the sources are identified the Discharger shall take all reasonable steps to reduce toxicity to meet the requirements.

B. Chronic Toxicity Testing

1. Definition of Chronic Toxicity

Chronic toxicity is a measure of adverse sub-lethal effects in plants, animals, or invertebrates in a long-term test. The effects measured may include lethality or decreases in fertilization, growth, and reproduction.

2. Chronic Toxicity Effluent Monitoring Program

- a. **Test Methods.** The Discharger shall conduct critical life stage chronic toxicity tests on 24-hour composite 100 % effluent samples or receiving water grab samples in accordance with EPA's *Short Term Methods for Estimating the Chronic Toxicity of Effluents and Receiving Waters to Freshwater Organisms*, October 2002 (EPA-821-R-02-013) or EPA's *Short Term Methods for Estimating the Chronic Toxicity of Effluents and Receiving Waters to Marine and Estuarine Organisms*, October 2002 (EPA-821-R-02-014), or current version.

b. **Frequency**

- (1). **Screening and Monitoring.** - The Discharger shall conduct the first chronic toxicity test screening for three consecutive months in 2008. The Discharger shall conduct short-term tests with the cladoceran, water flea (*Ceriodaphnia dubia* - survival and reproduction test), the

fathead minnow (*Pimephales promelas* - larval survival and growth test), and the green alga (*Selenastrum capricornutum* - growth test) as an initial screening process for a minimum of three, but not to exceed, five suites of tests to account for potential variability of the effluent / receiving water. After this screening period, monitoring shall be conducted using the most sensitive species.

- (2). **Re-screening** is required every 24 months. The Discharger shall re-screen with the three species listed above and continue to monitor with the most sensitive species. If the first suite of re-screening tests demonstrates that the same species is the most sensitive then the re-screening does not need to include more than one suite of tests. If a different species is the most sensitive or if there is ambiguity, then the Discharger shall proceed with suites of screening tests for a minimum of three, but not to exceed five suites.
- (3). Regular toxicity tests - After the screening period, monitoring shall be conducted monthly using the most sensitive species.

- c. **Toxicity Units.** The chronic toxicity of the effluent shall be expressed and reported in Chronic Toxic Units, TU_c, where,

$$TU_c = \frac{100}{NOEC}$$

The No Observable Effect Concentration (NOEC) is expressed as the maximum percent effluent concentration that causes no observable effect on test organisms, as determined by the results of a critical life stage toxicity test.

3. Accelerated Monitoring

If the chronic toxicity of the effluent or the receiving water downstream the discharge exceeds the monthly trigger median of 1.0 TU_c, the Discharger shall conduct six additional tests, approximately every two weeks, over a 12-week period. The samples shall be collected and the tests initiated no less than 7 days apart. The Discharger shall ensure that they receive results of a failing chronic toxicity test within 24 hours of the completion of the test and the additional tests shall begin within 5 business days of the receipt of the result. However, if the chronic toxicity of the receiving water upstream of the discharge is greater than the downstream and the TU_c of the effluent chronic toxicity test is less than or equal to a monthly median of 1 TU_c trigger, then accelerated monitoring need not be implemented for the receiving water.

- a. If any three out of the initial test and the six additional tests results exceed 1.0 TU_c the Discharger shall immediately implement the Initial Investigation of the TRE.

- b. If implementation of the initial investigation TRE Workplan indicates the source of toxicity (e.g., a temporary plant upset, etc.), then the Discharger shall return to the normal sampling frequency required in Table 3 and Table 4 of this MRP.
- c. If all of the six additional tests required above do not exceed 1 TUc, then the Discharger may return to the normal sampling frequency.
- d. If a TRE/TIE is initiated prior to completion of the accelerated testing schedule required, then the accelerated testing schedule may be terminated, or used as necessary in performing the TRE/TIE, as determined by the Executive Officer.

C. Quality Assurance

1. Concurrent testing with a reference toxicant shall be conducted. Reference toxicant tests shall be conducted using the same test conditions as the effluent toxicity tests (e.g., same test duration, etc).
2. If either the reference toxicant test or effluent test does not meet all test acceptability criteria (TAC) as specified in the test methods manual (EPA-821-R-02-012 and/or EPA-821-R-02-013), then the Discharger must re-sample and re-test within 14 days.
3. Control and dilution water should be receiving water or laboratory water, as appropriate, as described in the manual. If the dilution water used is different from the culture water, a second control using culture water shall be used.

D. Preparation of an Initial Investigation TRE Workplan

The Discharger shall prepare and submit a copy of the Discharger's initial investigation Toxicity Reduction Evaluation (TRE) workplan to the Executive Officer of the Regional Water Board for approval within 90 days of the effective date of this permit. If the Executive Officer does not disapprove the workplan within 60 days, the workplan shall become effective. The Discharger shall use USEPA manual EPA/833B-99/002 (municipal) as guidance, or most current version. At a minimum, the TRE Workplan must contain the provisions in Attachment G. This workplan shall describe the steps the Discharger intends to follow if toxicity is detected, and should include, at a minimum:

1. A description of the investigation and evaluation techniques that will be used to identify potential causes and sources of toxicity, effluent variability, and treatment system efficiency.
2. A description of the facility's methods of maximizing in-house treatment efficiency and good housekeeping practices, and a list of all chemicals used in the operation of the facility; and,

3. If a toxicity identification evaluation (TIE) is necessary, an indication of the person who would conduct the TIEs (i.e., an in-house expert or an outside contractor). See MRP Section V.E.3. for guidance manuals.

E. Steps in Toxicity Reduction Evaluation (TRE) and Toxicity Identification Evaluation (TIE)

1. If results of the implementation of the facility's initial investigation TRE workplan indicate the need to continue the TRE/TIE, the Discharger shall expeditiously develop a more detailed TRE workplan for submittal to the Executive Officer within 15 days of completion of the initial investigation TRE. The detailed workplan shall include, but not be limited to:
 - a. Further actions to investigate and identify the cause of toxicity;
 - b. Actions the Discharger will take to mitigate the impact of the discharge and prevent the recurrence of toxicity; and,
 - c. A schedule for these actions.
2. The following section summarizes the stepwise approach used in conducting the TRE:
 - a. Step 1 includes basic data collection.
 - b. Step 2 evaluates optimization of the treatment system operation, facility housekeeping, and selection and use of in-plant process chemicals.
 - c. If Steps 1 and 2 are unsuccessful, Step 3 implements a Toxicity Identification Evaluation (TIE) and employment of all reasonable efforts using currently available TIE methodologies. The objective of the TIE shall be to identify the substance or combination of substances causing the observed toxicity.
 - d. Assuming successful identification or characterization of the toxicant(s), Step 4 evaluates final effluent treatment options.
 - e. Step 5 evaluates in-plant treatment options.
 - f. Step 6 consists of confirmation once a toxicity control method has been implemented.

Many recommended TRE elements parallel source control, pollution prevention, and storm water control program best management practices (BMPs). To prevent duplication of efforts, evidence of compliance with those requirements may be sufficient to comply with TRE requirements.

By requiring the first steps of a TRE to be accelerated testing and review of the facility's TRE workplan, a TRE may be ended in its early stages. All reasonable steps shall be taken to reduce toxicity to the required level. The TRE may be ended at any stage if monitoring indicates there are no longer toxicity violations.

3. The Discharger shall initiate a TIE as part of the TRE process to identify the cause(s) of toxicity. The Discharger shall use the USEPA acute manual, chronic manual, EPA/600/R-96-054 (Phase I), EPA/600/R-92/080 (Phase II), and EPA-600/R-92/081 (Phase III), as guidance.
4. If a TRE/TIE is initiated prior to completion of the accelerated testing required in Section V.D. of this program, then the accelerated testing schedule may be terminated, or used as necessary in performing the TRE/TIE, as determined by the Executive Officer .
5. Toxicity tests conducted as part of a TRE/TIE may also be used for compliance, if appropriate.
6. The Regional Water Board recognizes that toxicity may be episodic and identification of causes of and reduction of sources of toxicity may not be successful in all cases. Consideration of enforcement action by the Board will be based, in part, on the Discharger's actions and efforts to identify and control or reduce sources of consistent toxicity.
 - a. If all the results of the six additional tests are in compliance with the chronic toxicity limitation, the Discharger may resume regular monthly testing.
 - b. If the results of any of the six accelerated tests exceeds the limitation, the Discharger shall continue to monitor weekly until six consecutive weekly tests are in compliance. At that time, the Discharger may resume regular monthly testing.
 - c. If the results of two of the six tests, or any two tests in a six-week period, exceed the limitation, the Discharger shall initiate a TRE.
 - d. If implementation of the initial investigation TRE workplan (see item D.3, above) indicates the source of toxicity (e.g., a temporary plant upset, etc.), then the Discharger shall return to the regular testing frequency.

F. Ammonia Removal

1. Except with prior approval from the Executive Officer of the Regional Water Board, ammonia shall not be removed from bioassay samples. The Discharger must demonstrate the effluent toxicity is caused by ammonia *because of increasing test pH* when conducting the toxicity test. It is important to

distinguish the potential toxic effects of ammonia from other pH sensitive chemicals, such as certain heavy metals, sulfide, and cyanide. The following may be steps to demonstrate that the toxicity is caused by ammonia and not other toxicants before the Executive Officer would allow for control of pH in the test.

- a. There is consistent toxicity in the effluent and the maximum pH in the toxicity test is in the range to cause toxicity due to increased pH.
 - b. Chronic ammonia concentrations in the effluent are greater than 4 mg/L total ammonia.
 - c. Conduct graduated pH tests as specified in the toxicity identification evaluation methods. For example, mortality should be higher at pH 8 and lower at pH 6.
 - d. Treat the effluent with a zeolite column to remove ammonia. Mortality in the zeolite treated effluent should be lower than the non-zeolite treated effluent. Then add ammonia back to the zeolite-treated samples to confirm toxicity due to ammonia.
2. When it has been demonstrated that toxicity is due to ammonia because of increasing test pH, pH may be controlled using appropriate procedures which do not significantly alter the nature of the effluent, after submitting a written request to the Regional Water Board , and receiving written permission expressing approval from the Executive Officer of the Regional Water Board.

G. Reporting

The Discharger shall submit a full report of the toxicity test results, including any accelerated testing conducted during the month, as required by this permit. Test results shall be reported in Acute Toxicity Units (TUa) or Chronic Toxicity Units (TUc), as required, with the self-monitoring report (SMR) for the month in which the test is conducted. If an initial investigation indicates the source of toxicity and accelerated testing is unnecessary, pursuant to Section V.A.2.d. and V.B.3., then those results also shall be submitted with the SMR for the period in which the Investigation occurred.

1. The full report shall be received by the Regional Water Board by the 15th day of the second month following sampling.
2. The full report shall consist of (1) the results; (2) the dates of sample collection and initiation of each toxicity test; (3) the toxicity limit; and, (4) printout of the toxicity program (ToxCalc or CETIS).

3. Test results for toxicity tests also shall be reported according to the appropriate manual chapter on Report Preparation and shall be attached to the SMR. Routine reporting shall include, at a minimum, as applicable, for each test, as appropriate:
 - a. sample date(s)
 - b. test initiation date
 - c. test species
 - d. end point value(s) for each dilution (e.g. number of young, growth rate, percent survival)
 - e. NOEC values in percent effluent
 - f. TUc value(s), where $TU_c = \frac{100}{NOEC}$
 - g. Mean percent mortality (+standard deviation) after 96 hours in 100% effluent (if applicable)
 - h. NOEC and LOEC (Lowest Observable Effect Concentration) values for reference toxicant test(s)
 - i. Available water quality measurements for each test (e.g., pH, D.O., temperature, conductivity, hardness, salinity, ammonia).
4. The Discharger shall provide a compliance summary that includes a summary table of toxicity data from at least eleven of the most recent samples.
5. The Discharger shall notify this Regional Water Board immediately of any toxicity exceedance and in writing 14 days after the receipt of the results of an effluent limit. The notification will describe actions the Discharger has taken or will take to investigate and correct the cause(s) of toxicity. It may also include a status report on any actions required by the permit, with a schedule for actions not yet completed. If no actions have been taken, the reasons shall be given.

VI. LAND DISCHARGE MONITORING REQUIREMENTS

Not applicable.

VII. RECLAMATION MONITORING REQUIREMENTS

Ventura Water Reclamation Facility is recycling wastewater under separate Water Recycling Requirements contained in Order No. 87-45.

Attachment E – MRP

April 27, 2007; Revised October 23, 2007, November 8, 2007, January 7, 2008,
February 20, 2008, and March 6, 2008

E-17

VIII. RECEIVING WATER MONITORING REQUIREMENTS

A. Surface Water

1. Monitoring Locations – R-003, R-004, and R-005 (See Attachment B)

The Discharger shall monitor receiving water at R003, R-004, and R-005 as follows:

Table 4a. Receiving Water Monitoring Requirements

Parameter	Units	Sample Type	Minimum Sampling Frequency	Required Analytical Test Method
Copper	µg/L	grab	monthly	2
Mercury	µg/L	grab	monthly	2
Silver	µg/L	grab	monthly	2
Zinc	µg/L	grab	monthly	2
Cyanide	µg/L	grab	semiannually ¹⁸	2
Chlorodibromomethane	µg/L	grab	semiannually ¹⁸	2
Dichlorobromomethane	µg/L	grab	semiannually ¹⁸	2
Bis(2-ethylhexyl)phthalate	µg/L	grab	semiannually ¹⁸	2
Dioxin	pg/L	grab	semiannually	13
Remaining priority pollutants excluding as asbestos	µg/L	grab	semiannually	2
Chronic toxicity	TUc	grab	quarterly	See Section V.B.2.a
Acute toxicity ¹⁹	TUa	grab	annually	See Section V.A.2.a

2. Monitoring Locations – R-001 to R-005 (See Attachment B)

The Discharger shall monitor receiving water at R-001 through R-005 as follows:

Table 4b. Receiving Water Monitoring Requirements

Parameter	Units	Sample Type	Minimum Sampling Frequency	Required Analytical Test Method
Total and fecal coliform	MPN/100 mL	grab	weekly	2
Residual chlorine ²⁰	mg/L	grab	weekly	2
Hardness	mg/L	grab	weekly	2
Salinity	ppt	field	weekly	2
pH	pH units	grab	weekly	2
Temperature	°F	field	weekly	2

¹⁸ If any result of this chemical exceeds the CTR-based criteria after the effective date of the Order, the receiving water monitoring frequency of this chemical shall be increased from semiannually to monthly.

¹⁹ Acute toxicity test for the receiving water is conducted in Stations R-005 and R-003 only.

²⁰ Residual chlorine test for the receiving water is conducted in Stations R-001 to R-004.

Parameter	Units	Sample Type	Minimum Sampling Frequency	Required Analytical Test Method
Dissolved oxygen ²¹	mg/L	field	weekly	2
Total phosphorous as P	mg/L	grab	monthly	2
Ammonia nitrogen	mg/L	grab	monthly	2
Nitrate nitrogen	mg/L	grab	monthly	2
Nitrite nitrogen	mg/L	grab	monthly	2
Organic nitrogen	mg/L	grab	monthly	2
Total Kjeldahl nitrogen	mg/L	grab	monthly	2
Chlorophyll a	mg/L	grab	monthly	2

3. Observation – R-001 to R-004 (See Attachment B)

Table 4c. Receiving Water Monitoring Requirements

Parameter	Minimum Sampling Frequency
Sludge banks or deposits	weekly
Oil, grease, or slicks	weekly
Foam	weekly
Solids of waste origin	weekly

B. Sediment

1. Monitoring Locations – R-003, R-004, and R-005 (See Attachment B)

a. Local Benthic Trends Survey:

This survey addresses the question whether benthic conditions under the influence of the discharge are changing over time. The data collected are used for regular assessment of trends in sediment contamination and biological response along a fixed grid of sites within the influence of the discharge.

- i. Until the stakeholder group has determined the appropriate number and locations of sediment monitoring stations, at a minimum, three monitoring stations (R-003 to R-005, Attachment B) shall be sampled annually during the 3rd quarter (July, August, and September) for benthic monitoring. The sampling method has to be approved by the Executive Officer.

²¹ Measuring DO in the receiving water shall continue weekly for a period of no more than six months from the Effective Date of this Order, at which time a diurnal sampling program will be implemented that includes at least one pre-dawn sample to fully evaluate the possible impact of the low DO levels on the Estuary given natural DO cycles in enclosed bays and estuaries and recognizing that there is no photosynthesis to generate oxygen during the night and all aquatic life depletes DO during the night. Following this study, the Executive Officer may consider modifications to the monitoring and reporting program.

- ii. The following determinations shall be made for each station, where appropriate: identification of all organisms to lowest possible taxon; community structure analysis for each station; mean, range standard deviation, and 95% confidence limits, if appropriate, for value determined in the community analysis. The Discharger may be required to conduct additional “statistical analyses” to determine temporal and spatial trends in the marine environment.

b. Sediment/Chemical Monitoring

One grab sample (upper five centimeters) shall be collected at three monitoring stations (R-003 to R-005) and analyzed for the following parameters:

Annual samples during the 3rd quarter (July, August, and September) - arsenic, cadmium, chromium, copper, lead, mercury, nickel, silver, zinc, cyanide, phenolic compounds (chlorinated), phenolic compounds (non-chlorinated), total halogenated organic compounds, aldrin and dieldrin, endrin, HCH, chlordane, total DDT, DDT derivatives, total PCB, PCB derivatives, toxaphene, total PAH, PAH derivatives, detected priority pollutants, compounds on the local 303(d) list, dissolved sulfides (pore water), TOC and grain size (sufficiently detailed to calculate percent weight in relation to phi size).

c. Sediment Toxicity

Until the stakeholder group has determined the appropriate number and locations of sediment monitoring stations, at a minimum, three monitoring stations (R-003 to R-005, Attachment B) shall be sampled annually during the 3rd quarter (July, August, and September) for sediment toxicity monitoring following protocol described in the *Evaluation of Methods for Measuring Sediment Toxicity in California Bays and Estuaries, March 2007*. The most sensitive species have to be used.

All sediment samples must be collected on the same day.

IX. OTHER MONITORING REQUIREMENTS

A. Focused Subwatershed Study of the Estuary

In order to optimize discharge conditions under the Bays and Estuaries Policy and to avoid negative impacts from the Facility’s flows to the Estuary and to protect beneficial uses within the Estuary system and subwatershed, including those related to sensitive, endangered and threatened species as well as human recreation, the discharger shall submit a Work Plan within 6 months of the effective date of this

Order, subject to the approval of the Executive Officer, to conduct a system-wide Estuary Subwatershed- Study. The Regional Board will encourage participation in the development and implementation of this Work Plan by the U.S. Fish and Wildlife Service (USFWS), California Department of Fish and Game (CDFG), California Department of Parks and Recreation (CDPR), the National Marine Fisheries Service (NMFS), Heal the Bay, Audubon Society, other dischargers and water users, and other interested stakeholders in the Estuary subwatershed (collectively "Stakeholders"). The City will consider all input received from participating Stakeholders in preparing and implementing the Work Plan .This Work Plan must address the following:

1. An Estuary water balance study to:
 - a. Quantify the average monthly, seasonal and annual flows to the Estuary from all quantifiable sources, including groundwater exfiltration, surface water runoff, Santa Clara River flows, and Facility discharges;
 - b. More specifically define the relationship between incoming flows and Estuary and habitat area, depth and volume; and,
 - c. Identify alternatives for future discharge flows, volumes and practices and map spatial inundation characteristics correlated with each discharge alternative, including the inundation boundaries for the existing and proposed treatment wetlands, the Estuary and adjacent McGrath State Park areas, and the areas, depths and volumes for the Estuary and its habitats, including critical habitat areas for listed aquatic species and nesting and foraging habitat areas for birds such as the California least tern.
2. The function of the sub-watershed and Estuary as a single unit.
3. The following monitoring requirements:
 - a. Continuation of the "Fish Survey" and "Macroinvertebrate Monitoring Plan" to assess population and number trends (An Index of Biological Integrity score should be calculated from annual macroinvertebrate surveys);
 - b. The influences of groundwater on the Estuary water volume and quality;
 - c. An evaluation of the breaching frequency and impacts on the water quality and endangered species of the Estuary, and subwatershed water quality, including impacts on beach water quality downshore;
 - d. The establishment of temporary receiving water monitoring station in a portion of the Estuary that temporally extends beyond the normal boundaries of the Estuary;

- e. The influences of discharge on the McGrath State Park bird habitat areas;
 - f. An inventory of existing and potential bird nesting and foraging habitats within the Estuary, and a quarterly inventory of bird species and their numbers using the Estuary and wildlife/treatment ponds throughout the year, and the relationship of habitat types present and the success of California Least Tern and other sensitive avian species using the Estuary.
 - g. The potential for all impacts on the Tidewater Goby and all listed species, plant and animal and aquatic invertebrates that shorebirds depend on.
 - h. An evaluation of dissolved oxygen (DO) conditions in the Estuary taking into account daily natural background DO levels and cycles within healthy, highly functioning Estuaries, including diurnal, or more frequent monitoring including predawn sampling within the Estuary for DO and preparation of a DO trend analysis based on existing data and new data obtained.
4. The Work Plan shall provide that the work products discussed in sections (a) and (b) above, and other related work products determined to be necessary and appropriate by the Executive Officer, shall be completed and submitted to the Regional Board no later than 3 years and from the effective date of this Order.

B. Recycled Water Market Study

Based on information in, and conclusions of the Estuary Subwatershed Study discussed in section IX.A. above, and the Treatment Wetlands Study discussed in section IX.C. below the City will develop and implement a work plan to identify, research and evaluate feasibility of alternatives for increasing water reuse throughout the City and other areas within five miles of the Waste Water Reclamation Facility (based on sufficient proximity to infrastructure and facilities locations).

1. The Study and Work Plan will be designed to determine the maximum volume of recycled water that should be planned for in order to meet the following goals:
 - a. Optimize discharge flows, volume and practices for protection of beneficial uses, and environmental functions and values of the Estuary, including uses and functions related to provision of habitat for aquatic, terrestrial and avian sensitive, endangered, and threatened species;
 - b. Implement the best feasible configuration for treatment wetlands to further enhance surface flow water quality prior to discharge to the Estuary and subwatershed environmental functions and values; and,

- c. Most appropriately conserve and recycle water, in light of the foregoing goals, and anticipated increases in influent, increases in water demand, and the potential for decreasing supplies.
2. A phased Work Plan for the Recycled Water Market Study shall be submitted on the date that is six months after the effective date of this Order. Phase 1 of the Recycled Water Market Study shall address macro-level supply and demand issues and their impact on a local recycled water market, together with potential local recycled water supply that could potentially be generated and demand for local supply from both anticipated population growth and expansion of the City's service area. Phase 1 of the Recycled Water Study shall be completed within 2 years of the effective date of this Order.

Phase 2 of the Recycled Market Study shall commence on or before the date that is 3 years from the effective date of this Order, and shall address identify, research and evaluate feasibility of alternatives for increasing effluent reclamation and use of recycled water based on information in, and conclusions of the Estuary Water Balance Study, the Treatment/Wildlife Pond Study, and Phase 1 of the Recycled Market Study, in order to meet the goals set forth in this Permit and developed within the Study.

Phases 1 and 2 of the Recycled Water Study shall be completed prior to the expiration of the term of this Order.

C. Treatment Wetlands Feasibility Study

The City will complete a Treatment Wetlands Feasibility Study within two years of the effective date of this Order. The Regional Board will encourage participation in the development and implementation of this study by the Stakeholders (the U.S. Fish and Wildlife Service (USFWS), California Department of Fish and Game (CDFG), California Department of Parks and Recreation (CDPR), the National Marine Fisheries Service (NMFS), Heal the Bay, Audubon Society, other dischargers and water users, and other interested stakeholders in the Estuary subwatershed). The City will consider all input received from participating Stakeholders in preparing and implementing the Work Plan.

1. The Treatment Wetlands Feasibility Study will include:
 - a. Identification of a preferred proposed wetland site location and preliminary, planning level design specifications for additional treatment wetlands;
 - b. Preliminary planning level specifications and measures to maximize treatment for nutrients and to address other contaminants appropriate for wetlands treatment;

- c. Modeling to predict projected discharge-related pollutant loads and concentrations entering the treatment wetlands, pollutant loads and concentrations leaving the treatment wetlands;
 - d. Preliminary planning level design and operational specifications and measures that can enhance wildlife use of the treatment wetlands without adversely affecting or limiting treatment functions; and,
 - e. Preliminary construction, maintenance and operation cost estimates and the shortest realistic and practicable proposed schedule for environmental approval, permitting and construction of additional treatment wetlands.
2. At the conclusion of the Treatment Wetlands Study and upon concurrence of participating Stakeholders or the Executive Officer of the Regional Board with the recommended additional wetlands treatment project, the City will begin during the term of this Order to implement the environmental approval, permitting and construction processes for the additional treatment wetlands in accordance with the recommendations and schedules established by the Study. Accordingly, the City will undertake, without limitation, the following tasks:
- a. Preparation of documentation, and initiation of public review and hearing processes and other required activities related to incorporation of the recommended additional wetlands treatment project into the City's integrated long-range water resource plan;
 - b. Preparation of documentation, and initiation of public review and hearing processes and other required activities related to review and approval of the additional wetlands treatment project under the California Environmental Quality Act;
 - c. Preparation of permit applications, supporting plans and materials, and other activities related to incorporation of the recommended additional wetlands treatment project under local land use regulations and applicable state and federal environmental laws;
 - d. Preparation of design documents and construction plans for the additional wetlands treatment project; and,
 - e. Upon receipt of all required permits, approvals and environmental clearances, construction activities related to implementation of the additional wetlands treatment project.

In the event the stakeholders do not concur, the Regional Board staff will consider the opinions submitted by all stakeholders. The EO will advise the City as to how to proceed, if she feels it is appropriate, may bring the matter to

the Regional Board, and the permit may be reopened to consider such recommendations or other relevant matters.

3. The Regional Board shall reopen this Permit to consider revision of permit provisions to require implementation of the additional wetlands treatment project determined by the Wetlands Feasibility Study to be appropriate for implementation, and concurred with by the Regional Board and participating stakeholders. Any new or revised permit requirements considered or adopted pursuant to this re-opener shall be consistent with the approval, permitting, design and construction actions and schedules developed in the Treatment Wetlands Feasibility Study, and shall allow reasonable time frames for completion of identified activities. The re-opened permit, if adopted, shall be for a term of 5 years, and shall require during that term the completion of all approval, permitting, and design processes and commencement of construction activities. The new permit requirements shall further expressly acknowledge that permitting and approval processes are subject to the potential for delays that are not reasonably within the control of Discharger, and Discharger shall not be held in violation of the permit as revised for any failure to comply with its terms resulting from delays in those processes that are not reasonably within its control, including ,by way of example, third party appeal or litigation of any required approvals or permits.

D. Regional Watershed-Wide Monitoring Program for the Santa Clara River Watershed

Pursuant of 40 CFR 122.41(j) and 122.48(b), the monitoring program for a Discharger receiving an NPDES Permit must determine compliance with NPDES permit terms and conditions, and demonstrate that water quality standards are met.

Compliance monitoring focuses only on the quality of the discharge, it is not designed to assess the impact of the discharge on the receiving water in combination with other point source discharges or with any other sources of pollution (e.g., non-point source runoff, aerial fallout). Likewise, it is not designed to evaluate the current status of important ecological resources on a regional basis. However, to support the Watershed Approach, a watershed-wide Regional Monitoring Program may be designed for the Santa Clara River Watershed, with input of stakeholders, to determine: compliance with receiving water objectives; trends in surface water quality; impacts to beneficial uses; and data needs for modeling contaminants of concern.

Once this Regional Monitoring Program has been designed, the Executive Officer may require the Discharger to participate in the Regional Program and/or revise the existing monitoring program.

X. REPORTING REQUIREMENTS

A. General Monitoring and Reporting Requirements

1. The Discharger shall comply with all Standard Provisions (Attachment D) related to monitoring, reporting, and recordkeeping.
2. If there is no discharge during any reporting period, the report shall so state.
3. Each monitoring report shall contain a separate section titled "Summary of Non-Compliance" which discusses the compliance record and the corrective actions taken or planned that may be needed to bring the discharge into full compliance with waste discharge requirements. This section shall clearly list all non-compliance with discharge requirements, as well as all excursions of effluent limitations.
4. The Discharger shall inform the Regional Water Board well in advance of any proposed construction activity that could potentially affect compliance with applicable requirements.

B. Self Monitoring Reports (SMRs)

1. At any time during the term of this permit, the State or Regional Water Board may notify the Discharger to electronically submit Self-Monitoring Reports (SMRs) using the State Water Board's California Integrated Water Quality System (CIWQS) Program Web site (<http://www.waterboards.ca.gov/ciwqs/index.html>). Until such notification is given, the Discharger shall submit hard copy SMRs in accordance with the requirements described in subsection B.5 below. The CIWQS Web site will provide additional directions for SMR submittal in the event there will be service interruption for electronic submittal.
2. The Discharger shall report in the SMR the results for all monitoring specified in this MRP under sections III through IX. Additionally, the Discharger shall report in the SMR the results of any special studies (ex, the Work Plan specified in TSO R4-2006-0093), acute and chronic toxicity testing, TRE/TIE, PMP, and Pollution Prevention Plan required by Special Provisions – VI.C. of this Order. The Discharger shall submit monthly and annual SMRs including the results of all required monitoring using USEPA-approved test methods or other test methods specified in this Order. If the Discharger monitors any pollutant more frequently than required by this Order, the results of this monitoring shall be included in the calculations and reporting of the data submitted in the SMR.
3. Monitoring periods and reporting for all required monitoring shall be completed according to the following schedule:

Table 5. Monitoring Periods and Reporting Schedule

Sampling Frequency	Monitoring Period Begins On...	Monitoring Period	SMR Due Date
Continuous	Permit effective date	All	Submit with monthly SMR
Daily	Permit effective date	(Midnight through 11:59 PM) or any 24-hour period that reasonably represents a calendar day for purposes of sampling.	Submit with monthly SMR
Weekly	Sunday following permit effective date or on permit effective date if on a Sunday	Sunday through Saturday	Submit with monthly SMR
Monthly	First day of calendar month following permit effective date or on permit effective date if that date is first day of the month	1 st day of calendar month through last day of calendar month	By the 15 th day of the second month after the month of sampling
Quarterly	Closest of January 1, April 1, July 1, or October 1 following (or on) permit effective date	January 1 through March 31 April 1 through June 30 July 1 through September 30 October 1 through December 31	May 15 August 15 November 15 February 15
Semiannually	Closest of January 1 or July 1 following (or on) permit effective date	January 1 through June 30 July 1 through December 31	August 15 February 15
Annually	January 1 following (or on) permit effective date	January 1 through December 31	April 1

4. Reporting Protocols. The Discharger shall report with each sample result the applicable Reporting Level (RL) and the current Method Detection Limit (MDL), as determined by the procedure in Part 136.

The Discharger shall report the results of analytical determinations for the presence of chemical constituents in a sample using the following reporting protocols:

- a. Sample results greater than or equal to the RL shall be reported as measured by the laboratory (i.e., the measured chemical concentration in the sample).
- b. Sample results less than the RL, but greater than or equal to the laboratory's MDL, shall be reported as "Detected, but Not Quantified," or DNQ. The estimated chemical concentration of the sample shall also be reported.

For the purposes of data collection, the laboratory shall write the estimated chemical concentration next to DNQ as well as the words "Estimated Concentration" (may be shortened to "Est. Conc."). The laboratory may, if such information is available, include numerical estimates of the data quality for the reported result. Numerical estimates of data quality may be percent accuracy (\pm a percentage of the reported value), numerical ranges (low to high), or any other means considered appropriate by the laboratory.

- c. Sample results less than the laboratory's MDL shall be reported as "Not Detected," or ND.
 - d. Dischargers are to instruct laboratories to establish calibration standards so that the ML value (or its equivalent if there is differential treatment of samples relative to calibration standards) is the lowest calibration standard. At no time is the Discharger to use analytical data derived from *extrapolation* beyond the lowest point of the calibration curve.
5. The Discharger shall submit hard copy SMRs (with an original signature) when required by subsection B.1 above in accordance with the following requirements:
- a. The Discharger shall arrange all reported data in a tabular format. The data shall be summarized to clearly illustrate whether the facility is operating in compliance with interim and/or final effluent limitations. The Discharger is not required to duplicate the submittal of data that is entered in a tabular format within CIWQS. When electronic submittal of data is required and CIWQS does not provide for entry into a tabular format within the system, the Discharger shall electronically submit the data in a tabular format as an attachment.
 - b. The Discharger shall attach a cover letter to the SMR. The information contained in the cover letter shall clearly identify violations of the WDRs; discuss corrective actions taken or planned; and the proposed time schedule for corrective actions. Identified violations must include a description of the requirement that was violated and a description of the violation.
 - c. SMRs must be submitted to the Regional Water Board, signed and certified as required by the Standard Provisions (Attachment D), to the address listed below: (Reference the reports to Compliance File No. 1822 to facilitate routing to the appropriate staff and file.)

California Regional Water Quality Control Board
320 West 4th Street, Suite 200
Los Angeles, CA 90013
Attention: Information Technology Unit

C. Discharge Monitoring Reports (DMRs)

1. As described in Section X.B.1 above, at any time during the term of this permit, the State or Regional Water Board may notify the Discharger to electronically submit SMRs that will satisfy federal requirements for submittal of Discharge Monitoring Reports (DMRs). Until such notification is given, the Discharger shall submit DMRs in accordance with the requirements described below.
2. DMRs must be signed and certified as required by the standard provisions (Attachment D). The Discharge shall submit the original DMR and one copy of the DMR to the address listed below:

Standard Mail	FedEx/UPS/ Other Private Carriers
State Water Resources Control Board Division of Water Quality c/o DMR Processing Center PO Box 100 Sacramento, CA 95812-1000	State Water Resources Control Board Division of Water Quality c/o DMR Processing Center 1001 I Street, 15 th Floor Sacramento, CA 95814

3. All discharge monitoring results must be reported on the official USEPA pre-printed DMR forms (EPA Form 3320-1). Forms that are self-generated or modified cannot be accepted.

D. Other Reports

1. Annual Summary Report

By April 1 of each year, the Discharger shall submit an annual report containing a discussion of the previous year’s influent/effluent analytical results and receiving water bacterial monitoring data. The annual report shall contain graphical and tabular summaries of the monitoring analytical data. The annual report shall also contain an overview of any plans for upgrades to the treatment plant’s collection system, the treatment processes, or the outfall system. The Discharger shall submit a hard copy annual report to the Regional Water Board in accordance with the requirements described in subsection B.5 above.

Each annual monitoring report shall contain a separate section titled “Reasonable Potential Analysis” which discusses whether or not reasonable potential was triggered for pollutants which do not have a final effluent limitation in the NPDES permit. This section shall contain the following statement:” The analytical results for this sampling period did/ did not trigger reasonable potential.” If reasonable potential was triggered, then the following information should also be provided:

- a. A list of the pollutant(s) that triggered reasonable potential;

- b. The Basin Plan or CTR criteria that was exceeded for each given pollutant;
 - c. The concentration of the pollutant(s);
 - d. The test method used to analyze the sample; and,
 - e. The date and time of sample collection.
2. The Discharger shall submit to the Regional Water Board, together with the first monitoring report required by this permit, a list of all chemicals and proprietary additives which could affect this waste discharge, including quantities of each. Any subsequent changes in types and/or quantities shall be reported promptly.
3. The Regional Water Board requires the Discharger to file with the Regional Water Board, within 90 days after the effective date of this Order, a technical report on his preventive (failsafe) and contingency (cleanup) plans for controlling accidental discharges, and for minimizing the effect of such events. The technical report should:
 - a. Identify the possible sources of accidental loss, untreated waste bypass, and contaminated drainage. Loading and storage areas, power outage, waste treatment unit outage, and failure of process equipment, tanks, and pipes should be considered.
 - b. Evaluate the effectiveness of present facilities and procedures and state when they become operational.
 - c. Describe facilities and procedures needed for effective preventive and contingency plans.
 - d. Predict the effectiveness of the proposed facilities and procedures and provide an implementation schedule contingent interim and final dates when they will be constructed, implemented, or operational.

ATTACHMENT F – FACT SHEET

As described in section II of this Order, this Fact Sheet includes the legal requirements and technical rationale that serve as the basis for the requirements of this Order.

This Order has been prepared under a standardized format to accommodate a broad range of discharge requirements for Dischargers in California. Only those sections or subsections of this Order that are specifically identified as “not applicable” have been determined not to apply to this Discharger. Sections or subsections of this Order not specifically identified as “not applicable” are fully applicable to this Discharger.

I. PERMIT INFORMATION

The following Table summarizes administrative information related to the facility.

Table 1. Facility Information

WDID	4A560107001
Discharger	City of San Buenaventura
Name of Facility	Ventura Water Reclamation Facility, Ventura
Facility Address	1400 Spinnaker Drive
	Ventura, CA 93002-0099
	Ventura County
Facility Contact, Title and Phone	Donald Burt, Interim Wastewater Superintendent, (805) 677-4131
Authorized Person to Sign and Submit Reports	Donald Burt, Interim Wastewater Superintendent, (805) 677-4131
Mailing Address	P.O. Box 99, Ventura, CA 93002-0099
Billing Address	P.O. Box 99, Ventura, CA 93002-0099
Type of Facility	Publicly Owned Treatment Works
Major or Minor Facility	Major
Threat to Water Quality	1
Complexity	A
Pretreatment Program	Y
Reclamation Requirements	Producer
Facility Permitted Flow	14 million gallons per day
Facility Design Flow	14 million gallons per day
Watershed	Santa Clara River Watershed
Receiving Water	Santa Clara River Estuary via Wildlife Ponds
Receiving Water Type	Estuary

- A.** City of San Buenaventura (hereinafter Discharger) is the owner and operator of Ventura Water Reclamation Facility (hereinafter Facility), a Publicly Owned Treatment Works.

For the purposes of this Order, references to the “discharger” or “permittee” in applicable federal and state laws, regulations, plans, or policy are held to be equivalent to references to the Discharger herein.

The Water Quality Control Policy for the Enclosed Bays and Estuaries of California (Enclosed Bay and Estuaries Policy), originally adopted by the State Water Resources Control Board in 1974 and updated as Resolution No. 95-84 on November 16, 1995, states that:

“It is the policy of the State Board that the discharge of municipal wastewaters and industrial process waters (exclusive of cooling water discharges) to enclosed bays and estuaries, other than the San Francisco Bay-Delta system, shall be phased out at the earliest practicable date. Exceptions to this provision may be granted by a Regional Board only when the Regional Board finds that the wastewater in question would consistently be treated and discharged in such a manner that it would enhance the quality of receiving waters above that which would occur in the absence of the discharge.”

The Enclosed Bay and Estuaries Policy does not define what is meant by “enhancement”. The determination is left to the discretion of the Regional Board.

Section I.A. of Order No. 00-143 states that “The running 30-day average volume of treated wastewater discharged to the Santa Clara River shall not be less than 5.6 mgd.” The minimal discharge of 5.6 mgd was based upon results of the 1976 Enhancement Study conducted by the Discharger and accepted by this Regional Water Board in 1977. However, there has not been a consensus among stakeholders of whether the treated wastewater discharge into the Estuary is beneficial and enhances the Estuary, or has adverse impacts to the Santa Clara River Estuary (Estuary).

Between October 12, 2000 and December 14, 2006, the Regional Board issued seven individual Time Schedule Orders (TSOs) to the City. These TSOs provided time to address the issue of whether the saltwater or the fresh water California Toxic Rule Criteria (CTR) should be applied for the effluent limitation calculations. The City was required to conduct the Salinity Study in 2001. The result showed that the Estuary is more like a blackish environment. Therefore, the more stringent Saltwater CTR was chosen to calculate the final effluent limitations.

A second, more fundamental issue is whether the discharge from the Facility should be allowed to continue, in view of the Bays and Estuaries Policy. Specifically, the discharge may be allowed under the Policy if it enhances the receiving waters (i.e., the Estuary) and endangered species habitat.

Regional Water Board staff met with the Discharger, Resource Agencies and other Interested Parties to review the results of the Updated Enhancement Study. This

Study was performed by Nautilus Environmental hired by the Discharger (meetings held at the Facility on March 27, 2006 and June 12, 2006). The conclusions of the Study were largely inconclusive. However, concern was expressed that a swift reduction in the volume of fresh wastewater to the Estuary could result in loss of habitat and adverse impacts on the Tidewater Goby. In addition, the resource agencies requested that the effluent should be monitored for emerging and pharmaceutical chemicals. This monitoring effort could determine the possible impact(s) of these chemicals on the aquatic life, particularly, the Tidewater Goby.

During a stakeholder meeting on October 19, 2007, the possible impacts of maintaining and eliminating discharge to the Estuary were discussed. "Pros" and "cons" expressed, however, no consensus was reached on the issues discussed. Resource agencies, environmental groups, interested parties, and stakeholders, all had varying opinions. The Regional Board agrees that scientific disagreement exists, and most of the commentors' opinions may have technical merit.

In addition, while the Regional Board has previously determined that the discharge enhances the Estuary, the Regional Board presently has inadequate information with which to determine whether and to what extent the discharge that could be authorized by this permit continues to constitute an enhancement. The Board also presently lacks the information necessary to determine what if any negative impacts would occur to the Estuary if the discharge was prohibited, and therefore lacks the current information necessary dispute the previous enhancement finding. The Board has conflicting, yet credible opinions from a variety of experts about harm to endangered species, habitat, and recreation, among other uses of the Estuary and areas impacted by the discharge, both with and without the discharge. In view of the aforesaid, the Regional Board finds that the best approach at this time is to cap the allowable discharge at present levels (9 MGD, as an annual average) and to require a watershed-wide study and dialogue, to determine the best approach for the Estuary that considers at a minimum:

1. A system-wide analysis that examines the biological, recreational, physical, chemical and hydrological relationships in the watershed; and,
2. A Comprehensive Plan that addresses the function of the sub-watershed and Estuary as a single unit.

To ensure compliance with the Bays and Estuaries Policy, this study should be completed as soon as practicable.

At the stakeholder meeting held on January 29, 2008, the revised tentative Order (January 7, 2008), Watershed-wide Study, and Work Plan was discussed. At this meeting, the Discharger expressed interest in exploring construction of wetlands near the Facility to improve the receiving water quality. This order contains a requirement for the Discharger to submit a Wetlands Feasibility Study (See Section VI.C.2.a.iv of Order). This order contains a requirement for the Discharger to submit

a Wetlands Feasibility Study that includes preliminary design specifications and proposed site location, to the Regional Board two years from the adoption of this order. Additional time can be granted by the Executive Officer for just cause.

- B.** The Facility discharges wastewater to the Estuary, a water of the United States, and is currently regulated by Order No. 00-143, which was adopted on October 12, 2000.
- C.** The Discharger filed a report of waste discharge and submitted an application for renewal of its Waste Discharge Requirements (WDRs) and National Pollutant Discharge Elimination System (NPDES) permit on April 18, 2005. A site visit was conducted on February 1, 2007, to observe operations and collect additional data to develop permit limitations and conditions.

II. FACILITY DESCRIPTION

The Discharger owns and operates the Facility, a tertiary wastewater treatment facility located at 1400 Spinnaker Road, Ventura, California. Figure 1 shows the location of the Facility. Figure 1 shows the location of the Facility. The Facility currently receives wastewater generated from the City of San Buenaventura. The wastewater is a mixture of domestic, commercial, and industrial wastewater that is pre-treated pursuant to 40 CFR Part 403. The Facility has a design capacity of 14 mgd and serves an estimated population of 105,000 people.

A. Description of Wastewater and Biosolids Treatment or Controls

The treatment system consists of screenings and grit removal, primary sedimentation, flow equalization, activated sludge nitrification and partial denitrification¹, tertiary filters, ammonia addition², chlorination and dechlorination,

¹ For the nitrification process, there are two steps for ammonia being oxidized into nitrate.

For the denitrification process, nitrate is through a redox reaction and becomes nitrogen.

The Facility currently does not have a full NDN process (full nitrification and partial denitrification). The effluent data between February 2003 and December 2006 did show the high effluent nitrate concentration (10.1 – 18.6 mg/L, average: 14.6 mg/L) and very low effluent nitrite concentration (always less than 0.4 mg/L, which is the detection limit). However, the nitrite effluent concentrations may exceed 1 mg/L of water quality objective specified in the Basin Plan based on the Best Professional Judgement, if the oxidation process of the nitrification is not complete. Therefore, a final nitrite limitation of 1 mg/L has been added to the Order No. R4-2008-0012 and the Discharger may request to have interim nitrite effluent limitations in the future. In addition, once the full NDN is on line, the effluent nitrate concentration shall be further reduced.

² Ammonia (NH₃) has been added into chlorine contact basin since April 2004. Ammonia reacts with hypochlorous acid (HOCl) to form chloramine (NH₂Cl). Here is the reaction below:

primary sludge thickener, dissolved air flotation (DAF) secondary sludge thickener, anaerobically digested, and dewatered (using plate and frame filter presses). All of the Class B anaerobically digested sludge is dewatered and composted to Class A at Lost Hills, Kern County and then land applied to a cotton farm in Kings County. Screenings and grits are disposed of at the Toland Road landfill. The Facility is also responsible for 375 miles of sewer mains and 12 lift stations. Wastewater is discharged from Discharge Point No. 001 (Outfall) to a system of Wildlife Ponds³ with a combined capacity of 34 million gallons providing approximately 4 days of detention, based on an average daily flow rate of 9.5 MGD and approximately 1.0 MGD of the treated wastewater percolating into groundwater from the Wildlife Ponds. This treated wastewater is then discharged to the Estuary, a water of the United States, within the Santa Clara River Watershed. Attachment B provides a map of the area surrounding the Facility. Attachment C provides a flow schematic of the Facility.

B. Discharge Points and Receiving Waters

1. The treated wastewater is discharged into the Estuary through the Wildlife Ponds with approximately 4-day retention, a water of the United State, at latitude 34° 14' 22.46", and longitude 119° 15' 54.84" (Discharge Serial No. 001).
2. The mouth of the Santa Clara River is sometimes closed off by a sand bar so that a shallow lagoon is created. However, at times when the sand bar is breached, either by floodwaters or by mechanical means, the lagoon empties directly into the Pacific Ocean.

Chloramine is used as a disinfectant in municipal water systems as an alternative to chlorination and also exhibits less tendency to convert organic materials into chlorocarbons such as chloroform, dichlorobromomethane, dibromochloromethane, and carbon tetrachloride.

³ Optimal water amounts for bird populations in the estuary probably include both a large open water surface area during California Least Tern nesting and exposed mudflats created when the estuary bar breaches during the fall in September. During the winter months the open water areas of the estuary and the wildlife ponds provide safe sleeping areas for ducks where they can't be reached by predators like the coyote. The above information was based upon the Ventura Audubon Society's February 3, 2008 comment letter for the January 7, 2008 tentative Ventura NPDES Permit.

3. The State of California Department of Parks and Recreation has declared McGrath State Beach and the surrounding 160 acres a natural preserve. The preserve includes the main channel of the Santa Clara River and adjacent natural lands of riparian shrub land and saltwater marsh. The purpose of the natural preserve is to protect and perpetuate the river ecosystem at the mouth of the Santa Clara River. Resource values of particular significance include: estuarine waters, which are used extensively by a wide variety of waterfowl and other water-associated birds; nesting habitat of the endangered California least tern; and riparian shrub land and saltwater marsh communities.
4. The effluent limits were derived based on the salinity of the receiving waters. The CTR specifies that fresh water criteria apply at locations where the salinity is 1 part per thousand (ppt) or less 95% or more of the time, and marine water criteria apply at locations where the salinity is 10 ppt or more 95% or more of the time. At locations where salinities fall between 1 and 10 ppt, the more stringent of either fresh or marine waters apply. The Santa Clara River Estuary typically experiences more tidal influence during winter and spring when the sand bar is open, while during the summer and fall the bar is closed and less tidal influence occurs. Data obtained from U.S. Fish and Wildlife Service demonstrate that the discharge point is classified as in-between freshwater and saltwater according to the definitions in the CTR. In this Order, the saltwater criteria were used to calculate the final effluent limits for CTR-based pollutants and ammonia.
5. A small portion of the treated wastewater is reused for turf and landscape irrigation. Approximately 1.0 MGD of the treated wastewater percolates into groundwater from three wildlife ponds on site at the treatment facility. The reuse of the treated wastewater and the percolation to groundwater are regulated under water reclamation requirements which are contained in a separate order (Order No. 87-45), adopted by this Board on April 27, 1987.

C. Summary of Existing Requirements and Self-Monitoring Report (SMR) Data

Effluent limitations contained in the existing Order for discharges from the Effluent Transfer Station and Outfall and representative monitoring data from the term of the previous Order are as follows:

Table 2. Historic Effluent Limitations and Monitoring Data

Parameter	Units	Effluent Limitation			Monitoring Data (January 2003 – August 2007)		
		Average Monthly	Average Weekly	Maximum Daily	Highest Average Monthly Discharge	Highest Average Weekly Discharge ⁴	Highest Daily Discharge
BOD ₅ 20°C	mg/L	20	30	45	5.1	3.8	8.6

D. Compliance Summary

Data submitted revealed the following effluent limitation violations during the permit term. These violations had been reviewed and taken proper action.

Table 3. Summary of Compliance History

E. Planned Changes to Treatment Systems

1. The most problematic metals were copper, nickel, and zinc. The City of Ventura installed temporary facilities for improved primary clarifier performance in the First Quarter of 2003. Prior to the addition of iron salt between October 2000 and December 2002, the average effluent concentrations of copper, nickel, and zinc were 19, 9.7, and 69 µg/L, respectively. The addition of iron salt greatly improved removal of copper, nickel, and zinc. Between August 2003 and August 2007, the average effluent concentrations of copper, nickel, and zinc were 7.1, 4.0, and 38.7 µg/L, respectively. Neither antimony (reported detection limit: 1.0 µg/L), arsenic (reported detection limit: 2.0 µg/L), beryllium (reported detection limit: 0.2 µg/L), cadmium (reported detection limit: 4.0 µg/L), copper (reported detection limit: 6 µg/L), lead (reported detection limit: 5.0 µg/L), mercury (reported detection limit: 0.2 µg/L), silver (reported detection limit: 0.2

µg/L), nor thallium (reported detection limit: 1.0 µg/L), was detected between February 2006 and August 2007. Chromium, nickel, and selenium were detected for one time during this period; however, they were all less than the CTR-based criteria. Zinc was all less than its CTR-based criteria since November 2004. Permanent facilities for iron salt addition were completed in November 2007. The final effluent concentrations of copper, nickel, and zinc are expected to be further reduced or non-detected. Due to the major upgrade on the primary clarifier in 2003 and consideration of the representative effluent data, the effluent data collected after July 2003 were used to calculate the final effluent limitations for metals.

2. To date the City has invested \$29.5 million for the Upgrades (Phase 1) and a new Influent Headworks. Upgrades (Phase II) will restore biological capacity decommissioned during Phase I, and add new nutrient removal facilities. Phase II is currently estimated at \$28 million with a final design and construction period of 36 to 48 months following the adoption of this Order.
3. The City of Ventura conducted the "Chloramine Disinfection Investigation" at the Facility between April 2 and June 30, 2004. The results indicated that chloramine resulting from ammonia reacting with hypochlorous acid greatly reduces the effluent concentrations of dibromochloromethane and dichlorobromomethane. These compounds were all well below the CTR-based criteria or non-detected Between May 2004 and August 2007. The maximum effluent concentration and CTR-based criterion for dibromochloromethane are 5.5 µg/L and 34 µg/L, respectively. The maximum effluent concentration and CTR-based criterion for dichlorobromomethane are 8.6 µg/L and 46 µg/L, respectively.

III. APPLICABLE PLANS, POLICIES, AND REGULATIONS

The requirements contained in the proposed Order are based on the requirements and authorities described in this section.

A. Legal Authorities

This Order is issued pursuant to section 402 of the federal Clean Water Act (CWA) and implementing regulations adopted by the U.S. Environmental Protection Agency (USEPA) and chapter 5.5, division 7 of the California Water Code (commencing with section 13370). It shall serve as an NPDES permit for point source discharges from this facility to surface waters. This Order also serves as Waste Discharge Requirements (WDRs) pursuant to article 4, chapter 4, division 7 of the Water Code (commencing with section 13260).

B. California Environmental Quality Act (CEQA)

Under Water Code section 13389, this action to adopt an NPDES permit is exempt from the provisions of CEQA, Public Resources Code sections 21100 through 21177.

C. State and Federal Regulations, Policies, and Plans

1. Water Quality Control Plans. The Regional Water Quality Control Board (Regional Water Board) adopted a Water Quality Control Plan for the Los Angeles Region (hereinafter Basin Plan) on June 13, 1994 that designates beneficial uses, establishes water quality objectives, and contains implementation programs and policies to achieve those objectives for all waters addressed through the plan. In addition, the Basin Plan implements State Water Resources Control Board (State Water Board) Resolution No. 88-63, which established state policy that all waters, with certain exceptions, should be considered suitable or potentially suitable for municipal or domestic supply. Beneficial uses applicable to the Estuary are as follows:

Table 4. Basin Plan Beneficial Uses

Discharge Point	Receiving Water Name	Beneficial Use(s)
002	Santa Clara River Estuary	<u>Existing:</u> Navigation (NAV), water contact recreation (REC-1), non-contact water recreation (REC-2), commercial and sport fishing (COMM), estuarine habitat (EST), marine habitat (MAR), wildlife habitat (WILD), rare, threatened, or endangered species ⁵ (RARE), migration of aquatic organisms ⁶ (MIGR), spawning, reproduction, and/or early development ⁶ (SPWN), and wet land ⁷ (WET).
Discharge Point	Receiving Water Name	<u>Beneficial Use(s)</u>
	Pacific Ocean, Nearshore ⁸	<u>Existing:</u> IND, NAV, REC-1, REC-2, COMM, MAR, WILD, Preservation of Biological Habitats ⁹ (BIOL), RARE ⁵ , MIGR ⁶ , SPWN ⁶ , and shellfish harvesting (SHELL).

Requirements of this Order implement the Basin Plan.

⁵ One or more rare species utilize all ocean, bays, estuaries, and coastal wetlands for foraging and/or nesting.
⁶ Aquatic organisms utilize all bays, estuaries, lagoons and coastal wetlands, to a certain extent, for spawning and early development. This may include migration into areas, which are heavily influenced by freshwater inputs.
⁷ Waterbodies designated as WET may have wetlands habitat associated with only a portion of the waterbody. Any regulatory action would require a detailed analysis of the area.
⁸ Nearshore is defined as the zone bounded by the shoreline and a line 1,000 feet from the shoreline or the 30-foot depth contours, whichever is further from the shoreline.
⁹ Areas of Special Biological Significance (along coast from Latigo Point to Laguna Point) and Big Sycamore Canyon and Abalone Cove Ecological Reserves and Point Femin Marine Life Refuge.

The 1994 Basin Plan provided water quality objectives for ammonia to protect aquatic life, in Tables 3-1 through Tables 3-4. However, those ammonia objectives were revised, based upon fresh and saltwater criteria.

- a. **Freshwater Ammonia Water Objective** – On April 25, 2002, the Regional Board adopted the Resolution No. 2002-011, *Amendment to the Water Quality Control Plan for the Los Angeles Region to Update the Ammonia Objectives for Inland Surface Waters (Including Enclosed Bays, Estuaries and Wetlands) with Beneficial Use Designations for Protection of Aquatic Life*. The ammonia Basin Plan amendment was approved by the State Water Board, the Office of Administrative Law, and USEPA on April 30, 2003, June 5, 2003, and June 19, 2003, respectively. Although the revised ammonia water quality objectives may be less stringent than those contained in the 1994 Basin Plan, they are still protective of aquatic life and are consistent with USEPA's 1999 ammonia criteria update.
- b. **Saltwater Ammonia Water Objective** – On March 4, 2004, the Regional Water Board adopted the Resolution No. 2004-022, *Amendment to the Water Quality Control Plan for the Los Angeles Region to Update the Ammonia Objectives for Inland Surface Waters Not Characteristic of Freshwater (Including Enclosed Bays, Estuaries and Wetlands) with Beneficial Use Designations for Protection of Aquatic Life*. The ammonia Basin Plan amendment is consistent with the U.S. EPA "Ambient Water Quality Criteria for Ammonia (Saltwater)-1989." The amendment revised the regulatory provisions of the Basin Plan by adding language to Chapter 3 "Water Quality Objectives."

For inland surface waters not characteristic of freshwater (including enclosed bays, estuaries, and wetlands), the proposed objectives are a 4-day average concentration of unionized ammonia of 0.035 mg/L, and a one-hour average concentration of unionized ammonia of 0.233 mg/L. The proposed objectives are fixed concentrations of unionized ammonia, independent of pH, temperature, or salinity. The proposed amendment includes an implementation procedure to convert un-ionized ammonia objectives to total ammonia effluent limits. The proposed amendment also simplifies the implementation procedures for translating ammonia objectives into effluent limits in situations where a mixing zone has been authorized by the Regional Water Board. Finally, the proposed amendment revises the implementation procedure for determining saltwater, brackish or freshwater conditions, to be consistent with the proposed objectives. The proposed objectives will apply only to inland surface waters not characteristic of freshwater (including enclosed bays, estuaries and wetlands) and do not impact the Ammonia Water Quality Objectives for ocean waters contained in the California Ocean Plan.

However, based on the beneficial uses of the Basin Plan, the freshwater ammonia water objective is not applicable in the Santa Clara River

Estuary. Therefore, the saltwater ammonia water objective will be used to calculate the final ammonia effluent limitations for the Facility (See Section IV.C.2.i.(iii)(iv) in this Fact Sheet, and Attachment M).

The ammonia Basin Plan amendment was approved by the State Water Board, the Office of Administrative Law, and USEPA on July 22, 2004, September 14, 2004, and May 19, 2005, respectively.

The State Water Board adopted the *Water Quality Control Plan for Control of Temperature in the Coastal and Interstate Water and Enclosed Bays and Estuaries of California* (Thermal Plan) on May 18, 1972, and amended this plan on September 18, 1975. This plan contains temperature objectives for surface waters. Requirements of this Order implement the Thermal Plan.

The 2006 303(d) listings for the Estuary are Chem A based on an unknown source and coliform bacteria and toxaphene based on nonpoint sources. The Total Daily Maximum Loads (TMDLs) for these pollutants in the Estuary have not been established.

2. **Enclosed Bay and Estuaries Policy.** The Water Quality Control Policy for the Enclosed Bays and Estuaries of California (Enclosed Bays and Estuaries Policy), adopted by the State Water Resources Control Board as Resolution No. 95-84 on November 16, 1995, states that *"It is the policy of the State Board that the discharge of municipal wastewaters and industrial process waters (exclusive of cooling water discharges) to enclosed bays and estuaries, other than the San Francisco Bay-Delta system, shall be phased out at the earliest practicable date. Exceptions to this provision may be granted by a Regional Board only when the Regional Board finds that the wastewater in question would consistently be treated and discharged in such a manner that it would enhance the quality of receiving waters above that which would occur in the absence of the discharge."*
3. **Thermal Plan.** The State Water Board adopted the *Water Quality Control Plan for Control of Temperature in the Coastal and Interstate Water and Enclosed Bays and Estuaries of California* (Thermal Plan) on May 18, 1972, and amended this plan on September 18, 1975. This plan contains temperature objectives for surface waters. Requirements of this Order implement the Thermal Plan.
4. **National Toxics Rule (NTR) and California Toxics Rule (CTR).** USEPA adopted the NTR on December 22, 1992, and later amended it on May 4, 1995 and November 9, 1999. About forty criteria in the NTR applied in California. On May 18, 2000, USEPA adopted the CTR. The CTR promulgated new toxics criteria for California and, in addition, incorporated the previously adopted NTR criteria that were applicable in the state. The CTR was amended on February 13, 2001. These rules contain water quality criteria for priority pollutants.

5. **State Implementation Policy.** On March 2, 2000, the State Water Board adopted the *Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California* (State Implementation Policy or SIP). The SIP became effective on April 28, 2000 with respect to the priority pollutant criteria promulgated for California by the USEPA through the NTR and to the priority pollutant objectives established by the Regional Water Board in the Basin Plan. The SIP became effective on May 18, 2000 with respect to the priority pollutant criteria promulgated by the USEPA through the CTR. The State Water Board adopted amendments to the SIP on February 24, 2005 that became effective on July 13, 2005. The SIP establishes implementation provisions for priority pollutant criteria and objectives and provisions for chronic toxicity control. Requirements of this Order implement the SIP.
6. **Alaska Rule.** On March 30, 2000, USEPA revised its regulation that specifies when new and revised state and tribal water quality standards (WQS) become effective for CWA purposes (40 C.F.R. § 131.21, 65 Fed. Reg. 24641 (April 27, 2000)). Under the revised regulation (also known as the Alaska rule), new and revised standards submitted to USEPA after May 30, 2000, must be approved by USEPA before being used for CWA purposes. The final rule also provides that standards already in effect and submitted to USEPA by May 30, 2000, may be used for CWA purposes, whether or not approved by USEPA.
7. **Antidegradation Policy.** Section 131.12 requires that the state water quality standards include an antidegradation policy consistent with the federal policy. The State Water Board established California's antidegradation policy in State Water Board Resolution No. 68-16. Resolution No. 68-16 incorporates the federal antidegradation policy where the federal policy applies under federal law. Resolution No. 68-16 requires that existing water quality be maintained unless degradation is justified based on specific findings. The Regional Water Board's Basin Plan implements, and incorporates by reference, both the State and federal antidegradation policies. The permitted discharge must be consistent with the antidegradation provision of section 131.12 and State Water Board Resolution No. 68-16.
8. **Anti-Backsliding Requirements.** Sections 402(o)(2) and 303(d)(4) of the CWA and federal regulations at title 40, Code of Federal Regulations¹⁰ section 122.44(l) prohibit backsliding in NPDES permits. These anti-backsliding provisions require that effluent limitations in a reissued permit must be as stringent as those in the previous permit, with some exceptions in which limitations may be relaxed. Section 402(o)(2) also provides that the establishment of less stringent limits may be allowed where:

¹⁰ All further statutory references are to title 40 of the Code of Federal Regulations unless otherwise indicated.

- a. There have been material and substantial alternations or additions to the permitted facility which justify this relaxation. See Section II. E. of the Fact Sheet.
- b. New information (other than revised regulations, guidance, or test methods) is available that was not available at the time of permit issuance which would have justified a less stringent effluent limitations. Based on the results of Copper Water Effect Ratio (WER) Study in the Updated Enhancement Study conducted by Nautilus Environmental and Metal Translator Factor (MTF) in the Metal Translator Study conducted by Entrix, WER of 1.58 and MTF of 0.86 were applied for copper final effluent limitations. In addition, based on the result of Metal Translator Factor (MTF) in the Metal Translator Study conducted by Entrix, MTF of 0.84 was applied for zinc final effluent limitations.

D. Impaired Water Bodies on CWA 303(d) List

The 2006 303(d) list of impaired waters classifies the Santa Clara River Estuary as impaired by Chem A (unknown source), coliform bacteria and toxaphene (nonpoint source).

E. Other Plans, Policies and Regulations

1. **Secondary Treatment Regulations.** Section 133 of 40 CFR establishes the minimum levels of effluent quality to be achieved by secondary treatment. These limitations, established by USEPA, are incorporated into this Order, except where more stringent limitations are required by other applicable plans, policies, or regulations.
2. **Storm Water.** CWA section 402(p), as amended by the Water Quality Act of 1987, requires NPDES permits for storm water discharges. Pursuant to this requirement, in 1990, USEPA promulgated 40 CFR, Section 122.26 that established requirements for storm water discharges under an NPDES program. To facilitate compliance with federal regulations, on November 1991, the State Board issued a statewide general permit, *General NPDES Permit No. CAS000001 and Waste Discharge Requirements for Discharges of Storm Water Associated with Industrial Activities*. This permit was amended in September 1992 and reissued on April 17, 1997 in State Board Order No. 97-03-DWQ to regulate storm water discharges associated with industrial activity.

The Discharger developed and currently implements a Storm Water Pollution Prevention Plan (SWPPP), to comply with the State Water Board's (Order No. 97-03-DWQ).

3. **Sanitary Sewer Overflows.** The Clean Water Act prohibits the discharge of pollutants from point sources to surface waters of the United States unless

authorized under an NPDES permit. (33 U.S.C. §§1311, 1342). The State Board adopted Statewide General Waste Discharge Requirements (WDRs) for Sanitary Sewer Systems, Water Quality Order No. 2006-0003 on May 2, 2006, to provide a consistent, statewide regulatory framework to address Sanitary Sewer Overflows (SSOs). The WDR requires public agencies that own or operate sanitary sewer systems to develop and implement sewer system management plans and report all SSOs to the State Water Board's online SSO database.

The requirements contained in this Order in Sections VI.C.3.b, VI.C.4, and VI.C.6. are intended to be consistent with the requirements in the SSO WDR. The Regional Water Board recognizes that there are areas of overlapping interest between the NPDES permit conditions and the SSO WDR requirements. The requirements of the SSO WDR are considered the minimum thresholds (see Finding 11 of WQ Order NO. 2006-0003). The Regional Water Board will accept the documentation prepared by the Permittee under the SSO WDR for compliance purposes, as satisfying the requirements in Sections .C.3.b, VI.C.4, and VI.C.6, provided for any more specific or stringent provisions enumerated in this Order, have also been addressed.

4. **Watershed Management.** This Regional Water Board has been implementing a Watershed Management Approach (WMA), to address water quality protection in the Los Angeles Region, as detailed in the Watershed Management Initiative (WMI). The WMI is designed to integrate various surface and ground water regulatory programs while promoting cooperative, collaborative efforts within a watershed. It is also designed to focus limited resources on key issues and use sound science. Information about the Santa Clara River Watershed and other watersheds in the region can be obtained from the Regional Water Board's web site at <http://www.waterboards.ca.gov/losangeles> and clicking on the word "Watersheds".

IV. RATIONALE FOR EFFLUENT LIMITATIONS AND DISCHARGE SPECIFICATIONS

The CWA requires point source dischargers to control the amount of conventional, non-conventional, and toxic pollutants that are discharged into the waters of the United States. The control of pollutants discharged is established through effluent limitations and other requirements in NPDES permits. There are two principal bases for effluent limitations in the Code of Federal Regulations: section 122.44(a) requires that permits include applicable technology-based limitations and standards; and section 122.44(d) requires that permits include water quality-based effluent limitations to attain and maintain applicable numeric and narrative water quality criteria to protect the beneficial uses of the receiving water.

A. Discharge Prohibitions

1. Effluent and receiving water limitations in this Board Order are based on the Federal Clean Water Act, Basin Plan, State Water Board 's plans and policies, U. S. Environmental Protection Agency guidance and regulations, and best practicable waste treatment technology. This order authorizes the discharge of tertiary-treated wastewater through Discharge Point 001 only. It does not authorize any other types of discharges.
2. Until the watershed-wide study has been completed, the discharge from the Facility may not exceed its current annual average of 9 MGD, because impacts on the endangered species due to the discharge of additional wastewater into the Estuary is unknown at this time.
3. Discharge of wastewater at a location different from that described in this Order is prohibited.
4. The bypass or overflow of untreated wastewater or wastes to surface waters or surface water drainage courses is prohibited, except as allowed in Standard Provision I.G. of Attachment D, Standard Provisions.
5. The maximum daily flow of influent from the collection system to the headworks of the Reclamation Facility shall not exceed the design capacity of 14 MGD. This prohibition is not applicable during wet weather storm events.
6. The Discharger shall not cause degradation of any water supply.
7. The treatment or disposal of wastes from the facility shall not cause pollution or nuisance as defined in section 13050, subdivision (l) and (m) of the CWC.

B. Technology-Based Effluent Limitations

1. Scope and Authority

Section 301(b) of the CWA and implementing USEPA permit regulations at section 122.44, title 40 of the Code of Federal Regulations, require that permits include conditions meeting applicable technology-based requirements at a minimum, and any more stringent effluent limitations necessary to meet applicable water quality standards. The discharge authorized by this Order must meet minimum federal technology-based requirements based on Secondary Treatment Standards at Part 133.

2. Applicable Technology-Based Effluent Limitations

This facility is subject to the technology-based regulations for the minimum level of effluent quality attainable by secondary treatment in terms of BOD₅20°C, TSS,

and pH as summarized in Table F-5. Previous Order No. 00-143 established technology-based effluent limits to meet applicable secondary treatment standards. These effluent limitations have been carried over from the previous Order to avoid backsliding. Furthermore, mass-based effluent limitations based on a design flow rate of 14 MGD are also included. The following table summarizes the technology-based effluent limitations for the discharge from the Facility:

**Summary of Technology-based Effluent Limitations
 Effluent Transfer Station**

Table 5. Summary of Technology-based Effluent Limitations

Parameter	Units	Effluent Limitations				
		Average Monthly	Average Weekly	Maximum Daily	Instantaneous Minimum	Instantaneous Maximum
BOD ₅ 20°C	mg/L	20	30	45	--	--
	lbs/day ¹¹	2,300	3,500	5,300	--	--
Total Suspended Solids (TSS)	mg/L	15	40	45	--	--
	lbs/day ¹¹	1,800	4,700	5,300	--	--
pH	standard units	--	--	--	6.5	8.5
Removal Efficiency for BOD and TSS	%	85	--	--	--	--

C. Water Quality-Based Effluent Limitations (WQBELs)

1. Scope and Authority

Section 301(b) of the CWA and section 122.44(d) require that permits include limitations more stringent than applicable federal technology-based requirements where necessary to achieve applicable water quality standards. This Order contains requirements, expressed as a technology equivalence requirement, more stringent than secondary treatment requirements that are necessary to meet applicable water quality standards. The rationale for these requirements, which consist of tertiary treatment or equivalent requirements or other provisions, is discussed in the Section IV.C.2. of the Fact Sheet.

Section 122.44(d)(1)(i) mandates that permits include effluent limitations for all pollutants that are or may be discharged at levels that have the reasonable potential to cause or contribute to an exceedance of a water quality standard, including numeric and narrative objectives within a standard. Where

¹¹ The mass emission rates are based on the plant design flow rate of 14 mgd, and are calculated as follows: Flow(MGD) x Concentration (mg/L) x 8.37 (Lxlbs/MGxmg) = lbs/day. During wet-weather storm events in which the flow exceeds the design capacity, the mass discharge rate limitations shall not apply, and concentration limitations will provide the only applicable effluent limitations.

reasonable potential has been established for a pollutant, but there is no numeric criterion or objective for the pollutant, water quality-based effluent limitations (WQBELs) must be established using: (1) USEPA criteria guidance under CWA section 304(a), supplemented where necessary by other relevant information; (2) an indicator parameter for the pollutant of concern; or (3) a calculated numeric water quality criterion, such as a proposed state criterion or policy interpreting the state's narrative criterion, supplemented with other relevant information, as provided in section 122.44(d)(1)(vi).

The process for determining reasonable potential and calculating WQBELs when necessary is intended to protect the designated uses of the receiving water as specified in the Basin Plan, and achieve applicable water quality objectives and criteria that are contained in other state plans and policies, or any applicable water quality criteria contained in the CTR and NTR.

2. Applicable Beneficial Uses and Water Quality Criteria and Objectives

The Regional Water Board adopted a Water Quality Control Plan for the Los Angeles River (hereinafter Basin Plan) that designates beneficial uses, establishes water quality objectives, and contains implementation programs and policies to achieve those objectives for all waters addressed through the Basin Plan. The beneficial uses applicable to the Santa Clara River Estuary are summarized in Section III.C.1. of this Fact Sheet. The Basin Plan includes both narrative and numeric water quality objectives applicable to the receiving water.

a. Biochemical Oxygen Demand (BOD) and Suspended solids

Biochemical oxygen demand (BOD) is a measure of the quantity of the organic matter in the water and, therefore, the water's potential for becoming depleted in dissolved oxygen. As organic degradation takes place, bacteria and other decomposers use the oxygen in the water for respiration. Unless there is a steady supply of oxygen to the system, the water will quickly become depleted of oxygen. Adequate dissolved oxygen levels are required to support aquatic life. Depressions of dissolved oxygen can lead to anaerobic conditions resulting in odors, or, in extreme cases, in fish kills.

40 CFR, Part 133 describes the minimum level of effluent quality attainable by secondary treatment, for BOD and suspended solids, as:

- i. the 30-day average shall not exceed 30 mg/L; and,
- ii. the 7-day average shall not exceed 45 mg/L.

The Ventura WRF provides tertiary treatment, as such, the limits in the permit being more stringent than secondary treatment requirements are

based on Best Professional Judgment. The Facility achieves solids removal that are better than secondary-treated wastewater by adding chemical coagulants to enhance the precipitation of solids, and by filtering the effluent.

The monthly average, the weekly average, and the daily maximum limits cannot be removed because none of the antibacksliding exceptions apply. Those limits were all included in the previous permit (Order No. 00-143) and the Discharger has been able to meet all three limits (monthly average, the weekly average, and the daily maximum), for both BOD and suspended solids.

In addition to having mass-based and concentration-based effluent limitations for BOD and suspended solids, the Facility also has a percent removal requirement for these two constituents. In accordance with 40 CFR, Sections 133.102(a)(3) and 133.102(b)(3), the 30-day (monthly) average percent removal shall not be less than 85 percent. Percent removal is defined as a percentage expression of the removal efficiency across a treatment plant for a given pollutant parameter, as determined from the 30-day (monthly) average values of the raw wastewater influent pollutant concentrations to the facility and the 30-day (monthly) average values of the effluent pollutant concentrations for a given time period

b. Settleable solids

Excessive deposition of sediments can destroy spawning habitat, blanket benthic (bottom dwelling) organisms, and abrade the gills of larval fish. The limits for settleable solids are based on the Basin Plan (page 3-16) narrative, "Waters shall not contain suspended or settleable material in concentrations that cause nuisance or adversely affect beneficial uses." The numeric limits are empirically based on results obtained from the settleable solids 1-hour test, using an Imhoff cone.

It is impracticable to use a 7-day average limitation, because short term spikes of settleable solid levels that would be permissible under a 7-day average scheme would not be adequately protective of all beneficial uses. The monthly average and the daily maximum limits cannot be removed because none of the antibacksliding exceptions apply. The monthly average and daily maximum limits were both included in the previous permit (Order No. 00-143) and the Discharger has been able to meet both limits.

c. Oil and grease

Oil and grease are not readily soluble in water and form a film on the water surface. Oily films can coat birds and aquatic organisms, impacting respiration and thermal regulation, and causing death. Oil and grease can

also cause nuisance conditions (odors and taste), are aesthetically unpleasant, and can restrict a wide variety of beneficial uses. The limits for oil and grease are based on the Basin Plan (page 3-11) narrative, "Waters shall not contain oils, greases, waxes, or other materials in concentrations that result in a visible film or coating on the surface of the water or on objects in the water, that cause nuisance, or that otherwise adversely affect beneficial uses."

The numeric limits are empirically based on concentrations at which an oily sheen becomes visible in water. It is impracticable to use a 7-day average limitation, because spikes that occur under a 7-day average scheme could cause visible oil sheen. A 7-day average scheme would not be sufficiently protective of beneficial uses. The monthly average and the daily maximum limits cannot be removed because none of the antibacksliding exceptions apply. Both limits were included in the previous permit (Order No. 00-143) and the Discharger has been able to meet both limits.

d. Residual chlorine

Disinfection of wastewaters with chlorine produces chlorine residual. Chlorine and its reaction products are toxic to aquatic life. The limit for residual chlorine is based on the Basin Plan (page 3-9) narrative, "Chlorine residual shall not be present in surface water discharges at concentrations that exceed 0.1 mg/L and shall not persist in receiving waters at any concentration that causes impairment of beneficial uses."

It is impracticable to use a 7-day average or a 30-day (monthly) average limitation, because it is not as protective as of beneficial uses as a daily maximum limitation is. Chlorine is very toxic to aquatic life and short-term exposures of chlorine may cause fish kills.

e. Total Dissolved Solids, Chloride, Sulfate, and Boron

The effluent discharge from the Facility flows into the Estuary. Page 3-12 of the Basin Plan indicates that there is no waterbody specific objectives for TDS, chloride, sulfate and boron.

f. Methylene Blue Activated Substances (MBAS)

The MBAS procedure tests for the presence of anionic surfactants (detergents) in surface and ground waters. Surfactants disturb the water surface tension, which affects insects and can affect gills in aquatic life. The MBAS can also impart an unpleasant soapy taste to water, as well as cause scum and foaming in waters, which impact the aesthetic quality of both surface and ground waters.

Given the nature of the facility (a POTW) which accepts domestic wastewater into the sewer system and treatment plant, and the characteristics of the wastes discharged, the discharge has reasonable potential to exceed both the numeric MBAS water quality objective (WQO) and the narrative WQO for prohibition of floating material such as foams and scums. Therefore an effluent limitation is required based upon Best Professional Judgement.

g. Total inorganic nitrogen ($NO_2 + NO_3$ as N)

Total inorganic nitrogen is the sum of Nitrate-nitrogen and Nitrite-nitrogen. High nitrate levels in drinking water can cause health problems in humans. Infants are particularly sensitive and can develop methemoglobinemia (blue-baby syndrome). Nitrogen is also considered a nutrient. Excessive amounts of nutrients can lead to other water quality impairments, ex. algae¹². Although there are no waterbody specific objectives for nitrogen in the Estuary, the discharge has reasonable potential to exceed the numeric Nitrate plus Nitrite as nitrogen 10 mg/L of water quality objective (WQO) specified in the Basin Plan page 3-11. An effluent limitation is required based upon Best Professional Judgement. Therefore, the Discharger will have to meet the 10 mg/L WQO at the end-of-pipe, since no dilution credit is appropriate at this time.

h. Nitrite as Nitrogen

Chapter 3 of the Basin Plan (page 3-11) contains the following water quality objective, "Waters shall not exceed the 10 mg/L nitrogen as nitrate-nitrogen plus nitrite-nitrogen ($NO_3-N + NO_2-N$), 45 mg/L as nitrate (NO_3), 10 mg/L as nitrate-nitrogen (NO_3-N), or 1 mg/L as nitrite-nitrogen (NO_2-N) or as otherwise designated in Table 3-8." The Discharger will have to meet the 1 mg/L WQO at the end-of-pipe, since no dilution credit is appropriate at this time. See the detailed explanation available in Footnote 1 on Page F-5.

i. Ammonia as Nitrogen

Ammonia is a pollutant routinely found in the wastewater effluent of Publicly Owned Treatment Works (POTWs), in landfill-leachate, as well as in run-off from agricultural fields where commercial fertilizers and animal manure are applied. Ammonia exists in two forms – un-ionized ammonia (NH_3) and the ammonium ion (NH_4^+). They are both toxic, but the neutral, un-ionized ammonia species (NH_3) is much more toxic, because it is able

¹² Excessive growth of algae and/or other aquatic plants can degrade water quality. Algal blooms sometimes occur naturally, but they are often the result of excess nutrients (i.e., nitrogen, phosphorus) from waste discharges or nonpoint sources. These algal blooms can lead to problems with tastes, odors, color, and increased turbidity and can depress the dissolved oxygen content of the water, leading to fish kills. Floating algal scum and algal mats are also an aesthetically unpleasant nuisance.

to diffuse across the epithelial membranes of aquatic organisms much more readily than the charged ammonium ion. The form of ammonia is primarily a function of pH, but it is also affected by temperature and other factors. Additional impacts can also occur as the oxidation of ammonia lowers the dissolved oxygen content of the water, further stressing aquatic organisms. Oxidation of ammonia to nitrate may lead to groundwater impacts in areas of recharge. There is no groundwater recharge in this reach. Ammonia also combines with chlorine (often both are present in POTW treated effluent discharges) to form chloramines – persistent toxic compounds that extend the effects of ammonia and chlorine downstream.

The 1994 Basin Plan provided water quality objectives for ammonia to protect aquatic life, in Tables 3-1 through Tables 3-4. However, those ammonia objectives were revised on March 4, 2004, by the Regional Water Board with the adoption of Resolution No. 2004-022, *Amendment to the Water Quality Control Plan for the Los Angeles Region to Update the Ammonia Objectives for Inland Surface Waters Not Characteristic of Freshwater (Including Enclosed Bays, Estuaries and Wetlands) with Beneficial Use Designations for Protection of Aquatic Life*. The ammonia Basin Plan amendment is consistent with the U.S. EPA "Ambient Water Quality Criteria for Ammonia (Saltwater)-1989." The amendment revised the regulatory provisions of the Basin Plan by adding language to Chapter 3 "Water Quality Objectives."

For inland surface waters not characteristic of freshwater (including enclosed bays, estuaries, and wetlands), the proposed objectives are a 4-day average concentration of unionized ammonia of 0.035 mg/L, and a one-hour average concentration of unionized ammonia of 0.233 mg/L. The proposed objectives are fixed concentrations of unionized ammonia, independent of pH, temperature, or salinity. The proposed amendment includes an implementation procedure to convert un-ionized ammonia objectives to total ammonia effluent limits. The proposed amendment also simplifies the implementation procedures for translating ammonia objectives into effluent limits in situations where a mixing zone has been authorized by the Regional Water Board. Finally, the proposed amendment revises the implementation procedure for determining saltwater, brackish or freshwater conditions, to be consistent with the proposed objectives. The proposed objectives will apply only to inland surface waters not characteristic of freshwater (including enclosed bays, estuaries and wetlands) and do not impact the Ammonia Water Quality Objectives for ocean waters contained in the California Ocean Plan.

(i). Freshwater Ammonia Criteria Maximum Concentration (CMC)

The Facility discharges into a receiving waterbody that has "MIGR" beneficial use designation. It is assumed that salmonids may be

present in waters designated in the Basin Plan as “MIGR” and that salmonids cannot be absent in water not designated in the Basin Plan as “MIGR,” in the absence of additional information to the contrary. Since the receiving water has “MIGR” designation, it will be assumed that salmonids are present in the water.

The one-hour average objective according to the Basin Plan amendment will be set as the CMC or equivalent to the Maximum Daily Effluent Limitation (MDEL) for ammonia nitrogen in mg/L. For waters not designated COLD and/or MIGR, the CMC or MDEL shall not exceed the values described in the equation below:

$$\text{One-hour Average Concentration} = \frac{0.411}{1 + 10^{7.204 - \text{pH}}} + \frac{58.4}{1 + 10^{\text{pH} - 7.204}}$$

(ii). Freshwater Ammonia Criteria Continuous Concentration (CCC)

The 30-day average objective according to the Basin Plan amendment Resolution No. 2002-011 will be set as the CCC or equivalent to the Average Monthly Effluent Limitation (AMEL) for ammonia nitrogen in mg/L. The Facility discharges into a receiving water that has a “SPWN” beneficial use designation. For freshwaters designated SPWN, the thirty-day average concentration of total ammonia as nitrogen (in mg/L) shall not exceed the values described in the equation below:

$$\text{30-day Average Concentration} = \left(\frac{0.0577}{1 + 10^{7.688 - \text{pH}}} + \frac{2.487}{1 + 10^{\text{pH} - 7.688}} \right) * \text{MIN} \left(2.85, 1.45 * 10^{0.028 * (25 - T)} \right)$$

Where T = temperature expressed in °C.

The 30-day average objective¹³ is dependent on pH and temperature. At lower temperatures, the 30-day average objective also is dependent on the presence or absence of early life stages of fish (ELS). Water bodies with Basin Plan designation of “SPWN”

¹³ This is the current Basin Plan definition of the 30-day average objective, according to the Ammonia Basin Plan Amendment, Resolution No. 2002-011, *Amendment to the Water Quality Control Plan for the Los Angeles Region to Update the Ammonia Objectives for Inland Surface Waters (including enclosed bays, estuaries and wetlands) with Beneficial Use designations for protection of “Aquatic Life,”* adopted by the Los Angeles Regional Water Board on April 25, 2002. It will be superseded by Resolution No. 2005-014, adopted by the Regional Water Board on December 1, 2005, following State Water Board, and Office of Administrative Law approval of the Ammonia Basin Plan Amendment. This new Resolution will implement ELS Provision as described under “implementation”, subparagraph 3. Currently, the Discharger’s receiving waterbody is designated as ELS already. Whether the new Resolution No. 2005-014 would be approve or disapprove by EPA, the calculated effluent limitation based upon Resolution No. 2002-011 definition of the 30-day average objective will remain the same until the receiving water is reclassified as being “ELS Absent” condition.

support high quality aquatic habitats suitable for reproduction and early development of fish and, therefore waterbodies are designated as ELS present waters.

However, based on the beneficial uses of the Basin Plan, the freshwater ammonia water objective is not applicable in the Santa Clara River Estuary. Therefore, the freshwater ammonia water objective will not be used to calculate the final ammonia effluent limitations for the Facility.

(iii). Saltwater Ammonia Criteria Maximum Concentration (CMC)

$$\text{Total ammonia} = 0.233 + 0.233 \times 10^{(pK_a^S + 0.0324 \times (298 - T) + 0.0415 \times P/T - pH)}$$

Where: P = 1 atm
T = temperature ($^{\circ}$ K)
 $pK_a^S = 0.116 * I + 9.245$, the stoichiometric acid hydrolysis constant of ammonium ions in saltwater on i, $i = 19.9273 * S(1000 - 1.005109S)^{-1}$, the molar ionic strength of saltwater based on S, S = salinity

(iv). Saltwater Ammonia Criteria Continuous Concentration (CCC)

$$\text{Total ammonia} = 0.035 + 0.035 \times 10^{(pK_a^S + 0.0324 \times (298 - T) + 0.0415 \times P/T - pH)}$$

Where: P = 1 atm
T = temperature ($^{\circ}$ K)
 $pK_a^S = 0.116 * I + 9.245$, the stoichiometric acid hydrolysis constant of ammonium ions in saltwater on i, $i = 19.9273 * S(1000 - 1.005109S)^{-1}$, the molar ionic strength of saltwater based on S, S = salinity

Ammonia-N, other Nitrogen Species – Reasonable potential analysis (RPA) was conducted for Ammonia as nitrogen, Nitrate plus Nitrite as nitrogen, Nitrate as nitrogen, and Nitrite as nitrogen using the Discharger's effluent data from their self monitoring reports. The RPA compares the effluent data with the Basin Plan WQOs. The Discharger's effluent exceeded the Basin Plan WQOs for Ammonia as nitrogen, Nitrate as nitrogen, and Nitrate plus Nitrite as nitrogen during the last permit cycle. In addition, the Facility currently only has a full nitrification and a partial denitrification process. Once the full nitrification and denitrification process is on line, the effluent nitrate concentration shall be further reduced. However, the nitrite effluent concentrations may exceed 1 mg/L of water quality objective specified in the Basin Plan based on the Best

Professional Judgement, if the oxidation process of the nitrification is not complete. Therefore, a final nitrite limitation of 1 mg/L has been added to the Order No. R4-2008-0011 and the Discharger may request to have interim nitrite effluent limitations in the future.

Based on this information, the Regional Water Board has determined that there is a reasonable potential that the discharge will cause or contribute to an exceedance of the Basin Plan WQOs and, consistent with 40 CFR 122.44(d), the Order contains numeric effluent limitations for Ammonia as nitrogen, Nitrate as nitrogen, and Nitrate plus Nitrite as Nitrogen.

Ammonia saltwater criteria are salinity, pH, and temperature dependent. Because there is such a wide temperature fluctuation in the Estuary during summer and winter months (74.5°F vs. 52.2°F), seasonal ammonia effluent limitations have been placed into the Order. The summer and winter ammonia effluent limitations cover May to October and November to April, respectively. The lowest monthly average and daily maximum of total ammonia projected among receiving water quality monitoring stations (R-001 to R-005), based on three years of monthly receiving water data, were used as monthly average and daily maximum ammonia effluent concentrations in this Order. The calculations are available in Attachment M.

j. Coliform/Bacteria

Total and fecal coliform bacteria are used to indicate the likelihood of pathogenic bacteria in surface waters. Given the nature of the facility, a wastewater treatment plant, pathogens are likely to be present in the effluent in cases where the disinfection process is not operating adequately. As such, the permit contains the following:

i. Effluent Limitations:

- The 7 day median number of coliform organisms at some point in the treatment process must not exceed 2.2 Most Probable Number (MPN) per 100 milliliters;
- The number of coliform organisms must not exceed 23 MPN per 100 milliliters in more than one sample within any 30-day period; and,
- No sample shall exceed an MPN of 240 total coliform bacteria per 100 milliliters.

These disinfection-based effluent limitations for coliform are for human health protection and are consistent with requirements

established by the Department of Health Services. These limits for coliform must be met at the point of the treatment train immediately following disinfection, as a measure of the effectiveness of the disinfection process.

ii. Receiving Water Limitation

- Geometric Mean Limits
 - * E.coli density shall not exceed 126/100 mL.
 - * Fecal coliform density shall not exceed 200/100 mL.
- Single Sample Limits
 - * E.coli density shall not exceed 235/100 mL.
 - * Fecal coliform density shall not exceed 400/100 mL.

These receiving water limitations are based on Resolution No. 01-018, Amendment to the Water Quality Control Plan for the Los Angeles Region to Update the Bacteria Objectives for Water Bodies Designated for Water Contact Recreation, adopted by the Regional Water Board on October 25, 2001. The Resolution was approved by State Water Board, OAL, and USEPA, on July 18, 2002, September 19, 2002, and September 25, 2002, respectively.

k. pH

The hydrogen ion activity of water (pH) is measured on a logarithmic scale, ranging from 0 to 14. While the pH of "pure" water at 25°C is 7.0, the pH of natural waters is usually slightly basic due to the solubility of carbon dioxide from the atmosphere. Minor changes from natural conditions can harm aquatic life. In accordance with 40 CFR section 133.102(c), the effluent values for pH shall be maintained within the limits of 6.0 to 9.0 unless the POTW demonstrates that: (1) Inorganic chemicals are not added to the waste stream as part of the treatment process; and (2) contributions from industrial sources do not cause the pH of the effluent to be less than 6.0 or greater than 9.0. The effluent limitation for pH in this permit requiring that the wastes discharged shall at all times be within the range of 6.5 to 8.5 is taken from the Basin Plan (page 3-15) which reads "the pH of inland surface waters shall not be depressed below 6.5 or raised above 8.5 as a result of waste discharge.

l. Temperature

The Basin Plan lists temperature requirements for the receiving waters and references the Thermal Plan. Based on the requirements of the Thermal

Plan and a white paper developed by Regional Water Board staff and comments previously received from staff of California Department of Fish and Game entitled *Temperature and Dissolved Oxygen Impacts on Biota in Tidal Estuaries and Enclosed Bays in the Los Angeles Region*, a maximum effluent temperature limitation of 86 °F (except as a result of external ambient temperature) is included in the tentative Order. The temperature limit is consistent with the limits in other POTW permits in the region. The white paper evaluated the optimum temperatures for steelhead, topsmelt, ghost shrimp, brown rock crab, jackknife clam, and blue mussel. The new temperature effluent limitation is reflective of new information available that indicates that the 100°F temperature is not protective of aquatic organisms. A survey was completed for several kinds of fish and the 86°F temperature was found to be protective.

m. Turbidity

Turbidity is an expression of the optical property that causes light to be scattered in water due to particulate matter such as clay, silt, organic matter, and microscopic organisms. Turbidity can result in a variety of water quality impairments. The effluent limitation for turbidity which reads, "For the protection of the water contact recreation beneficial use, the wastes discharged to water courses shall have received adequate treatment, so that the turbidity of the wastewater does not exceed: (a) a daily average of 2 Nephelometric turbidity units (NTUs); and (b) 5 NTUs more than 5 percent of the time (72 minutes) during any 24 hour period," is based on the Basin Plan (page 3-17) and Section 60301.320 of Title 22, Chapter 3, "Filtered Wastewater" of the California Code of Regulations.

n. Radioactivity

Radioactive substances are generally present in natural waters in extremely low concentrations. Mining or industrial activities increase the amount of radioactive substances in waters to levels that are harmful to aquatic life, wildlife, or humans. The existing effluent limitation for radioactivity which reads, "Radionuclides shall not be present in concentrations that are deleterious to human, plant, animal, or aquatic life or that result in accumulation of radionuclides in the food web to an extent that presents a hazard to human, plant, animal, or aquatic life." is based on the *Radioactivity substances* specified in the Basin Plan in order to protect the surface water beneficial use and human health.

o. Biostimulatory Substances

Biostimulatory substances include excess nutrients (nitrogen, phosphorus) and other compounds that stimulate aquatic growth. In addition to being aesthetical unpleasant (causing taste, odor, or color problems), this

excessive growth can also cause other water quality problems. The limits for biostimulatory substances are based on the Basin Plan (page 3-8) narrative, “Waters shall not contain biostimulatory substances in concentrations that promote aquatic growth to the extent that such growth causes nuisance or adversely affects beneficial uses.”

p. CTR and SIP

Priority pollutant water quality criteria in the CTR are applicable to the Estuary. The CTR contains both saltwater and freshwater criteria. Because a distinct separation generally does not exist between freshwater and saltwater aquatic communities, the following apply in accordance with 40 CFR § 131.38(c)(3): freshwater criteria apply at salinities of 1 part per thousand (ppt) and below at locations where this condition occurs 95 percent or more of the time; saltwater criteria apply at salinities of 10 ppt and above at locations where this occurs 95 percent or more of the time; and at salinities between 1 and 10 ppt the more stringent of the two apply. The CTR criteria for freshwater or human health for consumption of organisms, whichever is most stringent, are used to prescribe the effluent limitations in the tentative Order to protect the beneficial uses of the Estuary.

Some water quality criteria are hardness dependent. The Discharger provided hardness data collected from the Estuary. The receiving water hardness values ranged from 250 to 7700 mg/L. Since most of the receiving water hardness data (963 of 967) and their average hardness as CaCO₃ (1848 mg/L) are greater than 400 mg/L as CaCO₃, in accordance with the SIP/CTR procedures, the 400 mg/L hardness cap will be used in calculating metals criteria for evaluation of reasonable potential.

The following Table summarizes the applicable water quality criteria for priority pollutants reported in detectable concentrations in the effluent or receiving water. These criteria were used in conducting the Reasonable Potential Analysis for the tentative Order.

Table 6. Applicable Water Quality Criteria

CTR No.	Constituent	Most Stringent Criteria µg/L	CTR/NTR Water Quality Criteria					
			Freshwater		Saltwater		Human Health for Consumption of:	
			Acute µg/L	Chronic µg/L	Acute µg/L	Chronic µg/L	Water & Organisms µg/L	Organisms only µg/L
6	Copper	3.7	52	31	5.8	3.7	--	--
8	Mercury	0.051	--	--	--	--	--	0.051
11	Silver	2.2	44	--	2.2	--	--	--
13	Zinc	86	388	388	95	86	--	--

3. Determining the Need for WQBELs

In accordance with Section 1.3 of the SIP, the Regional Water Board conducted a reasonable potential analysis for each priority pollutant with an applicable criterion or objective to determine if a WQBEL is required in the permit. The Regional Water Board analyzed effluent data to determine if a pollutant in a discharge has a reasonable potential to cause or contribute to an excursion above a state water quality standard. For all parameters that demonstrate reasonable potential, numeric WQBELs are required. The RPA considers water quality criteria from the CTR and NTR, and when applicable, water quality objectives specified in the Basin Plan. To conduct the RPA, the Regional Water Board identified the MEC and maximum background concentration in the receiving water for each constituent, based on data provided by the Discharger.

Section 1.3 of the SIP provides the procedures for determining reasonable potential to exceed applicable water quality criteria and objectives. The SIP specifies three triggers to complete a RPA:

Trigger 1 – If the MEC is greater than or equal to the CTR water quality criteria or applicable objective (C), a limitation is needed.

Trigger 2 – If background water quality (B) > C and the pollutant is detected in the effluent, a limitation is needed.

Trigger 3 – If other related information such as CWA 303(d) listing for a pollutant, discharge type, compliance history, then best professional judgment is used to determine that a limit is needed.

Sufficient effluent and ambient data are needed to conduct a complete RPA. If data are not sufficient, the Discharger will be required to gather the appropriate data for the Regional Water Board to conduct the RPA. Upon review of the data, and if the Regional Water Board determines that WQBELs are needed to protect the beneficial uses, the permit will be reopened for appropriate modification.

In accordance with section 13267 of the CWC, the Regional Water Board required the Discharger to conduct an interim monitoring program of the effluent and the receiving water from January 2001 to April 2003 on a quarterly basis. At least nine data sets for effluent and receiving water monitoring for the period from January 2001 through April 2003 were available. In addition, samples for certain priority pollutants were collected as required by the existing MRP; these data were also used to complete the RPA.

The RPA was performed for the priority pollutants regulated in the CTR for which data are available. Based on the RPA, pollutants that demonstrate

reasonable potential are copper, mercury, silver, and zinc. Refer to Attachment J for a summary of the RPA and associated effluent limitation calculations.

Table 7. Summary of Reasonable Potential Analysis

CTR No.	Constituent	Applicable Water Quality Criteria (C) µg/L	Max Effluent Conc. (MEC) µg/L	Maximum Detected Receiving Water Conc.(B) µg/L	RPA Result - Need Limitation ?	Reason

4. WQBEL Calculations

a. Water quality-based effluent limits (final) are based on monitoring results and following the calculation process outlined in Section 1.4 of the California Toxics Rule and the Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays and Estuaries of California. A table providing the calculation for all applicable WQBELs for this Order is provided in Attachment J of this Order.

b. WQBELs Calculation Example

Using copper as an example, the following demonstrates how WQBELs based on human health criterion were established for this Order. The process for developing these limits is in accordance with Section 1.4 of the SIP. Attachment I summarizes the development and calculation of all WQBELs for this Order using the process described below.

Step 1: For each constituent requiring an effluent limit, identify the applicable water quality criteria or objective. For each criteria determine the effluent concentration allowance (ECA) using the following steady state equation:

the effluent concentration allowance (ECA) using the following steady state equation:

$$\begin{aligned} \text{ECA} &= C + D(C-B) \quad \text{when } C > B, \text{ and} \\ \text{ECA} &= C \quad \text{when } C \leq B, \end{aligned}$$

where C = The priority pollutant criterion/objective, adjusted if necessary for hardness, pH and translators. In this Order a hardness value of 400 mg/L (as CaCO₃) was used for development of hardness-dependent criteria.
D = The dilution credit, and
B = The ambient background concentration

For this Order, dilution was not allowed due to nature of the receiving water and quantity of the effluent, however, Water Effect Ratio, 1.58 is applicable for copper, therefore:

$$\text{ECA} = C \times 1.58$$

For copper, the applicable saltwater quality criteria are:

$$\begin{aligned} \text{ECA}_{\text{acute}} &= 5.58 \mu\text{g/L} \times 1.58 = 8.82 \mu\text{g/L} \\ \text{ECA}_{\text{chronic}} &= 3.60 \mu\text{g/L} \times 1.58 = 5.70 \mu\text{g/L} \end{aligned}$$

5.58 and 3.60 result from 4.8 (Acute Saltwater Dissolved Fraction Limit)/0.86 and 3.1 (Chronic Saltwater Dissolved Fraction Limit)/0.86, respectively. 0.86 is Copper Translator Factor.

Step 2: For each ECA based on aquatic life criterion/objective, determine the long-term average discharge condition (LTA) by multiplying the ECA by a factor (multiplier). The multiplier is statistically based factor that adjusts the ECA to account for effluent variability. The value of the multiplier varies depending on the coefficient of variation (CV) of the data set and whether it is an acute or chronic criterion/objective. Table 1 of the SIP provides pre-calculated values for the multipliers based on the value of the CV. Equations to develop the multipliers in place of using values in the tables are provided in Section 1.4, Step 3 of the SIP and will not be repeated here.

$$\text{LTA}_{\text{acute}} = \text{ECA}_{\text{acute}} \times \text{Multiplier}_{\text{acute}}$$

$$\text{LTA}_{\text{chronic}} = \text{ECA}_{\text{chronic}} \times \text{Multiplier}_{\text{chronic}}$$

The CV for the data set must be determined before the multipliers can be selected and will vary depending on the number of samples and the standard deviation of a data set. If the data set is less than 10 samples, or

at least 80% of the samples in the data set are reported non-detect, the CV shall be set equal to 0.6.

For copper, the following data was used to develop the acute and chronic LTA using Table 1 of the SIP:

<u>No. of Samples</u>	<u>CV</u>	<u>Multiplier_{acute}</u>	<u>Multiplier_{chronic}</u>
25	0.64	0.3026	0.5064

$$LTA_{acute} = 8.82 \text{ } \mu\text{g/L} \times 0.3026 = 2.61 \text{ } \mu\text{g/L}$$

$$LTA_{chronic} = 5.70 \text{ } \mu\text{g/L} \times 0.5064 = 2.84 \text{ } \mu\text{g/L}$$

Step 3: Select the most limiting (lowest) of the LTA.

LTA = most limiting of LTA_{acute} or $LTA_{chronic}$
 For copper, the most limiting LTA was the LTA_{acute}

$$LTA = 2.61 \text{ } \mu\text{g/L}$$

Step 4: Calculate the WQBELs by multiplying the LTA by a factor (multiplier). WQBELs are expressed as Average Monthly Effluent Limitations (AMEL) and Maximum Daily Effluent Limitation (MDEL). The multiplier is statistically based factor that adjusts the LTA for the averaging periods and exceedance frequencies of the criteria/objectives and the effluent limitations. The value of the multiplier varies depending on the probability basis, the coefficient of variation (CV) of the data set, the number of samples (for AMEL) and whether it is monthly or daily limit. Table 2 of the SIP provides the pre-calculated values for the multipliers based on the value of the CV and the number of samples. Equations to develop the multipliers in place of using values in the tables are provided in Section 1.4, Step 5 of the SIP and will not be repeated here.

$$AMEL_{aquatic \text{ life}} = LTA \times AMEL_{multiplier}$$

$$MDEL_{aquatic \text{ life}} = LTA \times MDEL_{multiplier}$$

AMEL multipliers are based on 95th percentile occurrence probability, and the MDEL multipliers are based on the 99th percentile occurrence probability. If the number of samples is less than four (4), the default number of samples to be used is four (4).

For copper, the following data was used to develop the AMEL and MDEL for aquatic life using Table 2 of the SIP.

<u>No. of Samples</u>	<u>CV</u>	<u>Multiplier_{MDEL}</u>	<u>Multiplier_{AMEL}</u>
25	0.66	3.3850	1.6127

$$AMEL_{\text{aquatic life}} = 2.61 \times 1.6127 = 4.20 \mu\text{g/L}$$

$$MDEL_{\text{aquatic life}} = 2.61 \times 3.3850 = 8.82 \mu\text{g/L}$$

Step 5: For the ECA based on human health, set the AMEL equal to the $ECA_{\text{human health}}$

$$AMEL_{\text{human health}} = ECA_{\text{human health}}$$

For copper:

$$AMEL_{\text{human health}} = \text{NONE}$$

Step 6: Calculate the MDEL for human health by multiplying the AMEL by the ratio of the $Multiplier_{MDEL}$ to $Multiplier_{AMEL}$. Table 2 of the SIP provides pre-calculated ratios to be used in this calculation based on the CV and the number of samples.

A copper $MDEL_{\text{human health}}$ could not be calculated because a copper $AMEL_{\text{human health}}$ was not available. However, for illustrative purposes, if a $AMEL_{\text{human health}}$ was available, the following data and equation would have been used to develop the $MDEL_{\text{human health}}$:

<u>No. of Samples Per Month</u>	<u>CV</u>	<u>Multiplier_{MDEL}</u>	<u>Multiplier_{AMEL}</u>	<u>Ratio</u>
25	0.66	3.3850	1.6127	2.0990

$$MDEL_{\text{human health}} = AMEL_{\text{human health}} \times Multiplier_{MDEL} / Multiplier_{AMEL}$$

Step 7: Select the lower of the AMEL and MDEL based on aquatic life and human health water quality based effluent limit for this Order.

For copper:

<u>AMEL_{aquatic life}</u>	<u>MDEL_{aquatic life}</u>	<u>AMEL_{human health}</u>	<u>MDEL_{human health}</u>
4.20 $\mu\text{g/L}$	8.82 $\mu\text{g/L}$	Not available	Not available

The lowest (most restrictive) effluent limits, those based on aquatic life criteria, were incorporated into this Order. Due to rounding of digits in the abovementioned calculation, the final limit for copper in this exercise is slightly different than the limit derived using the SIP spreadsheet, in which the numbers are not rounded off.

c. Mass based limits

40 CFR section 122.45(f)(1) requires that except under certain conditions, all permit limits, standards, or prohibitions be expressed in terms of mass units. 40 CFR section 122.45(f)(2) allows the permit writer, at its discretion, to express limits in additional units (e.g., concentration units). The regulations mandate that, where limits are expressed in more than one unit, the permittee must comply with both.

Generally, mass-based limits ensure that proper treatment, and not dilution, is employed to comply with the final effluent concentration limits. Concentration-based effluent limits, on the other hand, discourage the reduction in treatment efficiency during low-flow periods and require proper operation of the treatment units at all times. In the absence of concentration-based effluent limits, a permittee would be able to increase its effluent concentration (i.e., reduce its level of treatment) during low-flow periods and still meet its mass-based limits. To account for this, this permit includes mass and concentration limits for some constituents.

d. Final WQBELs

Summaries of the WQBELs required by this Order are described in Table 8 below. Mass-based effluent limitations are based on a design capacity of 14 MGD.

**Summary of Water Quality-based Effluent Limitations
 Effluent Transfer Station**

Table 8. Summary of Water Quality-based Effluent Limitations

Constituent	Units	Effluent Limitations	
		Average Monthly	Maximum Daily
Summer Ammonia Nitrogen (May – October)	mg/L	0.045	0.30
	lbs/day ¹¹	5.3	35
Winter Ammonia Nitrogen (November to April)	mg/L	0.079	0.53
	lbs/day ¹¹	9.3	62
Nitrite + Nitrate as Nitrogen	mg/L	10	--
	lbs/day ¹¹	1,200	--
Nitrite as Nitrogen	mg/L	1	--
	lbs/day ¹¹	120	--
Nitrate as Nitrogen	mg/L	10	--
	lbs/day ¹¹	1,200	--

Constituent	Units	Effluent Limitations	
		Average Monthly	Maximum Daily
Copper	µg/L	4.2 ¹⁶	8.8 ¹⁶
	lbs/day ¹⁷	0.49	1.0
Mercury	µg/L	0.051	0.10
	lbs/day ¹⁷	0.0060	0.012
Silver	µg/L	0.71	2.2
	lbs/day ¹⁷	0.083	0.26
Zinc	µg/L	45 ¹⁸	107 ¹⁸
	lbs/day ¹⁷	5.3	13

5. Whole Effluent Toxicity (WET)

Whole effluent toxicity (WET) protects the receiving water quality from the aggregate toxic effect of a mixture of pollutants in the effluent. WET tests measure the degree of response of exposed aquatic test organisms to an effluent. The WET approach allows for protection of the narrative “no toxics in toxic amounts” criterion while implementing numeric criteria for toxicity. There are two types of WET tests: acute and chronic. An acute toxicity test is conducted over a short time period and measures mortality. A chronic toxicity test is conducted over a longer period of time and may measure mortality, reproduction, and growth.

Because of the nature of industrial discharges into the POTW sewershed, it is possible that other toxic constituents could be present in the Facility’s effluent, or could have synergistic or additive effects. Also, because numeric limits for certain toxic constituents that did not show RP have been removed, the acute toxicity limit may provide a backstop to preventing the discharge of toxic pollutants in toxic amounts. In addition, 12 out of the 85 chronic toxicity tests conducted from January 2003 through December 2006 exceeded the monthly median chronic toxicity trigger of 1.0 TUc. Although all 4 acute toxicity testing results reported during the term of the previous Order exhibited 100% survival rates and thus did not exceed any acute toxicity requirements, Regional Water Board staff determined that, pursuant to the SIP, reasonable potential exists for chronic toxicity. As such, the permit contains effluent trigger limitations for chronic toxicity.

¹⁶ Based on the results of Copper Water Effect Ratio (WER) Study in the Updated Enhancement Study conducted by Nautilus Environmental and Metal Translator Factor (MTF) in the Metal Translator Study conducted by Entrix, WER of 1.58 and MTF of 0.86 were applied for copper final effluent limitations.

¹⁷ The mass emission rates are based on the plant design flow rate of 14 mgd, and are calculated as follows: Flow(MGD) x Concentration (µg/L) x 0.00837 (Lbs/MGxµg) = lbs/day. During wet-weather storm events in which the flow exceeds the design capacity, the mass discharge rate limitations shall not apply, and concentration limitations will provide the only applicable effluent limitations.

¹⁸ Based on the result of Metal Translator Factor (MTF) in the Metal Translator Study conducted by Entrix, MTF of 0.84 was applied for zinc final effluent limitations.

The toxicity numeric effluent limitations are based on:

- a. 40 CFR 122.44(d)(v) – limits on whole effluent toxicity are necessary when chemical-specific limits are not sufficient to attain and maintain applicable numeric or narrative water quality standards;
- b. 40 CFR 122.44(d)(vi)(A) – where a State has not developed a water quality criterion for a specific pollutant that is present in the effluent and has reasonable potential, the permitting authority can establish effluent limits using numeric water quality criterion;
- c. Basin Plan objectives and implementation provisions for toxicity;
- d. Regions 9 & 10 Guidance for Implementing Whole Effluent Toxicity Programs Final May 31, 1996;
- e. Whole Effluent Toxicity (WET) Control Policy July 1994; and,
- f. Technical Support Document (several chapters and Appendix B).

However, the circumstances warranting a numeric chronic toxicity effluent limitation when there is reasonable potential were under review by the State Water Resources Control Board (State Water Board) in SWRCB/OCC Files A-1496 & A-1496(a) [Los Coyotes/Long Beach Petitions]. On September 16, 2003, at a public hearing, the State Water Board adopted Order No. 2003-0012 deferring the issue of numeric chronic toxicity effluent limitations until a subsequent Phase of the SIP is adopted. In the meantime, the State Water Board replaced the numeric chronic toxicity limit with a narrative effluent limitation and a 1 TUC trigger, in the Long Beach and Los Coyotes WRP NPDES permits. This permit contains a similar chronic toxicity effluent limitation. This Order also contains a reopener to allow the Regional Water Board to modify the permit, if necessary, consistent with any new policy, law, or regulation.

a. Acute Toxicity Limitation:

The Dischargers may test for acute toxicity by using USEPA's *Methods for Measuring the Acute Toxicity of Effluents and Receiving Waters to Freshwater and Marine Organisms*, October 2002 (EPA-821-R-02-012). Acute toxicity provisions in the accompanying Order are derived from the Basin Plan's toxicity standards (Basin Plan 3-16 and 3-17). The provisions require the Discharger to accelerate acute toxicity monitoring and take further actions to identify the source of toxicity and to reduce acute toxicity.

b. Chronic Toxicity Limitation and Requirements:

Chronic toxicity provisions in the accompanying Order are derived from the Basin Plan's toxicity standards (Basin Plan 3-16 and 3-17). The provisions require the Discharger to accelerate chronic toxicity monitoring and take further actions to identify the source of toxicity and to reduce chronic toxicity. The monthly median trigger of 1.0 TU_c for chronic toxicity is based on *USEPA Regions 9 & 10 Guidance for Implementing Whole Effluent Toxicity (WET) Programs* Final May 31, 1996 (Chapter 2 – Developing WET Permitting Conditions, page 2-8). In cases where effluent receives no dilution or where mixing zones are not allowed, the 1.0 TU_c chronic criterion should be expressed as a monthly median. The “median” is defined as the middle value in a distribution, above which and below which lie an equal number of values. For example, if the results of the WET testing for a month were 1.5, 1.0, and 1.0 TU_c, the median would be 1.0 TU_c.

The *USEPA Regions 9 & 10 Guidance for Implementing Whole Effluent Toxicity (WET) Programs* Final May 31, 1996 (Chapter 2 – Developing WET Permitting Conditions, page 2-8) recommends two alternatives for setting up maximum daily limit: using 2.0 TU_c as the maximum daily limit; or using a statistical approach outlined in the TSD to develop a maximum daily effluent limitation. In this permit, neither maximum daily limitation nor trigger for chronic toxicity is prescribed.

D. Final Effluent Limitations

1. Satisfaction of Anti-Backsliding Requirements

The effluent limitations in this Order are at least as stringent as the effluent limitations in the previous Order. The effluent limitations for 122 priority pollutants are deleted because they did not show reasonable potential to cause or contribute to an excursion above the respective water quality standards. The new average monthly and daily maximum effluent limitations for copper, mercury, and zinc that are less stringent than those in the previous permit are derived from the calculation in the SIP. This relaxation of effluent limitations is consistent with the anti-backsliding requirements of the CWA and federal regulations.

2. Satisfaction of Antidegradation Policy

On October 28, 1968, the State Board adopted Resolution No. 68-16, *Maintaining High Quality Water*, which established an antidegradation policy for State and Regional Water Boards. The State Board has, in State Board Order No. 86-17 and an October 7, 1987 guidance memorandum, interpreted Resolution No. 68-16 to be fully consistent with the federal antidegradation policy. Similarly, the CWA (section 304(d)(4)(B)) and USEPA regulations (40 CFR, Section 131.12) require that all permitting actions be consistent with the

federal antidegradation policy. Together, the State and Federal policies are designed to ensure that a water body will not be degraded resulting from the permitted discharge. The provisions of this Order are consistent with the antidegradation policies.

3. Stringency of Requirements for Individual Pollutants

This Order contains both technology-based and water quality-based effluent limitations for individual pollutants. The technology-based effluent limitations consist of restrictions on BOD, TSS, pH, and percent removal of BOD and TSS. Restrictions on BOD, TSS, pH are discussed in Section IV.B. of this Fact Sheet. This Order's technology-based pollutant restrictions implement the minimum, applicable federal technology-based requirements.

Water quality-based effluent limitations have been scientifically derived to implement water quality objectives that protect beneficial uses. Both the beneficial uses and the water quality objectives have been approved pursuant to federal law and are the applicable federal water quality standards. To the extent that toxic pollutant water quality-based effluent limitations were derived from the CTR, the CTR is the applicable standard pursuant to section 131.38. The scientific procedures for calculating the individual water quality-based effluent limitations for priority pollutants are based on the CTR-SIP, which was approved by USEPA on May 18, 2000. All beneficial uses and water quality objectives contained in the Basin Plan were approved under state law and submitted to and approved by USEPA prior to May 30, 2000. Any water quality objectives and beneficial uses submitted to USEPA prior to May 30, 2000, but not approved by USEPA before that date, are nonetheless "applicable water quality standards for purposes of the CWA" pursuant to section 131.21(c)(1). Collectively, this Order's restrictions on individual pollutants are no more stringent than required to implement the requirements of the CWA and the applicable water quality standards for purposes of the CWA.

Summary of Final Effluent Limitations Effluent Transfer Station

Table 9. Summary of Final Effluent Limitations

Parameter	Units	Effluent Limitations					Basis
		Average Monthly	Average Weekly	Maximum Daily	Instantaneous Minimum	Instantaneous Maximum	
BOD ₅ 20°C	mg/L	20	30	45	--	--	Existing
	lbs/day ¹¹	2,300	3,500	5,300	--	--

Zinc	µg/L	45 ¹⁸	--	107 ¹⁸	--	--	CTR, SIP
	lbs/day ¹⁷	5.3	--	12	--	--	

E. Interim Effluent Limitations

Interim limits have been set as follows:

1. The SIP requires that the Regional Water Board establish interim requirements such as requiring the discharger to develop a pollutant minimization plan and/or source control measures and participate in the activities necessary to achieve the final effluent limitations.

2. The Discharger may not be able to achieve immediate compliance with the new non-CTR-based limits for ammonia nitrogen prescribed in this Order. Based on effluent and receiving monitoring data submitted by the Discharger, a comparison between the MEC (3.6 mg/L) and calculated AMEL (0.045 mg/L for summer and 0.079 for winter) and MDEL (0.30 mg/L for summer and 0.53 for winter) values shows that the Discharger may not be able to consistently comply with the AMEL and MDEL established in this Order for ammonia nitrogen. For non-CTR-based limits based on Basin Plans WQO, for which the Discharger will not be able to meet immediately, interim limits and compliance dates are provided in the accompanying Time Schedule Order R4-2008-0012.
3. Based on effluent monitoring data submitted by the Discharger, a comparison between the MEC (18.6 mg/L) and the Basin Plan WQO for nitrate as nitrogen (10 mg/L), shows that the Discharger may be unable to comply with the Basin Plan WQO established in this Order for nitrate as nitrogen. For non-CTR-based limits based on Basin Plans WQO, for which the Discharger will not be able to meet immediately, interim limits and compliance dates are provided in the accompanying Time Schedule Order R4-2008-0012.
4. Based on effluent monitoring data submitted by the Discharger, a comparison between the MEC (18.8 mg/L) and the Basin Plan WQO for nitrate + nitrite as nitrogen (10 mg/L), shows that the Discharger may be unable to consistently comply with the Basin Plan WQO established in this Order for nitrate + nitrite as nitrogen. For non-CTR-based limits based on Basin Plans WQO, for which the Discharger will not be able to meet immediately, interim limits and compliance dates are provided in the accompanying Time Schedule Order R4-2008-0012.

F. Land Discharge Specifications

Not Applicable.

G. Reclamation Specifications

The reuse of the reclaimed water is regulated under a separate Waste Discharge Requirements and Water Recycling Requirements for City of San Buenaventura, Order No. 87-45, CI No. 6190.

V. RATIONALE FOR RECEIVING WATER LIMITATIONS

A. Surface Water

The Basin Plan contains numeric and narrative water quality objectives applicable to all surface waters within the Los Angeles Region. Water quality objectives include an objective to maintain the high quality waters pursuant to federal regulations (40 CFR § 131.12) and State Water Board Resolution No. 68-16. Receiving water

limitations in the tentative Order are included to ensure protection of beneficial uses of the receiving water.

B. Groundwater

Not Applicable.

VI. RATIONALE FOR MONITORING AND REPORTING REQUIREMENTS

Section 122.48 requires that all NPDES permits specify requirements for recording and reporting monitoring results. Water Code sections 13267 and 13383 authorize the Regional Water Board to require technical and monitoring reports. The Monitoring and Reporting Program (MRP), Attachment E of this Order, establishes monitoring and reporting requirements to implement federal and state requirements. The following provides the rationale for the monitoring and reporting requirements contained in the MRP for this Facility.

A. Influent Monitoring

Influent monitoring is required to:

- Determine compliance with NPDES permit conditions.
- Assess treatment plant performance.
- Assess effectiveness of the Pretreatment Program

Influent monitoring in this Order follows the influent monitoring requirements in the previous Order with minor modification. The monitoring frequencies for parameters have been increased due to RP with those parameters.

B. Effluent Monitoring

The Discharger is required to conduct monitoring of the permitted discharges in order to evaluate compliance with permit conditions. Monitoring requirements are given in the proposed Monitoring and Reporting Program (Attachment E). This provision requires compliance with the Monitoring and Reporting Program, and is based on 40 CFR 122.44(i), 122.62, 122.63, and 124.5. The Monitoring and Reporting Program is a standard requirement in almost all NPDES permits (including the proposed Order) issued by the Regional Water Board. In addition to containing definition of terms, it specifies general sampling/analytical protocols and the requirements of reporting spills, violation, and routine monitoring data in accordance with NPDES regulations, the California Water Code, and Regional Water Board policies. The Monitoring and Reporting Program also contains sampling program specific for the Discharger's wastewater treatment plant. It defines the sampling

stations and frequency, pollutants to be monitored, and additional reporting requirements. Pollutants to be monitored include all pollutants for which effluent limitations are specified. Further, in accordance with Section 1.3 of the SIP, a periodic monitoring is required for all priority pollutants defined by the CTR, for which criteria apply and for which no effluent limitations have been established, to evaluate reasonable potential to cause or contribute to an excursion above a water quality standard.

Monitoring for those pollutants expected to be present in the discharge from the facility, will be required as shown on the proposed Monitoring and Reporting Program (Attachment E) and as required in the SIP.

The effluent monitoring in this Order follows the effluent monitoring requirements in the existing Order. The changes are summarized in the following table.

Table 11. Effluent Monitoring Program Comparison Table

Parameter	Monitoring Frequency (2000 Permit)	Monitoring Frequency (2007 Permit)
Total residual chlorine	continuous	continuous ¹⁹
Total residual chlorine	--	5 days/week ²⁰
Total waste flow	continuous	continuous ²¹
Turbidity	continuous	continuous ²⁰
Total and fecal coliform	daily	daily
Settleable solids	daily	daily
BOD ₅ 20°C	daily	daily
Suspended solids	daily	daily
Dissolved oxygen	daily	daily
Temperature	weekly	weekly
pH	weekly	weekly
Oil and grease	weekly	weekly
Total dissolved solids	monthly	monthly
Fluoride	monthly	monthly
Phosphate as P	monthly	monthly
Phosphorous	monthly	monthly
Ammonia nitrogen	monthly	monthly

¹⁹ Total residual chlorine shall be continuously recorded. The recorded data shall be maintained by the Permittee for at least five years. The Permittee shall extract the maximum daily peak, minimum daily peak, and daily average from the recorded data and shall make available upon request of the Regional Water Board. The continuous monitoring data are not intended to be used for the compliance determination purposes.

²⁰ Daily grab samples shall be collected at monitoring location M-001, Monday through Friday only, except for holidays. Analytical results of daily grab samples will be used to determine compliance with total residual chlorine effluent limitation. Furthermore, additional monitoring requirements as specified in section IV.A.2. shall be followed.

²¹ Where continuous monitoring of a constituent is required, the following shall be reported:
 Total waste flow – Total daily and peak daily flow (24-hr basis);
 Turbidity – Maximum daily value, total amount of time each day the turbidity exceeded five turbidity units, flow-proportioned average daily value

Parameter	Monitoring Frequency (2000 Permit)	Monitoring Frequency (2007 Permit)
Nitrate nitrogen	monthly	monthly
Nitrite nitrogen	monthly	monthly
Organic nitrogen	monthly	monthly
Total Kjeldahl nitrogen	monthly	monthly
Detergents (as MBAS)	monthly	monthly
Chlorophyll <i>a</i>	monthly	monthly
Cyanide	quarterly	monthly ²²
Chronic toxicity	monthly	monthly
Acute toxicity	annually	annually
Aluminum	quarterly	semiannually
Antimony	quarterly	semiannually
Arsenic	quarterly	semiannually
Barium	quarterly	semiannually
Beryllium	quarterly	semiannually
Cadmium	quarterly	semiannually
Chromium VI	quarterly	semiannually
Cobalt	quarterly	semiannually
Copper	quarterly	monthly
Iron	quarterly	semiannually
Lead	quarterly	semiannually
Mercury	quarterly	monthly
Molybdenum	quarterly	semiannually
Nickel	quarterly	semiannually
Selenium	quarterly	semiannually
Silver	quarterly	monthly
Thallium	quarterly	semiannually
Vanadium	quarterly	semiannually
Zinc	quarterly	monthly
Chlorodibromomethane	quarterly	monthly ²¹
Dichlorobromomethane	quarterly	monthly ²¹
Bis(2-ethylhexyl)phthalate	quarterly	monthly ²¹
Acetone	quarterly	semiannually
TCDD	semiannually	semiannually
Benzene	quarterly	semiannually
Bromoform	quarterly	semiannually
Carbon tetrachloride	quarterly	semiannually
Chloroform	quarterly	semiannually
Dichloromethane	quarterly	semiannually
Tetrachloroethylene	quarterly	semiannually

²² This chemical needs to be monthly monitored until the end of Year 2008. If the results are non-detected or less than the CTR-based criteria, then the monitoring frequency can be reduced from monthly to semiannually. If any result exceeds the CTR-based criteria before or/and after Year 2008, the monitoring frequency shall remain as monthly.

Parameter	Monitoring Frequency (2000 Permit)	Monitoring Frequency (2007 Permit)
Phenols (chlorinated & non chlorinated)	quarterly	semiannually
PCBs	quarterly	semiannually
Aldrin	quarterly	semiannually
Dieldrin	quarterly	semiannually
Chlordane	quarterly	semiannually
Endrin	quarterly	semiannually
Heptachlor	quarterly	semiannually
Heptachlor epoxide	quarterly	semiannually
Endosulfan	quarterly	semiannually
Toxaphene	quarterly	semiannually
DDT	quarterly	semiannually
Total xylene	quarterly	semiannually
Remaining priority pollutants (excluding asbestos)	semiannually	semiannually
Pesticides ²³	semiannually	semiannually
Radioactivity (Including gross alpha, gross beta, combined radium-226 and radium-228, tritium, strontium-90 and uranium)	semiannually	semiannually
Emerging chemicals ²⁴	--	biannually
Endocrine disrupting chemicals ²⁵	--	biannually
Pharmaceuticals ²⁶	--	biannually

The reduction of monitoring frequencies for priority pollutants listed in the above table is based on the fact that previous monitoring data for these pollutants indicate that the discharge did not demonstrate reasonable potential to exceed water quality standards. However, monitoring frequency for priority pollutants with RP to exceed the WQOs is increased.

C. Whole Effluent Toxicity Testing Requirements

²³ Pesticides are, for purposes of this order, those six constituents referred to in 40 CFR, Part 125.58 (p) (methoxychlor, demeton, guthion, malathion, mirex, and parathion).

²⁴ Emerging chemicals include 1,4-dioxane (USEPA 8270c test method), perchlorate (USEPA 314 test method), 1,2,3-trichloropropane (USEPA 504.1 or 8260B test method), and methyl tert-butyl ether (USEPA 8260B test method). These chemicals need to be monitored in August.

²⁵ Endocrine disrupting chemicals include ethinyl estradiol, 17-B estradiol, estrone, bisphenol A, nonylphenol and nonylphenol polyethoxylate, octylphenol and octylphenol polyethoxylate, and polybrominated diphenyl ethers. These chemicals need to be monitored, only when the analytical methods for these chemicals are applicable and approved by the CDPH. These chemicals need to be monitored during August.

²⁶ Pharmaceuticals include acetaminopen, amoxicillin, azithromycin, caffeine, carbamazepine, ciprofloxacin, ethylenediamine tetra-acetic acid (EDTA), gemfibrozil, ibuprofen, iodinated contrast media, lipitor, methadone, morphine, salicylic acid, and triclosan. These chemicals need to be monitored, only when the analytical methods for these chemicals are applicable and approved by the CDPH. These chemicals need to be monitored during August.

Whole effluent toxicity (WET) protects the receiving water quality from the aggregate toxic effect of a mixture of pollutants in the effluent. An acute toxicity test is conducted over a short time period and measures mortality. A chronic toxicity test is conducted over a longer period of time and may measure mortality, reproduction, and growth.

This requirement establishes conditions and protocol by which compliance with the Basin Plan narrative water quality objective for toxicity will be demonstrated and in accordance with Section 4.0 of the SIP. Conditions include required monitoring and evaluation of the effluent for acute and chronic toxicity and numerical values for chronic toxicity evaluation to be used as ‘triggers’ for initiating accelerated monitoring and toxicity reduction evaluation(s).

D. Receiving Water Monitoring

1. Surface Water

Receiving water monitoring is required to determine compliance with receiving water limitations and to characterize the water quality of the receiving water. Requirements are based on the Basin Plan. The receiving water monitoring program in this Order includes the following modifications to the existing receiving water monitoring program:

- a. Monitoring for priority pollutants and chronic toxicity in the previous Order No. 00-143 was at Stations R-001, R-003, and R-005. Monitoring for these constituents in the renewal MRP are Stations R-003, R-005, and Station R-004 replacing Station R-001.
- b. The reduction of monitoring frequencies for priority pollutants listed in Table 12 is based on the fact that previous effluent monitoring data for these pollutants indicate that the discharge did not demonstrate reasonable potential to exceed water quality standards. However, monitoring frequency for priority pollutants and chronic toxicity with RP to exceed the WQOs is increased.

Table 12. Receiving Water Monitoring Program Comparison Table

Parameter	Monitoring Frequency (2000 Permit)	Monitoring Frequency (2007 Permit)
Copper	quarterly	monthly
Mercury	quarterly	monthly
Silver	quarterly	monthly

Parameter	Monitoring Frequency (2000 Permit)	Monitoring Frequency (2007 Permit)
Zinc	quarterly	monthly
Cyanide	quarterly	monthly ²⁷
Chlorodibromomethane	quarterly	monthly ²⁷
Dichlorobromomethane	quarterly	monthly ²⁷
Bis(2-ethylhexyl)phthalate	quarterly	monthly ²⁷
Remaining priority pollutants (excluding asbestos)	quarterly	semiannually
Chronic toxicity	semiannually	quarterly

c. Annual acute toxicity test is added at Stations R-005 and R-003 to fulfill Section V.A.14.d of Order.

2. Groundwater

Not Applicable.

E. Other Monitoring Requirements

1. Biosolids/Sludge Monitoring

This section establishes monitoring and reporting requirements for the storage, handling and disposal practices of sludge generated from the operation of this Facility.

VII. RATIONALE FOR PROVISIONS

A. Standard Provisions

Standard Provisions, which apply to all NPDES permits in accordance with section 122.41, and additional conditions applicable to specified categories of permits in accordance with section 122.42, are provided in Attachment D. The discharger must comply with all standard provisions and with those additional conditions that are applicable under section 122.42.

Section 122.41(a)(1) and (b) through (n) establish conditions that apply to all State-issued NPDES permits. These conditions must be incorporated into the permits either expressly or by reference. If incorporated by reference, a specific citation to the regulations must be included in the Order. Section 123.25(a)(12) allows the state to omit or modify conditions to impose more stringent requirements. In accordance with section 123.25, this Order omits federal conditions that address

²⁷ If any result of this chemical exceeds the CTR-based criteria after the effective date of this Order, the receiving water monitoring frequency of this chemical shall be increased from semiannually to monthly.

enforcement authority specified in sections 122.41(j)(5) and (k)(2) because the enforcement authority under the Water Code is more stringent. In lieu of these conditions, this Order incorporates by reference Water Code section 13387(e).

B. Special Provisions

1. Reopener Provisions

This provision is based on 40 CFR Part 123. The Regional Water Board may reopen the permit to modify permit conditions and requirements. Causes for modifications include the promulgation of new regulations, modification in sludge use or disposal practices, or adoption of new regulations by the State Water Board or Regional Water Board, including revisions to the Basin Plan.

2. Special Studies and Additional Monitoring Requirements

a. Toxicity Reduction Requirements

If the discharge consistently exceed an effluent limitation for toxicity, the Discharger needs to conduct TIE/TRE detailed in Section V of the MRP (Attachment E). The TRE will help the Discharger identify the possible source(s) of toxicity. Once the source(s) of toxicity is identified, the Discharger shall take all reasonable steps to reduce toxicity to the required level.

3. Best Management Practices and Pollution Prevention

a. Storm Water Pollution Prevention Plan (SWPPP)

CWA section 402(p), as amended by the Water Quality Act of 1987, requires NPDES permits for storm water discharges. Pursuant to this requirement, in 1990, USEPA promulgated 40 CFR 122.26 that established requirements for storm water discharges under an NPDES permit. To facilitate compliance with federal regulations, on November 1991, the State Board issued a statewide general permit, *General NPDES Permit No. CAS000001 and Waste Discharge Requirements for Discharges of Storm Water Associated with Industrial Activities*. This permit was amended in September 1992 and reissued on April 17, 1997 as State Board Order No. 97-03-DWQ. JWPCP is covered under this general permit and an updated SWPPP is required.

b. **Spill Contingency Plan (SCP)**

Since spill or overflow is a common event in the treatment plant service areas, this Order requires the Discharger to review and update, if necessary, SCP after each incident. The Discharger shall ensure that the up-to-date SPC is readily available to the sewage system personnel at all times and that the sewage personnel are familiar with it.

c. **Pollutant Minimization Program.**

This provision is based on the requirements of Section 2.4.5 of the SIP.

4. Construction, Operation, and Maintenance Specifications

This provision is based on the requirements of 40 CFR 122.41(e) and the previous Order.

5. Special Provisions for Municipal Facilities (POTWs Only)

a. **Biosolids Requirements.** To implement CWA Section 405(d), on February 19, 1993, USEPA promulgated 40 CFR 503 to regulate the use and disposal of municipal sewage sludge. This regulation was amended on September 3, 1999. The regulation requires that producers of sewage sludge meet certain reporting, handling, and disposal requirements. It is the responsibility of the Discharger to comply with said regulations that are enforceable by USEPA, because California has not been delegated the authority to implement this program. The Discharger is also responsible for compliance with WDRs and NPDES permits for the generation, transport and application of biosolids issued by the State Board, other Regional Water Boards, Arizona Department of Environmental Quality or USEPA, to whose jurisdiction the Facility's biosolids will be transported and applied.

b. **Pretreatment Requirements.** This permit contains pretreatment requirements consistent with applicable effluent limitations, national standards of performance, and toxic and performance effluent standards established pursuant to Sections 208(b), 301, 302, 303(d), 304, 306, 307, 403, 404, 405, and 501 of the CWA, and amendments thereto. This permit contains requirements for the implementation of an effective pretreatment program pursuant to Section 307 of the CWA; 40 CFR 35 and 403; and/or Section 2233, Title 23, California Code of Regulations.

c. **Spill Reporting Requirements.** This Order established a reporting protocol for how different types of spills, overflow or bypasses of raw or partially treated sewage from its collection system or treatment plant covered by this Order shall be reported to regulatory agencies.

The State Water Board issued General Waste Discharge Requirements for Sanitary Sewer Systems, Water Quality Order No. 2006-0003-DWQ (General Order) on May 2, 2006. The General Order requires public agencies that own or operate sanitary sewer systems with greater than one mile of pipes or sewer lines to enroll for coverage under the General Order. The General Order requires agencies to develop sanitary sewer management plans (SSMPs) and report all sanitary sewer overflows (SSOs), among other requirements and prohibitions.

Furthermore, the General Order contains requirements for operation and maintenance of collection systems and for reporting and mitigating sanitary sewer overflows. Inasmuch that the Discharger's collection system is part of the system that is subject to this Order, certain standard provisions are applicable as specified in Provisions, section VI.C.5. For instance, the 24-hour reporting requirements in this Order are not included in the General Order. The Discharger must comply with both the General Order and this Order. The Discharger and public agencies that are discharging wastewater into the facility were required to obtain enrollment for regulation under the General Order.

7. Compliance Schedules

- a. This Order establishes final effluent limitations for ammonia, nitrate plus nitrite as nitrogen, nitrite as nitrogen, copper, mercury, silver, and zinc.
- b. For the aforementioned non-CTR-based pollutants, the interim limits and compliance dates are provided in the accompanying Time Schedule Order No. R4-2008-0012.

VIII. PUBLIC PARTICIPATION

The California Regional Water Quality Control Board, Los Angeles Region (Regional Water Board) is considering the issuance of waste discharge requirements (WDRs) that will serve as a National Pollutant Discharge Elimination System (NPDES) permit for Ventura Water Reclamation Facility. As a step in the WDR adoption process, the Regional Water Board staff has developed tentative WDRs. The Regional Water Board encourages public participation in the WDR adoption process.

A. Notification of Interested Parties

The Regional Water Board has notified the Discharger and interested agencies and persons of its intent to prescribe waste discharge requirements for the discharge and has provided them with an opportunity to submit their written comments and recommendations. Notification was provided through the following newspapers: (Ventura County Star and date).

B. Written Comments

The staff determinations are tentative. Interested persons are invited to submit written comments concerning these tentative WDRs. Comments must be submitted either in person or by mail to the Executive Office at the Regional Water Board at the address above on the cover page of this Order.

To be fully responded to by staff and considered by the Regional Water Board, written comments must be received at the Regional Water Board offices by 5:00 p.m. on February 7, 2008.

C. Public Hearing

The Regional Water Board will hold a public hearing on the tentative WDRs during its regular Board meeting on the following date and time and at the following location:

Date: March 6, 2008
Time: 9:00 a.m.
Location: City of Simi Valley, Council Chambers
2929 Tapo Canyon Road
Simi Valley, California

Interested persons are invited to attend. At the public hearing, the Regional Water Board will hear testimony, if any, pertinent to the discharge, WDRs, and permit. Oral testimony will be heard; however, for accuracy of the record, important testimony should be in writing.

Please be aware that dates and venues may change. Our Web address is <http://www.waterboards.ca.gov/losangeles/> where you can access the current agenda for changes in dates and locations.

D. Waste Discharge Requirements Petitions

Any aggrieved person may petition the State Water Resources Control Board to review the decision of the Regional Water Board regarding the final WDRs. The petition must be submitted within 30 days of the Regional Water Board's action to the following address:

State Water Resources Control Board
Office of Chief Counsel
P.O. Box 100, 1001 I Street
Sacramento, CA 95812-0100

E. Information and Copying

The Report of Waste Discharge (RWD), related documents, tentative effluent limitations and special provisions, comments received, and other information are on file and may be inspected at the address above at any time between 8:30 a.m. and 4:45 p.m., Monday through Friday. Copying of documents may be arranged through the Regional Water Board by calling (213) 576-6600.

F. Register of Interested Persons

Any person interested in being placed on the mailing list for information regarding the WDRs and NPDES permit should contact the Regional Water Board, reference this facility, and provide a name, address, and phone number.

G. Additional Information

Requests for additional information or questions regarding this order should be directed to Don Tsai at (213) 576-6665.

Ventura WRF Upgrade Project Secondary Treatment Technical Memorandum No. 1

Prepared By: Brown and Caldwell

Date: June 30, 2006

Introduction

The Ventura Water Reclamation Facility (VWRF) currently treats equalized primary effluent using activated sludge followed by tertiary filtration. The original plant was constructed in 1958 and included a primary clarifier, two trickling filters, and a secondary clarifier. In 1971, activated sludge facilities and final effluent filters were constructed to provide tertiary treatment. The activated sludge facilities comprised four aeration tanks, six rectangular secondary clarifiers, and associated return activated sludge (RAS) and waste activated sludge (WAS) pumps and piping. The activated sludge facilities were designed to operate in parallel with the existing trickling filter facilities. New solids handling facilities, including the dissolved air flotation thickeners (DAFTs), digesters, and sludge dewatering, were constructed in 1983.

The Phase 1 upgrade project was constructed in the late 1990s. It included primary effluent equalization basins, the flow equalization/primary effluent pump station, conversion of the original secondary clarifier to a second primary clarifier, structural rehabilitation of the aeration tanks and secondary clarifiers, and replacement of aeration tank swing arm-mounted tubular diffusers with full-floor coverage fine-bubble diffusers.

The capacity of the existing secondary treatment facilities is less than the discharge permit limit of 14 million gallons per day (mgd) annual average flow. The existing activated sludge process has a rated capacity of 10.3 million gallons per day (mgd) based on a planning study completed nearly 13 years ago (Montgomery Watson, Ventura Water Renovation Facility Master Plan, September 1993). The trickling filters were included in the total secondary capacity cited in the 1993 Master Plan, but they have not been used since the original secondary clarifier was converted to a primary clarifier. The main goal of the VWRF Upgrade - Phase 2 project is to restore secondary treatment capacity to 14.0 mgd annual average flow to realize the full permitted capacity. In addition to increasing secondary treatment capacity, the Phase 2 facilities will meet anticipated final effluent discharge limits for total nitrogen. The project includes a new aeration air blower building and an additional DAFT to handle additional secondary solids production.

This technical memorandum summarizes biological treatment alternatives and recommended facilities to restore capacity to 14 mgd and to meet more stringent effluent discharge limits (esp., nitrogen limits). Three of the four secondary treatment alternatives discussed included suspended growth biological treatment (i.e., activated sludge). These alternatives require varying modification and/or expansion of the existing aeration tanks and oxygen transfer system. However, the existing rectangular secondary clarifiers will be used for any of these three alternatives to limit the project construction cost. Space is reserved for possible construction of circular secondary clarifiers in the future. Additional technical memoranda will be prepared that evaluate metals removal to meet anticipated final effluent discharge limits, solids handling modifications, and aeration air blower selection.

Objectives

The secondary treatment system was selected to meet the following objectives:

1. Restore secondary treatment capacity to the permitted value of 14.0 mgd annual average flow.
2. Plan for the ultimate treatment capacity of 16.7 mgd annual average flow in laying out and sizing new facilities.
3. Use existing aeration tanks and secondary clarifiers and locate new facilities within the existing secondary treatment footprint.
4. Provide positive RAS removal from each secondary clarifier.
5. Provide flexibility to meet future discharge requirements for nitrogen and metals, and also for phosphorus if feasible.
6. Comply with a total nitrogen limit of 10 milligrams per liter (mg/L) as nitrogen, which is the anticipated value in the next discharge permit.

Primary effluent flow is equalized, so that the aeration tank influent flow rate and secondary clarifier influent flow rate are approximately constant throughout the day. Assuming that adequate primary effluent equalization capacity is maintained to handle projected increased influent flows, the projected equalized peak day flow rate is the basis for secondary treatment design flow. An evaluation of future equalization capacity needs is not included in this project, but is needed to ensure that the design flow basis (e.g., equalized peak day flow) is achieved.

This technical memorandum describes the flow and loading criteria and the recommended facilities.

Existing Facilities

Existing secondary treatment facilities and performance are described in this section. The two existing trickling filters are no longer used, so are not included in this description.

Primary Effluent Equalization

Primary effluent, DAFT supernatant, and recessed chamber filter press filtrate are equalized in four equalization basins. The total capacity of the four basins is approximately 2.56 million gallons (MG). Historically, excess flows have been pumped to the equalization basins during the day and returned at night, so the secondary treatment system receives a relatively constant flow throughout the day. The filter press filtrate generated from batch dewatering operations is routed to the equalization tanks, so the activated sludge system sees the filtrate ammonia loading during the late night and early morning hours when the equalization basins are emptied. Plant staff washes down the equalization basins each morning after they are drained.

Aeration Influent Pumping

The flow equalization/primary effluent pumping station has three primary effluent pumps that pump to the aeration tanks. Separate pumps are used for the equalized flow. The primary effluent pumps have a capacity of 4,000 gallons per minute (gpm) each, for a total firm capacity of approximately 11.5 mgd with one pump out of service.

The equalized primary effluent pipe between the pumping station and aeration tanks appears to be undersized to handle future flows. The capacity of the existing 24-inch pipe is approximately 14 mgd based on 7 feet per second (fps) velocity.

Aeration Tanks

The plant has four aeration tanks with circular flexible membrane fine-bubble diffusers manufactured by Sanitaire. The four tanks can be operated in series or in parallel, with options for step feed. Each tank holds approximately 0.73 MG with a side water depth (SWD) of 16.2 ft, assuming the water surface is at the invert of the primary effluent gates. Plant staff limits mixed liquor concentrations to less than 1,500 mg/L due to operational problems.

Configuration. The four aeration tanks are configured typically in series as plug flow reactors. Equalized primary effluent and RAS are introduced at the north end of aeration tank 1. Aeration tank 1 (the westernmost tank) is operated as an anoxic selector. The airflow to this tank is limited to 40 to 60 standard cubic feet per minute (scfm) to mix the tank only. According to Sanitaire, this tank has the highest diffuser density. At 60 scfm, the airflow per diffuser would be less than 0.02 scfm per diffuser in this tank, which is far below the minimum recommended airflow per diffuser. At this low airflow, air distribution would not

be equal through the tank, and mixing would not be uniform. Recommended modification and improvements for anoxic zone configuration and mixing are presented below.

Mixed liquor then flows sequentially through aeration tanks 2, 3, and 4. There is a single gate between each pair of aeration tanks. The single gates cause significant headloss at higher flows and represent a hydraulic bottleneck. There is a noticeable difference in water surface elevation (WSEL) among the four aeration tanks.

The plant is operated at a solids retention time (SRT) high enough to nitrify. Data over the last two years show the secondary effluent ammonia is typically less than 2 mg/L as N.

Internal Mixed Liquor Recycle. The plant installed an internal mixed liquor recycle system to partially denitrify the wastewater and prevent denitrification and floating sludge in the secondary clarifiers. Although the pump has additional capacity, current operation is limited to 7.5 mgd because of the hydraulic limitations discussed above. Typical effluent nitrate concentrations are 10 to 20 mg/L as N. At peak flows, the plant turns down the mixed liquor recycle flow to alleviate hydraulic limitations.

Peak Flow Handling. The plant has two modes of operation to deal with peak flows. To convey more flow to the aeration tank than the 11.5 mgd capacity of two primary effluent pumps, valves from the equalization pumps can be set so a portion of the flow pumped by the equalization pumps goes directly to the aeration tanks instead of to equalization. Based on the pipeline size, the plant may be able to convey 14 to 16 mgd to the aeration tanks in this mode.

During large storm events, influent is pumped directly to the aeration tanks, bypassing primary treatment. During these peak flow events, the plant turns off the air in aeration tank 4, allowing solids to settle in the aeration tank to prevent clarifier overloading. This mode of operation does not last for an entire day. Plant staff uses this mode at flows above approximately 20 mgd.

Secondary Clarifiers

The plant has six rectangular secondary clarifiers, each with a surface area of 3,000 square feet (sq ft) and a sidewater depth of 10 ft. Performance of the secondary clarifiers limits the activated sludge operation. The plant reports operational problems above a mixed liquor concentration of 1,600 mg/L. Mixed liquor settling characteristics affect secondary clarifier performance and are measured typically as the sludge volume index (SVI). For 2004 and 2005, the 90th percentile SVI was 166 mL/g. Figure 1 shows the SVI trend for 2004 and 2005.

Figure 1. Historical SVI

Return Activated Sludge Pumping

Return activated sludge (RAS) from the six rectangular secondary clarifiers flows through a common header to a common wet well at the south end of the aeration tanks. Valves are used to adjust the RAS flow rate from each clarifier. Three variable speed centrifugal pumps are rated at 3,000 gpm each, for a firm RAS capacity of approximately 8.6 mgd.

Waste Activated Sludge Pumping

The waste activated sludge (WAS) pumps are located at the southwest corner of the aeration tanks and pump directly to the DAFT. There are two pumps rated at 250 gpm each (0.36 mgd).

Solids Handling Returns

The plant currently thickens primary sludge in the gravity thickener and WAS in the DAFT. Thickened primary sludge and WAS are stabilized in three anaerobic digesters. The stabilized sludge is dewatered using two recessed chamber filter presses.

Gravity Thickener Overflow. The gravity thickener receives primary sludge. Overflow is returned to the headworks.

DAFT Overflow. The DAFTs treat waste activated sludge. Subnatant is routed to the equalization basins. DAFT capacity relative to projected WAS production and recommended modifications to mitigate any capacity shortfalls will be evaluated in a future technical memorandum.

Recessed Chamber Filter Press Filtrate. Digested sludge is dewatered using recessed chamber filter presses. The filter presses are not operated continuously, but are operated approximately eight to nine shifts per week to handle current sludge production. Filtrate is routed to the equalization basins. Up to eight dewatering cycles can be achieved during each shift.

Tertiary Filtration

Following secondary treatment, six pressure filters are used for residual suspended solids removal prior to disinfection and disposal. Backwash water, and associated solids, is routed to the headworks. Any other issues with tertiary treatment are not considered in this technical memorandum.

Influent Conditions

Historical data were analyzed to project future flows and loadings to use for secondary treatment system design.

Historical Flows and Loadings

Historical influent flows are shown on Figure 2. Flows have remained relatively constant over the last nine years, averaging 9.2 mgd. The maximum 30-day flow was 12.6 mgd, with a peak day flow of 18.6 mgd.

Figures 3 through 6 show the historical influent total suspended solids (TSS), biochemical oxygen demand (BOD), chemical oxygen demand (COD), and nitrogen loadings respectively. Data from 2002 to 2005 were not used in projecting future loadings as the data were not considered representative. The influent sampler was relocated during this period to accommodate headworks construction activities. In addition, the temporary sampler location included solids handling recycle streams based on discussion with plant staff. The period of higher concentrations and loadings started abruptly during a time when construction was occurring on the headworks. Despite the dramatic increase in influent loadings, primary effluent loadings remained constant over the nine-year period. The sampler location has been changed recently, but influent concentrations have not returned to earlier levels based on data for the first seven months of 2006.

Figure 2. Historical Influent Flows (curve indicates 30-day moving average)

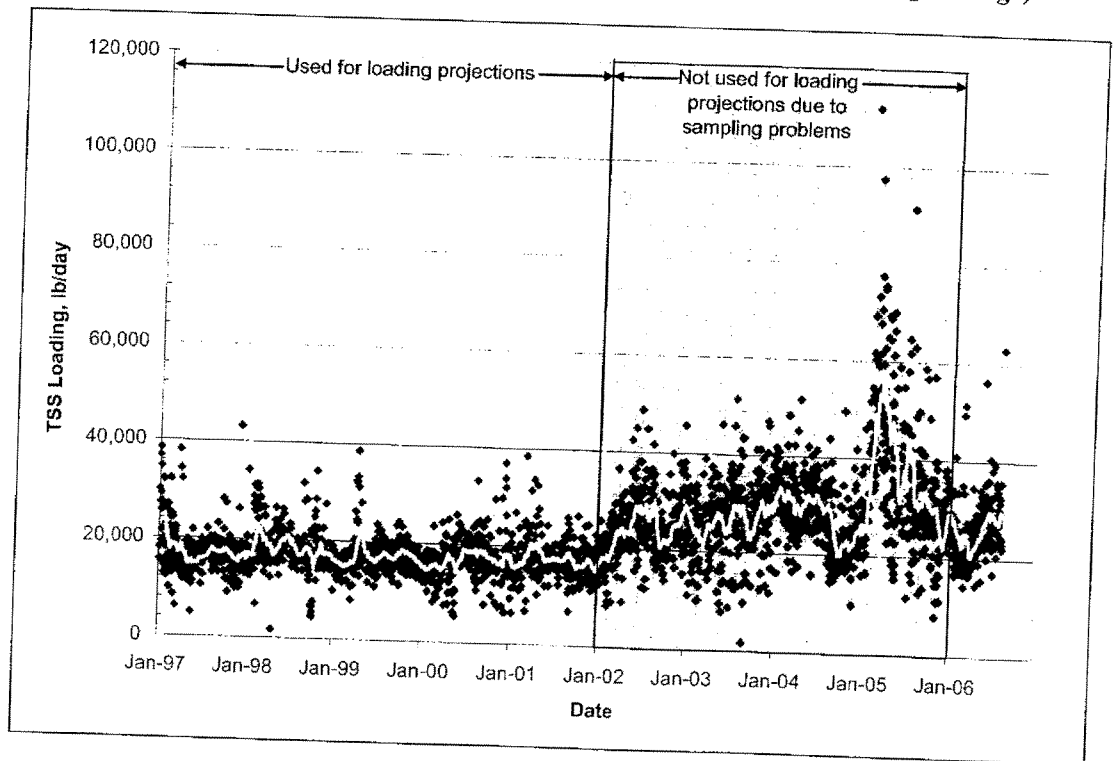

Figure 3. Historical TSS Loading (curve indicates 30-day moving average)

Figure 4. Historical BOD Loading (curve indicates 30-day moving average)

Figure 5. Historical COD Loading (curve indicates 30-day moving average)

Phase 2

Phase 2 is based on an annual average flow rate of 14 mgd, corresponding to the permitted capacity stated in the plant NPDES permit. Recommended Phase 2 facilities are sized to handle the range of flows and loadings anticipated throughout the year that are associated with a 14 mgd average annual flow rate.

Influent Flows and Loadings. Peak flows associated with design annual average flows were based on an analysis of patterns of peak flow and average flow using 9 years of historical flow data. Projected peak flows were calculated based on historical patterns and design annual average flow. Projected peak flows were adjusted (i.e., peaking factors were adjusted) to reflect the type and pattern of future development within the City. City staff indicate that future development will be infill within existing sewer areas, and that the total length of sewers within the collection system will not increase significantly. As new development occurs, existing pipe will be replaced to increase capacity. Increasing infiltration/inflow in the remaining existing pipe will be offset by minimal infiltration/inflow in the new pipe. So, while average annual flow may increase with future development the quantity of infiltration/inflow is expected to remain relatively constant. In other words, the flow peaking factor is expected to decrease in the future. Future average and peak flows should be monitored to verify this assumption.

Projected loadings are based on historical loading data from 1997 to 2001, as discussed above. Recent influent data (through July 2006) indicate that loadings may not have returned to pre-2002 levels, and the per capita loading evaluation discussed above further corroborates this conclusion. Additional data (e.g., calendar year 2006 to capture seasonal variations) should be analyzed to confirm that loads have returned to pre-2002 levels with the sampler location change. If loadings are indeed higher, the capacity of the Phase 2 expansion will be less than 14 mgd.

The secondary treatment process will be sized for two conditions. Winter conditions assume the maximum month BOD loading and peak day flows occur simultaneously. During winter, all tanks will be in service. Summer conditions assume the maximum summer month BOD loading occurs simultaneously with the maximum summer day flow. During the summer, either one aeration tank or one secondary clarifier will be out of service so that preventative maintenance can be performed. Table 1 shows the influent flow and loading criteria used for process sizing.

Table 1. Design Flows and Loadings

Criteria	Phase 2	Phase 3 (Ultimate)
Flow		
Annual average, mgd	14 ✓	16.7
Average dry weather flow, mgd	13.5	16.1
Maximum month, mgd	17.1 ✓	19.8
Maximum week, mgd	18.2 ✓	20.9
Maximum summer day, mgd	18.5 ✓	21.2
Maximum day, mgd	23.3 ✓	26.0
BOD		
Annual average loading, lb/day	31,000 ✓	36,900
Annual average concentration, mg/L	265	265
Maximum summer month, lb/day	34,400 ✓	41,100
Maximum month, lb/day	37,000 ✓	44,100
Maximum day, lb/day	95,480	113,895
TSS		
Annual average loading, lb/day	26,300 ✓	31,400
Annual average concentration, mg/L	226	226
Maximum summer month, lb/day	28,900 ✓	34,500
Maximum month, lb/day	35,500 ✓	42,400
Maximum day, lb/day	65,500	78,100
Ammonia		
Annual average loading, lb/day	2,700 ✓	3,200
Annual average concentration, mg/L	23	23
Maximum summer month, lb/day	3,200 ✓	3,800
Maximum month, lb/day	3,500 ✓	4,100
Total phosphorus		
Assumed concentration, mg/L	10	10
Alkalinity, mg/L as CaCO ₃	350 ✓	350
Assumed pH, standard units	7.3	7.3
Wastewater temperature		
Minimum monthly (winter), °C	17.7 ✓	17.7
Maximum monthly (summer), °C	24.6 ✓	24.6

Recycle Loads. Recycle loads must be accounted for in the sizing of secondary treatment processes. For Ventura, recycle loads include gravity thickener overflow, DAFT supernatant, filtrate from the filter presses, and tertiary filter backwash. Recycle loads were accounted for in process simulations by simulating the entire plant performance, including solids handling facilities.

Phase 3

Estimated Phase 3 flows and loadings are also shown in Table 1. Phase 3 conditions are based on an annual average flow rate of 16.7 mgd. This flow rate exceeds the projected flow at buildout condition per the City's General Plan and the current permitted capacity, but is included in this evaluation to ensure space for additional facilities is reserved should projected buildout conditions change.

a. Existing Process (MLE Process)

b. BAR Process

Figure 7
Process Configuration Alternatives

Bioaugmentation Reaeration (BAR). Figure 7 also shows a diagram of the bioaugmentation reaeration (BAR) process, which leverages the volume of the existing aeration tanks and lowers the clarifier solids loading rate compared to an equivalent MLE process. The BAR process accomplishes nitrification and denitrification, and is a modification of the MLE process. The BAR process separately treats the high ammonia filtrate stream to enhance the nitrifier population – a process referred to as “bioaugmentation”. In the BAR process, the high ammonia filtrate is introduced to a reaeration tank with the return activated sludge. The return streams are nitrified in this tank, and in the process, the proportion of nitrifying bacteria increases. Flow from the BAR tank goes to the anoxic zone, where primary effluent and mixed liquor recycle are introduced and denitrification occurs. Aerobic zones for nitrification of the primary effluent follow. In addition to improving nitrification, mixed liquor solids are stored in the BAR tank at RAS concentrations, lowering the solids loading to the clarifiers at the same SRT, which is critical for VWRF because of the existing secondary clarifier problems.

Simulator Application

Two representative 30-day periods were selected for simulation to confirm tank sizing is adequate. The flow and loading patterns from the maximum BOD loading month (March 30, 1999 to April 29, 1999) was used as a basis for winter simulations. For summer, the peak summer month BOD loading that occurred during a month with average flows was selected (August 10, 2001 to September 8, 2001).

The process simulations included the MLE and BAR processes only based on the existing secondary treatment facilities (i.e., aeration tanks, secondary clarifiers) and the limited construction budget for this expansion project. Other processes could be used to meet the anticipated final effluent discharge criteria and restore secondary treatment capacity to 14 mgd, but they would include significant new facilities that would exceed the construction budget and possibly increase long-term operations and maintenance costs.

For example, granular media denitrifying filters could be constructed downstream of the activated sludge system. Denitrifying filters would enable the activated sludge system to be operated for nitrification only; however, this alternative would not address rising sludge due to denitrification in the existing secondary clarifiers. New clarifiers with rapid sludge withdrawal could be constructed to mitigate this problem, but this represents an additional construction cost. Additionally, denitrifying filters require continuous methanol addition, a necessary long-term operating cost.

A membrane bioreactor (MBR) is another feasible process alternative. While less aeration tank volume is needed with an MBR, new membrane tanks and ancillary facilities would be needed. Again, the construction cost of this alternative would exceed the construction budget.

MLE and BAR represent the lowest cost alternatives based on their use of existing aeration tanks and secondary clarifiers. This approach leverages the City's historical investment at the plant to minimize construction costs. In addition, these alternatives minimize long-term operations costs by using wastewater constituents within an MLE or BAR configuration to accomplish denitrification, recover alkalinity consumed in nitrification, and minimize aeration air blower power costs.

Process Recommendations

The capacity of a treatment system is limited by the unit with the least capacity. The secondary treatment modifications discussed below are designed for a capacity of 14 mgd average annual flow. This implies that they can accommodate the normal peaks expected in a year with an average flow of 14 mgd, up to the equalized peak day flow of 23.3 mgd.

It is critical to note that processes not included in our scope of work (primary clarifiers, equalization volume and aeration influent pumping) limit the overall plant capacity. Further consideration of how the plant will manage peak flows is required, but it is beyond the scope of this project.

Phase 2

The current project (Phase 2) includes expansion of the secondary treatment system to 14 mgd average annual flow. The components of the Phase 2 project are discussed in this section.

Primary Effluent Equalization. The aeration tank sizing assumes that primary effluent is equalized, and the equalization basins are emptied daily. Therefore, the secondary treatment system is sized to accommodate constant flows throughout a day up to the maximum daily flow of 23.3 mgd. To reduce loadings to the secondary clarifiers, the plant may wish to consider adding more equalization volume to lower the equalized flow rate.

An analysis of the required equalization volume for diurnal equalization is not included in this analysis. We were instructed to assume that sufficient equalization is available.

Aeration Influent Pumping. Modifications to the aeration influent pumping station are not included in the scope of work for this project. However, additional aeration influent pumping is required to handle projected Phase 2 flows. The pumping station currently has a capacity of 11.5 mgd with two of three pumps in service. The system was designed to be expanded with the addition of a fourth pump. However, due to the size of the pipeline, with the addition of a fourth pump the firm hydraulic capacity of the station would be limited to a peak of 17 mgd or less, depending on head losses in the pipeline.

At an annual average flow of 14 mgd, the peak week flow is projected to be 18.2 mgd, and the peak day flow is projected to be 23.3 mgd. The addition of a fourth pump will not be sufficient to accommodate future peak flows.

The plant should consider adding two larger pumps (one as backup) to the station along with a new pipeline to accommodate peak flows.

Aeration Tank Alternatives. The simulator was used to determine the maximum mixed liquor suspended solids (MLSS) concentration during the maximum month loading condition. This peak MLSS concentration represents the stressed secondary clarifier solids loading condition. Under average loading conditions, the maximum MLSS concentration will be lower. New aeration tanks were assumed to be the same volume and depth as existing tanks.

State point analysis, which is discussed in more detail below, was used to determine the maximum MLSS capacity of the clarifiers at a variety of influent peak flows. When combined, the simulated MLSS concentration and critical clarifier suspended solids concentration indicate the capacity of the plant under a specific configuration. An analysis of historical data showed that the peak day flow and the maximum aeration tank MLSS concentrations were not concurrent. Therefore, the critical MLSS concentrations for the clarifiers at maximum loading conditions were determined assuming a peak flow historically exceeded an average of one time per year. At peak day flows, MLSS concentrations will be lower, so clarifiers will have capacity.

Figure 8 shows the winter plant capacities with the MLE and BAR processes. The simulated MLSS concentrations are shown for a range of number of aeration tanks. The curves are shown as a function of average dry weather flow (ADWF). Corresponding annual average flow and peak flow to clarifiers are shown also.

The pink or yellow lines show the maximum MLSS concentration leaving the aeration basins during the maximum month loading conditions. Note that this condition does not occur for an extended period of time, but only for one day or less during the maximum month. The turquoise lines show the maximum MLSS that clarifiers can handle at the peak flow to clarifiers, which is shown on the axis. The annual average capacity of a given aeration tank configuration is where it intersects the clarifier MLSS capacity. Each configuration shown is capable of meeting the effluent discharge requirements, but the maximum MLSS concentration differs. With more tanks, the MLSS concentration is lower.

Summer capacities were also analyzed, with either an aeration tank or clarifier off-line. Summer capacities were always greater than winter capacities, so the results are not shown.

(a)

(b)

Figure 8. Winter Capacities for (a) MLE and (b) BAR Processes

Table 2 shows the firm capacities of the various process alternatives.

Table 2. Capacities of Process Alternatives

Criteria	Annual Average Flow Capacity, mgd
MLE Process	
6 activated sludge tanks	12.9
7 activated sludge tanks	14.5
BAR Process	
BAR tank plus 6 activated sludge tanks	14.0
BAR tank plus 7 activated sludge tanks	15.7

We recommend that the BAR tank plus 6 activated sludge tanks alternative be selected. This option is capable of treating the expected flow and loading conditions throughout a year with an annual average flow of 14 mgd.

If the loadings to the plant are higher than projected, the clarifiers will limit capacity to a reduced value.

Recommended Aeration Tank Configuration. For Phase 2, we recommend the addition of a BAR tank with a volume of 0.37 million gallons, and two new aeration tanks with a volume of 0.73 million gallons each. The new tanks are laid out with two passes, to take better advantage of the available space and accommodate the BAR process. Aeration tank 5 will have submersible mechanical mixers for operation as a two-pass anoxic zone. Aeration tank 6 can be operated in either anoxic mode with submersible mechanical mixers, or in aerobic mode with diffusers. A small tank for equalization of the filtrate before the BAR will also be added. Figure 9 shows the secondary treatment facilities layout on the site.

Normal Configuration. Process schematics showing normal operation are shown in Figures 10 and 11. Figure 11 is a schematic of the plan layout of the recommended facilities corresponding to the layout shown on Figure 9. Return sludge and equalized filtrate enter the south end of the BAR tank. Flow from the BAR tank exits into the south aeration tank inlet channel. Equalized primary effluent and mixed liquor recycle are added at this point. The mixed liquor enters aeration tank 5, which is operated in an anoxic mode. Mixed liquor flows through the south and north aeration tank inlet channels and is split between five aeration tanks (aeration tanks 1, 2, 3, 4 and 6). These five tanks will be operated with the first twelfth as an additional anoxic zone to provide the required level of denitrification. Baffles and submersible mixers will be added to the existing aeration tanks. Operating the existing tanks in parallel solves the hydraulic bottlenecks the plant has experienced with series operation. The new tanks are both designed to pass the entire flow, including mixed liquor recycle.

Figure 11
Secondary Treatment Facilities Configuration

Alternate Configuration. When a tank needs to be taken off line during the summer, flexibility is available. Tanks should not be taken off line in the winter, since the higher mixed liquor concentrations resulting with a tank off-line will overload the secondary clarifiers at high winter flows.

If the BAR tank is down in the summer, the plant can operate in the conventional MLE mode described above. Filtrate can be routed through the existing pipe to the equalization tanks. The RAS, equalized primary effluent (including filtrate), and mixed liquor recycle are all introduced into aeration tank 5, which is anoxic. The flow splits among the remaining tanks, which operate with the first twelfth anoxic and the remainder aerobic. The mixed liquor concentration leaving the aeration tanks is higher in conventional mode than in BAR mode, but with well-settling sludge and either five or six clarifiers on line, the solids loading rate is within acceptable limits at peak summer flows.

If aeration tank 5 is off-line, flow from the BAR tank along with RAS and primary effluent enters aeration tank 6, as shown on Figure 12. In this mode, aeration tank 6 is operated as an anoxic tank. Flow is then split among the four existing aeration tanks. The first twelfth of each tank is operated as an additional anoxic zone.

If aeration tank 6 or one of the existing aeration tanks is down, flow from the BAR tank along with RAS and primary effluent enters tank 5, operated as an anoxic tank. Flow is then split among the remaining aeration tanks in service.

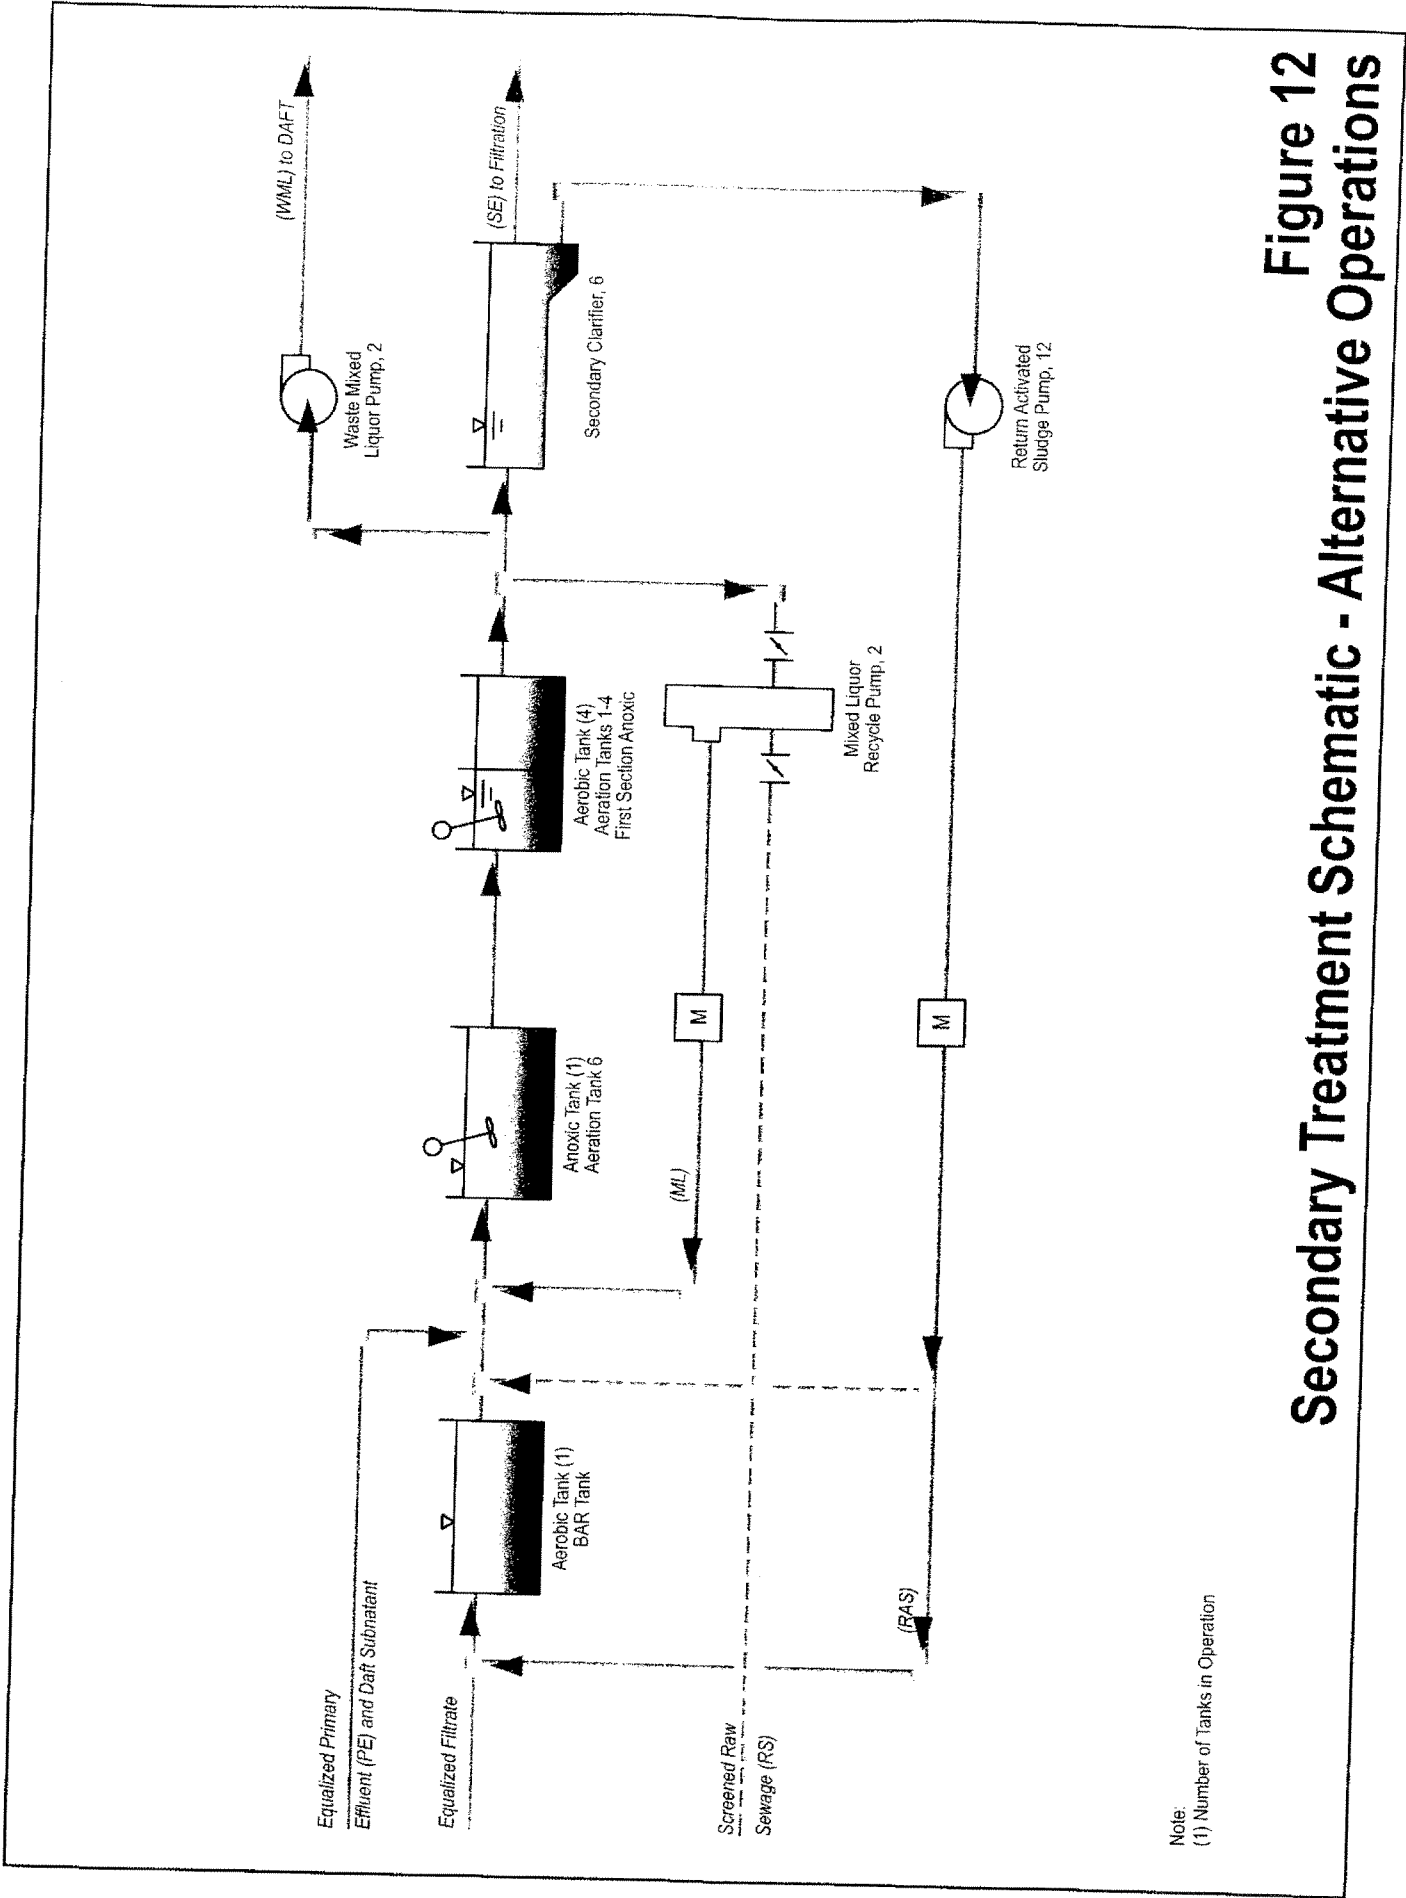

Internal Mixed Liquor Recycle Pumping. The mixed liquor recycle will have a capacity of 300 percent of the Phase 3 annual average flow (50.1 mgd). The mixed liquor recycle pumping station will be at the south end of aeration tank 5. Three vertical turbine solids handling (VTSH) pumps (two duty/one standby) with variable speed drives will be used.

Secondary Clarifiers. The existing secondary clarifiers will be used for the Phase 2 modification. RAS pumping improvements to provide positive RAS control for each clarifier are discussed in more detail below.

State point analysis was used to ensure the clarifiers were not overloaded with solids under the various conditions. Based on previous experience, the state point solids loading rates were derated by 20 percent because of the type and shallow depth of the clarifiers.

A plant operating with an anoxic zone and denitrification is expected to produce a good-settling sludge. A 90th percentile SVI of 150 mL/g was assumed for the state point analysis.

All six clarifiers need to operate during winter peak flow conditions to accommodate the solids loading generated by the BAR processes. In the summer, one clarifier can be taken out of service at a time.

Note:
 (1) Number of Tanks in Operation

Figure 12
Secondary Treatment Schematic - Alternative Operations

State point analysis shows that the solids loading to the clarifiers at peak flows are acceptable. However, this depends on the RAS pumping system being able to effectively remove the solids. Positive control of RAS pumping will help, but the system is still not ideal because the scrapers must transport the sludge the length of the tanks.

Hydraulic loading to the clarifiers is also critical. At 23.3 mgd (peak day flow) the surface overflow rate with all six clarifiers operating is 1,300 gallons per square foot per day, which is high, especially for shallow clarifiers such as these.

To be confident that the clarifiers have the required capacity, we strongly recommend the CRTC Protocol for evaluating clarifiers be followed. Our design assumes that the existing clarifiers can accommodate projected peak flows with the proposed RAS modifications, but this can only be stated with field verification of the clarifier performance under these operating conditions.

Return Activated Sludge Pumping. Positive RAS control is desired to improve clarifier operation. This section describes the proposed new RAS pumps.

Background. The purpose of this analysis is to identify if feasible alternatives are available to provide positive RAS control at each existing secondary clarifier. The existing secondary clarifiers gallery (gallery 3) has limited space available for installing dedicated RAS pumps. If a feasible alternative is identified, this will avoid having to construct new clarifiers to achieve positive RAS control. The projected plan of operation is to return up to 16 mgd of the design flow as RAS.

RAS Pumps Design Criteria. The RAS pumps are designed for a flow of 16 mgd, or 100 percent of the estimated buildout annual average flow.

Pump Selection. Only pumping alternatives capable of providing positive RAS control were considered. Candidate pump types included progressive cavity, screw centrifugal, rotary lobe and non-clog centrifugal. Progressive cavity pumps were dismissed from further consideration because they would be the most maintenance intensive and would not fit the available space. Screw pumps were dismissed because they are inefficient, tend to induce vibrations in connected piping due to the single-vane impellers, and because the application does not require special pumps capable of passing stringy material. Rotary lobe pumps in a stacked arrangement (motors mounted above pumps) and vertical centrifugal pumps were identified as feasible to fit the available space. The vertical arrangement is the only configuration that would fit in the available space. On further analysis, rotary lobe pumps were dismissed as too costly and not suitable for this application because they would be subject to excessive wear in a continuous pumping application. We recommend vertical centrifugal pumps with variable speed drives for this application.

Preliminary Layout. Pumping layout alternatives considered using a single pump for each clarifier and two pumps for each clarifier (one for each sludge hopper). Candidate pump selections and motors are included in Appendix B. Preliminary pumping layouts (to scale) and a cross section were sketched on

prints of record drawings, showing a single pump per clarifier, and various arrangements of two pumps per clarifier. These sketches, included in Appendix C, revealed that it will be necessary to relocate both existing stairways into gallery 3 and both exhaust fans outside of the gallery to provide space for installing pumps, and to provide accessibility for picking up and moving all pumps to alternative central locations for removal from the gallery. They also revealed that the single pump arrangement would take up too much space, and that single pumps would appear to preferentially withdraw sludge from the closest sludge hopper, contrary to the goal of positive RAS control. Although more pumps would be required, we recommend one vertical centrifugal pump for each sludge hopper, which will provide a pair of pumps for each clarifier and manual pumping backup in case one pump in a pair fails.

Recommended Pumping Arrangement. Preliminary (drafted) demolition and mechanical layout drawings (four) were prepared using record drawings as backgrounds to show the recommended arrangement of two vertical centrifugal pumps per clarifier and new access stairways to the gallery. These drawings are included in Appendix D. The new pumps will require a larger, separate discharge manifold from the existing sludge withdrawal manifold. This preliminary sludge pumping layout offers minimal disruption to the existing sludge withdrawal arrangement, so that the existing sludge withdrawal method can remain in service throughout installation of the new pumps and until they have been tested and are ready to be placed in service.

Also included in Appendix E is a candidate adjustable crane that may work in the minimal available space. The adjustable crane may need to be modified to permit separately lifting motors and pumps from a cantilever boom attachment; alternatively, a short (10 feet long) monorail beam could be provided across the gallery above each pump to enable removal and installation of each pump from the gallery floor adjacent to each pump support.

Mixed Liquor Wasting Pumping. We recommend that the Phase 2 facilities use mixed liquor wasting to control SRT. SRT control is crucial for this plant, since the facility needs to maintain a long enough aerobic SRT to completely nitrify, but as short an SRT as possible to reduce mixed liquor concentrations (and clarifier solids loading rates). If return sludge is wasted, the RAS flow rate affects the sludge concentration, making it difficult to determine the wasting rate to maintain the desired SRT. SRT control is much easier with mixed liquor wasting, since the flow is set based tank volume. For example, to maintain a four-day aerobic SRT, set the waste mixed liquor pumps to waste one fourth of the aerobic aeration tank volume each day. The mixed liquor wasting rate only requires adjustment if the desired SRT changes or tanks are taken off line.

While the same mass of solids is wasted using settled sludge (RAS) wasting or mixed liquor wasting to maintain a given SRT, the flow rate is higher with mixed liquor wasting because of the lower solids concentration. So, the solids loading rate to the downstream thickening process is the same regardless of RAS or mixed liquor wasting, but the hydraulic loading rate is higher with mixed liquor wasting. The DAFTs used for secondary sludge thickening at the VWRf are

compatible with mixed liquor wasting as they can handle the relatively higher hydraulic load.

The waste mixed liquor pumping station will be located north of the mixed liquor channel between the aeration tanks and secondary clarifiers. This location ensures proportional wasting from all aeration tanks. A surface baffle will be installed in the channel to trap foam or scum and direct it to the waste mixed liquor pumping station next to the channel. Submersible pumps with variable speed drives will be used to pump the waste mixed liquor to the DAFTs. The waste flow rate will be set based on the desired SRT. Downward opening slide gates between the channel and the waste mixed liquor pumping station will modulate to maintain a constant water surface elevation in the waste mixed liquor pumping station.

Waste Activated Sludge Pumping. The existing waste activated sludge pumps will be retained as a backup and will be reconfigured so the pump suction piping is connected to the new RAS line to the modified activated sludge system. This system will be available as a backup to the mixed liquor wasting system

Filtrate Equalization and Piping. For the BAR process to work effectively, filtrate flow must be relatively constant to provide a consistent source of ammonia. Therefore, an equalization tank for filtrate is necessary given the intermittent filter press operation throughout the week. To reduce the volume of this tank, we recommend installing a new pipe to separate the filtrate from the DAFT supernatant. To equalize just the filtrate, a tank volume of approximately 270,000 gallons is needed if dewatering is only five days per week.

Peak Flow Management. The plant would like to continue the current peak flow management scheme for large storm events. Therefore, a pipe will be added to route screened raw sewage to the aeration tanks directly using the mixed liquor recycle pumps for situations where the equalization basins are full and flows are high. The plant has historically turned the air off to the last aeration tank during peak flow events to let the solids settle in the aeration tank and reduce loading to the clarifiers.

A thorough analysis based on hourly influent flow data should be performed to predict the frequency and duration of these events. A preliminary analysis based on daily flows shows that if the secondary capacity is equal to the peak day flow, this mode would not be required unless the primary clarifier capacity was exceeded. If the secondary capacity is limited to peak week flows with the existing equalization basins, this mode would occur 0.2 percent of the days, based on the last 9 years of flow data. However, it could occur as often as four days in one month, based on the historical record. As flows increase, this condition will occur more frequently unless equalization capacity is increased.

Nitrogen removal may be impacted during peak flow events, since less aerobic volume will be available for nitrification and mixed liquor recycle flows will be reduced or eliminated, hindering denitrification. Depending on the duration and frequency of these events, the plant may experience problems meeting the monthly total nitrogen limit.

Phase 3

To accommodate the Phase 3 flow of 16.7 mgd, provisions are included for a future aeration tank. This future tank would operate in parallel with the four existing tanks.

Additional clarifiers will also be required for ultimate conditions. Even with an additional aeration tank, solids loading to the existing clarifiers is too high at ultimate flows.

Design Criteria

Design criteria for the recommended secondary treatment facilities for the Phase 2 project are summarized in Table 3. These design criteria are based on the process simulations described above. An aerobic SRT of 3.75 days is recommended for operation at a minimum monthly average temperature of 17.7 degrees C. The mixed liquor suspended solids concentration will vary throughout the year with a constant SRT as influent loads and wastewater temperatures change, but will not affect process performance.

Assumptions Confirmation

The recommendations presented above are based on a number of assumptions which should be confirmed, if possible. These include:

1. Influent flow peaking factors should be confirmed through collection system modeling or other planning efforts.
2. Influent loadings were assumed to have returned to pre-2001 levels because of the sampler relocation. This should be confirmed by analyzing 2006 data, since higher loadings could significantly impact the system design. Preliminary 2006 data indicate that loadings have not returned to earlier levels.

3. The fraction of readily biodegradable COD was based on only two days of characterization sampling. This fraction is critical, since readily biodegradable COD is necessary for denitrification. Methanol addition could be required if this fraction is lower than assumed.
4. A thorough analysis of hourly flows, equalization volumes, and peak flow management should be conducted.
5. Secondary clarifier performance is critical. Comprehensive stress testing of the secondary clarifiers is required to determine maximum surface overflow rates and verify the solids loading rates.

Preliminary Cost Estimate

The preliminary cost estimate will be included in the Preliminary Design Report

OPW 634LPC Low Profile Fill Cap (634LPC-0400)

The OPW 634LPC low profile top seal fill cap is designed for tight installations where the clearance between the top of the fill adaptor and the underside of the spill container cover is limited. The rugged iron lever provides a positive cam-action that seats the cap firmly in the adaptor groove for a water and vapor tight seal. When engaged, the lockable cap adds only 1/2" to the final height of the adaptor. The 634LPC can be used with the 4" OPW 633T, 633TE, 633TC, and 61SA series top seal fill adaptors.

WARNING
 DO NOT OPERATE THIS MACHINE WITHOUT PROTECTIVE GUARD IN PLACE. ANY OPERATION OF THIS MACHINE WITHOUT PROTECTIVE GUARD CAN RESULT IN SEVERE BODILY INJURY.
 -A- SUPPLIED BY FMPC -B- SUPPLIED BY OTHERS

- NOTES:
- (1) ALL FLANGES ARE 125# ANSI DRILLING UNLESS NOTED.
 - (2) ALL DIMENSIONS ARE IN INCHES UNLESS NOTED.
 - (3) DIMENSIONS REFLECT USABLE SHAFT LENGTH.
 - (4) FLANGE IS STANDARD 250# ANSI DRILLING.
 - (5) 5400'S AND 5400K'S ARE DIMENSIONALLY IDENTICAL.
 - (6) BASES ARE DESIGNED TO HAVE FULL CONTACT WITH GROUT OR A SOLE PLATE GROUTED IN PLACE.
 - (7) INSTALL DRIVE SHAFT PER MANUFACTURER'S RECOMMENDATION.
 - (8) NOT FOR CONSTRUCTION, INSTALLATION, OR APPLICATION PURPOSES UNLESS CERTIFIED. DIMENSIONS SHOWN MAY VARY DUE TO NORMAL MANUFACTURING TOLERANCES.

POSITIONS #1 OR #9 ARE STANDARD WHEN VIEWED FROM THE DRIVER END UNLESS OTHERWISE SPECIFIED. CLOCKWISE ROTATION DISCHARGE POSITION #1 SHOWN.

**CITY'S COMMENTS AND
BROWN AND CALDWELL'S RESPONSE**

CITY OF VENTURA COMMENTS AND BROWN AND CALDWELL RESPONSES
TECH MEMO 1 SECONDARY TREATMENT
07-12-2006

1. Verify hydraulic capacity of the existing aeration basin Influent/Effluent weir gates to handle 14 MGD + recycle (parallel flow aeration tanks 1-4)
 - a. Some hydraulic imbalance is evident during current recycle ratio and primary effluent flow pumping regime.
 - i. How much hydraulic capacity is gained by adding the additional 6 effluent gates.

Response: The hydraulic capacity of the proposed modifications will be evaluated as part of the PDR to ensure that peak aeration influent, mixed liquor recycle, and RAS flow rates can be accommodated. The hydraulic flow split among parallel aeration tanks and parallel clarifiers will be evaluated to ensure an equal loading – and equal performance – among parallel process units

- b. Would the existing PE/RAS channels Aeration Tanks 1-4 be converted to MLSS channels?
 - i. Will the existing aeration tank 1-4 influent gates (RAS + PE) handle the increase in recycle flow?

Response: Yes, these channels would be modified for mixed liquor channels serving aeration tank 1 through 4

2. Verify capacity of existing aeration basin effluent ML channel.

- a. In past storm events this channel was a bottleneck

Response: The hydraulic capacity will be calculated and verified as part of the PDR

- b. The channel was tested during the KJ clarifier stress test, however verification may be prudent.

Response: The maximum mixed liquor flow rate during the clarifier stress test was less than 20 mgd, which is less than our projected screened and dewatered raw sewage flow.

3. Concern over the wisdom of wasting MLSS (surface wasting)

- a. Cost consideration of increased pumping.

Response: The waste sludge flow rate with mixed liquor wasting will be approximately three times the flow rate with settled sludge (RAS) wasting, based on a RAS flow rate of 50 percent of the aeration influent flow. The energy cost of pumping mixed liquor could be up to approximately 27 times greater than the cost of pumping settled sludge, assuming the same piping is used. While this appears to be a significant difference, waste sludge pumping is a small component of the plant electrical power cost compared to raw sewage pumping, aeration influent pumping, aeration air blowers, and mixed liquor recycle pumping for example..

- b. Surface wasting for foam control okay, but should consider redundant wasting connection to new RAS pumping system.

Response: An alternate means of wasting settled sludge (RAS) will be provided.

CITY OF VENTURA COMMENTS AND BROWN AND CALDWELL RESPONSES
TECH MEMO 1 SECONDARY TREATMENT
07-12-2006

- c. Concern over the capacity of the existing daft unit process available for increased hydraulic loading due to lower MLSS concentration.

Response: The waste sludge loading to the DAFT will be the same whether mixed liquor wasting or settled sludge (RAS) wasting is used, so there is no change in pressurization air, polymer requirements, or DAFT performance with the wasting system used. DAFT performance is insensitive to hydraulic loading rate, so the additional liquid in waste mixed liquor will not affect DAFT performance. The capacity of the DAFT overflow piping will be verified as part of the PDR.

- d. RAS to WAS connection would provide process alternatives.

- i. Potential routing from new RAS discharge line, through existing RAS/WAS MCC gallery to existing WAS line.

Response: Connecting the new RAS line directly to the existing WAS line would require a flow meter and control valve. A significant headloss across the control valve is needed for adequate process control. There may be insufficient head following the control valve to transport the WAS across the plant to the DAFTs. Reusing the existing WAS pumps, as described below, is the recommended means of providing an alternate sludge wasting system.

- e. Retaining existing WAS station as alternative to surface wasting MLSS

- i. WAS station is fed from existing RAS channel, which would become a MLSS channel?

Response: The existing WAS pump suction could be connected to the new RAS line before it discharges into the new mixed liquor channel. The suction conditions would be similar to the existing (i.e., WAS pumps at grade, elevated RAS water surface elevation (WSEL)).

4. Recycle loads

- a. Tertiary filter backwash recycled flow considered as part of total flow to secondary unit process.
b. BW not listed in recycle loads page 10.

Response: Filter backwash is included in the process simulations, so the simulated mixed liquor concentrations are correct. However, the filter backwash flow was inadvertently left out of the state point calculation used to evaluate secondary clarifier operation. This error has been corrected.

5. Aeration Influent Pumping

- a. System improvements could be considered during design of equalized primary influent line to the channel feeding anoxic tank 1 and aeration tank 5.

Response: Additional aeration influent pumping capacity is needed to realize the additional secondary process capacity provided with the WRF Modifications Project. The existing pumping capacity is 10 mgd and we project an equalized peak day flow of 18 mgd. Pumping station and aeration influent piping modifications are needed to provide a reliable capacity of 18 mgd. However, these modifications are not included in our current scope of work.

CITY OF VENTURA COMMENTS AND BROWN AND CALDWELL RESPONSES
TECH MEMO 1 SECONDARY TREATMENT
07-12-2006

- b. Capacity increase through replacement of existing aeration influent system discharge piping.

Response: See previous response. A parallel pipe could be used with the existing pipe, or a single larger diameter pipe could be used.

- c. Design should include new equalized flow metering (flume on top anoxic aeration tank?)

Response: An in-line flow meter (e.g., magnetic flow meter) with appropriate upstream and downstream piping configuration would provide a more accurate flow signal. Additionally, replacing the existing aeration influent pipe with a single larger diameter pipe would simplify aeration influent metering as only one meter would be needed rather than two meters with parallel pipes.

6. Filtrate equalization and piping

- a. Current operation is 8 to 9 shifts per week

- i. Maximum of 8 batch cycles per shift
- ii. 10,500 gallons of filtrate per batch
- iii. 75 gpm constant flow (24/7) at 9.3 MGD

Response: See following response.

- b. Size of equalization tank?

- i. Significant odor during filtrate no flow periods.
- ii. Review dewatering operation to improve ammonia loading (7-day operation)

Response: The equalization tank will be covered to contain odors. The tank vent will be routed to the primary clarifier bulk media biofilter for odor treatment. Active ventilation of the equalization tank is not necessary; the biofilter will treat any foul air displaced as the tank is filled.

7. Direct RAS pumping

- a. Hatch for pump removal

- i. Located in the new stairwell landing?

Response: Our preliminary sketches show new stairwell landings are not covered. The hatches will be included in the final design if the City decides to cover the new stairwell landings.

- b. Connection to existing WAS line

Response: We will provide the flexibility to waste solids either from waste mixed liquor or from RAS. See response above.

- c. Two pumps running off of one drive

Response: This is feasible, but if VFD is down then both pumps would be out of service. If, for some reason, one pump develops higher torque, it may trip the VFD stopping both pumps. We suggest that this option be considered during final design.

CITY OF VENTURA COMMENTS AND BROWN AND CALDWELL RESPONSES
TECH MEMO 1 SECONDARY TREATMENT
07-12-2006

- d. Reevaluate a one pump per clarifier system?

Response: One pump per clarifier arrangement is indicated on the sketch included in Appendix C. The single pump arrangement would take up too much space and the single pumps would preferentially withdraw sludge from the closest sludge hopper, contrary to the goal of positive RAS control

8. Handwritten comment p.12, second paragraph under Process Recommendations, referring to items not in our scope (primary clarifiers, equalization volume, and aeration influent pumping): Should we be looking at this now too?

Response: These items are not in our scope of work. In our opinion, they should be evaluated. The future peak flow handling requires further analysis. Specific questions which should be addressed: (1) Is the equalization capacity sufficient for peak day flows? If not, how frequently will it fill up? (2) When equalization is full, how will peak flows be handled and how long will these events last? (3) During peak flow events where equalization is full, will the effluent exceed permit limits for nitrogen and other compounds? Is more equalization capacity required?

9. Handwritten comment p.13, referring to selected alternative: Have O&M costs been analyzed to help make the decision? Are there any real alternatives, or is this how it has to be done?

Response: We limited our analysis to process which reused most of the existing tanks to keep capital costs as low as possible. Other alternatives, such as MBRs, new clarifiers, or replacing the tertiary filters with denitrification filters, were not considered for this reason. We have added a brief description of these alternatives to the report. In addition, we have included the capacity for various staging options for new aeration tanks. O&M costs are not expected to be significantly different between these options, and were not considered.

10. Handwritten comment p. 20: We probably need a pretty good idea now how close we will be to budget before we finish a PDR that turns out way too expensive for us to do and after decisions on secondary treatment have been made.

Response: Cost estimates will be included in the PDR. If the probable construction cost of the facilities described in this technical memorandum exceeds the \$17 million construction budget available, we will evaluate staging of these facilities to reduce initial construction costs. For example, one aeration tank could be deferred.

Technical Memorandum

To: Daniel Pfeifer, Wastewater Superintendent
Susan Rungren, Utilities Engineer

From: Ron Moeller, David Seymour, and Mike Joyce
Ventura Water Reclamation Facility (VWRF) Evaluation Team

Subject: Wastewater Master Plan
VWRF Evaluation - Final Sedimentation Tank Stress Testing
K/J 0689017

I. Introduction

As part of the update of the City of Ventura (City) Wastewater Master Plan, Kennedy/Jenks Consultants conducted a capacity evaluation of the Ventura Water Reclamation Facility (VWRF). This technical memorandum presents a discussion of the field stress testing of the secondary clarifiers used to evaluate performance at flows equivalent to 14 million gallons per day (MGD) and greater.

Three methods were used to estimate clarifier capacity: (1) mathematical determinations based on engineering principles, (2) a state-point analysis, and (3) stress testing. In addition to clarifier capacity evaluation, process simulation will help to identify other potential bottlenecks at the VWRF for use in developing a capital improvement plan. This information will enhance the City's ability to meet the needs of the VWRF and its serviced population.

II. Facility Design Criteria

Design parameters for the VWRF secondary clarifiers are identified in Table 1 below and compared with 2005 performance and typical design values.

Table 1: VWRF Design Criteria, 2005 Loadings, and Typical Design Values

Design Parameters:	Average [Peak]
Number of Clarifiers	6
Surface Area (total), ft ²	18,000
Weir Length, linear feet (LF)	2,952
2005 Surface Overflow Rate (SOR), gallons per day per square foot (GPD/ft ²)	564 [830]
2005 Solids Loading Rate (SLR), pounds per square foot per day (lbs/ft ² -d)	6.6 [11.8]
2005 Weir Overflow Rate (WOR), GPD/LF	3,438 [5,061]
Typical Design SOR, GPD/ft ²	400 – 700 [1,300]

Technical Memorandum

Daniel Pfeifer, Wastewater Superintendent
Susan Rungren, Utilities Engineer
31 August 2010
Page 2

Design Parameters:	Average [Peak]
Typical Design SLR, lbs/ft ² -d	20 - 30 [40]
Typical Design WOR, GPD/LF	[20,000]
VWRF Design SOR, GPD/ft ²	570 [850]
VWRF Design WOR, GPD/LF	3,490 [5,180]

As shown in Table 1, the secondary clarifiers are performing near their original hydraulic design criteria, but SOR and WOR are in the mid-range of typical design values. The current SLR is low compared to typical design values, indicating that additional capacity may be available. Stress testing was planned for the secondary clarifiers in order to evaluate the facility's capability to perform beyond its original design. Secondary clarifier #1 is pictured in Figure 1 below.

Figure 1: Secondary Clarifier #1

Page 3

Kennedy/Jenks Consultants met with VWRf staff on 7 March 2006 before conducting stress testing and agreed upon the following plan of action:

- Stress testing will evaluate the operation of five clarifiers at an equivalent flow rate of at least 14 MGD, allowing one redundant unit to be offline.
- Additionally, operation of five clarifiers at an equivalent flow rate of 16 MGD will be attempted toward the end of the stress testing.
- Test parameters will include mixed-liquor suspended solids (MLSS), settleability, Sludge Volume Index (SVI), total suspended solids (TSS), and turbidity (NTU) in the combined effluent channel from individual clarifier launders, from the combined clarifier influent channel, and at the head end of each clarifier. In addition, sludge blanket depths will be measured in each clarifier. These measurements allow individual clarifier operation to be evaluated if it is determined that clarifier performance varies significantly. In addition, the time required for the secondary influent to begin denitrifying will be roughly gauged during testing.
- Settled solids in the isolated clarifiers will continue to be returned to the activated sludge process through the Return Activated Sludge (RAS) pumps.
- Flow will be monitored using the mixed media filter (MMF) flow meter, which is the most accurate and recently calibrated meter.

Because it was determined that the VWRf could not provide 14 MGD of flow for the duration of the test, three clarifiers were taken offline, and 8.5 MGD of flow was run through the remaining three clarifiers to simulate operation at 14 MGD.

Stress testing was conducted on 14 March 2006. Kennedy/Jenks Consultants' participants in the test included Mike Joyce, David Seymour, Joan Venluan, and Ron Moeller. Participants from VWRf included Don Burt, John Willis, Cary Adams, Curtiss Montague, Nick Hardesty, Michael Torres, Mary Champion, and Jason Wong. This stress testing would not have been as successful, nor the results as meaningful, without the assistance of the VWRf staff.

III. Stress Test Procedures

Before beginning the stress test, Kennedy/Jenks Consultant staff collected baseline samples under normal operating conditions to use for comparison. After the baseline samples had been collected, VWRf staff increased flow through the VWRf by increasing the pumping of influent wastewater from the equalization basins. Secondary clarifiers 4, 5, and 6 were taken offline, and flow to the remaining three clarifiers was allowed to stabilize. Samples were collected and blanket depths measured every 30 minutes. During the stress test, samples were collected twice from the secondary influent channel and at the head end of each clarifier. Measurements of MLSS, turbidity, settleable solids, and SVI were taken from these samples.

Technical Memorandum

Susan Rungren, Utilities Engineer

31 August 2010

Page 4

Although the stress test was initially planned to start at a SOR equivalent to 14 MGD with five clarifiers in service, the flow stabilized at a SOR equivalent to 16 MGD. After a brief discussion with VWRP staff, it was decided to maintain the higher flow rate and continue testing while closely monitoring clarifier performance. After 2½ hours, flow was increased to a SOR equivalent to 20 MGD. The increased flow rate gradually decreased over the next 2 hours as the equalization basin emptied. At the conclusion of the stress test, the three operating clarifiers were subjected to 5½ hours of hydraulic and solids loading in excess of an equivalent flow of 15 MGD with five clarifiers. Measured flow during and the equivalent flow through five operating clarifiers are shown on Figure 2 below.

Figure 2: Measured and Equivalent Flows

IV. Stress Test Results and Discussion

When secondary clarifiers 4, 5, and 6 were taken offline at the start of stress testing, the spike in flow through the remaining operating clarifiers resulted in a transient hydraulic plume that carried some lighter solids into the effluent launders. This rapid change in flow resulted in a temporary increase in effluent TSS, as shown on Figures 3 and 4. Similar spikes in effluent TSS were recorded throughout the day as flow was varied, but the increase in effluent TSS appeared to subside after a short stabilization period.

Figure 4: Combined Secondary Clarifier Effluent Quality

Technical Memorandum

Daniel Pfeifer, Wastewater Superintendent
 Susan Rungren, Utilities Engineer
 31 August 2010
 Page 6

As shown on Figure 4, the combined clarifier performance as a result of the increased flow did not deteriorate for extended periods of time, and the effluent quality was well within acceptable TSS and turbidity concentrations. Although both individual clarifier and combined effluent samples were collected, only the combined samples are reported because individual clarifier performance did not vary significantly.

The sludge blanket within each clarifier increased noticeably, as seen on Figure 5 below. As with effluent TSS, the sludge blanket level increased sharply when testing began, but appeared to stabilize after a short adjustment period. It was not determined during the stress test whether or not the RAS pumps possess sufficient capacity to prevent the accumulation of sludge blankets during extended periods of operation at high flows. Because extended operation at elevated flows is not possible at this time, adequate RAS and Waste Activated Sludge (WAS) pump capacities will be evaluated with wastewater process simulations.

Figure 5: Secondary Clarifier Sludge Blanket Depths

The MLSS concentrations measured from samples collected from the combined influent channel and at the head end of each clarifier during stress testing are indicated in Tables 2 and 3 below. Samples were collected at the start of stress testing and at noon, when the influent flow was increased to an equivalent flow of 20 MGD.

Notes:

^(a)mg/L = milligrams per liter.^(b)NTU = Nephelometric Turbidity Units.^(c)mL/L = milliliters per liter.^(d)mL/g = milliliters per gram.

Table 3: Secondary Clarifier Influent at 20 MGD Equivalent (11:30 a.m.)

Time		11:51 a.m.			
ID	MLSS mg/L	Turbidity NTU	Settleability mL/L	Time to Denitrify hr	SVI mL/g
S/C #1	1150.0	8.88	170	3.15	148
S/C #2	1108.4	8.56	170	3.57	153
S/C #3	1176.0	7.70	180	3.65	153
Combined Influent Channel	1352.4	8.74	225	3.58	166

The SVI, which represents the space occupied by 1 gram of sludge, is an indicator of how well the sludge settles and compacts, thus directly indicating sludge quality. A favorable value for SVI is between 75 and 150 milliliters per gram. A low SVI indicates a lack of filamentous bacteria and a sludge that will compact to occupy very little space. A high SVI indicates sedimentation problems, usually caused by filamentous bacteria that bridge across flocs, reducing their ability to compact and settle. Higher mixed liquor SVIs require larger clarifiers and greater blanket depth to settle the activated sludge.

Although the mixed liquor at the VVRF has a relatively high SVI, the clarifiers performed well during stress testing. This was confirmed with a theoretical state-point analysis.

A state-point clarifier analysis produces a flux curve, as seen below on Figure 6.

Technical Memorandum

Daniel Pfeifer, Wastewater Superintendent

Susan Rungren, Utilities Engineer

31 August 2010

Page 8

Figure 6: State-Point Analysis for VWR Secondary Clarifiers

The bell curve is based on sludge quality (SVI). The lower the SVI, the greater the “safe” area under the bell curve. The two lines represent the overflow and underflow (i.e., RAS) rates. The point where the lines cross is called the state point, which is also the MLSS concentration. If the state point is ever outside the bell curve, the clarifiers are overloaded, and increasing solids will be wasted in the effluent. The point where the underflow line touches the left side of the graph marks the solids loading rate. The point where the underflow line touches the bottom of the graph marks the RAS concentration in grams. This underflow line should stay below the right side of the flux bell curve. If it crosses the flux bell curve in this region, solids are being added to the clarifier more quickly than they are being removed. The overflow line represents how quickly solids flux increases, for a fixed flow rate, with increasing solids concentration.

Figure 6 is a representation of the VWRF clarifier performance at 20 MGD of influent flow. Table 4 summarizes the data used to generate the model.

Table 4: State-Point Summary Information

Influent Flow	20	MGD
Total Clarifier Surface Area	14250	ft ²
Surface Overflow Rate	1404	gal/ft ² d
SVI	200	mL/g
MLSS Concentration	1200	mg/L
RAS Flow	5	MGD
RAS Concentration	6000	mg/l
Solids Loading	17.55	lb/ft ² d

Technical Memorandum

Daniel Pfeifer, Wastewater Superintendent

Susan Rungren, Utilities Engineer

31 August 2010

Page 9

As implied by the state-point evaluation, the VWRP secondary clarifiers could potentially operate beyond the evaluated limits of stress testing if the VWRP continues to operate at a low MLSS, which minimizes the solids loading rate.

V. Conclusions

Although the stress testing was not executed as originally planned, it achieved its primary objectives. Based on the data collected during testing, the state-point analysis, and comparison of typical design criteria with recent performance, the VWRP secondary clarifiers appear to have sufficient size and capacity to operate at 16 MGD with only five clarifiers in service, provided that RAS and WAS pumping capacities are sufficient for long-term operation. RAS and WAS pumping capabilities should be evaluated carefully because they were not assessed during stress testing.

Additional consideration should be given to evaluating the activated sludge process to investigate incomplete denitrification in the anoxic selector during the afternoon, which could result in rising sludge blankets in the secondary clarifiers. In addition, further evaluation of the possibility to mitigate certain biological "growth pressures" to gain better overall control of the process by selecting against filaments may prove valuable for future expansion.

CITY OF SAN BUENAVENTURA WASTEWATER TREATMENT PLANT
SLUDGE DEWATERING
ALTERNATIVES EVALUATION

April 2002

This report summarizes the sludge dewatering alternatives evaluation and recommendations. Brown and Caldwell was retained by the City of San Buenaventura (City) to identify and evaluate dewatering options for the ultimate replacement of the existing plate and frame dewatering units.

Objectives of this study included identifying current and future loads to the dewatering process, alternative dewatering equipment, alternative operating scenarios, equipment sizing, building and auxiliary system requirements and modifications.

Introduction

The City is planning an improvements project for their existing Sludge Handling and Disposal Facility. The existing dewatering building contains two plate-and-frame dewatering units that discharge directly to trailers. The building also includes a pump room (pumps that feed the press units), a chemical feed room, a control room, an MCC room, a storage area, mechanical/HVAC equipment, a drive through truck/trailer loading area, and a 5- ton bridge crane. The existing dewatering units are about 20 years old, require full-time attention during operation, spare parts are very difficult to obtain, and the machines are nearing the end of their useful life.

The City's primary goal for this project is to identify a project to include in their Capital Improvement Plan (CIP) that provides the following improvements and benefits: improved dewatering system performance (higher cake concentration), reduced maintenance, less attended operation, and meets sludge dewatering capacity needs with one shift per day operation. Constraints for the project include being able to accommodate the new system structurally within the existing building and to not create an odor nuisance.

Belt filter presses and centrifuges were selected for evaluation as potential replacements for the plate and frame units. Sludge samples were collected and analyzed by two centrifuge manufacturers and one belt filter press (BFP) manufacturer to estimate dewaterability and to project performance of their devices. Visits to several other wastewater treatment plants were made by City staff to review BFPs, centrifuges, conveyors, cake pumps, and cake hoppers.

A sludge use/disposal review was conducted to evaluate the future direction of sludge hauling and land application costs. Costs for sludge disposal are expected to increase over the next several years, which favor alternatives that produce a drier cake. The brief structural review determined that the existing building can be modified to accommodate new equipment, as the new units are lighter and smaller than the existing. However, significant structural modifications would be required to accommodate any dewatered sludge storage inside the building. Building

foundation loading conditions would limit the amount of sludge cake hopper capacity that can be added within the existing building. Additional MCC capacity will be required for the recommended dewatering system equipment.

Several centrifuge and BFP technology alternatives for the existing building were evaluated and screened to determine the most appropriate options. These involved different building modifications including locating the new equipment over the existing floor openings for direct discharge to haul trailers, installation of a cake storage hopper in one of the existing floor openings, locating cake storage outside, and to the south of the building. Varying amounts of dewatered cake storage was possible depending on where the storage would be located. The largest volume of storage is available when located outside the building, and supported by its own new foundation.

Centrifuges. Centrifuges are available in low speed and high speed or high solids versions. Typically, centrifuges installed since about 1990 to dewater wastewater sludges are of the high solids type. These machines operate at almost 2,500 to 3,500 revolutions per minute and exert a force on the solids of about 3,000 to 4,000 gravities. These centrifuges are capable of achieving dewatered sludge concentrations of 20 percent to 30 percent, depending upon the hydraulic load, the relative proportions of primary and secondary sludge, the degree of stabilization, and polymer dosage. The torque that a centrifuge experiences is directly related to the solids inventory in the bowl. As the torque fluctuates, the differential speed of the scroll is varied proportionally. The scroll conveys solids from the bowl to the beach and ultimately to discharge through the discharge ports. Hence, as the speed differential between it and the bowl increases or decreases, solids will be removed more quickly or slowly, respectively. Thus, the rate of removal is varied in response to the solids inventory. This method of control assures consistent cake and minimizes uneven wear.

Polymer must be used to condition anaerobically digested sludge prior to dewatering. The dosage affects the capture of solids and, to a lesser degree, solids content of the cake. For City digested sludge, a polymer dosage of 23 to 27 pounds (active) per ton (lb(active)/ton) of dry solids is required to achieve cake densities between 22 percent and 25 percent at reasonable flow rates (see Appendix 1), when dewatering using centrifuges.

Belt Filter Presses. Belt filter presses have been used since the 1970s for dewatering wastewater sludges. They have two or three belts (1.0-m to 3.0-m wide), which travel through and around a series of rollers. Sludge is dewatered as it passes through distinct zones. In the initial gravity zone, sludge drains under the influence of gentle mixing from rows of stationary "plows" and capillary suction pressure exerted by the belt. In the second compression zone, the sludge is pressed together between two converging belts. In the third pressure zone, the two belts follow a serpentine pattern around a series of rollers. Belt tension combines with the wraparound pattern to exert pressures of up to 350 kPa on the sludge cake. Water expelled from the sludge in these three zones exits through the porous belt; the fine-mesh belt filters solids from the liquid in this passage. Dewatered sludge is scraped from the belt by a knife at the end of the pressure zone and falls into a hopper, which feeds a conveyor or solids pump. In the belt return

area, water sprays are used to clean the belt fabric and expel an enmeshed solids, which then, with the filtrate, are returned to the mainstream process.

The main control parameters for a belt filter press are sludge feed rate and polymer dosage. Typically, the operator monitors the gravity zone and the discharge point. With an appropriate combination of feed rate and polymer dosage, sludge will drain well in the gravity zone and will separate easily from the belt at the discharge point. These are subjective judgments on the part of the operator, who must manually adjust machine settings during a belt filter press run.

Belt filter presses are incapable of achieving as high a solids content as newer generation centrifuges. With the optimum polymer dosage, City dewatered sludge concentrations of 14 to 15 percent would be expected. Compared to City centrifuge dewatered sludge (at 22 to 25 percent), the belt filter press dewatered sludge volumes would be about 40 percent greater.

Belt filter presses are typically open machines requiring high rates of air changes for odor control. The high-pressure spray water increases moisture in the room. Although the belt filter presses use less horsepower (HP) than centrifuges, the total HP requirements increase closer to that of centrifuges when the high-pressure spray water pumps and additional HVAC HP are included.

On the basis of the functional analysis, summarized in Table 1, centrifuges are recommended as the best overall dewatering machine. They will produce a drier cake, resulting in significantly reduced hauling and disposal costs. The life cycle costs and rankings were unchanged when tested with a wide range of power, polymer and disposal costs.

Ten project alternatives were developed. The variations in the alternatives were:

- Either two (one operational and one standby) or three (two operational and one standby) dewatering units.
- Direct discharge of cake to trucks or conveyance to storage hoppers
- For alternatives with cake storage, storage inside the building or outside the building
- For alternatives with cake storage, the use of either conveyors or pumps to convey the cake
- One shift operation 5 days a week, one shift operation 7 days a week. Continuous operation was also considered in the early evaluations.

Table 1. Functional Analysis – Dewatering

Criteria	Belt filter press	Centrifuge
Capital cost	+	0
Operating and maintenance cost	0	+
Maintenance of flows during construction	0	0
Compatibility with existing building	0	0
Odor control	0	+
Cake solids	-	+
Polymer consumption	+	0
Electrical requirements	0	0
Typical life cycle cost	-	+

- + Demonstrates advantage in evaluation category.
- 0 Demonstrates no advantage in evaluation category.
- Demonstrates disadvantage in evaluation category.

Costs for the preferred alternatives are shown below in Table 2.

**Table 2. Project Costs of Preferred Alternatives
(Construction, Engineering, CM and Administrative Costs)**

Alternative Number	Alternative Description	Capital cost, \$M ¹	Present value of 20-year life cycle cost, \$M ²
1	3 Centrifuges, Direct Discharge, 1 shift/day operation (7 days per week)	\$7.3	\$20.9
3	3 Centrifuges, Direct Discharge, 1 shift/day operation (5 days per week)	\$9.6	\$23.7
10	3 Centrifuges, Conveyors to Outdoor storage hoppers, 1 shift/day operation (7 days per week)	\$9.6	\$22.5

- 1 Capital cost includes estimated construction cost, contingency, engineering, construction management and administration.
- 2 Life cycle costs are based on \$2/pound of active polymer, \$0.154/kwhr, and \$23.50/wet ton haul cost.

Background

The existing Sludge Handling and Disposal Facility contains two Edward & Jones plate-and-frame units that dewater anaerobically digested sludge. They were installed in 1983. The units are very labor intensive to run. The facility is currently operated for eight to ten eight-hour shifts per week. Because the dewatered sludge does not release easily from the filter fabric, an operator is always present during operation to scrape cake from the filter at the end of a press run. Spare parts for the units are difficult to obtain and require a long lead time. The units are nearing the end of their useful life, and the City will need to replace them within about 5 years. This technical memorandum summarizes the evaluations of replacement alternative options and recommendations.

Flow and Load Projections

The current average wastewater flow treated by the plant is 9.5 million gallons per day (mgd). The design basis for the evaluations of new dewatering system alternatives is 16 mgd (16 mgd is the projected influent flow for the year 2040 assuming water conservation; reference Chapter 6 of the 1993 VWRP Master Plan). Solids production projections are based on a scale up of existing sludge production values. No changes are currently planned to either the liquid stream or upstream solids stream processes that would significantly alter the unit sludge production rates. Table 3 summarizes the design loading criteria.

Table 3. Current and Projected Solids Loading

Item	Current	Projected for 2040
Influent wastewater flow	9.5 mgd	16 mgd
Thickened sludge production, # TSS/mgd	3020	3020
Average thickened sludge (DAFT) concentration	5.4	5.4
Average volatile fraction in digester feed	78%	78%
Average volatile solids destruction in digesters	57%	57%
Annual average digested sludge to dewatering	64,000 gpd	107,000 gpd
Peak 3-week to average peaking factor	1.22	1.22
Peak day to average peaking factor	1.63	1.63

Operating Hour Scenarios

The existing dewatering facility operates two shifts per day for 2 or 3 days a week, and one shift per day the remainder of the week. The existing plate and frame system would need to run, on average 17 hours per day, seven days a week to process the future solids production. This evaluation initially considered several operating scenarios. These included:

- 24 hours per day, 7 days per week
- one shift per day, 7 days per week
- one shift per day, 5 days per week

The operating hour scenario has a direct impact on the selection of the number and capacity of each dewatering machine. A continuous operation (24/7) would result in the smallest number and/or the smallest capacity machines required. The one shift per day, 5 days per week operation results in the largest machine capacity required.

The City has subsequently decided to plan to move towards overall plant staffing of one shift per day. Therefore the continuous operation alternatives are not considered for recommendation as a preferred alternative.

Sludge Testing and Preliminary Assessment

Existing Plate and Frame Units. The existing dewatering machines produce a dewatered cake that is about 20 percent solids.

Sludge Testing. Two manufacturers conducted dewaterability tests of sludge samples from the City's wastewater treatment plant. One of the manufacturers produces both belt filter presses and centrifuges, and provided dewaterability estimates for both types of machines. The second manufacturer produces centrifuges and provided a performance estimate for their machine. Based on this testing, a dewatered cake concentration of 24 percent was used in the evaluation of the centrifuge options, and 14.5 percent solids for the belt filter press option. The manufacturer's reports are provided in Appendix 1.

Use/Disposal Options. Brown and Caldwell reviewed beneficial use and disposal options for Class B dewatered biosolids as part of this project. The results of the use/disposal options review are presented in Appendix 2. It documents that hauling and disposal costs are expected to rise in the future and that efforts to increase the cake solids concentration should be implemented to offset, or even reduce, this expected cost increase. The projections of hauling and disposal costs were used in the evaluation of life cycle costs for the project alternatives.

Site Visits. We accompanied City staff on site visits to other dewatering facilities. The purpose of the tours was to see operating installations of the types of equipment considered for future installation at Ventura. City staff visited the Riverside, San Bernardino, Rialto, County Sanitation District of Los Angeles County, and Laguna Niguel wastewater treatment plant. City staff saw Andritz, Alfa Laval and other centrifuges, screw conveyors and cake storage hoppers, dry and liquid type polymer systems, and regular and high solids belt filter presses. These trips provided opportunities for staff to see these systems in operation and to talk to their operators to obtain information and insight into relative ease of operation, control and maintenance (a video tape of the site visits was made by City staff).

Current O&M Requirements. Much of the Sludge Handling and Disposal Facility operator's time is spent scraping dewatered cake from the filter units at the end of each press run, and moving the hauling trucks.

Summary of Alternatives

For the first presentation of alternatives to the City, 6 alternatives were developed. Based on input and requests from City staff, three new alternatives were added. After evaluation of the combinations of equipment sizing and operating hours, the City requested a tenth alternative be added. The ten alternatives are briefly described below and summarized in Table 13 in Appendix 4. All alternatives include new digested sludge feed pumps with variable speed control, sludge grinders, polymer storage/dilution/aging/ feeding systems, and odor control.

Alternative 1. This alternative would consist of three 165 gpm centrifuges that would be located for direct discharge to the haul trucks through the existing openings. Two machines would be positioned over the existing openings. A third unit would have a reversing (bi-directional) conveyor that could discharge to either truck bay. No cake storage would be provided. The centrifuges are sized based on one shift per day, 7 days per week operation. The layout for this alternative is shown on Figure 1, all drawings are located in Appendix 3.

Alternative 2. This alternative would consist of three 165 gpm centrifuges that would each discharge to cake pumps that would convey the material to a storage hopper. The cake pumps would be located on the first floor, in one of the existing truck bays. The storage hopper is located in one of the existing floor openings above one of the truck bays. The centrifuges are sized based on one shift per day, 7 days per week operation. The layout for this alternative is shown on Figures 2 and 3. Four to eight hours of storage would be provided.

Alternative 3. This alternative would consist of three 225 gpm centrifuges that would be located for direct discharge to the haul trucks through the existing openings. It is similar in layout to Alternative 1 (refer to Figure 1). No cake storage would be provided. The centrifuges are sized based on one shift per day, 5 days per week operation.

Alternative 4. This alternative would consist of two high-capacity (350 gpm) centrifuges. Each would be located directly over one of the existing openings for direct discharge to the haul trucks. No cake storage would be provided. The centrifuges are sized based on one shift per day,

7 days per week operation. This and the other two-machine alternatives provide the least back-up or redundant capacity. The layout for this alternative is shown on Figure 4.

Alternative 5. This alternative would consist of three 165 gpm belt filter presses located for direct discharge to the haul trucks. The belt filter presses are sized based on one shift per day, 7 days per week operation. The layout for this alternative is shown on Figure 5. Due to the open nature of the dewatering process on the belt filter presses, this alternative would have the highest ventilation and odor control requirements.

Alternative 6. This alternative would consist of two smaller centrifuges, 125 gpm, sized for a 24 hours per day, 7 days per week operation. The machines would be positioned for direct discharge to the haul trucks. It is similar in layout to Alternative 4 (refer to Figure 4).

Alternative 7. This alternative would consist of two smaller centrifuges, 125 gpm, sized for 24 hours per day, 7 days per week operation. The centrifuges would discharge to a system of screw conveyors that would transport the cake to storage/loadout hoppers located on the south end of the building. Trucks would continue to drive through the building as part of their route. This alternative is shown on Figures 6 and 7.

Alternative 8. This alternative would consist of two high-capacity (350 gpm) centrifuges. The centrifuges are sized based on one shift per day, 7 days per week operation. The centrifuges would discharge to a system of screw conveyors that would transport the cake to storage/loadout hoppers located on the south end of the building. The layout for this alternative is shown on Figure 8. Reference Figure 7 for similar cross-section with the exception that the centrifuges are of different capacities.

Alternative 9. This alternative would consist of three 225 gpm centrifuges that would discharge to cake pumps that would transport the sludge to storage hoppers located on the south end of the building. The centrifuges are sized based on one shift per day, 5 days per week operation. The layout for this alternative is shown on Figures 9 and 10.

Alternative 10. This alternative would consist of three 165-gpm centrifuges, sized for a one shift per day, 7 days per week operation. The centrifuges would discharge to a system of screw conveyors that would transport the cake to storage/loadout hoppers located on the south end of the building. The layout for this alternative is shown on Figure 11. Reference Figure 7 for similar cross-section with the exception that the centrifuges are of different capacities.

Auxiliary Systems

Digested Sludge Storage. At the 2040 projected flows and loadings, the existing digested sludge (DS) storage upstream of dewatering will provide 0.5 day of storage at future peak day, 0.7 (17 hours) days at peak week, and 0.82 days (20 hours) on average day. DS storage volume is important to consider when evaluating dewatering scenarios with less than 24 hour per day operation. The existing DS storage volume is just adequate at peak week to hold for 8 hr/day, 7 day per week dewatering. Unless additional DS storage is built, at peak day loadings either sludge will have to be stored in the digesters or the dewatering operation will have to run additional hours.

To consider a 5-day-per-week operation, additional DS storage volume would be required. Combined storage for 64 hours at average would be required.

Cake Solids Holding. The ability to hold and store dewatered cake enhances operational flexibility and reliability, and reduces operator hours to monitor and move trucks. With the existing system, cake is discharged directly into trucks. The plate-and-frame dewatering operation is a batch type process, providing time to move a full truck and position an empty one without interfering with the dewatering production. Both centrifuges and belt filter presses are continuous flow devices. If these machines discharge directly to the haul truck, the level in the truck will have to be monitored closely. Feed to the dewatering machines would have to be stopped when switching trucks. Also, the new dewatering devices discharge at a single point, where the plate-and-frame units discharge over the entire length of the machine. More time would be required to move, or "jockey" the trailers to make sure that the dewatered cake product is loaded evenly in the trailer.

If cake holding capacity were provided, the time spent coordinating loading sludge cake into hauling trucks would decrease. Two options for providing cake storage hoppers were considered: installing a hopper inside the building, and installing a hopper outside the building, to the south. Cake storage inside the building would be limited by the structural load capacity of the building, and clearance requirements for a truck to drive under the hopper and through the building. A hopper inside the building could provide about 4 to 8 hours of storage. With a hopper location on the same floor as the dewatering equipment, there is not enough space (horizontally or vertically) to transport the cake from the centrifuges to the hopper using conveyors. Therefore, this alternative is shown using cake pumps to convey the dewatered sludge. The centrifuges would discharge through chutes to the cake pumps, which would be located on the first floor. The pumps would then convey the material back up to the second floor to the hopper. The layout and cost estimate for this type of configuration is based on open-throat progressing cavity pumps.

Additional storage could be provided with a new hopper structure. This structure could be located adjacent to the building on its south side. Truck routing would remain the same as existing. The location allows for a screw conveyor system to transport cake to the hoppers. The layouts and cost estimates for the hoppers assume 2 days of storage (at average), a live bottom screw load out system, and covered hoppers vented to odor control. The area underneath the hoppers where the trucks load is assumed to be open (not enclosed). The hoppers would be mounted on load-cells that would be used to control the weight of sludge cake discharged to the haul trucks. A load cell system continuously weighs the amount of cake within the hopper. Changes in the hopper weight during loading determine the amount of cake that is loaded into the hauling truck. The accuracy of a load cell is around 2.5 percent. Load cells could be provided with a control system to support an automated load-out sequence. The control panel typically displays the total weight of the hopper and the amount of sludge cake being loaded into each sludge hauling truck. Load cell weighing systems include interconnecting cables and a central control panel to provide instantaneous and accumulated loads from each hopper.

Increasing the cake solids holding capacity is expected to decrease hauling costs. By having at least one day's worth of storage, the hauler could pick the time of day most convenient for their operation for sludge pick-up. Typically, this is first thing in the morning. This provides more flexibility in scheduling for the hauler and typically results in lower contract hauling costs than when the hauler is required to provide trucks around-the-clock to match production. If weekend or holiday hauling is eliminated, the cost might be even less. A slightly decreased hauling cost (\$/wet ton) was used in the present worth analyses for alternatives with cake storage.

Building HVAC. Some modifications to building HVAC and odor control additions will be required, and modifications will vary based on the alternative. A belt filter press installation would require the most ventilation. It is an open process (the sludge is always exposed to air), and one that can create a high humidity environment in the room (due to the high pressure wash water sprays and cascade of filtrate from the machine itself). Cake storage hoppers will require ventilation to odor control.

The City has experience with biological foul air treatment and is installing a biological filter for odor control. The City intends to operate and evaluate the biological filters for about 2 years before deciding on the type of odor control unit for the dewatering facility. If a biological filter is selected, it could be located in the area between Digester 3 and future Digester 4, as shown on Figure 14 (it is likely that the timing of the dewatering replacement project would coincide with the construction of Digester 4; if so, the staging of the construction in the area of Digester 4 will be simplified).

Cake Transfer System. Dewatered sludge cake is typically transported by positive displacement cake pumps, direct discharge or mechanical conveyors (such as shaftless screw augers or belts). Cake pumps require significantly less space than the other alternatives and have less location restrictions in existing facilities than conveyors or direct discharges. They also offer odor control, provide more flexibility in discharge locations or changes, reduce spill potential, and can often be more easily accessed for maintenance. However, their capital cost is typically higher than a conveyor system, and they typically have higher maintenance and parts

replacement costs. The City's engineering and operations staff have indicated a preference for conveyors over cake pumps.

Belt conveyors have high spill potential and can be relatively high maintenance. In addition, their angle of incline is limited to approximately 15 to 20 degrees above horizontal, which greatly impedes their practicality in a facility with limited space. Screw conveyors provide an economical and reliable means of sludge cake transfer. A screw conveyor's trough is typically covered to minimize spill potential. Screw conveyors of long lengths (greater than about 25 feet) require intermediate bearings for additional support. A screw conveyor's capacity decreases as its angle of incline increases. Screw lengths and screw incline angle should be minimized for optimum performance. City staff indicated that covered screw conveyors were the cake transfer equipment they preferred.

Polymer System. The existing polymer feed system dilutes an emulsion polymer solution and feeds the solution to the sludge feed for the plate and frame units. It includes several bulk chemical storage tanks that may be able to be reused for the new system.

The costs for each alternative are based on the addition of a bulk storage tank, a dual emulsion and mannich dilution system, two blend/age tanks, and one adjustable speed polymer solution feed pump per dewatering device.

Control System. Various degrees of automation are available for dewatering systems. Systems can be completely manually controlled, automatically controlled, or automatic with manual capabilities. We recommend a programmable logic controller (PLC) based system for each dewatering train. The PLC system provides for safety interlocks, automatic sequencing of startup and shutdown, some automatic adjustments and alarms.

These automatic control systems are typically provided by the dewatering equipment manufacturer and control the digested sludge feed pump, dewatering machine, polymer solution feed pumps, and any connected cake conveyance equipment. A separate PLC-based control system would control a cake storage and load-out system.

Some systems are available commercially for polymer dosing control. These systems have not yet been perfected, but could be reevaluated when the project goes into design.

Building Structural. Modifications to the existing structure will be required to accommodate new equipment in alternate locations. The weight of new centrifuges will be less than that for the existing plate and frame units. The load from a storage hopper mounted inside the building is very high and is not recommended.

New equipment will be of a different configuration than the existing units, and will necessarily be supported differently, transferring the load into the structure at different locations. During design, a detailed evaluation of loads and load transfer needs to be performed. We expect that modifications to the second floor will include new penetrations for centrifuge discharges and spanning existing openings with new equipment supports. New concrete and/or steel beams will

be required to support the new equipment and transfer the loads to the walls and foundation. We expect that these new beams would be installed on the bottom side of the slab.

A change to rotating equipment will introduce the potential for translation of vibration into the structure. The centrifuges and associated piping must be specified with vibration isolation. The mass of the building is significantly greater than the mass of the equipment and appears adequate to withstand the vibration. At the time of designing the new floor support beams, the floor stiffness and natural frequency need to be calculated and checked.

The existing building was designed in 1980. The Uniform Building Code requirements for seismic requirements have changed since the building was completed. However, since the occupancy and use of the building will be unchanged, code does not require a seismic upgrade of the building. At the time of design, a detailed analysis of the floor will be required. That analysis should include a detailed review of the wall to floor and roof to floor connections. These connections may need to be upgraded or stiffened for either load or vibration. You may evaluate at that time if any seismic upgrades are desired.

Temporary Facilities during Construction. All of the alternatives will require temporary dewatering capabilities during construction. Trailer-mounted dewatering machinery brought on site would be required and would cost approximately \$175,000. The temporary dewatering equipment, cake conveyance, and truck loading would be outdoors and probably without odor control.

Equipment Access. Access to equipment for monitoring during operation and working space around the equipment for maintenance would be addressed in all alternatives. Space adjacent to BFPs for roller removal would be provided in Alternative 5. Pull space for centrifuge scroll, bowl and feed tube removal would be provided in all other alternatives.

Electrical Power. According to the single line diagram for the Sludge Handling and Disposal Facility (drawing 1E04, 1980), the MCC for the building (1MCC) has a 600 amp bus. Although there is some spare capacity in the MCC, it will not be adequate for a new centrifuge dewatering system. A second MCC of about the same size, depending on the alternative, will be required.

Permits. As neither the use nor the capacity of the dewatering building will be changing, there should be no CEPA/NEPA requirements.

Typical local permits, including but not limited to, building permits, air permits, and stormwater management plans will be required for construction.

Preliminary Project Costs and Life Cycle Costs

Preliminary project costs were estimated for each alternative. Project costs include the estimated construction cost, contingency, engineering, construction management and administrative costs. A summary of the costs is presented in Table 4.

We prepared a 20-year life cycle cost for each alternative, using a 3 percent inflation rate, and 6 percent effective annual interest rate. The life cycle costs are the present worth of the project cost and 20 years of operations and maintenance costs. For each alternative the following values were used:

- Electrical power at \$0.154/kwhr
- Polymer at \$2.00/pound (active)
- Hauling and disposal at \$23.50 per wet ton

In addition, the following assumptions were made for labor:

- One full time equivalent (FTE) per shift for alternatives without cake storage
- One half of a FTE per shift for alternatives with cake storage
- 1.25 operator shifts per shift of dewatering (8 hours of operation, plus one hour to start up, and one hour for shut down and clean up.)
- \$70,000 per FTE per year
- Maintenance costs were estimated as 3 to 8 percent of the equipment cost, depending on the complexity of the equipment.

A summary of annual operations and maintenance costs are presented in Table 5. Life cycle costs are presented in Table 6.

Capacity Machine Cost (each)	Alternative 1 Direct Discharge 3 Cent 7 shifts 165 GPM \$425,000	Alternative 8 Pump/Storage 3 Cent 5 shifts 225 GPM \$425,000	Alternative 9 Pump/Storage 3 Cent 5 shifts 225 GPM \$425,000	Alternative 10 Conveyor/Storage 3 Cent 7 shifts 165 GPM \$425,000

SLUDGE DEWATERING ALTERNATIVES EVALUATION

Table 6—Present Worth of Project Alternatives

Alternative Number	Alternative Description	Present value of 20-year life cycle cost, \$M	Relative Ranking	Comments
1	3-Centrifuges Direct discharge to trucks 1 shift/day, 7 days/week	\$20.9	2	Preferred alternative
2	3-Centrifuges Cake pumps & Storage 1 shift/day, 7 days/week	\$23.7	8	City prefers not to have cake pumps, therefore not a preferred alternative
3	3-Centrifuges Direct discharge to trucks 1 shift/day, 5 days/week	\$23.7	9	Preferred alternative
4	2-Centrifuges Direct discharge to trucks 1 shift/day, 7 days/week	\$21.8	4	City preference is for a 3 machine installation for better reliability & redundancy, therefore not a preferred alternative
5	3-Belt filter presses Direct discharge to trucks 1 shift/day, 7 days/week	\$23.5	7	High PW costs due to low cake solids, highest priced alternative as haul costs increased. Therefore not a preferred alternative
6	2-Centrifuges Cake pumps & Storage 24 hours/day, 7 days/week	\$21.1	3	City preference is for a 3 machine installation for better reliability & redundancy, therefore not a preferred alternative
7	2-Centrifuges Conveyors & Storage 24 hours/day, 7 days/week	\$20.7	1	City preference is for a 3 machine installation for better reliability & redundancy, therefore not a preferred alternative
8	2-Centrifuges Conveyors & Storage 1 shift/day, 7 days/week	\$23.2	6	City preference is for a 3 machine installation for better reliability & redundancy, therefore not a preferred alternative
9	3-Centrifuges Cake pumps & Storage 1 shift/day, 5 days/week	\$23.8	10	City prefers not to have cake pumps, therefore not a preferred alternative
10	3-Centrifuges Conveyors & Storage 1 shift /day, 7 days/week	\$22.5	5	Preferred alternative

(\$M = millions of dollars)

The polymer usage rates are based on dewatering equipment manufacturers' projected usage rates estimated as part of their sludge dewaterability test results. Usage rates used were 27 pounds (active) per ton for centrifuges and 22 pounds (active) per ton for belt filter presses.

Electrical power costs are based on the main motors driving the dewatering equipment, i.e., the main and back drive for the centrifuge and the belt drive for the BFP. Washwater power costs are based on washwater equipment for the BFP and ancillary system power costs for the centrifuge, such as lube oil power and polymer system power.

Cake solids concentrations are based on expected performance for each machine type. The wet tons of cake solids per year are based on the product of total dry solids and capture efficiency divided by the percent solids. The cake hauling rate of \$23.50 per wet ton of cake is based the current unit hauling rate.

Sensitivity Analysis. We calculated the present worth of all 10 alternatives at various polymer, power and hauling cost to determine if the relative ranking of the projects was sensitive to variations in any of these factors. The ranges used in the sensitivity analyses were:

- Polymer -- \$1.50 to \$2.50 per pound (active)
- Power -- \$0.075 to \$0.154/kwhr
- Hauling-- \$23.50 to \$40/wet ton

The variation of these element costs did not change the ranking of the lowest present worth alternative. The variations did not change the relative rankings of the preferred alternatives. As the hauling price increased, the present worth of the belt filter press alternative increased much more than the others, due to the low estimated cake solids from the BFPs. Table 12 in Appendix 4 summarizes this analysis.

Construction Costs. Construction costs are based on the estimates in Table 3. Engineering fees, construction management fees and administration fees were assumed to be 30 percent of construction costs. The 20-year total present value cost is the sum of the capital cost and the 20-year present value of O&M costs. As expected, the capital cost of the project increases as the scale of the project increases. Alternative 1 has the lowest life cycle cost but some nonquantifiable costs are not addressed adequately, such as improving the environmental conditions in the building and subsequent worker health and safety, minimizing odor release potential, easing truck loading, improving operator time efficiency by minimizing time spent attending trucks and monitoring BFPs, and addressing machinery preferences of staff.

Recommendations

To meet the future loadings to the plant, to provide additional reliability and redundancy, while lowering the labor hours necessary to operate the facility, we recommend that Alternative 10 be selected. This alternative includes cake conveyance and storage. Though the life cycle cost of the project is slightly higher than the similar alternative with direct discharge (Alternative 1), we

believe that it provides better operational flexibility. Alternative 10 will also become more attractive as operator salaries continue to increase. The following features are part of this alternative:

- Three 165-gpm centrifuges, two duty and one standby unit.
- Classifying conveyors under each centrifuge. The conveyors serve two purposes, they allow the initial liquid that passes through the machine at start up to drain away, and they convey the sludge to the transfer conveyors. Each classifying conveyor will have two discharge gates, each will discharge to one of the transfer conveyors. The gate positions would be selected manually, and would reflect which transfer conveyor is in service.
- Two transfer conveyors. Each will be sized to take the full cake production load. One unit will be duty, the other standby. The transfer conveyors will convey the sludge to a distribution conveyor on top of the cake hopper.
- One distribution conveyor. This conveyor will be reversing, and will direct the sludge for distribution through multiple ports or gates into the storage hopper.
- The storage hopper will have two units, each with a load out conveyor. Each will be oriented such that a truck positioned to go through the drive through will be able to receive a load of sludge. The load out conveyor will have multiple ports to distribute the sludge as it loads into the trailer.
- Hoppers with a total of two days sludge cake holding capacity (for the design year 2040).
- Load cells on the new hoppers for sludge cake production and loadout.
- New dual polymer dilution system.
- Installation of new DS feed pumps in the existing pump room.
- Installation of a new MCC in the MCC or Control Room.
- Additional odor control capacity.
- Adequate access to the dewatering machinery and associated equipment for operational monitoring and maintenance work.

The process schematic site layout and auxiliary system layouts for the recommended alternative are provided in Appendix 3 (Figures 13 through 16).

Conceptual Plan for Construction of an Ocean Outfall

3 December 2007

Technical Memorandum

To: Dan Pfeifer, City of San Buenaventura

From: Al Shewey and Alison Evans, Kennedy/Jenks Consultants

Subject: City of San Buenaventura - Ventura Water Reclamation Facility
Conceptual Plan and Conceptual Cost Estimate for Construction of an Ocean Outfall
K/J 0689017

Introduction

Kennedy/Jenks Consultants (K/J) was asked to prepare a conceptual plan and profile for an ocean outfall from the Ventura Water Reclamation Facility (VWRF) in order to assess the length, size and location. Contractor input is included to evaluate construction strategies and to assist with preparation of a conceptual construction cost estimate. The conceptual findings contained herein are intended to assist City staff with an assessment of ocean discharge as a viable option for the City along with identification and review of the key issues and decisions required to move forward with a potential next step in defining a preliminary design process for an ocean outfall.

The outfall would serve as a potential alternative to accommodate excess discharge of tertiary treated wastewater that otherwise would discharge to the Santa Clara River Estuary (Estuary). In accordance with provisions stated within the renewed Draft NPDES Permit No. CA0053651, scheduled for additional workshop discussion by the Los Angeles Regional Water Quality Control Board (LARWQCB) and interested stakeholders on 6 December 2007, the City of San Buenaventura (City) has been directed to reduce discharge to the Estuary by 1 million gallons per day (MGD), each calendar year commencing within 3 years of NPDES adoption (to provide for construction of needed infrastructure), with full elimination expected by 2018.

According to the City's Recycled Water Market Assessment, completed by K/J on 26 April 2007, only approximately 1.9 MGD of the total 14 MGD capacity discharged from the VWRF can be accommodated by existing and proposed recycled water users, including large landscapes, golf courses, etc. This shortfall requires the assessment of a realistic alternative that can be completed within the predetermined timeframe.

The following memorandum describes the major conceptual design components anticipated for an outfall, including a very generalized conceptual alignment (i.e., size, length and location), depth and length of ocean pipeline, and construction materials, technologies and conceptual level estimates of probable costs.

Outfall Sizing

Wastewater flow projections to the VWRP are identified in the City's Wastewater Master Plan, under preparation by K/J, and are summarized in Table 1. The Annual Average, Maximum Month, Maximum Day and Peak Hour Flows are based on the peaking factor curves presented in the Wastewater Master Plan and previous technical calculations conducted by K/J in July 2006.

**TABLE 1
TOTAL PROJECTED FLOWS**

Development Condition	Annual Avg. Flow	Max Month Flow	Max Day Flow	Peak Hour Flow
General Plan	14 MGD	17.5 MGD	23.8 MGD	37.8 MGD

Although the Peak Hour flow rate (37.8 MGD) can likely be attenuated by offline storage, resulting in a comparable rate to the Max Day Flow (23.8 MGD), it is anticipated that full build-out will ultimately create larger Max Day flows than those identified under the General Plan rates above. For this reason, it is expected that the outfall would be sized to accommodate a capacity of 35 MGD.

Because an ocean outfall will be lengthy (about 2,000 lineal feet [lf] from the beach) and there is minimal elevation head currently available from the existing VWRP outfall, an effluent pumping station will still be required to provide the head necessary to transport the effluent to a discharge point in the Ocean. The size of the pipeline can be determined by using pressurized full pipe flow equations and nomographs since a pumping station is necessary. A 30-inch inside diameter pipeline transporting 35 MGD will have a velocity of 11.3 feet per second and a head loss of 9.4 feet per thousand feet of pipe length for an HDPE pipeline with an assumed "c" value of 140. An outfall that is 5,280 lf (1 mile) in length will generate approximately 50 feet or 22 psi of friction head loss to drive 35 MGD.

Based on these forecast flow assumptions and calculations it is recommended that a 30-inch ocean outfall pipeline be installed.

Conceptual Alignment

At first glance, the shortest possible outfall alignment would extend due west from the VWRP. Figure 1 graphically depicts this option in both plan and profile views. Two things are readily apparent from this figure:

1. About 2,000 feet of outfall is required from the southwest corner of the VWRP to the beach.
2. At a distance of one mile westerly from the beach the depth of water is estimated to be only approximately 15 feet.

Technical Memorandum

**FIGURE 1
POTENTIAL VWRF OCEAN OUTFALL PLAN AND PROFILE**

Mr. Dan Pfeifer
3 December 2007
Page 4

From the VWRF to the beach, the barriers to construction are significant, including extensive land development and the Santa Clara River Estuary. For these reasons we considered a construction method that initiates Horizontal Directional Drilling (HDD) at the southwest corner of the VWRF continuing with this method to the termination of the outfall at a distance of approximately one mile offshore. The total distance under this alignment option is approximately 7,300 feet.

This launch point was selected because the identified area is on VWRF property, or would be in close proximity to the VWRF on land immediately to the south or west. A plant access road is located south of the existing digesters and extends easterly past the effluent pump station to the southeast corner of the VWRF site. This area provides room to develop a temporary construction site and sufficient length to fuse polyethylene or welded steel pipe and string it out behind the HDD launch location to the east. An open area is also available where future expansion room for a fourth on-site digester presently exists that can be used for mud recovery, staging, storage, an office, and related construction staging needs.

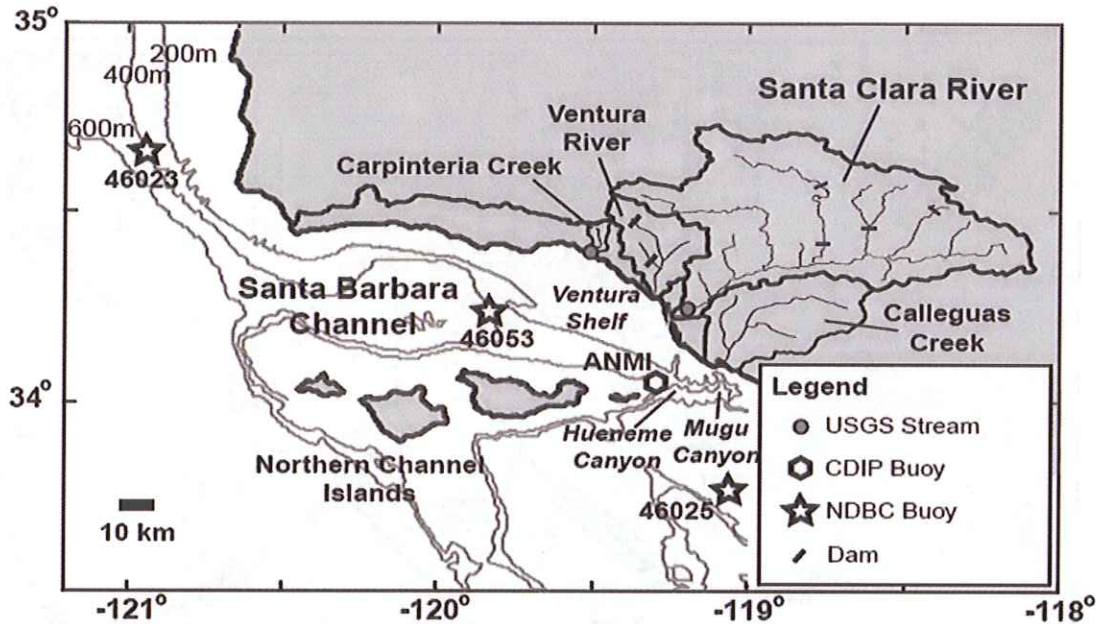

Specifically, the anticipated outfall alignment would begin at the southwestern corner of the VWRF and would extend west for approximately 0.28 miles (1,490 lf) to the south of the Spinnaker Drive right-of-way, until it reaches Surfer's Knoll Beach. Once at the beach, the pipeline would continue for approximately 0.11 miles (572 lf) under the beach located south of the Ventura Harbor. The pipeline would then travel offshore for one mile (approximately 5,280 lf) to resurface on the seafloor outside of the surf line. Installation of the pipeline using HDD operations, as indicated, is expected to be required to reduce the potential for drilling spoils to enter the sensitive estuarine and near-shore ocean environments, and to reduce or avoid scouring effect from large wave action and ocean-current disturbance of the pipeline. In addition, it is expected that a diffuser on the sea floor to connect the exit portal and diffuser would be required at the pipeline's exit point.

This alignment includes approximately 0.39 miles (2,062 lf) of land-based pipeline, and 1 mile (5,280 lf) of ocean pipeline, for a total of 1.39 miles of pipeline.

Conceptual Ocean Outfall Profile

The proposed outfall alignment would be located on the Ventura mainland shelf, with a shore crossing onto the Oxnard Plain. The onshore Oxnard Plain and Santa Clara River Valley, together with the adjacent offshore Ventura Mainland Shelf and Santa Barbara Channel form the Ventura Basin. The Ventura Basin is an elongated deep geologic basin that bisects the Transverse Ranges between the Santa Barbara Channel and the San Gabriel Fault, and is bounded on the north by the Santa Ynez Mountains and on the south by the Santa Monica Mountains and the Santa Barbara Channel Islands (CMWD 2007 and J.A. Warrick et al. 2004), and shown in Figure 2.

FIGURE 2
REGIONAL GEOLOGIC BASINS

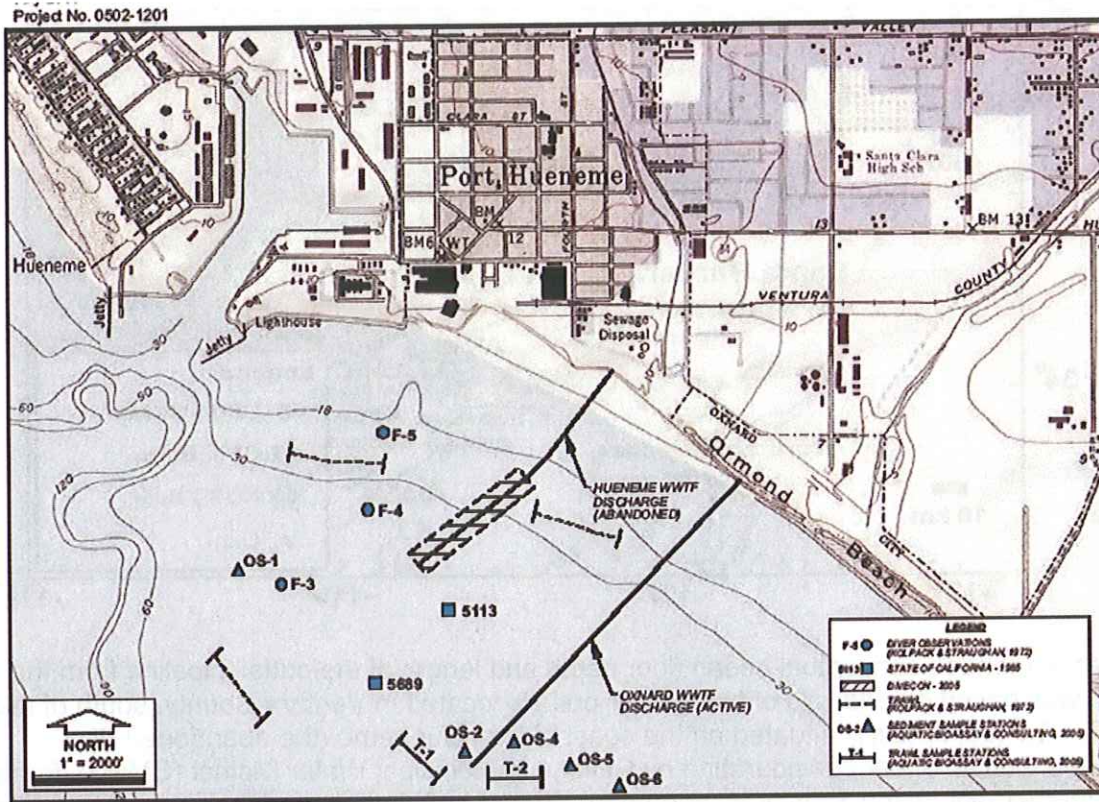

The recommended conceptual ocean floor depth and length of the outfall pipeline from the WRF was based on analysis of two similar outfalls located in Ventura County, south of the WRF. The first outfall is situated off the coast of Port Hueneme (the abandoned Port Hueneme Outfall, under consideration by Calleguas Municipal Water District (CMWD) for re-use and improvement as the Salinity Management "Brine Line" Outfall) and the second outfall is situated off the coast of Oxnard (the Oxnard WWTP ocean outfall). Figure 3 identifies the location of these two outfalls on a USGS quadrangle map (CMWD 2007).

Brine Line Outfall

The Brine Line outfall, once constructed, will extend a total of 0.95 miles (5,000 lf) offshore, and at its terminus will be located at a depth of 48 feet below sea level. Specifically, the HDD and outfall component of the Brine Line requires the installation and operation of approximately 5,000 feet of pipeline comprising an offshore outfall from the parking lot to the shoreline west of the Port Hueneme Fishing Pier where it terminates offshore. The initial 2,350 feet of outfall pipeline extends from the parking lot under the surf zone to a tie-in point in approximately 30 feet of water. The remaining 2,350 linear feet of pipeline extends from the tie-in point to the diffuser in approximately 48 feet of water.

FIGURE 3
 LOCATION OF HUENEME AND OXNARD WWTP OUTFALLS

Oxnard WWTP Outfall

The Oxnard WWTP outfall extends offshore approximately 1 mile, and is at a similar depth ranging from 30 feet to 50 feet below sea level at its terminus. The Oxnard WWTP outfall is designed for an average flow of 18 mgd, and a maximum design flow of 37.1 mgd. The outfall currently discharges secondary treated effluent.

Ventura WRF Outfall (Conceptual)

Accordingly, it is recommended that the WRF ocean outfall be conceptually designed to a length of 1 mile. The depth of the outfall will be less than either of the outfalls indicated above due to the long gentle slope of the Ventura Shelf extending outward from the beach at the WRF facility. Available depths on this shelf are 20 feet or less extending several miles from the beach. Geotechnical reports along the beach north of the WRF and seafloor contour information verify the existence of a long gentle sloping shelf extending westward from the beach comprised of sands, gravels, silty sand and interspersed clay layers.

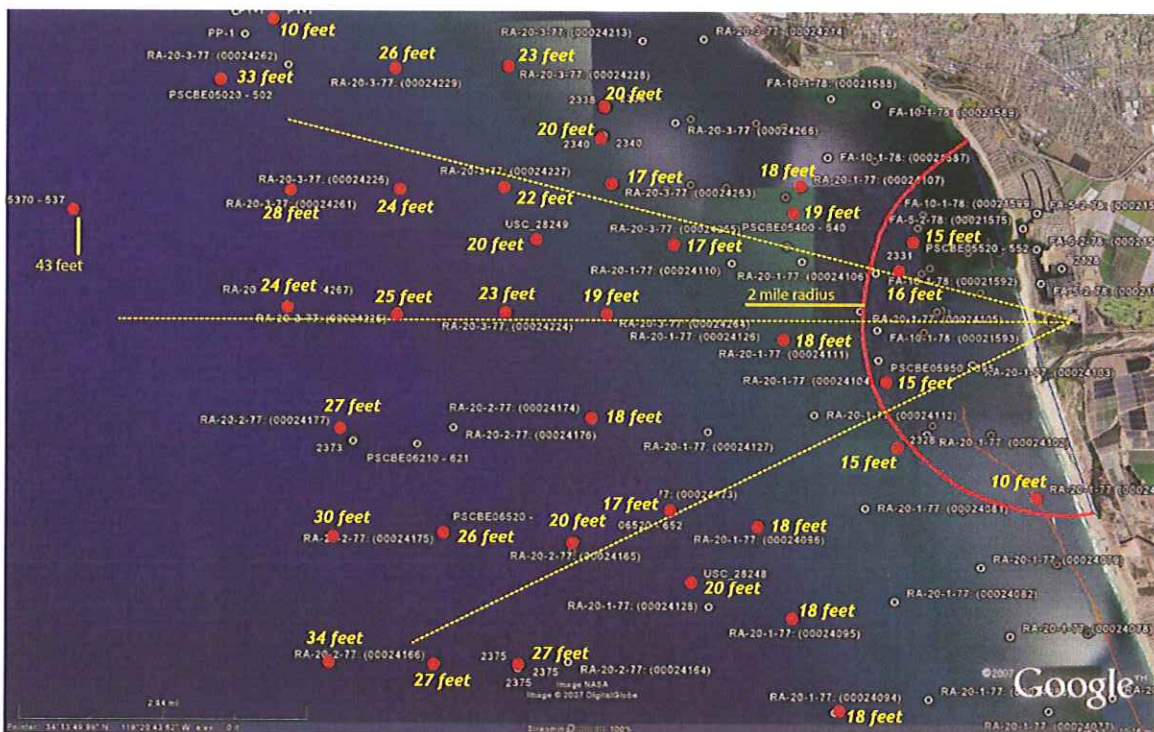

Studies conducted on the sediment dispersal and turbidity plume associated with large runoff events of the Santa Clara River indicate that rapid settling of sediment mass occurs immediately within 1 km (3,280 feet) of the river mouth (at depths ranging from 10 to 18 feet below sea level), and continues to settle (albeit more slowly) outside of this relatively shallow Ventura mainland shelf (J.A. Warrick et al. 2004). Other outfalls in the area presented above extend outside of the initial 10 m isobath (about 32 feet below sea level). The question for the VWRFF outfall that remains to be answered is how dependent is depth in this range to obtain adequate mixing and reduction of potential turbidity plumes at the point of dispersal. A site-specific model that evaluates tidal action, impact of wind, outward migration of groundwater from the Santa Clara River Watershed and other factors is needed to determine the amount of mixing obtained in shallower water.

The actual depth and length needed to ensure proper mixing of effluent ratios would be defined and confirmed in future studies, should the outfall become a viable option for handling the additional discharge requirements following adoption of the NPDES restrictions.

Seafloor Elevations Ventura Shelf

Figure 4 provides elevation information of the seafloor on the Ventura shelf. It is significant to note that the seafloor exhibits a gentle slope from the beach westerly for a distance of several miles. Little additional depth is obtained from extending the outfall beyond 1 mile from the beach. To obtain a significant increase in ocean depth requires a minimum of 9.5 miles of outfall from the beach. This distance is well beyond the available technical capability of current trenchless methods and available funding from the City.

FIGURE 4
VENTURA SHELF SEAFLOOR ELEVATIONS

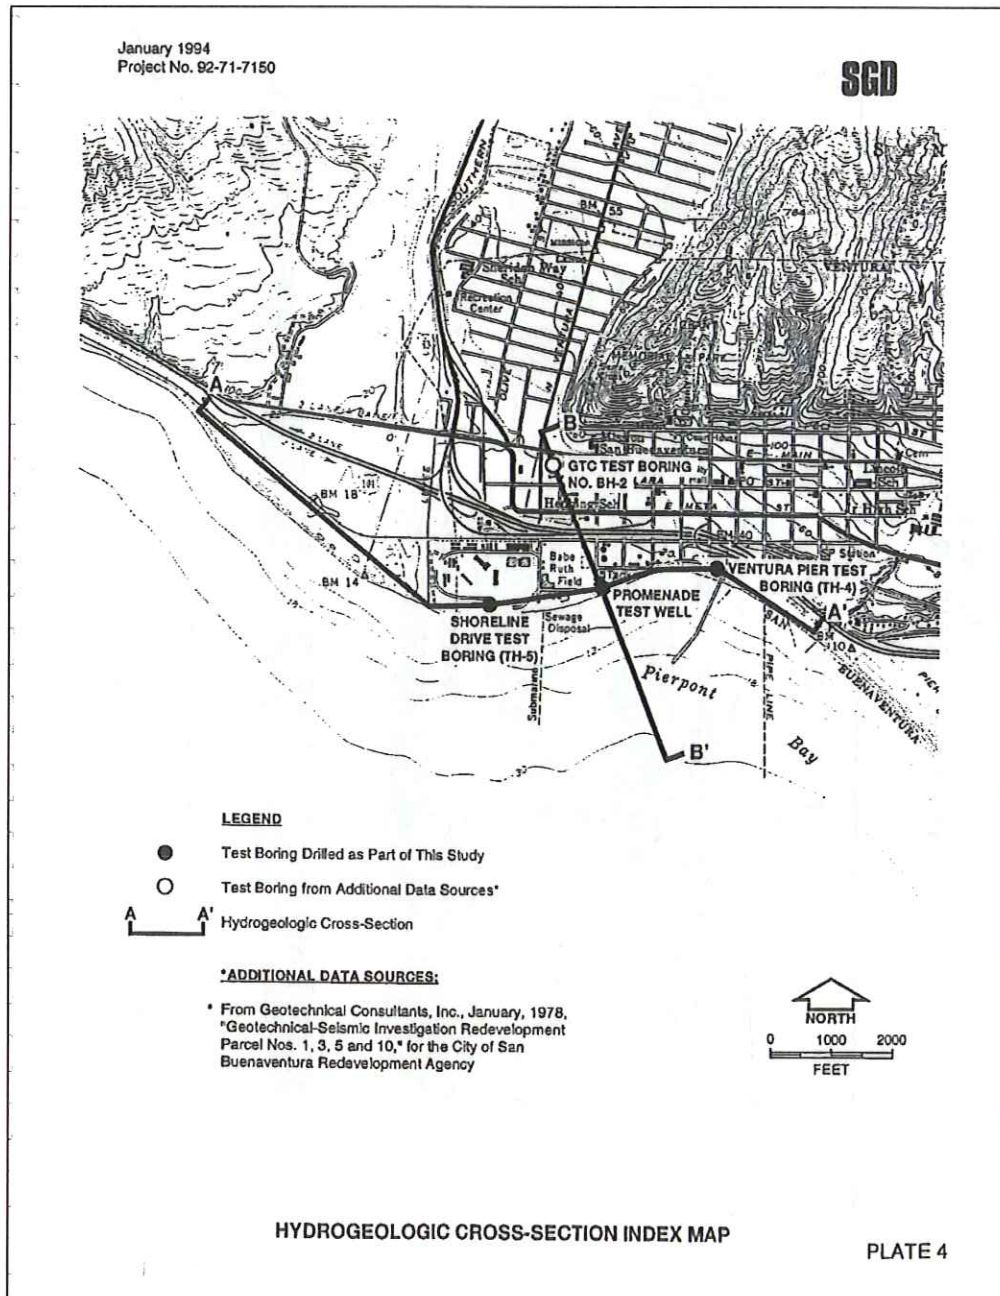

Construction**Geology**

The City's Desalination Project Feasibility Study (Staal, Gardner & Dunne Inc. 2004) undertook soil borings in the Ventura area adjacent to the beach and north of the VWRP. These borings are deep enough to provide a comparable picture of the geology anticipated to be encountered by an ocean outfall constructed between mean sea level and -120 feet MSL. According to this study, the area is located near the edge of the geologic province known as the Ventura Basin, a structural depression characterized by thick sedimentary deposits and major faulting. Alluvial deposits in the basin include, from youngest to oldest, fan deposits from streams draining the Ventura foothills, floodplain deposits of Holocene and upper Pleistocene age, (from both the Ventura and Santa Clara Rivers), the San Pedro Formation of lower Pleistocene age, and the Santa Barbara Formation of upper Pliocene/lower Pleistocene age. The maximum accumulated thickness of these sediments beneath the subject site is likely on the order of 1,000 feet (Staal, Gardner & Dunne Inc. 2004).

Figures 5, 6 and 7 present Plates 4, 5, 6 from the 2004 Staal, Gardner and Dunne, Inc. study. These figures provide information about the subsurface soil classifications in the area. Figure 6 identifies the locations of the soil crosssections within the City of Ventura presented in Figures 7 and 8.

**FIGURE 6
 HYDROGEOLOGIC CROSS-SECTION A**

**FIGURE 7
HYDROGEOLOGIC CROSS-SECTION B**

Additional, relevant information on the geology of the area is available within the CMWD's "Brine Line" EIR/EA. The findings within that document further attest to the alluvial nature of the offshore sediments in the area. According to that assessment, the Oxnard plain and Ventura Mainland Shelf is a prograding delta resulting from the deposition of sediments transported to the coast by the Ventura and Santa Clara Rivers. The Santa Clara is the largest river in terms of discharge and suspended sediment load, and is the largest source of sediment to the area. During periods of lowered sea levels, these two large rivers crossed the exposed delta and adjacent offshore continental shelf, transporting sediments directly to the shelf edge. Both the Ventura and Santa Clara Rivers have migrated across the coastal plain and shelf through geologic time. Geologic evidence suggests that the Santa Clara River has migrated as far south as the Hueneme Canyon during periods of lowered sea level in the late Pleistocene. Soils within the Port Hueneme Beach Park are characteristic of coastal beaches (CnB). Coastal beaches consist of narrow, sandy beaches and adjacent sand dunes, some of which are partly covered by waves during high tide. Offshore, seafloor sediments within a few kilometers of the coast are characterized as dense silty sand with patches of gravel and scattered rocks. Further offshore, the seafloor sediments become more silty (CMWD 2007).

Understanding the site-specific impact of geologic conditions on the outfall pipeline and ancillary facilities is vital to characterizing the best fit alignment and profile. There are known faults in the area, but it is unknown whether the outfall alignment will cross a fault zone. A geotechnical investigation would be required to be conducted prior to initiating a pipeline design for an ocean outfall.

Any pipeline design should also consider standard measures to address geologic hazards that enable the pipeline to withstand forces that have a potential to occur during its design life. The recommendations should include pipe material, pipe joints, depth of bury and route.

The proposed outfall will traverse an offshore area with bottom slopes of 1 to 2 percent. At this time, the outfall is not expected to cross or lie within any steep slopes or canyons.

Outfall Construction Options

The outfall is proposed to originate at the southwest corner of the VWRP and to terminate at approximately 1 mile offshore from the beach. The total distance is estimated to be 7,300 feet.

Four options have been identified for consideration in constructing the outfall, and are described in greater detail below. These options include:

- Option 1 – Horizontal Directional Drilling (HDD)
- Option 2 – Horizontal Directional Drilling (HDD) and Seafloor Construction Methods
- Option 3 – Horizontal Directional Drilling (HDD) Offshore and Open Cut Construction on Land
- Option 4 – Horizontal Directional Boring (HDB)

Technical Memorandum

Kennedy/Jenks Consultants

Mr. Dan Pfeifer
3 December 2007
Page 13

Option 1 – Horizontal Directional Drilling (HDD)

This option proposes to begin the HDD effort at the southwest corner of the VWRP facility extending to the diffuser location proposed for 1 mile off shore for a total length of 7,300 feet.

Option 2 – Horizontal Directional Drilling (HDD) and Seafloor Construction Methods

Option 2 is identical to Option 1 from the southwest corner of the VWRP to outside the wave breaking/surf line zone. This portion of the alignment would be constructed using HDD methods. The actual length of HDD installed outfall would be based on the successful advance of the outfall when using these methods. For planning purposes, the HDD outfall would at least extend to a total length of 1 mile (5,280 feet). The remaining 2,300 feet would then be advanced with seafloor methods using open water trench excavation methods in the shallow seafloor strata.

Option 3 – Horizontal Directional Drilling (HDD) Offshore and Open Cut on Land

In this option the 30-inch pressurized outfall from the VWRP to near the beach would be advanced with open cut construction methods. The route of the outfall is proposed to extend westerly from the southwest corner of the VWRP between open water and Spinnaker Drive in an open vegetated area. At the eastern extreme of Surfer's Knoll Beach, behind the fore dune an appropriate distance, the HDD portion of the alignment would be initiated and continue under the ocean to the proposed location of the diffuser. The minimum length of the HDD portion of the alignment would be 1 mile (5,280 feet) offshore and have a sufficient distance on shore to develop a vertical pipeline alignment that would cross under the surf line at a depth of 60 feet. At a slope of 15 percent this distance would be approximately 500 feet. Therefore the outfall distance completed by HDD methods would extend to approximately 5,800 feet. The length of open cut construction methods on shore would be approximately 1,500 feet.

Option 4 – Horizontal Directional Boring (HDB)

The final option considered is Horizontal Directional Boring (HDB). This technology is unique, combining the attributes of Horizontal Directional Drilling and Microtunneling. It is particularly adept at long distance bores, and in locations where the potential to hydro-fracture (frac-out) due to the presence of soft soil is present in an extremely sensitive ecological environment.

HDB advances a welded steel casing behind a drilling head by applying jacking forces to the steel casing in similar fashion to microtunneling. The drilling head is steerable allowing the advancement of the bore on a horizontal and vertical alignment. A positive displacement pump is used in the steel casing to deliver the excavated material back to the inlet where mud separation equipment removes excavated soil cuttings from the drilling fluid. Because a pump is used inside a casing to remove the drilling fluid the pressure on the bore hole at the face of the machine does not increase with distance from the inlet, as is the case with HDD. In addition, the pressure at the face of the bore can be closely controlled to provide the increased certainty of protection against frac-out.

Comparison of Outfall Construction Options

The four options for constructing the outfall will be compared based on comparative risk, cost and environmental sensitivity.

Risk

Each of the four options presents a varying amount of risk. The highest risk is associated with Option 1 where HDD is proposed over a length of 7,300 lineal feet. Ocean outfalls constructed using HDD in the 5,000 foot range do exist. Stretching this length to 7,300 lineal feet will require substantial experience, resources and knowledge on the contractor's part. The lowest risk is associated with Options 3 and 4. Option 3 constructs the onshore portion of the outfall using open cut methods. Where this is possible it shortens the HDD portion of the outfall into a more commonly accomplished length. Option 4 uses Horizontal Directional Boring (HDB) technology which limits borehole collapse and controls the pressure to an acceptable level at the face of the drilling head. Option 2 also limits the required length of the HDD bore, however, there is uncertainty associated with seafloor excavation.

Cost

Each of these options offers a varying degree of cost for construction. Option 4 using HDB and Option 2 are likely to present the highest cost. A high potential cost for Option 4 using HDB is related to the scarcity of this type of equipment and skill to operate it involved in drilling fluid management to provide absolute protection of the environment. The likely high price for construction using Option 2 is related to the uncertainty of seafloor construction from the surface of the ocean. Option 1 and Option 3 represent the lowest cost options. Option 3 which combines HDD offshore and open cut onshore reduces the price for HDD by shortening its length, makes the HDD portion more in line with current capabilities in the industry. The cost of open cut should also be significantly less than HDD in the onshore area.

Environmental Sensitivity

Sensitivity to the environment varies from option to option. The most environmentally sensitive alternative for construction is Option 4. This option is able to complete the outfall from the VVRF to the diffuser while maintaining the highest factor of safety relative to the potential for release of drilling fluid into the environment. Option 3 is also environmentally sensitive, although to a lesser degree. This option limits the length of HDD reducing the potential for frac-out of drilling fluid. The onshore construction using open cut methods, however, could have an impact on sensitive species of plants and animals and to surface water quality in the area. Option 1 and Option 3 present environmental concerns. Option 1 calls for construction of the outfall using HDD methods over its entire length (7,300 lineal feet). As in the pipeline bore advances toward the diffuser the risk of frac-out, though manageable, increases. Option 3 calls for open excavation in the seafloor to install the pipeline where the HDD terminates. This option will have environmental impact including resuspension of sediment and disturbance to be seafloor along the route of pipeline installation.

Preferred Outfall Construction Options

Overall, the most preferred option when using the comparative concerns identified above is Option 4 - Horizontal Directional Boring (HDB). This option is more costly but greatly reduces the potential for environmental impact and provides an option to construct below the surface from the VWRP to the diffuser. Second to this option is Option 3, which combines open cut construction on shore with HDD construction offshore. This option reduces cost, reduces risk of frac-out for the HDD alignment and reduces the length of HDD outfall construction. The negative associated with this option is the potential for impact to surface areas associated with onshore open cut construction. The third preferable alternative is Option 1, which uses HDD construction methods to develop the entire outfall. There are two (2) uncertainties that lower this alternative into third position. The first is the 7,300 lineal foot length of the bore. The second is the potential for frac-out of drilling fluid onto the seafloor as the bore approaches the diffuser location.

The last alternative to be considered is Option 2 which pairs HDD outfall development with open seafloor construction. The potential environmental impact from seafloor construction is a significant concern.

Offshore HDD and HDB Construction Issues

The primary geologic impacts to HDD and HDB crossings are limited to the potential for release of clay-based drilling fluids and settlement of the ground or seafloor surface along the alignment of the bore. The potential release of drilling fluids can be minimized by the incorporation of an appropriate drilling fluid and through adherence to a drilling fluid monitoring program. An appropriate program will specify drilling parameters such as drilling equipment capacity, directional bore depths and entry and exit angles. Drilling fluid properties including fluid weight, viscosity, water loss and gel strength will be designed and monitored by a qualified drilling fluids engineer (Fugro 2006).

As indicated, the outfall pipeline is suggested to be installed using one of the options for HDD or HDB methods from the VWRP site on Spinnaker Drive, located approximately 1,200 feet from the closest beach access (Surfer's Knoll). A steel conductor casing will likely be required to be driven in the initial portion of an HDD/HDB alignment to contain drilling fluids and to obtain a depth below adjoining surface water bodies without causing an impact from the release of drilling fluid or surface subsidence. Use of a steel casing may also be of value in drilling through the sands and silts under the seafloor as it can be driven from the shore and will help to maintain an open hole in difficult soil conditions. In the case of HDB, a steel casing is advanced as the boring proceeds. Where a steel casing is used, an HDPE pipeline should be inserted inside to provide a long life solution that is resistant to corrosion.

The land-based portion of the pipeline where HDD/HDB would begin requires an approximate 10 to 15 percent down angle drilling, to ensure a depth of approximately -60 feet MSL when crossing under the public beach. It would continue offshore at a similar angle to a depth of approximately -120 feet MSL for HDD and a continuous depth of -60 feet MSL for HDB. Near the HDD/HDB termination offshore, the drilling would then continue up at an angle of 10 to

Mr. Dan Pfeifer
3 December 2007
Page 16

15 percent to a point located approximately 1 mile from the beach, to the connection with the associated diffuser section.

The offshore diffuser section would likely be laid on the seabed using a pipe barge. The offshore installation method would be chosen during the preliminary design phase, and finalized with input gathered from permitting agencies as well as site-specific geotechnical data obtained during the environmental and regulatory process. The depth attained at the termination of the outfall will also impact the diffuser design and placement.

Once outfall construction is completed the only elements of the outfall that will be visible will be the entry structure and appurtenances at the VWRf.

Conceptual Estimate of Probable Cost

The cost for an ocean outfall that will extend to a mile offshore can vary greatly. One of the primary contributors to cost is the site constraints to be dealt with by the contractor hired to undertake the work. It is important to have sufficient lay-down area at the beginning of the HDD or HDB operation on land to undertake the bore and to allow storage and stringing of the pipeline. Pipe that will require assembly prior to installation needs sufficient area behind the drilling rig. Typical pipelines include welded steel casing pipe and/or an HDPE piping system, often with a partial or full steel casing. A pipeline extended from the land side into the borehole can also utilize steel casing installed in sections pushed into place with a mechanical joint design.

The costs for this conceptual estimate should be considered to vary between a plus 30 percent and a minus 30 percent and were derived from input obtained in discussions with Horizontal Directional Drilling contractors and offshore contractors. We anticipated in this effort that the on-shore HDD contractor would be the prime contractor for the work and would obtain an offshore contractor as a subcontractor.

The estimated per foot probable cost per lineal foot for the outfall described in this memorandum ranges from:

- Low estimate of probable cost - \$1,300 per foot
- Estimate of probable cost - \$1,750 per foot
- High estimate of probable cost - \$2,300 per foot

The outfall is estimated to be 5,280 feet offshore and 2,000 feet onshore for a total length of 7,280 lineal feet. Therefore the total estimate of probable cost on a conceptual basis is:

- Low estimate of probable cost - \$1,300 per foot x 7,300 lineal feet = \$9,500,000
- Estimate of probable cost - \$1,750 per foot x 7,300 lineal feet = \$12,800,000

- High estimate of probable cost - \$2,300 per foot x 7,300 lineal feet = \$16,800,000

Outfall Corrosion and Longevity

Corrosion of outfall piping material can be a serious matter for steel pipe in a marine environment. In fact, in excess of 20 mils per year of corrosion can be encountered for ferrous metals exposed to seawater. For this reason steel pipeline often acts as the outer pipe material for construction purposes where limited layout space is available and bore hole stability is in question. Once the steel pipe is in place an HDPE pipeline is inserted on the inside to act as a carrier pipe for the effluent.

Conclusions

A significant barrier to evaluation of the outfall exists due to the shallow depth of the seafloor for nearly 10 miles offshore from Ventura. A dynamic mixing model to determine the available mixing from the tides, wind and ocean currents is needed to determine if an effluent outfall placed a mile offshore meets appropriate dispersal rates to avoid any potential for turbidity or beach/estuarine contamination. This analysis should be the next step in the process of determining the potential feasibility to place an ocean outfall off the Ventura Coast at a reasonable distance.

Installation from the VVRF by means of HDB or an HDD Option into the ocean is an effective method for placement of an outfall pipeline. An option to use a steel outer casing may offer advantages for construction in sand and silt sediments due to its inherent stiffness, the ability to weld or use mechanical press fit joints and the material's ability to withstand high thrust forces during jacking into the borehole. Where steel casing is used, an HDPE carrier pipe installed within this pipeline offers extended longevity due to corrosion resistance of this material. Once the HDPE carrier pipe is installed the diffuser at the end of the outfall can be installed by an offshore contractor.

Substantial variability exists in the options available to extend an outfall a mile out into the ocean. This variability translates to a range of cost to construct the outfall. One method of improving on the estimate and fine tuning the potential option to be selected is to enlist the assistance of a noted HDD/HDB contractor (such as the Cherrington Corporation) along with K/J and the addition of a modeling consultant experienced in evaluating mixing of a wastewater effluent in a shallow marine environment.

In summary, the potential exists to construct an ocean outfall off the Ventura Coast. The above steps will help to further define the location, cost and construction option most advantageous to the City of Ventura.

CHAPTER 1 RECOMMENDED PROJECT

The recommended project is summarized below, additional details can be found in the applicable report chapters. Estimated construction cost for the project is \$1.65 million.

- Ultimate station capacity of 3035 gpm (4.4 mgd) with initial average flow of 300 gpm (0.43 mgd)
- Dry pit/wet pit pumping station to provide reliability, ease of maintenance, and increased safety
- Vertical non-clog centrifugal pumps with extended shafts to motors located at a middle level
- Ultimate arrangement of four pumps with variable frequency drives, each with a rated capacity of 1,040 gpm (1.5 mgd)
- Trench-type wet well to reduce odors and reduce capital and maintenance costs
- Power supply from PG&E with standby diesel generator
- MCC room located at ground level, over the pumping station
- Odor control with type to be determined after field testing
- Architectural style to be residential to match surrounding area
- Landscaping to match the surrounding area and soften the visual impact of the station

This is a draft report and is not intended to be a final representation of the work done or recommendations made by Brown and Caldwell. It should not be relied upon; consult the final report.

CHAPTER 2 BACKGROUND AND DESIGN FLOWS

In August 2001, the City of San Buenaventura retained Brown and Caldwell to prepare contract drawings and specifications for the construction of a new North Bank Lift Station. On August 30, 2001, the City and Brown and Caldwell met to kick-off this project and to brainstorm the design features Brown and Caldwell should provide in the North Bank Lift Station facility. In the brainstorming session, the City directed Brown and Caldwell to further evaluate the following pumping station parameters prior to proceeding with final design:

- alternate pump types and related arrangement plans;
- lift station power supply and emergency power;

This Report presents the findings of our evaluations conducted since the brainstorming meeting, and identifies our recommendations for the design of the North Bank Lift Station. This Report is intended to serve as the Basis of Design for the North Bank Lift Station. Upon acceptance of the Report recommendations, Brown and Caldwell will immediately proceed with the preparation of drawings and specifications for this project.

Background

The existing North Bank Lift Station was installed as a temporary means of sewer service. The station is located in the southwest corner of Tract 4395 along North Bank Drive. The need for upgrading the North Bank Lift Station was identified in the City's East Ventura Sanitary Collector Study, dated August 1995 (Collector Study). In the report, the impact of future projects on the City's collection and treatment systems is assessed. The report concluded that the existing North Bank Lift Station will not have the capacity needed for the additional wastewater flow that will be discharged to the station from future developments identified in the comprehensive plan development scenario.

Based on the findings presented in the Collector Study, the City made the decision to replace the existing North Bank Lift Station to handle future wastewater flows projected through the year 2040. The City further made the decision to construct these needed improvements in the year 2002. In support of the City's decision to construct the needed improvements, the City requested proposals for engineering design services for the new North Bank Lift Station. In July 2001, the City selected Brown and Caldwell to provide the needed engineering services. In August 2001, the City contracted with Brown and Caldwell to provide contract documents for the construction of the new North Bank Lift Station.

This is a draft report and is not intended to be a final representation of the work done or recommendations made by Brown and Caldwell. It should not be relied upon; consult the final report.

Design Flows

The Collector Study recommended that wastewater flow from the Wells Road Lift Station, Topaz Ave Lift Station, Harper Drive Lift Station, and Saticoy Wastewater Treatment Plant be routed to the new North Bank Lift Station. The capacity of the existing North Bank Lift Station is 0.83 mgd (576 gpm). Based on the Collector Study, the peak design flow will be 4.4 mgd (3035 gpm) by 2040. Table 2-1 provides projected flows at the location of the New North Bank Lift Station. Existing flows are based on City personnel estimates. Ratios of 2:1 and 1.5:1 were used for peak to average flows and for average to minimum flows, respectively.

Table 2-1. Projected Flows at New North Bank Lift Station

Year	Min Flow gpm (mgd)	Avg Flow gpm (mgd)	Peak Flow gpm (mgd)	Direction of Flow
2002	200 (0.29)	300 (0.43)	600 (0.87)	Flows from only North Bank Lift Station
2005	495 (0.71)	740 (1.07)	1485 (2.15)	Flows from North Bank & Wells Road Lift Stations
2040	1012 (1.46)	1518 (2.2)	3035 (4.4)	Flows from North Bank, Wells Road, Topaz, & Harper Lift Stations & Saticoy Wastewater Treatment Plant

This is a draft report and is not intended to be a final representation of the work done or recommendations made by Brown and Caldwell. It should not be relied upon; consult the final report.

CHAPTER 3 PUMPING STATION CONFIGURATION

In the August 30, 2001 brainstorming meeting, it was agreed that the new pumping station should be designed to provide:

- easy operation and maintenance
- easy access to pumping equipment
- pumping even in flooded conditions
- variable frequency drives
- standby power

To satisfy these conditions several pumping station arrangements and pump types were discussed. It was concluded that more evaluation was required prior to selecting the pump type and arrangement for final design.

Pumping Station Design Alternatives

At the request of the City, Brown and Caldwell considered four pumping arrangement plans for this application. The alternates considered are listed below, followed by a brief description of each:

- Option 1 – Submersible Pumping Station
- Option 2 – Dry Pit Submersible Pumping Station
- Option 3 – Column Type Solids Handling Pumping Station
- Option 4 – Dry Pit/Wet Pit Pumping Station

Option 1 – Submersible Pumping Station. For Option 1, as shown in Figure 3-1, submersible pumps would be located in a larger wet pit or wet well. An above grade structure would be provided to house the VFDs, MCCs and a standby generator. Each pump would be provided with a guide rail system that would allow the pump to be raised to grade level by a lifting chain and lowered by gravity.

Option 2 – Dry Pit Submersible Pumping Station. For option 2, as shown in Figure 3-2, dry pit submersible type pumps would be located in a dry pit and the pumps would draw suction from a wet pit. Separate stairs would be provided to the dry pit pump area. VFDs, MCCs and an emergency generator would be provided and located in an above grade structure. The dry pit equipment area would be provided with lighting and ventilation systems.

Option 3 – Column Type Solids Handling Pumping Station. For Option 3, Vertical Turbine Solids Handling (VTSH) pumps were considered. As shown in Figure 3-3 the pumps and motors would be located outdoors with the motors and pump discharge at grade. Each pump's column, housing shaft, impeller, and suction, would extend down into the wet pit area. An above grade structure would be provided to house the VFDs, MCCs, and an emergency generator.

This is a draft report and is not intended to be a final representation of the work done or recommendations made by Brown and Caldwell. It should not be relied upon; consult the final report.

Figure 3-1. Submersible Pumping Stations

Figure 3-2. Dry Pit Pumping Station

This is a draft report and is not intended to be a final representation of the work done or recommendations made by Brown and Caldwell. It should not be relied upon; consult the final report.

Figure 3-3. Column Type Solids Handling Pumping Station

This is a draft report and is not intended to be a final representation of the work done or recommendations made by Brown and Caldwell. It should not be relied upon; consult the final report.

Option 4 – Dry Pit/Wet Pit Pumping Station. For Option 4, as shown in Figure 3-4, non-clog centrifugal vertical pumps would be located in a dry pit and the pumps would draw suction from the wet pit. Pumps would be provided with an extended shaft so the motors can be located at a level above the pumps. Separate stairs would be provided to access the motor room and dry pit pump area. VFDs, MCCs and a standby generator would be provided and located in an above grade structure. The dry pit equipment area would be provided with lighting and ventilation systems.

Advantages and Disadvantages of Pumping Options

The major advantages and disadvantages of each pumping station alternative for this application were identified. Equipment manufacturers were contacted and preliminary equipment was selected. Highlights of the evaluation are summarized below:

Option 1 – Submersible Pumping Station. A submersible pumping station features pumping equipment that will work under submersible conditions. In this arrangement the pumps are located in the wet pit area. This arrangement eliminates the need for a dry pit area, and offers lower construction cost.

The major disadvantage of a submersible pumping station is that it requires significantly more effort to perform preventative maintenance. Unlike the other three options, access to the pump motors and equipment is difficult, potentially making the pumping system less reliable. Operation and maintenance personnel need to lift the pumps to grade to perform maintenance procedures. According to the manufacturer of the submersible pumping equipment, each pump needs maintenance work at least every six months. This pumping station will be one of the City's largest and it should be highly reliable and easily maintained. Brown and Caldwell does not recommend a submersible pumping station for this application. It was agreed in the brainstorming meeting not to further consider a submersible pumping station arrangement for the new North Bank Lift Station.

Option 2 – Dry Pit Submersible Pumping Station. A dry pit submersible pumping station features pumping equipment that will work under submersible conditions in case the dry pit becomes flooded. Locating submersible pumps in a dry pit area encourages easy operation and maintenance. The pumps are located in a dry pit area below grade and draw suction from an adjacent wet well. Access to pump equipment is convenient, which facilitates preventative maintenance. Pump parts are easily accessible to perform preventative maintenance, troubleshoot, and make repairs.

Three submersible pump manufacturers, Flygt, ABS, and Fairbanks Morse, currently build pumps suitable for this application. The pumps include a jacket of circulating cooling fluid that surrounds the pump motor. Manufacturers may use a hydraulic fluid, potable water, and even the pumped fluid itself as cooling liquid. Hydraulic fluid requires occasional replacement and a separate pumping system is used to circulate the liquid. Potable water (City water) systems use a continuous supply, which is not recirculated, leading to high water use. Systems that use the pumped liquid (wastewater) for cooling utilize a unique, self-cleaning, rotating flow-control disc which prevents solids from entering and accumulating in the mechanical seal area and cooling water jacket; this results in a longer mechanical seal life as well as a clean cooling system, greatly increasing pump life.

This is a draft report and is not intended to be a final representation of the work done or recommendations made by Brown and Caldwell. It should not be relied upon; consult the final report.

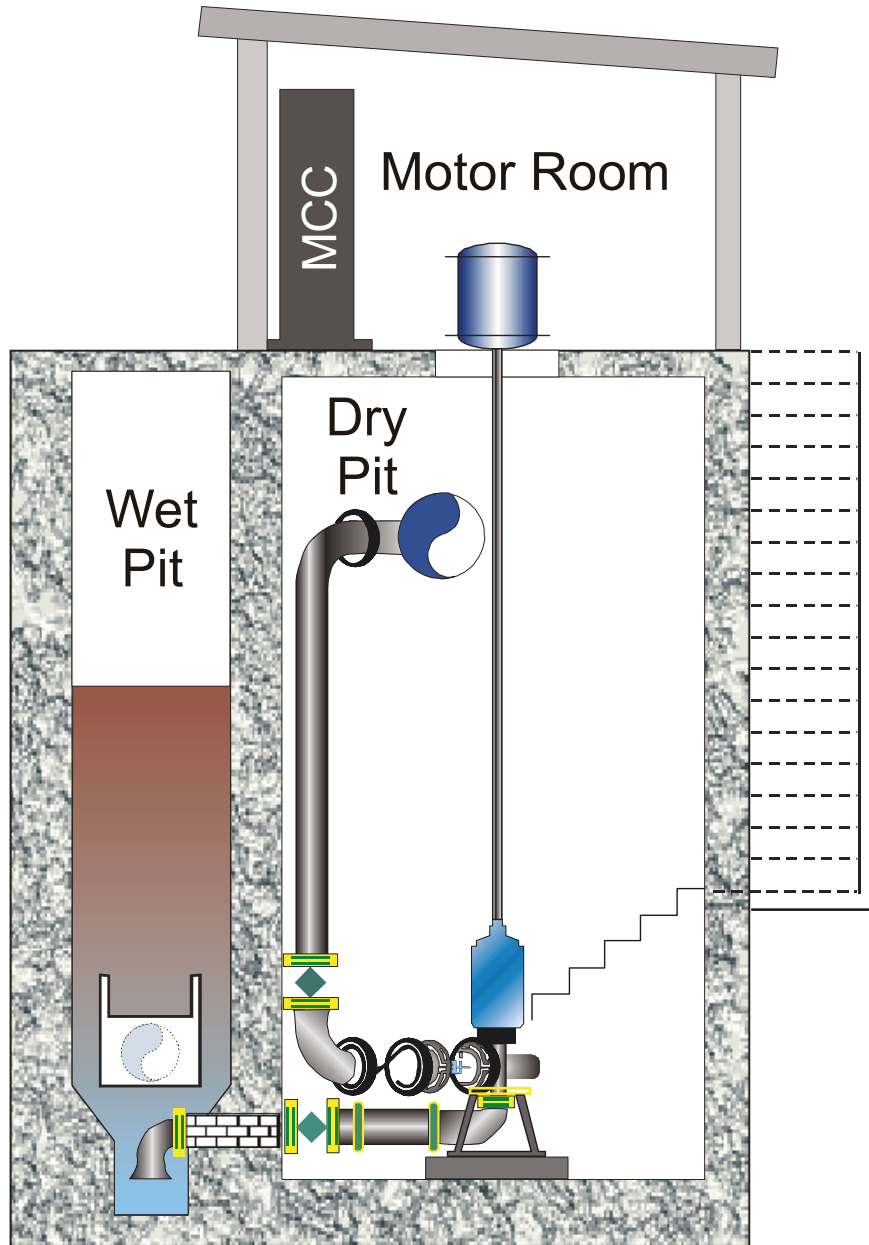

Figure 3-4. Dry Pit/Wet Pit Pumping Station

This is a draft report and is not intended to be a final representation of the work done or recommendations made by Brown and Caldwell. It should not be relied upon; consult the final report.

The major advantages of this pumping station style are that it increases operator safety, simplifies routine maintenance procedures, allows for a self-cleaning wet well and smaller future odor control system, and is highly reliable.

There are several disadvantages when selecting this pump style and pump arrangement plan. The major disadvantage is the higher costs incurred in the construction of a dry pit equipment area. Another disadvantage is the concern the City has about increased maintenance costs due to cleaning and fluid change out. Any plugging will result in major repair costs. There have been mixed testimonials from actual pump users. Due to these reasons, we do not consider the Dry Pit Submersible Pumping Station as the best choice for this important lift station.

Option 3 – Column Type Solids Handling Pumping Station. Column type solids handling pumping stations feature pump motors and discharges located above grade allowing for easy access for preventative maintenance. This type of pump has been developed as an alternate to centrifugal dry pit pumps and submersible pumps. The pumps have higher pump efficiency than standard centrifugal pumps and submersible pumps. Higher pump efficiencies can potentially lower annual electrical costs. The likelihood of pumps being out of service due to flooding is remote since motors are not located in an underground dry pit room. There is no need to construct an underground dry pit area, reducing construction costs.

Typically this type of pumping station provides the most reliable pumping system and easiest to operate and maintain. Considering the North Bank Lift Station is the largest pumping station in the City's collection system, we believe the City should select the pumping station arrangement that will be easiest to operate and maintain. However VTSH pumps are not available in sizes that fit this application due to expected low flows and high discharge pressure required.

The City requested that Brown and Caldwell provide background information on VTSH pumps and a list of installations and names of individuals the City could contact to discuss the success and shortcomings of VTSH pumps, as well as their operation and maintenance requirements. Information collected is included in Appendix D.

Option 4 – Dry Pit/Wet Pit Pumping Station. A dry pit/wet pit pumping station features pumps in a below grade room with their suction extending through a wall into the wet well. This arrangement allows for easy access to the pumps for maintenance. Pumps would be provided with an extended shaft so the motors can be located at above flood level. Although close coupled pumps may be less expensive initially, having the motor separated from the pumps allows easier maintenance of the equipment and keeps the motors above water level of the wet well in the remote chance of flooding of the dry pit. The pumps would be non-clog centrifugal vertical pumps. VFDs, MCCs and an emergency generator would be provided and located in an above grade structure. The dry pit equipment area would be provided with lighting and ventilation systems.

The major advantages of this pumping station style are that it increases operator safety, simplifies routine maintenance procedures, allows for a self-cleaning wet well and smaller future odor control system, and is highly reliable.

The major disadvantage is the higher costs incurred in the construction of a dry pit equipment area compared to Option 3. But VTSH pumps are not available in sizes to fit this application.

This is a draft report and is not intended to be a final representation of the work done or recommendations made by Brown and Caldwell. It should not be relied upon; consult the final report.

Recommended Option

Option 4 the dry pit/wet pit pumping station, is the recommended configuration. It provided high reliability, ease of operation and maintenance.

Pumping Station Location

The existing North Bank Lift Station is located in the southwest corner of Tract 4395. The new lift station will be located about 1000 ft west of the existing station on the opposite side of the Sudden Barranca. Brown and Caldwell recommends that the new pumping station be located as shown on drawings in Appendix B. Brown and Caldwell also recommend that fencing topped with barbed wire should be considered for security.

Pump Selection

Brown and Caldwell recommends that the North Bank Lift Station be designed to pump a peak flow of 3,035 gpm (4.4 mgd). Four pumps should be installed, where three pumps will be duty pumps, and one pump will be standby. This will provide smaller capacity pumps that meet the initial low flow conditions. Under reduced speed operation each pump should have a maximum capacity of 1,040 gpm (1.5 mgd) at a TDH of 95 feet.

Considering the flow range, we recommend four variable speed pumps, each with a rated capacity of 1040 gpm (1.5 mgd). To reduce the initial capital cost of the project, we recommend installing only three pumps at this time, providing flow of 3 mgd with one pump as the standby. Two pumps will be able to pump the expected year 2005 peak flow of 1485 (2.15 mgd). The facilities will be designed to allow easy addition of a fourth pump in the future to achieve the 3035 gpm (4.4 mgd) maximum flow and retain one standby pump.

Preliminary pump selection for this application is 6-inch non-clog centrifugal pumps with 60 horsepower motors, operated at 1180 rpm. Preliminary system head curves and calculations are presented in Appendix A. Selection details will be confirmed during detail design.

The recommended plan arrangement for final design is provided in Appendix B. Flexibility will be provided in the pump layout that will allow operations to directly pump from the wet well to the force main using portable pumps in the event of catastrophic failure.

Pumping Station Wet Well

We propose using a trench-type wet well as described in the Hydraulic Institute Standards, Section 9.8.3.2. As the name implies, the wet well will be long and narrow with the wastewater entering at one end. Using the variable speed capability of the drives, the speed of the pumps would be changed to match the flow-depth relationship of the incoming sewage. This eliminates all influent turbulence, thus minimizing the release of hydrogen sulfide and other gasses. This type of wet well also allows the wet well to be easily cleaned. During the cleanup cycle, only the end pump is operated, at a flow greater than the influent flow. This allows the level of the wet well to drop and cause a hydraulic jump to form in the wet well, resuspending any solids and cleaning the wet well. The primary advantages of the trench-type wet well are:

This is a draft report and is not intended to be a final representation of the work done or recommendations made by Brown and Caldwell. It should not be relied upon; consult the final report.

- reduction in capital costs due to a smaller wet well,
- increase in personnel safety due to a reduction in toxic and corrosive gases released by eliminating turbulence of the wastewater,
- reduction in foul air treatment cost due to a smaller wet well, and
- reduction in maintenance costs due to elimination of extensive wet well cleaning.

Pump Control Strategy

The pumps will be sequenced on and off and their speeds varied to match the flow and level of incoming sewage in the pumping station wet well. Pump speed will be varied by using a variable frequency drive (VFD). Each VFD will be provided with a HAND-OFF-REMOTE selector switch and manual speed controls in case of PLC failure.

The pump lead-lag standby sequence will be selected at the host unit using a selector switch whose status is monitored by a PLC. The level signal from the wet well will be transmitted to the PLC based level controller as well as the host unit for backup monitoring. The operator will determine the level setpoints of the controller by input to the PLC. The level controller output will determine the common VFD speed. When the HOR switch on the VFD is in the R position, all operating VFDs will operate at the same speed. When the output of the level controller rises to a preset point, a start time delay sequence will be triggered. If the output of the controller remains above the trigger point until the timer times out, an additional pump will start. When the output of the level controller falls to a preset point, a stop time delay sequence will be triggered. If the output of the controller remains below the trigger point until the timer times out, a pump will shut down. Pumps will be shed based on the first one on, last one off, until the sequence is changed by the Lead-Lag-Standby selector switch.

Normally a maximum of three pumps will run at a time. If the standby pump is needed, an alarm will be activated. Operators will also be able to start and stop the pumps and set pump speed manually from the host unit.

VFD fault will be indicated at the VFD and will be input to the PLC. A fault condition will shut down the pump motor until the condition has been cleared, and the reset button at the VFD has been depressed.

Motor running status and Hand-Off-Remote mode status will be indicated at the VFD and input to the PLC.

The pumps will not run in any mode when the Lockout Stop pushbutton located near the pump is depressed.

This is a draft report and is not intended to be a final representation of the work done or recommendations made by Brown and Caldwell. It should not be relied upon; consult the final report.

A seal water valve will open whenever the associated pump runs. The valve will open on loss of power (fail-open). If the seal water pressure does not rise to a preset value within a short time after the pump starts, an alarm will sound at the host.

Alarms will be provided for wet well low level, wet well high level, VFD fault, pump high motor temperature, pump low seal water pressure, for standby pump running, power failure, for loss of communication with host unit, and for dry well flooded. Alarms will be transmitted back to the main treatment plant using radio transmission to match the existing system.

This is a draft report and is not intended to be a final representation of the work done or recommendations made by Brown and Caldwell. It should not be relied upon; consult the final report.

CHAPTER 4 AUXILLIARY PROCESSES

This chapter presents various auxiliary processes: odor control, power supply, standby generator, coordination with existing facilities, architecture, and landscaping.

Odor Control

At the time of this writing, the City is performing sulfide testing at the North Bank and Wells Road lift stations. Based on the results of this testing, the extent of odor control will be determined. Types of odor control to be considered will be a small soil-type biofilter or a packaged activated carbon scrubber. Both these are reliable and low maintenance systems. Preliminary evaluation indicates that (a biofilter will be adequate due to reasonable low levels of sulfides)(the carbon will be needed due to high sulfides) in the wastewater.

Power Supply

The existing North Bank Lift Station is powered by a secondary power source serviced by Pacific Gas and Electric. The new station will continue to use this power source. As shown on the drawings in Appendix B, in the recommended project, pump motor controls, and VFDs will be located in the MCC Room directly above the motor room.

Standby Generator

The recommended project will be designed with standby power. Our calculations found that a 230 kW generator is required to provide emergency power to start and operate three 60 hp pump motors with VFDs and other pump station loads. The recommended generator is Caterpillar 3306. A 500-gallon fuel tank, which provides fuel for 28 hours of full-load operation, will be provided with the generator. The fuel tank requires a 36-inch deep base. Any fuel storage more than 120 gallons will change the classification of the building to "H" rating that requires fire sprinklers in the generator room. Alternatively, a 500-gallon tank can be provided outside the building either as an above ground concrete tank or a below ground fiberglass tank. The emergency generator will be located in a separate room as shown on the drawings in Appendix B.

As shown on the drawings in Appendix B, in the recommended project, pump motor controls, and VFDs will be located in the MCC Room.

This is a draft report and is not intended to be a final representation of the work done or recommendations made by Brown and Caldwell. It should not be relied upon; consult the final report.

Coordination with Existing Facilities

Modifications to Existing Pumping Station. For the recommended project, the existing North Bank Lift Station must remain in service while the new pumping station is constructed. Upon start-up of the new facilities, the existing pumping station should be taken out of service.

Influent Sewer. Flow will be conveyed by gravity from the existing North Bank Lift Station to the new North Bank Lift Station through 450 feet of 21-inch diameter pipe. The pipe is not presently in the project scope. Brown and Caldwell will provide 20 feet of pipe upstream of the station to ensure proper flow conditions entering the wet well.

Architecture

In the brainstorming meeting, the City requested that Brown and Caldwell use architecture that blends in with the houses planned in the area. Brown and Caldwell recommends that the MCC room, Generator room, and stairway access buildings be designed in a style similar to the houses in the area. Architectural views of the recommended above grade structures are presented in Appendix E. Features include:

- Stucco exterior (over concrete block)
- Concrete tile on sloped roof
- Generator exhaust to look like chimney
- Rollup door to be residential garage door type

Landscaping

Landscaping will be provided to screen the facility from North Bank Drive. Landscaping will give the facility the look of a park. Plants will be selected to match plants in the surrounding area.

This is a draft report and is not intended to be a final representation of the work done or recommendations made by Brown and Caldwell. It should not be relied upon; consult the final report.

CHAPTER 5 DESIGN CRITERIA

This chapter presents design data and criteria for key equipment and processes recommended for the new North Bank Lift Station. The criteria are presented in Table 5-1.

Table 5-1. Lift Station Design Data

Design Flows:	
Minimum	200 gpm (0.29 mgd)
Peak	3035 gpm (4.4 mgd)
Pumps:	
Number	4 (3 duty, 1 standby)
Type	Non-clog centrifugal
Speed	1180 rpm with VFDS
HP	60
Standby Generator:	
Number	1
Rating	230 ekW
Odor Control:	
HVAC Motor Wet Well Room	3000 cfm
Pump Room	30 air changes/hr

This is a draft report and is not intended to be a final representation of the work done or recommendations made by Brown and Caldwell. It should not be relied upon; consult the final report.

CHAPTER 6 SCHEDULE AND COSTS

This chapter presents the predesign estimated construction costs for the North Bank Lift Station, as well as the predesign estimated project schedule.

Project Costs

A preliminary construction cost has been developed using Brown and Caldwell's Cost Estimating Program. Details of the estimate are included in Appendix C. Costs include VFDs, MCCs, and an emergency generator located in an above grade room, and odor control equipment.

Table 6-1. Estimated Construction Cost

Item	Cost (\$1,000)
Lift Station	1,377
Design Contingency (25%)	273
Total	1,650

The cost estimate is based on 4th quarter 2001 dollars. The design phase contingency amounts are calculated based on the degree of completeness of the design and the level of the estimate (in this case, predesign level). A 25 percent design contingency has been included based on the following items and contingency percentages.

Table 6-2. Design Contingency

Item	Percentage (%)
Plot plans	3
P&Ids	2
Site conditions	7
Major equipment pricing	3
Layout details	3
Unlisted items	5
Labor resources	2
Total	25

This is a draft report and is not intended to be a final representation of the work done or recommendations made by Brown and Caldwell. It should not be relied upon; consult the final report.

Project Schedule

The project schedule is presented on Figure 6-1. The schedule shows the duration, start and finish dates of key tasks.

This is a draft report and is not intended to be a final representation of the work done or recommendations made by Brown and Caldwell. It should not be relied upon; consult the final report.

Figure 6-1. Project Schedule

This is a draft report and is not intended to be a final representation of the work done or recommendations made by Brown and Caldwell. It should not be relied upon; consult the final report.

Seaside Transfer Station Force Main Condition Assessment Report

CITY OF VENTURA

Sanitation Division

Seaside Transfer Station Force Main

CONDITION ASSESSMENT REPORT

Prepared by

Mimiaga **E**ngineering **G**roup

August 2007

Table of Contents

<u>Tab#</u>	<u>Description</u>
1.	Executive Summary
2.	Existing As-Built Record Drawings
3.	Photographic Pipe Alignment Mapping
4.	STS Force Main Repair and Maintenance Log
5.	STS Condition Assessment Inspection Log
6.	Existing Condition Assessment (Narrative)
7.	Risk Management Failure Analysis
8.	Air-Vac Assembly Impact Analysis
9.	Pipe Line Materials and Appurtenances Index
10.	Recommended Repair and Rehabilitation Projects

Item No. 1 - Executive Summary

The purpose of this report is to provide comprehensive information relative to the existing **SEASIDE TRANSFER STATION (SEWER) FORCE MAIN**. The pipe alignment runs along the City's environmentally sensitive oceanfront between the Seaside Transfer Station and the Ventura Water Reclamation Facility. On average the force main carries more than 2 million gallons per day of raw sewage from the City's west side to the regional water reclamation facility near Ventura Harbor. The force main is an essential pipe line that cannot be shutdown for any significant amount of time without severe impacts. Pipeline ruptures have occurred in the past resulting in NPDES Permit violations and major expenditures of City resources in responding to the public health emergency. The City has commissioned this report as part of an effort to prevent future pipe line failures and permit violations.

General Condition Assessment

The 35 year old force main appears to be in surprisingly good condition along most of the alignment with only a few problem areas. The exterior of the pipe appears to be in very good condition in most of the potholed locations. The pipe line preservation appears to be attributable to polyethylene pipe wrap that was carefully and properly installed during the original construction. Ultrasonic metal thickness test results appear to confirm the pipeline's current integrity along the vast majority of the alignment.

Current High Risk Conditions

The segment of force main directly upstream of the Arundell Barranca appears to be severely corroded. This is the general vicinity of the two major pipeline ruptures that occurred previously due to corrosion failures. During recent potholing and pipeline inspections it was determined that this segment of pipe continues to be at risk of eminent failure. This determination is based on observed levels of exterior pipe corrosion and ultrasonic metal thickness test results. It is recommended that the City urgently replace a 500-ft segment of the existing 20" pipe from the Arundell Barranca to 500-ft north of the Barranca.

Potential Future Problem Areas

Exterior pipe surfaces appear to be severely corroded where the pipeline passes through five existing maintenance vaults. However, ultrasonic metal thickness test results appear to indicate that these locations are currently not at high risk of eminent failure.

Item No. 2 - Existing As-Built Record Drawings

The Seaside Transfer Station Force Main was constructed in four separate construction projects designed by Boyle Engineering. Four sets of as-built drawings have been re-compiled and combined into a single comprehensive as-built set encompassing the entire pipe alignment.

A printed full sized copy of the combined as-built drawing set is on file in Sanitation Division's plan archives located at 1400 Spinnaker Drive.

The existing as-built drawing packages were assembled as follows:

Boyle Engineering Plans dated 2/24/71

- From Seaside Transfer Station to Figueroa St.
- From California St. to San Pedro St.
- From Seaward Ave. to Arundell Barranca
- *From Arundell Barranca to Spinnaker Dr. (gravity sewer segment)*

Boyle Engineering Plans dated 1/21/71

- From Figueroa St. to California St.

Boyle Engineering Plans dated 9/23/70

- From San Pedro St. to near Seaward Ave.

Boyle Engineering Plans dated 1/21/71

- From near Seaward Ave. to Seaward Ave.

The above four as-built drawing sets have been combined and re-configured into a single drawing package which includes the entire continuous pipe alignment. The combined as-built drawings have been updated to include the following information obtained during potholing: (1) pipeline condition assessment data; (2) pipeline location relative to existing surface improvements; and (3) major and obvious changes to surface improvements occurring since the pipeline installation.

Attached herein are the following as-built drawing versions:

- Printed reduced size copy (8.5 x 11 paper)
- Compact disk PDF copy (Adobe Acrobat)

Item No. 3 - Photographic Pipe Alignment Mapping

The following pages contain photograph record of the alignment above the pipeline.

CC : MANNY RAMIREZ

CITY OF SAN BUENAVENTURA
MEMORANDUM

DATE: November 7, 1996
TO: Dan Rayburn
FROM: Betsy Cooper, Associate Civil Engineer
SUBJECT: Seaside Transfer Station Force Main Repair

I am now the project engineer for the subject project. I met with Manny Ramirez last week and discussed the project in detail.

I am recommending that the first order of work be to pothole the existing pipeline, from the point of the failure upstream, and measure the pipes thickness at each pothole, so we can verify the limits of the repair work. The attached map shows the points that should be potholed.

Basically, I'm recommending that measurements be taken every 200 feet for a distance of 1000 feet. If the measurements indicate substantial pipe deterioration at 1000 feet, measurements should continue upstream until the condition is found to improve. It is also recommended that the line be potholed and measurements taken at one location downstream of the failure, just upstream of Arundell Barranca.

Since your staff would be responsible for taking the measurements, I was hoping they could take care of coordinating with Sam Hill, or another contractor, to have the potholing performed. I would like to have the information by early December if possible.

If you have any questions, please contact me at ext. 4756. Thanks for your help.

cc: Bob Zastrow

CITY OF SAN BUENAVENTURA
MEMORANDUM

DATE: February 26, 1997
TO: Dan Rayburn, Greg Morehead, Rick Raives, Bob Zastrow
FROM: Betsy Cooper, Associate Civil Engineer
SUBJECT: Seaside Force Main Repairs

BACKGROUND

In March of 1996, repairs were made to a section of the Seaside Force Main that had ruptured. The point of rupture occurred north of Arundell Barranca just upstream of the point in which the force main changes to a gravity main. A Capital Improvement Project, "Seaside Force Main Repairs", was later activated in order to analyze what additional repairs were necessary to protect the sewerline from future damage.

On February 13, 1997 the Sanitation Department, as requested by the Engineering Department, conducted a series of pipeline wall thickness measurements along the Seaside Force Main, upstream of Arundell Barranca. Sam Hill & Sons performed the potholing and Sanitation took the measurements. Measurements were taken at six locations. Five were located at 200-foot increments starting 200 feet upstream of the point of rupture. One was located approximately 70 feet downstream of the point of rupture. The results are summarized on the attached table.

ANALYSIS

It was originally envisioned that the project would consist of sliplining a portion of the existing mortar lined ductile iron pipe with polyethylene. The measurements were taken in order to define the limits of sliplining. However, measurements did not show the expected improvement of pipeline conditions as the measurements progressed upstream. The measurements indicated that approximately 60% to 80% of the mortar lining has deteriorated (the pipeline was constructed in 1971). The measurement taken downstream of the rupture surprisingly showed the least amount of deterioration. In addition, measurements previously taken by Sanitation at a vault at Harbor and Peninsula indicate that all the lining has deteriorated from the top of the pipe.

The point of rupture occurred at a high point in the pipeline, just before the pipeline steeply drops to cross under Arundell Barranca. This location was original designed with a maintenance station which contained an air release valve. Five other maintenance stations were originally designed along the force main. According the Manny Ramirez, the stations have never operated properly and are a constant maintenance problem. They fill up with water in the winter and the air release valves do not work.

FEB 26 1997

SANITATION DIV.

The rupture was obviously caused by the buildup of hydrogen sulfide. The long force main (approximately 3.5 miles) has little natural ventilation, and thus is deficient in oxygen which has led to sulfide production. The rate of release of hydrogen sulfide would be the greatest at points of high turbulence, as is the case at Arundell Barranca where the force main contains a steep vertical drop.

In analyzing the system it becomes apparent that only sliplining a portion of the pipe, without any modifications to reduce sulfide production, will not take care of future problems within other areas of the pipeline. In addition to sulfide production, the accumulation of air at high points of the pipeline, without any means of releasing it, decreases the capacity of the force main.

RECOMMENDATIONS

Without further analysis, I would recommend to slipline the pipeline with a polyethylene liner a distance of approximately 500 feet upstream of the rupture. This is the location that the pipeline was originally designed with polyethylene lining, instead of the mortar lining that was actually installed, and is the theoretical distance in which the pipeline could become unsealed during low flows. In addition, I would recommend redesigning the maintenance stations in order to maintain a sewage system that is not excessively deficient in oxygen. It is my understanding that air-relief valves on force mains do not typically function well, since they are likely to become clogged with grease. Some sort of manually controlled valves or vertical riser pipes may instead be installed in order to vent the pipeline. Other problems that are occurring, such as the stations filling up with water, should also be addressed, so that maintenance at these stations is minimized.

There may also be other economical solutions such as pumping air into the pipeline at the pump station or adding chemicals to the system. I understand that Sanitation has experimented with some of these ideas.

Since the measurements taken did not show an improvement in the condition of the pipeline, I recommend that, prior to spending any money improving the system, we contact Yosh Katsura (who originally designed that system) and have him prepare a small study. I think his expertise in this area would provide the most cost effective solution to correct the problems occurring in the force main. It was originally envisioned that the slipline repairs would occur during the summer of 1997. However, having a study performed and adding other improvements would most likely delay the project until the summer of 1998.

If you have any comments or questions, please contact me at ext. 4756. I plan to contact Dan Rayburn within the next week to discuss this memo. If you agree that we should have Yosh prepare a study, I will try to get a proposal from him prior to March 21st (my last day prior to maternity leave) and have another engineer oversee the study in my absence.

CITY MEMORANDUM

RECEIVED

OCT 22 1997

DATE: October 22, 1997
TO: Greg Morehead, Utility Manager
FROM: Robert Du Boux, Assistant Engineer 
SUBJECT: Seaside Force Main Repair
Project Recommendations

BACKGROUND

The original scope of work for this project was to inspect and repair the damaged sections of the Seaside Force Main. The scope was later refined to slipline the existing 20" mortar lined ductile iron pipeline approximately 500 linear feet north of the Arundell Barranca with a polyethylene lining. To verify the length of the slipline, the thickness of the existing mortar-lined pipeline needed to be measured.

On February 13, 1997, San Hill and Sons performed the potholing while Sanitation performed the thickness measurements. These measurements were taken at six different locations. Five were located at 200-foot increments starting 200 feet upstream from the abandoned Maintenance Station and one was located approximately 70 downstream of the abandoned Maintenance Station. The length of the sliplining was to be based on the amount of deterioration of the mortar lining. The results are summarized on the attached Table 1.

It was later determined that the measurements taken using the Ultrasonic Thickness Gage measured the thickness of the DIP and not the mortar lining. Also, the gage was not calibrated correctly for the measurements taken. Therefore, the measurements taken were erroneous and were not used.

During a meeting on March 6, 1997, with Greg Morehead, Don Davis, Dick Simmons, Manny Ramirez, Bob Zastrow, Betsy Cooper and Robert Du Boux, it was agreed that the amount of deterioration of the mortar

lining still needed to be determined. The method to determine the amount of deterioration was as follows:

- Install tapping sleeves
- Install 6" valves
- Hot tap each location
- Remove the 6" diameter "cookie" and measure the thickness.

On September 29, 1997, Sam Hill and Sons began this work. The samples were taken at the same locations as the previous potholing plus an additional location was added near the Arundell Barranca. The result of this testing are outlined in the attached Table 2. The new sample located near the Arundell Barranca could not be taken because of the lack of room in the trench and unstable trench conditions.

RECOMMENDATIONS

I would recommend that the existing 20" DIP sewerline located north of the abandoned maintenance station not be sliplined at this time. This line is coated with a polyethylene coating for approximately 500 linear feet and is in good condition. Beyond the 500 linear feet north of the abandoned maintenance station, the 20" CIP sewerline is coated with a mortar lining. Three samples were taken of this mortar-coated line (#5-7). Unfortunately, Sanitation was only able to retrieve a small sample of the mortar lining (sample #5). Of the other samples, the mortar lining fell into the line while the contractor was hot tapping. Based on the condition of the mortar lining and the DIP, this section does not need to be lined at this time. But, due to some deterioration, it is recommended that the mortar-coated line be sliplined in approximately seven (7) years. Additional testing will be needed to determine the length of deteriorated pipe to be sliplined.

San Jon Maintenance Station Vault

STS Force Main Failure 25 Sept 2003

Street Dept identified a sinkhole on Harbor Blvd 11 September 2003.

Wastewater Division notified of possible sewer issue 3pm on 25 September 2003.

Contacted Sam Hill construction to expose line. Top of pipe gone due to H2S. Line failure just west of Arundel Barranca on Harbor Blvd and East of Beachmont.

Length of failure is about 15 feet. Potholed upstream and down stream to find good pipe. Left bridge of dirt on top afraid that if we attempted to remove it might cave in.

Took fast lane out of service on Harbor so no cars can drive over it.

Do to concert at fair grounds over weekend will start set of for bypass Monday.

Ordered 12 storage tanks (21,000 gallons each) from ECI (Ruddy 648-5123)

Ordered 2 each 8" pumps that can handle 2000gpm from Rain for Rent (Dick 525-3306) and for them to set up piping to storage tanks.

Met with Ron Murphy Maintenance Supervisor for Ventura County Fair Grounds. Met at fair grounds to show him where we needed to set up storage tanks and pumps. No problem

Removed Section of Ruptured Pipe at Section 174+30

Item No. 5 – STS Condition Assessment Inspection Log

Station	Location/Description	Date of Inspection	Depth of Cover	Pipe Wall Thickness Measured			
				top	mid	mid	bottom
60+00	Maintenance Station Vault at Harbor and San Jon	8/8/07	14'-0"	na	na	na	na
	Comments and Observations	Exterior pipe is visually in poor condition inside of vault. Extensive corrosion is evident and exterior coating has failed. Ultrasonic testing not performed. This location should be a concern due to visible corrosion.

170+00	Pothole excavation at center of Harbor at 600' north of Barranca (north of Beachmont). See attached field notes.	4/10/07	5'0"	0.475	0.474	0.456	0.465
	Comments and Observations	Visqueen wrap was still in place. Exterior top, sides, and bottom of pipe appear to be in good condition. Original pipe coating is also in good condition. Ultrasonic readings are above 0.40. This location does not appear to be a concern.					
173+00	Pothole exaction at center of Harbor at 300' north of Barranca (south of Beachmont). See attached Longview Inspection Report.	3/29/07	4'-5"	0.475	0.474	0.463	*na
	Comments and Observations	Visqueen wrap was still in place. Exterior top and sides of pipe appear to be in fair condition. While excavating below pipe, extensive corrosion was discovered on the exterior bottom of pipe. Ultrasonic readings are above 0.40. This location should be considered a concern due to visible corrosion.					
174+50	Pothole excavation in #1 lane of Harbor at 150' north of Barranca. See attached Long view Inspection Report.	3/29/07	3'-9"	0.418	0.202	0.240	*na
	Comments and Observations	Visqueen wrap was still in place. Exterior pipe is visually in fair condition. Ultrasonic readings at spring line are dangerously low. While grinding pipe for ultrasonic testing at pipe spring line, interior mortar lining was exposed indicating a failure of DIP at this location. This location is considered a high priority immediate concern due to the visual observations and low ultrasonic thickness readings.					
Notes: 1	See attached field sketches and notes from potholing inspections noted above.						
Notes: 2	The original total combined pipe wall thickness is 0.578", DIP thickness is 0.390" and mortar thickness is 0.188".

Z - Pipeline Field Notes

Z - Pipeline Field Notes

Item No. 6 - Existing Condition Assessment

The 35 year old force main appears to be in surprisingly good condition along much of the alignment with only few potential problem areas . This general statement of pipeline condition is based on inspection observations and metallurgy testing as noted in the Condition Assessment Inspection Log (Tab 5). The recommendations and assumptions included in this report are based on the extrapolation of _____ inspection points along the alignment.

The actual condition of the pipeline between these inspection points is not known and as such it is certainly possible that isolated areas of severe corrosion do exist. The exterior of the pipe appeared to be in near perfect condition at most pothole locations. The pipeline exterior longevity is most likely a result of the polyethylene pipe wrap being carefully and properly installed during the original construction. Therefore, it should be assumed that isolated and undiscovered areas of deficient polyethylene pipe wrap and severe pipe corrosion could be present.

This report provides data and analysis to support the general conclusion that the existing pipeline currently has a minimum remaining service life of five years, with the following isolated exceptions:

Locations & Segments of Potential Pipeline Deficiency

Arundell Barranca (underground pipe from the Barranca to about 500' upstream)

Maintenance Vaults (Exposed piping inside of 5 maintenance vaults)

Seaward & Harbor (underground pipe corrosion noted during inspection)

Undiscovered areas of severe corrosion on underground piping (unknown)

Item No. 7 - Risk Management Failure Analysis

Arundell Barranca (Upstream of Channel Crossing)

- Start at Station 172+00
- End at Station 177+00
- Repair Length: 500-ft approximate
- Pipe Condition: Segment is currently considered at high risk for future rupture based on inspection observations of surface corrosion and ultrasonic metal thickness testing of pipe wall thickness.
- Failure Scenario: The segment of force main directly upstream of the Arundell Barranca is the general vicinity of two major pipeline ruptures that occurred previously. During recent potholing and pipeline inspections it was determined that this segment of pipe continues to be at risk of eminent failure.
- Recommendation: City should immediately begin plans to replace a 500-ft segment of the existing 20" pipe from the Arundell Barranca to 500-ft north of the Barranca.

Maintenance Station Vault No. 2

- Location Station 60+00
- Repair Length: 15-ft approximate
- Pipe Condition: Exposed segment of force main pipe inside the vault is currently considered at moderate risk for future rupture based on observed surface corrosion of exposed pipe.
- Failure Scenario: The segment of force main that passes through the vault is visibly damaged due to corrosion. Many locations of exposed piping in the vaults exhibit signs of severe corrosion including major flaking of oxidized piping material. The City should still consider this location a significant risk based on the level of observed surface corrosion (i.e. in spite of the favorable pipe wall thickness testing)
- Recommendation: City should include vault piping rehabilitation projects in upcoming CIP budgets such that projects are undertaken within the next 24 to 36 months.

Maintenance Station Vault No. 3

Location Station 91+00

Repair Length: 15-ft approximate

Pipe Condition: Exposed segment of force main pipe inside the vault is currently considered at moderate risk for future rupture based on observed surface corrosion of exposed pipe.

Failure Scenario: The segment of force main that passes through the vault is visibly damaged due to corrosion. Many locations of exposed piping in the vaults exhibit signs of severe corrosion including major flaking of oxidized piping material. The City should still consider this location a significant risk based on the level of observed surface corrosion (i.e. in spite of the favorable pipe wall thickness testing)

Recommendation: City should include vault piping rehabilitation projects in upcoming CIP budgets such that projects are undertaken within the next 24 to 36 months.

Maintenance Station Vault No. 4

Location Station 117+00

Repair Length: 15-ft approximate

Pipe Condition: Exposed segment of force main pipe inside the vault is currently considered at moderate risk for future rupture based on observed surface corrosion of exposed pipe.

Failure Scenario: The segment of force main that passes through the vault is visibly damaged due to corrosion. Many locations of exposed piping in the vaults exhibit signs of severe corrosion including major flaking of oxidized piping material. The City should still consider this location a significant risk based on the level of observed surface corrosion (i.e. in spite of the favorable pipe wall thickness testing)

Recommendation: City should include vault piping rehabilitation projects in upcoming CIP budgets such that projects are undertaken within the next 24 to 36 months.

Maintenance Station Vault No. 5

Location Station 145+00

Repair Length: 15-ft approximate

Pipe Condition: Exposed segment of force main pipe inside the vault is currently considered at moderate risk for future rupture based on observed surface corrosion of exposed pipe.

Failure Scenario: The segment of force main that passes through the vault is visibly damaged due to corrosion. Many locations of exposed piping in the vaults exhibit signs of severe corrosion including major flaking of oxidized piping material. The City should still consider this location a significant risk based on the level of observed surface corrosion (i.e. in spite of the favorable pipe wall thickness testing)

Recommendation: City should include vault piping rehabilitation projects in upcoming CIP budgets such that projects are undertaken within the next 24 to 36 months.

Seaward & Harbor Intersection

Start at Station 117+00

End at Station 119+00

Repair Length: 200-ft approximate

Pipe Condition: Segment is currently considered at low risk for near term failure and rupture based on inspection observations of surface corrosion and ultrasonic metal thickness testing of pipe wall thickness.

Failure Scenario: The segment of force main is the single most prominent high point in the pipeline alignment. There is a high potential for interior pipe damage due to likelihood that foul air is being trapped at the high point. During recent potholing and pipeline inspection it was determined that this segment of pipe shows significant exterior corrosion as compared to the very good exterior pipe condition noted at other pothole locations.

Recommendation: City should plan to replace a 200-ft segment of the existing 20" pipe from north of Seaward to across the intersection.

Item No. 8 - Air-Vac Assembly Impact Analysis

The original STS Force Main pipeline design and construction included a total of six (6) air-vacuum release assemblies housed in the maintenance station vaults. These air-vac assemblies were located as follows:

Maintenance Station No. 1 (Station 34+00) near the Beach Parking Structure
Maintenance Station No. 2 (Station 60+00) near Harbor Blvd. and San Jon
Maintenance Station No. 3 (Station 91+00) near Harbor Blvd. and San Pedro
Maintenance Station No. 4 (Station 117+00) near Harbor Blvd. and Seaward
Maintenance Station No. 5 (Station 145+00) near Harbor Blvd. and Peninsula
Maintenance Station No. 6 (Station 174+00) near Harbor Blvd. and Beachmont

The air-vac systems did not operate correctly and were ineffective. The air-vac systems were decommissioned and dismantled years ago due to on going problems with clogging, sewage containment, and foul air containment. The vaults for Maintenance Stations 1 through 6 remain in place and serve no significant purpose. Maintenance Station No. 6 vault was demolished and removed as part of the repairs made in response to a preceding pipeline rupture.

Adverse Conditions Resulting from Decommissioned Air Vacuum Assemblies:

The following is an analysis of adverse effects on the pipeline due to the decommissioned air-vac assemblies:

- The ductile iron and steel coatings exposed within the Maintenance Station vaults are currently failing.
- The pipe exteriors are severely corroded and in need of immediate rehabilitation to ensure that future failures do not occur.
- The extensive corrosion inside of the vaults was caused by the presents of sewage and/or foul air while the air-vac assemblies were in service.
- The on-going presents of ground water in the vaults continues to exacerbate the exterior pipeline corrosion problem.
- It should be assumed that the pipeline interior coating systems are also being adversely affected by the inability to vent trapped foul air and hydrogen sulfide gas. This should be a significant concern currently and in the future.
- It should also be assumed that the pipeline flow capacity is being reduced as a result of trapped foul air and hydrogen sulfide gas.

Potential Positive Impact from Adding Air Vac Assemblies:

The following are the potential positive impacts of adding air-vac assemblies:

- Reduce the presents of corrosive conditions inside the pipeline.
- Increase pipeline flow capacity and reduce the strain on pumping systems.
- Provide a project opportunity to rehabilitate adjacent pipe coatings.

It is strongly recommended that the City consider adding back the decommissioned air-vacuum assemblies with foul air systems and drainage to local gravity sewers.

Item No. 9 - Line Materials and Appurtenances Index

Material Description	Description of Installation	Locations	Comments
Pipeline	20" ductile iron pipe with bell & Spigot joints, and polyethylene wrap.	Sta 10+00 to Sta 177+00	Mortar lining sta 18+00 to 170+00 polyethylene lining sta 170+00 & 177+00
Redundant Pipe Line	Intermittent installation of parallel line.	The location of the second parallel pipe is not clear on as-builts.	City would have to T.V. inspect pipe to verify locations & conditions.
Valves	20" gate valve (each side of maintenance stations).	Stations 32+00, 91+00, 60+00, 117+00, 145+00	Valves are no longer operable.
Air Vacs.	None. Air Vacs were decommissioned & removed.	Previous locations 32+00, 91+00, 60+00, 117+00, 145+00, 174+00	It is recommended that Air Vacs be reinstalled.
Tapping Valves	20"x6" tapping sleeves with 6" tapping valve install by hot tap	Sta 164+30, 166+30, 168+30, 170+30, 172+30, 174+30, 175+00	Installed by City staff to inspect pipe interior.
Maintenance Station Vaults	Installed to house Air Vacs.	Stations 32+00, 91+00, 60+00, 117+00, 145+00	Vaults remain in place but serve no purpose.
Tees and Blind Flanges	20x20x20 tees install with tapped blind flanges at Air Vacs.	Stations 32+00, 91+00, 60+00, 117+00, 145+00	Tees and blind flanges remain in place but serve no purpose.
Gravity Sewer with Manholes	Force main converts to gravity sewer at Arundell Barranca.	Sta 177+00 to Sta 210++	Not included in this analysis.

Item No. 10 - Recommended Repair and Rehab Projects

1. (Urgent) Force Main Replacement from Arundel Barranca to 300' north

Possible Design Approach: Open Trench installation of new 24" HDPE or PVC pipe parallel to existing pipe with diversion manholes at each end of replacement section to facilitate tie-ins and provide future access to the pipe. Perform tie-ins during low flow limited time shutdowns of pipeline using baker tanks for temporary storage of sewage.

2. Rehabilitate Corroded Piping Exposed in Maintenance Vaults

Possible Design Approach: Remove existing corrosion and scale from exposed pipes, apply sealant and water-stops on piping and existing vault interiors, fill vaults with concrete to fully encase the corroded piping. No shutdowns necessary.

Possible Design Approach: Remove and replace existing pipe to beyond outside of vault walls during low flow shutdowns of pipeline using multiple baker tanks for temporary storage of sewage.

3. Add Air Vac Assemblies with connections to locate gravity sewers

Possible Design Approach: Provide new 2" saddle type pipe taps on existing 20" force main at all high points along the alignment. Provide new sewage rated air vac assemblies in small pre-cast concrete vaults installed over the force main pipeline. Provide gravity sewer drainage from the vault into a nearby gravity sewer system.

4. Add Mandrel Launching Facilities

Possible Design Approach: Add 20" wyes in vaults at mandrel launching locations.

5. Add In-Line Force Main Isolation Valves

Possible Design Approach: Add 20" valves in vaults at mandrel launching locations.

6. In Situ Pipe Rehabilitation

Possible Design Approach: Provide new pipe liner during short pipeline shutdowns.

7. Survey and Mark Pipe Alignment at 100-ft intervals

Possible Design Approach: NA

Stormwater Quality Management

What is Stormwater Runoff?

Runoff is generated when water flows over pervious and impervious surfaces (paved streets, parking lots, building rooftops, lawns, etc.) and does not percolate into the ground. As cities grow and people move into new areas, we create more opportunity for runoff to be generated. Stormwater runoff is runoff associated with rainstorms, snowmelt and surface water drainage. Non-stormwater runoff is any runoff not entirely comprised of stormwater. Common sources of non-stormwater runoff are commercial and industrial wash water, sidewalk rinsing/cleaning, landscape irrigation and construction site discharges. Stormwater and non-stormwater runoff are often collectively referred to as stormwater pollution.

The City of Ventura is nestled between the Ventura River watershed, Santa Clara River watershed and the Pacific Ocean. The stormwater quality program works to preserve these waterways for the enjoyment by our residents, visitors and future generations to come. The program works to integrate water quality benefits into all City operations. The City's storm drain system drains to local creeks, rivers and the ocean; all materials dumped, discharged or deposited in backyards, driveways, parking lots and City streets eventually ends up in these waters, untreated. Working with our community is essential in order to ensure local water quality continues to provide recreational opportunities as well as support wildlife.

What is a Watershed?

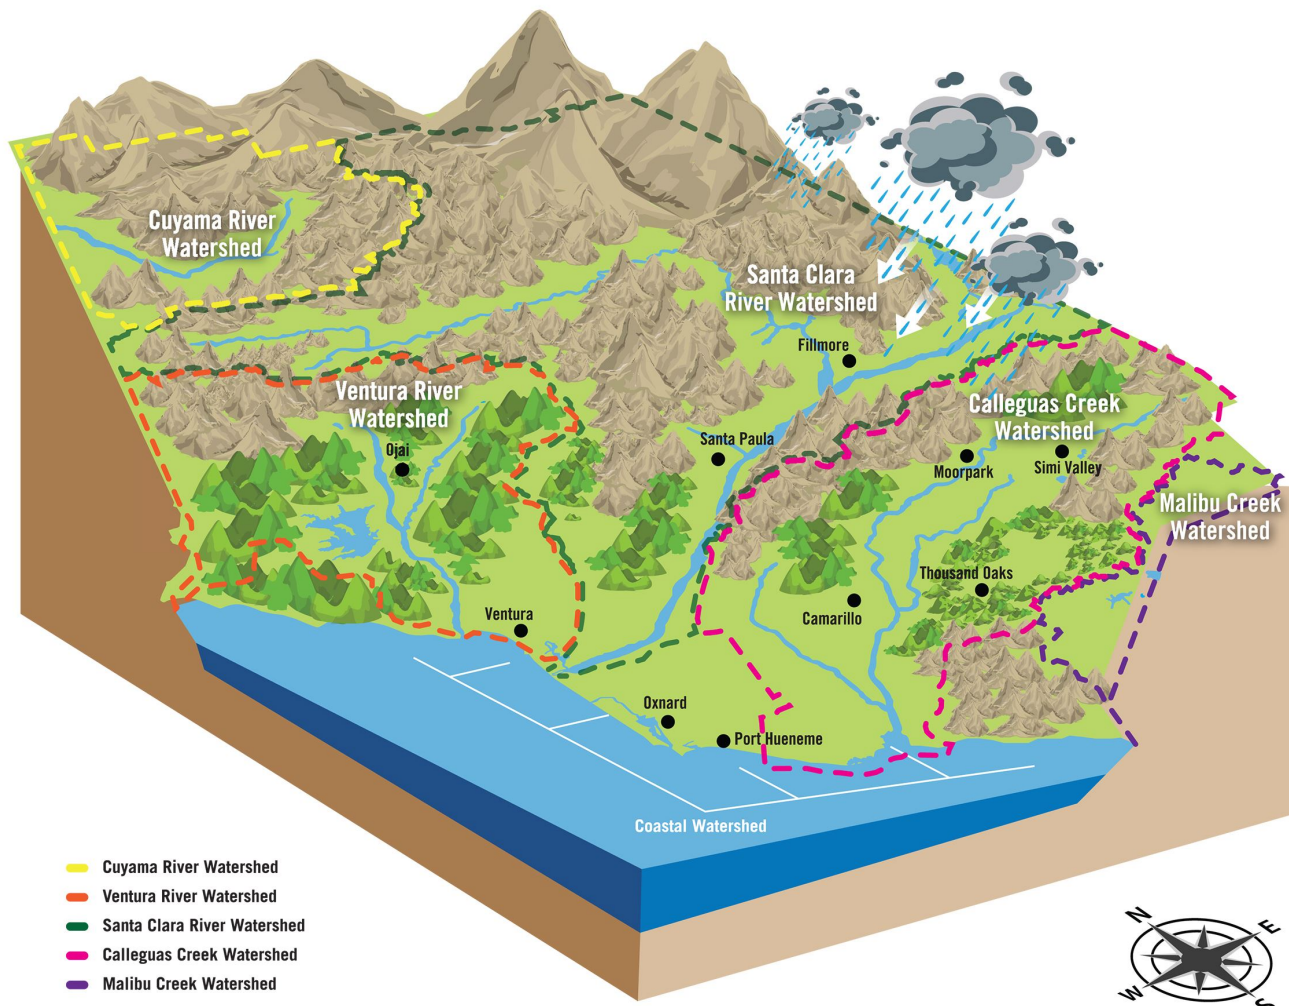

A watershed is the total area of land from which runoff drains into streams, rivers and other bodies of water. Watersheds take many shapes and sizes, but all have one thing in common - they act as a drainage basin. Catchment areas that empty into a single body of water. The City of Ventura is located in three separate

Hello 🙋. How can we help you?

watersheds: the Ventura River Watershed, Santa Clara River Watershed and Ventura Coastal Watershed. Our local watersheds' are beautiful and something to preserve. It is the responsibility of the community to keep our watersheds healthy and clean for generations to come.

What is Stormwater Pollution?

As stormwater and non-stormwater runoff flow over landscapes and impervious surfaces, it accumulates pollutants such as debris, chemicals, sediment and bacteria that can adversely affect water quality. This runoff flows through local creeks, rivers and lakes - eventually draining, untreated, into the ocean. Items like cigarette butts, pet waste, leaves, grass, oil, fast food wrappers, etc. belong in trash or yard waste bins, NOT in our local watersheds.

Many of our daily activities have the potential to cause stormwater pollution. Car washing detergents, lawn/garden fertilizers and pesticides, pool/spa chemicals, oil, gasoline, paint products and many more such items are potentially hazardous and life threatening to plant life, people and animals. These harmful products were never intended to be disposed of in creeks, streams, rivers and the ocean. The "Don't Dump, Drains to Ocean" postings are a continual reminder that we all need to be concerned about stormwater. The majority of harmful impacts caused by pollution can be reduced or eliminated altogether.

The best way to protect our waterways and keep them clean and pollution free is by following best management practices (BMPs). BMPs can be implemented at home and work. Most large stormwater discharges are heavily regulated and require coverage under a National Pollutant Discharge Elimination System (NPDES) permit. The City of Ventura is a Permittee under the Ventura County Municipal NPDES Stormwater Permit and is required to implement programmatic BMPs to reduce pollutants coming from City limits.

Stormwater runoff picks up materials/pollutants on streets, driveways, parking lots and backyards and deposit them into our local waterbodies untreated. These harmful pollutants (metals, grease, oils, fertilizers, soaps, etc.) can cause serious damage to our local streams, creeks, rivers, estuaries and the ocean. In addition, stormwater runoff can be a human health risk when people are swimming in polluted waters. Stormwater pollution is one of the biggest leading threats to water quality in urban and developing areas. As more areas are urbanized in watersheds, the potential for runoff to contain harmful pollutants also increases.

The City implements several programs aimed at reducing and eliminating stormwater pollution impacts. These programs vary from public outreach and education to business and commercial inspections. All stormwater programs share a common goal of improving, protecting and preserving local watersheds for the enjoyment of current and future generations. On a daily basis the City removes trash and debris from city streets and storm drain, inspects local businesses for pollution control measures, and works with construction sites to mitigate discharges of sediment and pollutants to the municipal separate storm sewer system (MS4). Additional projects and programs include the completion of the Hartman Drive Green Street pilot project, residential parkway bioswale program and monthly household hazardous waste collection program.

For over 20 years the City has been working with partner agencies on stormwater management. City of Ventura helped establish the Ventura County Community for a Clean Watershed program to help residents understand how to respect and protect our local watersheds. The City is also a member of the Ventura Countywide Stormwater Quality Management Program that works to improve stormwater quality, monitoring the health of our watersheds and meet compliance requirements of the Ventura Countywide Stormwater Permit.

Things You Can Do for Our Watershed

The [Ventura County Community for a Clean Watersheds](#) as well as [Ventura Countywide Stormwater Quality Management Program](#) website contain publications, watershed protection tips, teaching materials and brochures for businesses and residents that focus on pollution reduction. These websites contain great information for to all age groups on how to protect and enhance our local environments. [Check out 10 quick and easy ways to protect our watersheds here.](#)

Want to get involved? [Check out upcoming community and volunteer events, including cleanup events!](#) Or you can organize your own small group cleanup or self-led cleanup. View the [Litter and Trash Prevention Toolkit](#) and learn how to plan your own successful cleanup. Contact sustainability@cityofventura.ca.gov for cleanup supplies, including gloves and trash bags.

Construction & Demolition Waste Management

About

How To Comply

Forms: WMP and Final Report

About the Program

The City of Ventura Environmental Sustainability division manages the City's Construction and Demolition Debris program. Our goal is to help your project meet state and local requirements by diverting as much landfill-bound waste as possible and protecting our local environment from harmful pollutants.

The Construction and Demolition Debris Program helps ensure that all projects comply with state and local laws. In accordance with the California Green Building Standards Code (CALGreen), all new residential, commercial, and mixed-use construction projects in Ventura are required to divert a minimum of 65 percent of construction and demolition (C&D) waste from landfill disposal. In order to ensure that all projects in the City are compliant, building permit applicants must submit a [Form 1: Waste Management Plan](#) (WMP) for approval before receiving a permit and a [Form 2: Final Report](#) at the time of Final Inspection of their project. The WMP will describe how each applicant plans to manage the waste generated on their project. The Final Report will provide the documentation to show that the applicant carried out their plan as described and achieved the required diversion rate for the project. For more information about the program, check out the [Helpful Tips for Ventura Builders and Residents on Construction and Demolition Debris](#).

The City requires Stormwater Best Management Practices (BMPs) be implemented at any construction or demolition activity, clearing, grading, grubbing, or excavation or any other activity that causes soil disturbance. An effective combination of stormwater pollution controls to prevent the discharge of wastes to the storm drain system are required to be implemented during all construction and demolition activities. More information can be found [Learn more about Stormwater BMPs](#).

Hello 🙋. How can we help you?

Select Language ▼

Google Translate

Who Must Comply with CALGREEN Standards?

Residential:

- All new construction of permitted structures
- All demolition of permitted structures
- Additions and alterations to residential buildings that increase the structure's conditioned area, volume or size are also required to meet the 65% minimum diversion requirement

Non-Residential:

- All new construction of permitted structures
- All demolition of permitted structures
- Additions of permitted structures
- Alterations of permitted structures

Source

2019 California Green Building Standards Code (CALGreen) Part 11 of Title 24, California Code of Regulations. The applicable sections for residential construction can be found in Section 4.408 and in Section 5.408 for most non-residential new construction. Sections 301.1.1 and 301.3 addresses additions and alterations diversion requirements. [SOURCE](#).

Overview

In the City of Ventura there are two options for handling construction waste: onsite service from E.J. Harrison & Sons or self-haul material to a recycling, disposal, and re-use facility.

Each project that qualifies is required to submit a Form 1: Waste Management Plan (WMP) before a building permit is issued. All records of recycling receipts and/or weight tags must be maintained for all materials generated from the project, which can be used to fill out a Form 2: Final Report. The Final Report is due at the end of the project.

Onsite Roll-offs Or Bins from the City's Hauler

Projects, who choose to use onsite collection services, must use the City's franchise hauler, E. J. Harrison & Sons. They are the only authorized hauler for solid waste (City of Ventura Ordinance Code Article 2, Sec. 6.500.210 et. seq.). E.J. Harrison & Sons can assist by diverting at least 65% of the materials and provide final reporting forms for the project. **Please inform E.J. Harrison & Sons if the construction project is under a WMP when ordering service. Projects using this service will need to request a recycling receipt at the end of the project.**

To request services from E.J. Harrison, please call their customer service line at (805) 647-1414.

Self-Haul C&D Material

Self-hauling of C&D materials is allowed only when a licensed contractor uses his/her own employees and equipment as an incidental part of the total service (City Ordinance Code Article 2, Section 6.500.230.5). If the contractor does not have his/her own bins and hauling equipment or employees to self-haul, the contractor is required to use E. J. Harrison & Sons services. All contractors that self-haul are encouraged to segregate the C&D waste on-site and direct haul the materials to local recycling facilities. For projects that require a WMP, the contractor is responsible for submitting to the City of Ventura, all necessary forms, weight tags and final reports on waste diversion for the project.

Looking for a self-haul drop off location near you? The County of Ventura provides a [list of all available recycling, disposal, and re-use facilities in the County](#). In order to determine what percent diversion a facility can provide your project, please call the facility. All self-haulers are responsible for ensuring that the chosen facility will provide the required diversion rate of 65%.

[View The Construction and Demolition Debris Program Guide For Applicants](#)

Form 1: Waste Management Plan

The Form 1: Waste Management Plan is to be completed and approved before a building permit is issued and before construction begins.

If you do not have a contractor selected at the time of submittal, be sure to check the box at the bottom of section A, which indicated that no contractor has been selected. For projects without a contractor at the time of submittal, you can select a waste management option in section B if you have that information, or leave Section B blank until a contractor is selected. Once a contractor is selected, projects will need to resubmit their updated WMP indicating their waste management options for each material type (Section B).

Form 2: Final Report

The Form 2: Final Report is to be completed and approved at the end of a project before final inspection. Please submit copies of all waste hauler tickets and/or recycling receipts with the Final Report.

How to Submit a Form

The most efficient way to submit a Waste Management Plan and a Final Report is by uploading it to [Ventura Online Permits Services \(OPS\)](#).

Turn around time for approvals can take a few days to a week. Once it is uploaded, The C&D Coordinator can approve the Form 1: WMP or Form 2: Final Report within Ventura OPS.

For additional information or assistance filling out the WMP for Final Report, please email CDFORMS@cityofventura.ca.gov or call (805)652-4525.

2020 URBAN WATER MANAGEMENT PLAN

ADOPTED BY THE BOARD OF DIRECTORS ON JUNE 23, 2021

Prepared by:

- Michael Flood, PE, General Manager
- Kelley Dyer, PE, Assistant General Manager
- Julia Aranda, PE, Engineering Manager
- Tyrone LaFay, Public Affairs & Water Conservation Manager
- Michael Shields, Operation and Maintenance Manager
- Janyne Brown, Chief Financial Officer

Table of Contents

- 1. Introduction and Lay Description 1
- 2. Plan Preparation 5
 - 2.1. Plan Preparation 5
 - 2.2. Basis for Preparing a Plan 5
 - 2.2.1. Public Water Systems..... 5
 - 2.2.2. Suppliers Serving Multiple Service Areas/Public Water Systems 6
 - 2.3. Regional Planning..... 6
 - 2.4. Individual or Regional Planning and Compliance..... 6
 - 2.4.1. Regional UWMP 6
 - 2.4.2. Regional Alliance 6
 - 2.5. Fiscal or Calendar Year and Units of Measure 6

1. Introduction and Lay Description

Casitas Municipal Water District (Casitas or District) has prepared this 2020 Urban Water Management Plan (UWMP) in compliance with the Urban Water Management Planning Act of 1983. This section provides an overview of Casitas' water supplies, demands, water service reliability, and strategies for managing risks.

Overview. Casitas provides wholesale and retail water service to western Ventura County and is governed by a five-member elected Board of Directors (Board). Originally named the Ventura River Municipal Water District, Casitas was formed in 1952 to provide supplemental water to the agricultural communities in its service area. The service area also includes residential, commercial, and industrial uses. Wholesale customers include the City of Ventura and several special districts and mutual water companies. In June 2017, Casitas acquired the Ojai Water System (OWS) from Golden State Water Company (GSWC) and absorbed those customers as retail customers.

Water Supplies. All water supplies are local, consisting of groundwater wells and surface water in Lake Casitas. Lake Casitas was formed by the construction of Casitas Dam by the US Bureau of Reclamation in 1958. The total lake capacity is 237,761 acre-feet (AF) as of 2017. The Robles Diversion and Fish Passage Facility is located on the north end of the Ventura River and allows Casitas to divert river flow to the Robles Canal to feed Lake Casitas. Operation of the Robles Facility is under the jurisdiction of the 2003 non-jeopardy Biological Opinion (BO) prepared by National Marine Fisheries Service (NMFS) due to the listing of steelhead trout as an endangered species.

As of December 31, 2020, Lake Casitas was at approximately 39.3 percent of capacity (93,449 AF in storage) due to the ongoing drought. The Safe Yield of Lake Casitas was re-evaluated in 2020 and the hydrology model was updated as described in Section 6.2.3. The Board adopted a safe yield of 18,420 acre-feet per year (AFY) in April 2021 and applied a supply safety factor of -15 percent and a climate change adjustment of -4.3 percent for planning purposes.

The Casitas System also includes one groundwater well, the Mira Monte Well, located in the Upper Ventura River Groundwater Basin. The combined planned operational yield from Lake Casitas and the Mira Monte Well is 15,010 AFY.

In 2017, Casitas acquired the OWS from GSWC. Prior to this, GSWC had been a wholesale customer of Casitas. Ojai Water System customers are now direct customers of Casitas. The Ojai Water System includes the Ojai Wellfield on the east end of Ojai with six groundwater wells. These wells are located in the Ojai Groundwater Basin and currently provide approximately 1,800 AFY of supply. The Ojai Groundwater Basin is unadjudicated and is not considered to be in an overdraft condition.

In 1963, the Ventura County Flood Control District (now the Ventura County Watershed Protection District) contracted with the State of California for up to 20,000 AFY of water from the State Water Project (SWP). In 1971, Ventura County Flood Control District assigned the administration of the contract to Casitas. Casitas' contractual share is 5,000 AFY of State Water Project (SWP), the City of Ventura has 10,000 AFY and United Water Conservation District has 5,000 AFY. To date the infrastructure is not in place to deliver the contractual share to Casitas. Design of a 1.5-mile intertie between Casitas and Carpinteria Valley Water District, referred to as the Ventura-Santa Barbara Counties Intertie, is expected to be complete in 2022, and funding is being pursued for construction. The

intertie will allow delivery of imported water to Casitas to augment local supplies and mitigate impacts of droughts and emergencies.

Water Demands. Demands on the Casitas system have ranged from a low of approximately 8,545 AF in 2019 to a high of approximately 24,000 AF in 1989. Figure 1-1 shows a snapshot of water demands from 1999-2020. In general, agricultural customers make up the majority of demand at 50 percent. Wholesale customers comprise approximately 30 percent and retail customers 20 percent¹.

Every Casitas customer has an assigned water allocation. Casitas manages customer demands through the Water Efficiency Allocation Program (WEAP), which includes conservation targets based on lake level. Currently, Casitas is currently in Stage 3 of the WEAP with mandated 30 percent conservation. Customers who exceed their allocation pay penalties for overuse.

Both the Casitas Retail and Ojai Retail systems met their '20 by 2020' goal to reduce water use 20 percent from the pre-2010 baseline period. Casitas retail users target was 295 gallons per capita per day (gpcd) and the actual 2020 use was 195 gpcd. Ojai users' goal was 257 gpcd and actual 2020 usage was 209 gpcd.

Challenges Ahead. The ongoing drought continues to affect Casitas as all water supplies are local groundwater and surface water diversions. As of December 31, 2020, Lake Casitas was at 39.3 percent capacity with 93,449 AF of water in storage.

The Robles Diversion Facility on the Ventura River may be impacted by the future removal of the Matilija Dam upstream. The release of large quantities of sediment may affect Casitas' ability to divert water to

¹ 2011-2020 average

Lake Casitas. Casitas continues to work with the County of Ventura to evaluate the best alternatives to maintain diversions, protect endangered species, and reduce flooding.

The City of Ventura initiated a water rights adjudication of four groundwater basins within the Ventura River watershed. The basins named in the lawsuit include: Upper Ventura River Groundwater Basin, Lower Ventura River Groundwater Basin, Ojai Valley Groundwater Basin, and Upper Ojai Valley Groundwater Basin. The outcome of the adjudication is currently unknown. Casitas is actively defending and protecting its water rights in the case of *Santa Barbara Channelkeeper v. State Water Resources Control Board; City of San Buenaventura; City of San Buenaventura v. Duncan Abbott, et al.*, Cross-Complaint, Superior Court of the State of California, County of Los Angeles, Case No. 19STCP01176. More information can be found at: <http://www.venturariverwatershedadjudication.com>

Strategies to Manage Reliability. During drought conditions, the WEAP is a cornerstone policy for Casitas' demand management. The WEAP describes the water demand reduction strategies and measures to address water shortage conditions, promote water conservation and the efficient use of water, and the application of a penalty to customers who waste water. The WEAP was originally developed in response to the 1987-1991 drought period, and is updated and modified as needed. The collective work in 1992 set the starting point for a system of water allocation assignments and demand response criteria based on the level of water storage in Lake Casitas.

Casitas prepares an annual Water Supply Assessment each April and provides a summary of the previous fiscal year's weather conditions, water resources, and water demands. The Board may take action to implement various stages of the WEAP in response to these factors.

Casitas is currently designing the Ventura-Santa Barbara Counties Intertie project to allow Casitas to access to its SWP allocation and supplemental water when there is excess delivery capacity in the Santa Barbara County facilities. This intertie would mitigate impacts of droughts and emergencies when local supplies become limited.

This page left intentionally blank.

2. Plan Preparation

Casitas is preparing this UWMP in compliance with California Water Code. Casitas is a wholesale and retail water provider and this UWMP incorporates these two elements. On the retail side, Casitas has two water systems, the Casitas System and the Ojai System, each with their own Public Water System Identification Number. Information presented will reflect these three entities: 1) Casitas Wholesale, 2) Casitas System Retail, and 3) Ojai System Retail.

2.1. Plan Preparation

This UWMP was prepared by Casitas staff from Engineering, Public Outreach and Conservation, Finance, and Operations and Maintenance departments.

2.2. Basis for Preparing a Plan

Casitas is both a wholesale and retail water supplier and will complete applicable sections and tables for both wholesale and retail information. Casitas is required to prepare an UWMP as a retail provider since it serves more than 3,000 AF per year and more than 3,000 connections to retail customers. The Ojai System served 2,953 customers as of December 31, 2020, which is under the threshold of 3,000 customers required to submit an UWMP. Casitas is including the Ojai System to provide a comprehensive picture of the systems Casitas operates.

Casitas completed a combined UWMP and Agricultural Water Management Plan (AWMP) in 2015 though it did not meet the criteria for an AWMP. An AWMP is required when at least 10,000 acres of land is irrigated (excluding recycled water deliveries). Casitas provides water to agricultural customers with reported irrigable lands of approximately 5,000 acres. For this 2020 UWMP, Casitas did not complete an AWMP as the criteria was not met.

2.2.1. Public Water Systems

The Casitas water system provides wholesale and retail water service. The OWS, acquired from GSWC in 2017, is a retail system only. The Casitas and OWS have separate Public Water System Numbers as shown in Table 2-1.

Submittal Table 2-1 Retail Only: Public Water Systems			
Public Water System Number	Public Water System Name	Number of Municipal Connections 2020	Volume of Water Supplied 2020 (Acre-Feet)
5610024	Casitas Municipal Water District	3,187	7,122
5610014	Ojai Water System	2,943	1,625
TOTAL		6,130	8,747
NOTES: Does not include resale (wholesale); includes agricultural, and agricultural-domestic customers. Casitas acquired the Ojai Water System in June 2017.			

2.2.2. [Suppliers Serving Multiple Service Areas/Public Water Systems](#)

This section is not applicable since Casitas is reporting information for each system (rather than grouping the systems together).

2.3. [Regional Planning](#)

Casitas did not participate in a regional effort in the context of 2020 UWMP for establishing regional targets and compliance.

2.4. [Individual or Regional Planning and Compliance](#)

Casitas is preparing this 2020 UWMP as an individual water supplier as shown in Table 2-2.

Submittal Table 2-2: Plan Identification		
Select Only One	Type of Plan	Name of RUWMP or Regional Alliance if applicable
<input checked="" type="checkbox"/>	Individual UWMP	
<input type="checkbox"/>	Water Supplier is also a member of a RUWMP	
<input type="checkbox"/>	Water Supplier is also a member of a Regional Alliance	
<input type="checkbox"/>	Regional Urban Water Management Plan (RUWMP)	

2.4.1. [Regional UWMP](#)

This section is not applicable to Casitas.

2.4.2. [Regional Alliance](#)

This section is not applicable to Casitas.

2.5. [Fiscal or Calendar Year and Units of Measure](#)

Casitas is both a wholesaler and retailer as shown in Table 2-3. Table 2-3 also shows the year type and units of measure used throughout this UWMP.

Submittal Table 2-3: Supplier Identification	
Type of Supplier (select one or both)	
<input checked="" type="checkbox"/>	Supplier is a wholesaler
<input checked="" type="checkbox"/>	Supplier is a retailer
Fiscal or Calendar Year (select one)	
<input checked="" type="checkbox"/>	UWMP Tables are in calendar years

Submittal Table 2-3: Supplier Identification	
<input type="checkbox"/>	UWMP Tables are in fiscal years
Units of measure used in UWMP	
Unit	Acre-Feet (AF)
<i>* Units of measure (AF, CCF, MG) must remain consistent throughout the UWMP as reported in Table 2-3.</i>	

2.5.1. [Fiscal or Calendar Year](#)

The data reported in this 2020 UWMP is on a calendar year basis.

2.5.2. [Reporting Complete 2020 Data](#)

All data for the complete calendar year 2020 is included herein.

2.5.3. [Units of Measure](#)

Casitas is reporting all water data in acre-feet.

2.6. Coordination and Outreach

Coordination and outreach regarding the preparation of this 2020 UWMP is discussed in the following subsections.

2.6.1. [Wholesale and Retail Coordination](#)

Casitas Wholesale System. Casitas supplies water on a wholesale basis to the agencies listed in Table 2-4.

Submittal Table 2-4 Wholesale: Water Supplier Information Exchange (select one)	
<input checked="" type="checkbox"/>	Supplier has informed more than 10 other water suppliers of water supplies available in accordance with Water Code Section 10631. Completion of the table below is optional. If not completed, include a list of the water suppliers that were informed. Provide page number for location of the list.
<input type="checkbox"/>	Supplier has informed 10 or fewer other water suppliers of water supplies available in accordance with Water Code Section 10631. Complete the table below.
Water Supplier Name	
Casitas Mutual Water Company	
City of Ventura	
Del Vasco Mutual Water Company	
Hermitage Mutual Water Company	
Meiners Oaks Water District	
Old Creek Road Water Company	

Submittal Table 2-4 Wholesale: Water Supplier Information Exchange (select one)
Rancho del Cielo Mutual Water Company
Rincon Road and Water Works
Senior Canyon Mutual Water Company
Siete Robles Mutual Water Company
Sisar Mutual Water Company
Sulphur Mountain Road Water Association
Tico Mutual Water Company
Ventura River Water District
NOTES:

Casitas Retail System. Casitas serves as the ‘wholesaler’ to Casitas retail customers so notifications are not necessary. Casitas does not purchase water from any other wholesalers.

Submittal Table 2-4 Retail: Water Supplier Information Exchange – Casitas Retail
The retail Supplier has informed the following wholesale supplier(s) of projected water use in accordance with Water Code Section 10631.
Wholesale Water Supplier Name
Not applicable.
NOTES: Casitas serves as the ‘wholesaler’ to Casitas retail customers so notifications are not necessary. Casitas does not purchase water from any other wholesalers.

Ojai Water System. Casitas serves as the ‘wholesaler’ to Ojai Water System retail customers so notifications are not necessary. Casitas does not purchase water from any other wholesalers.

Submittal Table 2-4 Retail: Water Supplier Information Exchange – Ojai Retail
The retail Supplier has informed the following wholesale supplier(s) of projected water use in accordance with Water Code Section 10631.
Wholesale Water Supplier Name
Not applicable.
NOTES: Casitas serves as the ‘wholesaler’ to Ojai Water System retail customers so notifications are not necessary. Casitas does not purchase water from any other wholesalers.

2.6.2. Coordination with Other Agencies and the Community

Notifications regarding the preparation of this 2020 UWMP were sent to the following agencies and community groups:

Calleguas Municipal Water District	Surfrider Foundation Ventura County
Carpinteria Valley Water District	United Water Conservation District
Farm Bureau of Ventura County	Upper Ventura River Groundwater Management Agency
Friends of the Ventura River	Ventura County Agriculture Commissioner
Ojai Basin Groundwater Management Agency	Ventura County Local Agencies Formation Commission
Ojai Chamber of Commerce	Ventura County Resource Conservation District
Ojai FLOW	Ventura County Supervisor Matt LaVere
Ojai Pixie Growers Association	Ventura County Watershed Protection District
Ojai Valley Land Conservancy	Ventura River Watershed Coordinator
Ojai Valley News	Watersheds Coalition of Ventura County
Ojai Valley Sanitary District	

A sample letter is provided in Appendix A. Additionally, Casitas posted a notice on their website and social media accounts including Facebook and Twitter regarding the availability of the Draft 2020 UWMP.

2.6.3. Notice to Cities and County

Notification letters at least 60-days in advance of the public hearing on the 2020 UWMP were sent to the following Cities and Counties:

- County of Ventura
- City of Ventura
- Ventura Water
- City of Ojai

The sample letter is provided in Appendix B.

This page left intentionally blank.

3. System Description

Descriptions of the Casitas and Ojai water systems are included in the following subsections.

3.1. General Description

Casitas is a Municipal Water District providing wholesale and retail potable water to western Ventura County including 6,130 agricultural, commercial, and residential customers. The District boundaries (Figure 3-1) encompass the City of Ojai, Upper Ojai, the Ventura River Valley area, the City of Ventura (west of Mills Road), and the beach communities of Solimar, La Conchita, and Rincon.

Casitas Wholesale System. Casitas supplies water to several water agencies on a wholesale basis; there is a total of 24 wholesale connections. The largest wholesale customer is the City of Ventura (City or Ventura). Ventura is supplied via the gravity-fed Cañada Larga (30-inch) and Ventura 1(M) (33-inch) Mains. There are two connection points to the City, one at the City's Avenue Treatment Plant, and one near Olive and Ramona Streets in west Ventura. The maximum demand from the City can periodically reach 20 cubic feet per second (cfs). Casitas' service area also includes smaller mutual water companies, and two water districts, Meiners Oaks Water District and Ventura River Water District.

Casitas Retail System. The Casitas retail system includes the services directly to end users such as residential, agricultural, commercial, and industrial customers.

The Casitas wholesale and retail customers share a potable water supply and distribution system.

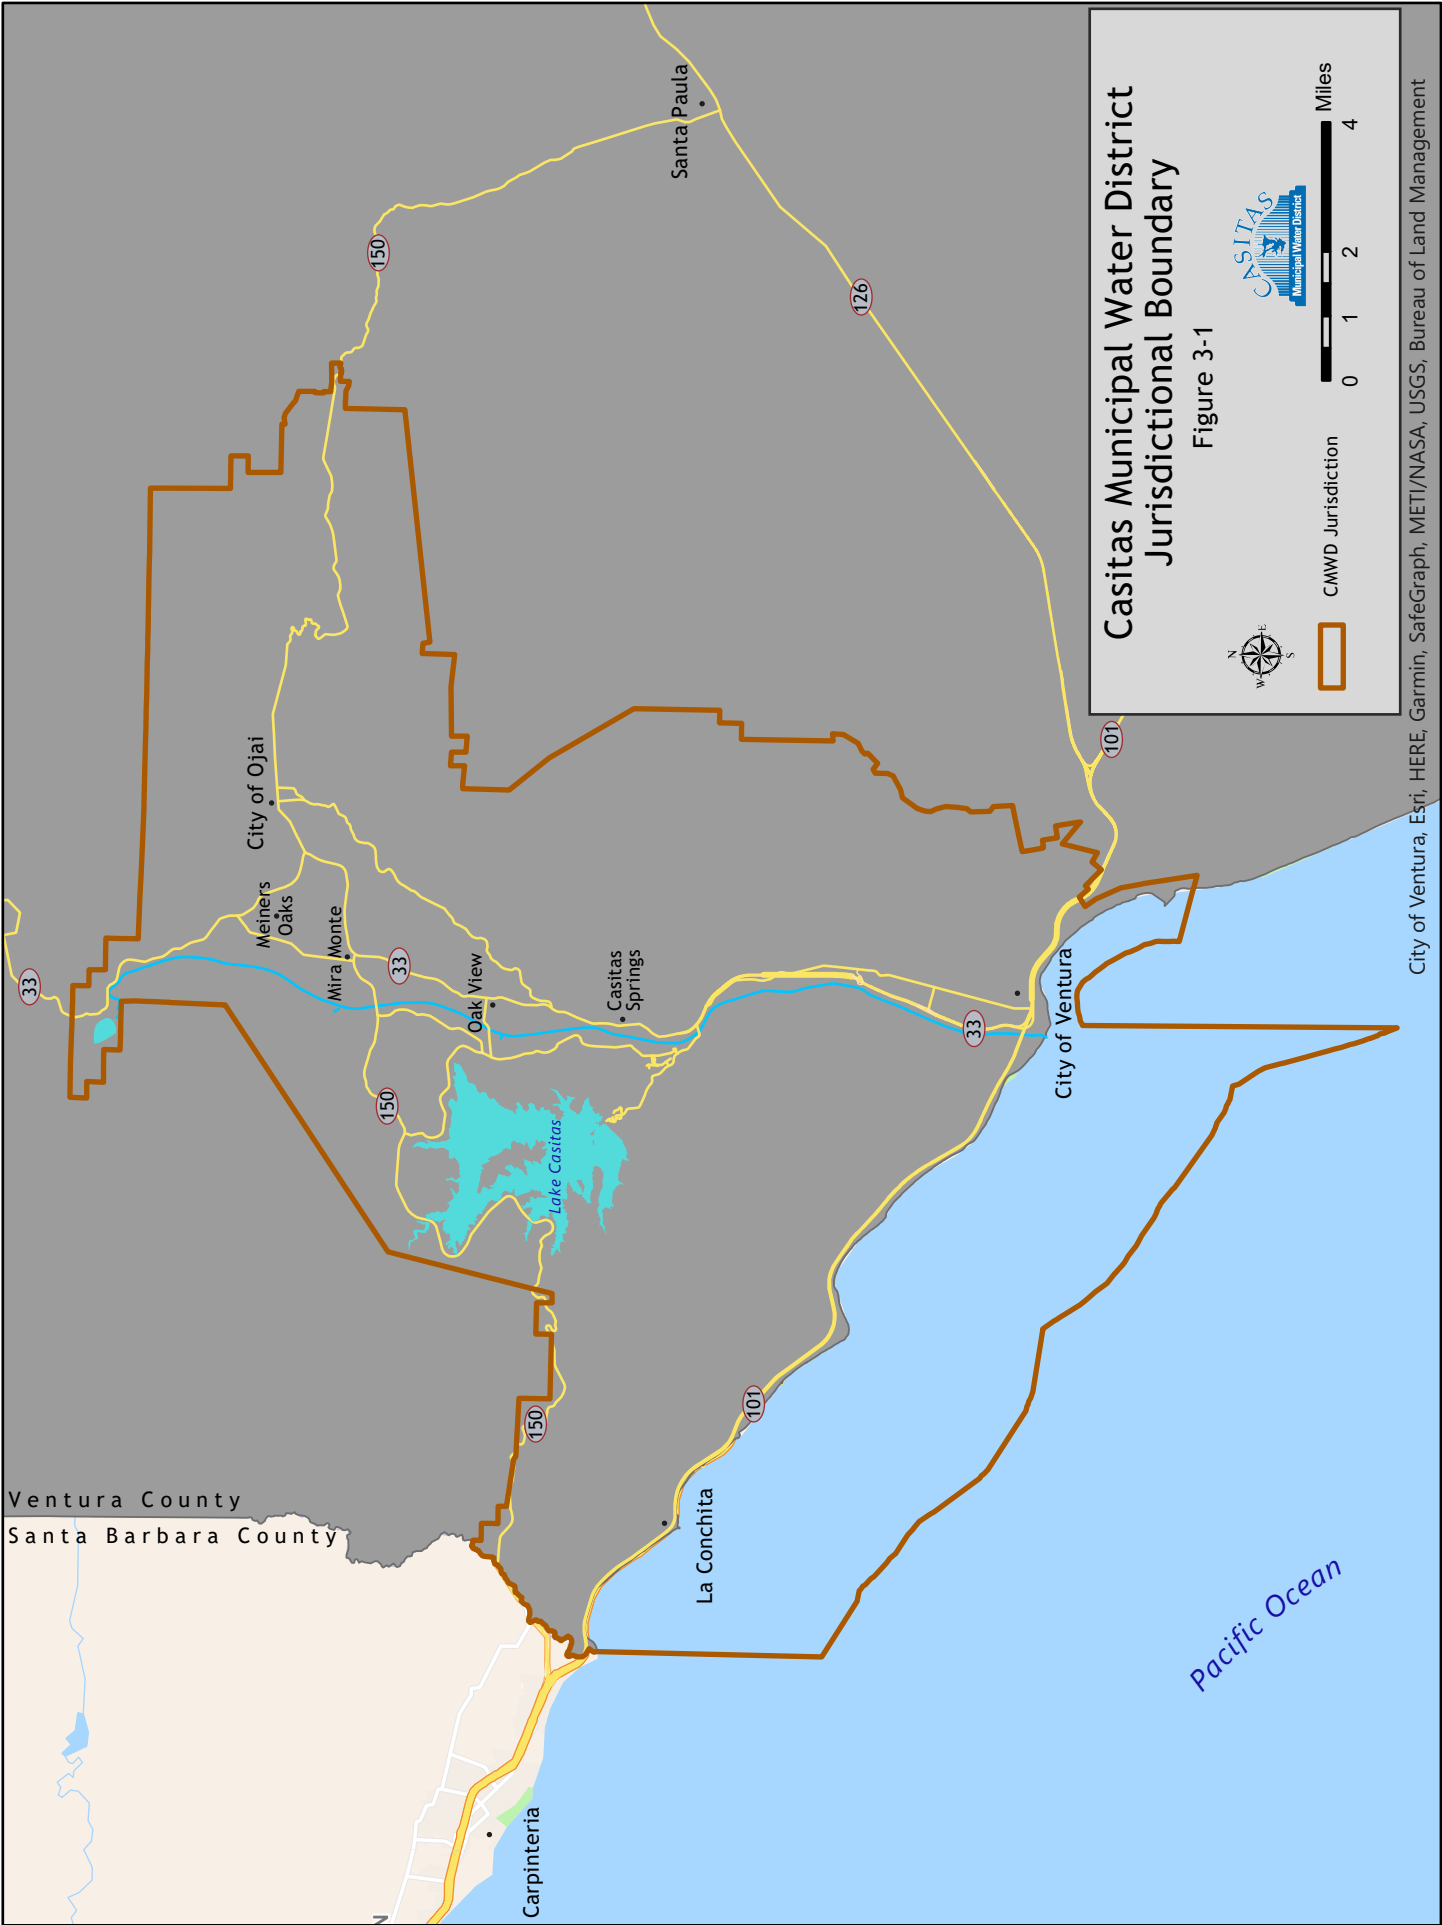

Casitas Municipal Water District was originally formed as Ventura River Municipal Water District in 1952. The main source of supply is Lake Casitas, which was formed by the construction of Casitas Dam. The Dam, the Robles Diversion Facility on the Ventura River, and a majority of the transmission system was constructed by the United States Bureau of Reclamation (USBR) in the late 1950s and 1960s. In addition to the facilities constructed by USBR, Casitas also constructed water infrastructure (pipelines, tanks, and pump plants) to further expand the system.

The original capacity of Lake Casitas was 254,000 acre-feet (AF); a 2017 bathymetric survey re-calculated the capacity to approximately 238,000 AF. As of December 2020, Lake Casitas was at approximately 39.3 percent of capacity (93,449 AF in storage) due to the ongoing drought.

Lake Casitas receives inflow from the surrounding watershed, Coyote Creek, Santa Ana Creek, and the Robles Diversion Facility. The Robles Fish Passage Facility was constructed at the Robles Diversion in 2004 as a result of the listing of steelhead trout in the Endangered Species Act (ESA). A 2003 non-jeopardy Biological Opinion (BO) prepared by the National Marine Fisheries Service (NMFS) determines the conditions under which water can be diverted from the Ventura River to the Robles Canal (which feeds into Lake Casitas).

The Marion Walker Water Treatment Plant (MWWTP) at the base of Casitas Dam was constructed in 1995 and is a 65 million-gallon per day (mgd) facility utilizing pressure filtration to treat water before distribution in compliance with the State of California Surface Water Treatment Rule.

The Casitas System also includes the Mira Monte Well with a planned operational supply of 145 to 180 AFY. The well water is blended with surface water from Lake Casitas at a high ratio to ensure nitrate concentrations are below the maximum contaminant level.

Casitas Municipal Water District
Jurisdictional Boundary

Figure 3-1

CMWD Jurisdiction

City of Ventura, Esri, HERE, Garmin, SafeGraph, METI/NASA, USGS, Bureau of Land Management

Ojai Water System. Casitas acquired the Ojai Water System in 2017 from Golden State Water Company and completed a Condition Assessment and Master Plan in 2018.

The Ojai System obtains water from Ojai Basin groundwater and two interconnections supplying water from the Casitas System. The Ojai System acquisition included several groundwater wells, with some wells over 45 years old and in need of rehabilitation and replacement. The wells acquired by GSWC were unable to produce their original design capacity of 4,404 AFY and Ojai wellfield production from 1994 to 2016 averaged about 1,800 AFY. Since 2017, Casitas has made progress in improving the condition of the wells, although work is not yet complete.

The Ojai Basin is managed by the Ojai Basin Groundwater Management Agency (OBGMA). In May 2020 the OBGMA Well at Carne Road and Grand Avenue showed groundwater levels at 78 percent full (62,400 AF of stored water remaining) in the Ojai Basin².

3.2. Service Area Boundary Map

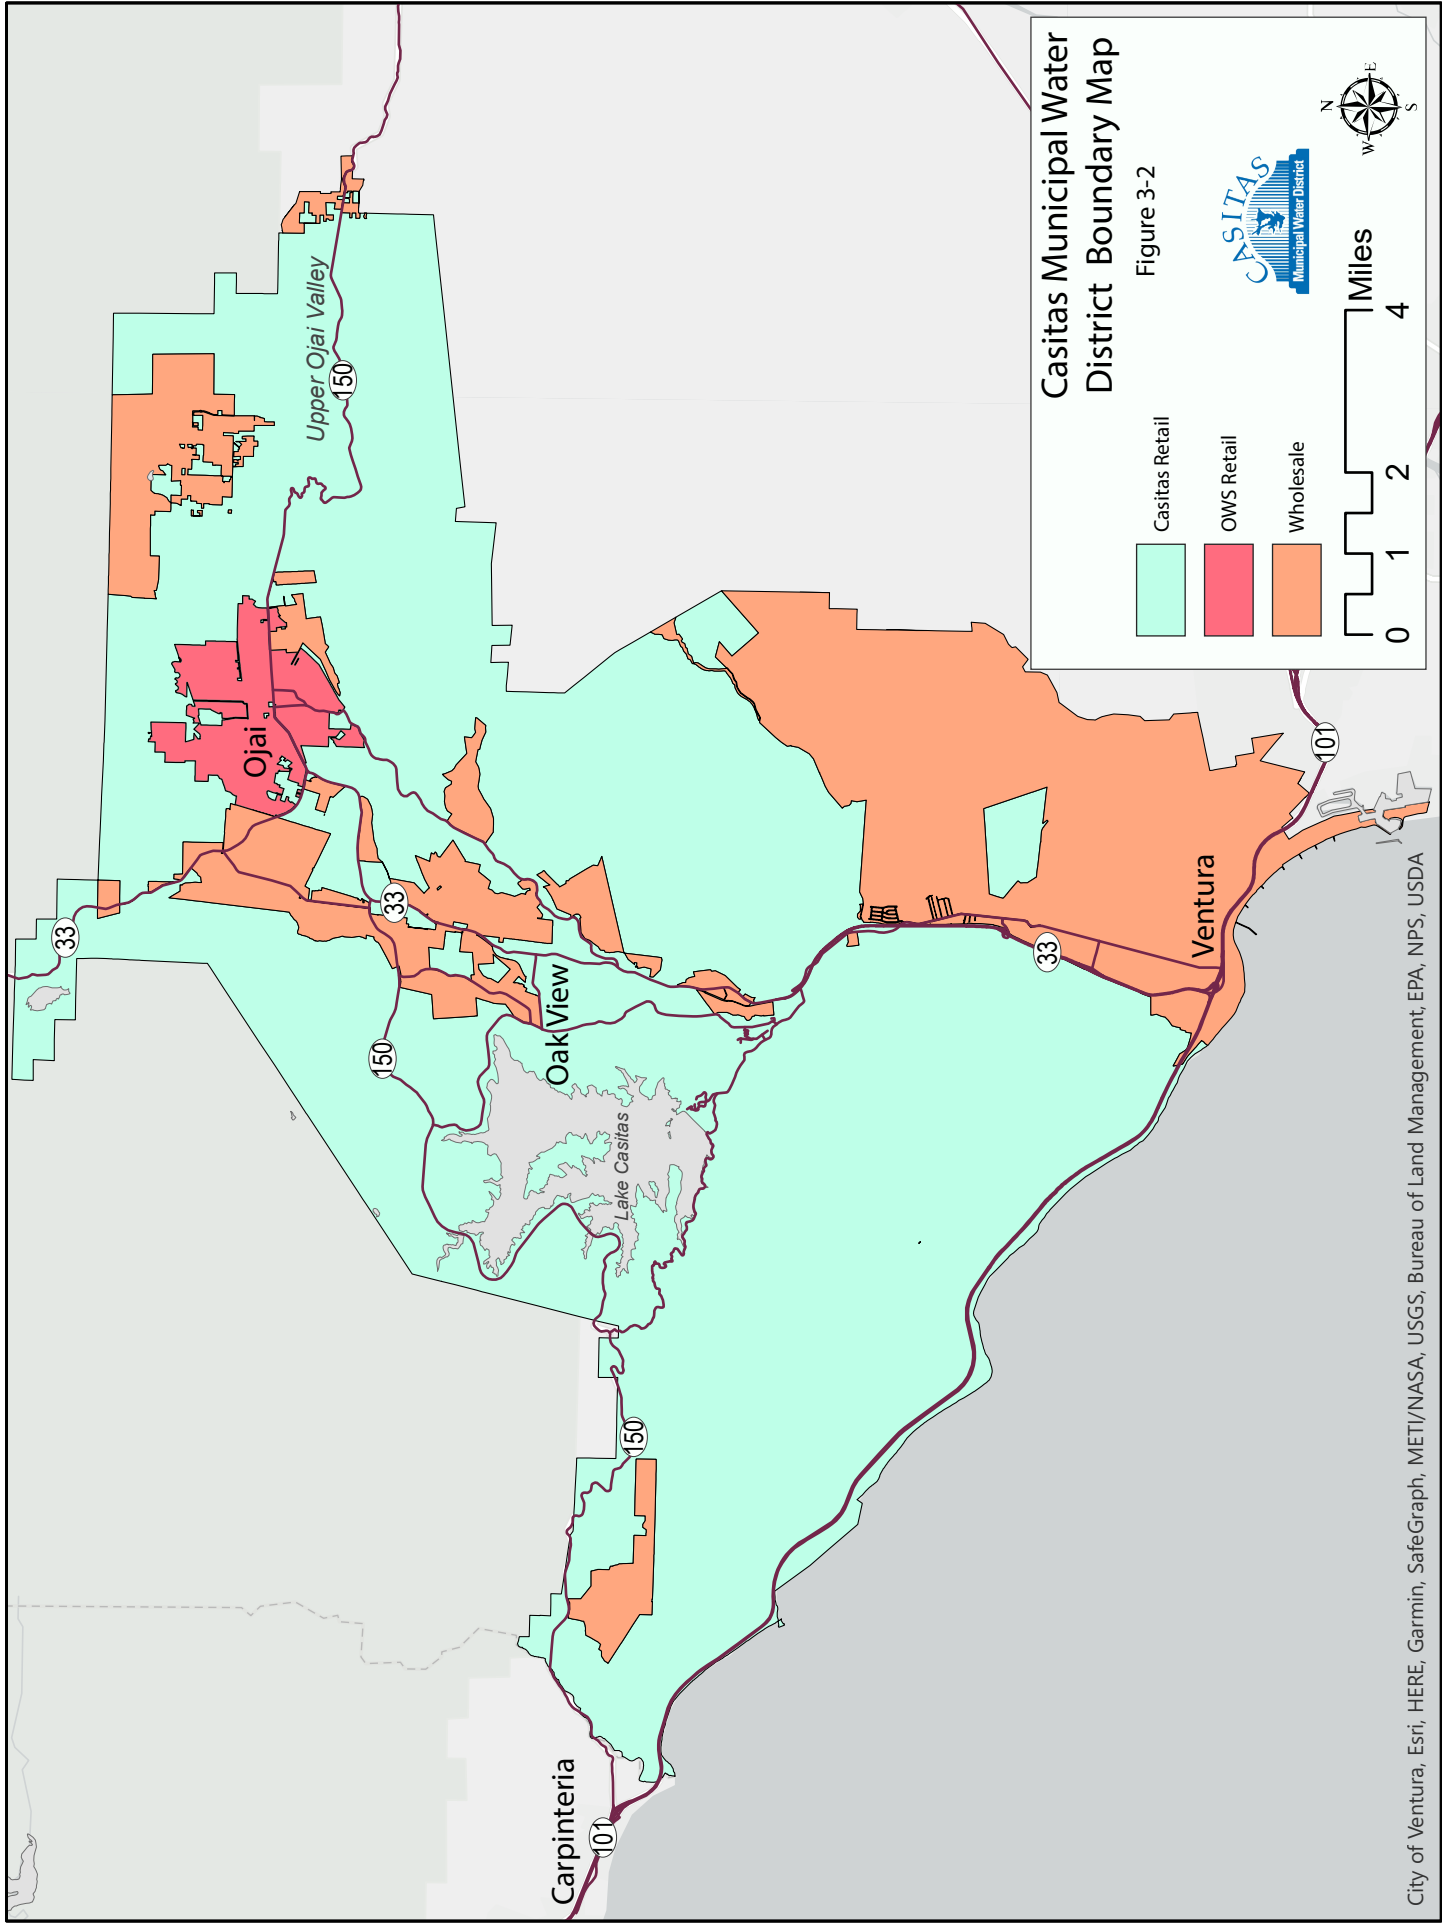

The following subsections show the specific boundaries of the Casitas wholesale system, Casitas retail system and Ojai Water System. Figure 3-2 shows each system's boundaries. Geographic Information System (GIS) files will be uploaded to the California Department of Water Resources (DWR) website when the 2020 UWMP is submitted.

Casitas Wholesale System. The wholesale system boundary was created using the service areas of Casitas' wholesale (resale) customers.

Casitas Retail System. The Casitas Retail System boundary was created by excluding the wholesale (resale) customers and the Ojai retail system.

Ojai Retail System. The Ojai retail system boundary map was created using the boundaries of the former Golden State Water Company.

² *Basin Conditions and Summer Planning*, Jordan Kear PG, CHG, 20 January 2021

3.3. Service Area Climate

The climate conditions for Casitas' entire service area are described in the following subsections. Casitas' service area includes micro-climates of coastal and inland areas. Casitas maintains a weather station at Soule Park Golf Course in Ojai. Precipitation and evaporation is also measured at Casitas Dam and the Lake Casitas Recreation Area. Data for the period 2010 to 2020 is evaluated herein.

Evapotranspiration. Average evapotranspiration by month was evaluated over the 2010-2020 period, and ranged from 1.69 inches in December to 7.48 inches in July, with an average monthly evapotranspiration of 4.26 inches. Total annual evapotranspiration over the period averaged 51.15 inches.

Temperature. Casitas service area experiences significant temperature variation over its terrain. Coastal areas are milder with less temperature fluctuation, while inland areas see a wider temperature swing. For the period of 2010 to 2020, the Soule Golf Course weather station in Ojai showed an average temperature of 37.5 degrees Fahrenheit (°F) in December and an average temperature of 92.0°F in July.

Precipitation. Similarly, annual precipitation varies throughout the service area. In Ojai for the previous ten years, the average monthly precipitation ranged from 0.0 inches in July to 3.89 inches in January. Total annual precipitation over the period averaged 14.91 inches.

At Casitas Dam, the minimum annual precipitation was 9.9 inches (2014) and maximum annual precipitation was 36.0 inches (2011). Total annual precipitation over the period averaged 19.0 inches.

Climate Change. A report titled *Projected Changes in Ventura County Climate* was prepared by the Desert Research Institute in 2019. The report was commissioned by Watersheds Coalition of Ventura County, of which Casitas is a member, and can be found on their website www.wcvc.ventura.org under Climate Resilience Resources. The projected climate change impacts for the Casitas service area include:

- Winters may get wetter with more short duration/high intensity precipitation due to atmospheric rivers, resulting in increased potential for flash flooding
- Shoulder seasons may have more dry days
- Potential increase in wildfire frequency due to spring/fall drying
- Increased drought susceptibility and increased water demand due to increasing temperatures and evapotranspiration rates
- Good agreement across models for increase in inland area temperatures between 3 – 5°F and coastal areas between 2 – 3°F
- More days exceeding extreme/impactful temperature thresholds

As with any climate modelling efforts, there is uncertainty. These potential impacts are the results of the best tools available at this time and are meaningful in their applicability to the service area and can support decision-making. Casitas will continue to participate in these modeling efforts going forward.

3.4. Service Area Population and Demographics

The service area populations of the Casitas wholesale, Casitas retail, and Ojai Water System are described in the following subsections. Demographics are discussed for the entire service area.

3.4.1. Service Area Population

The service area populations for the Casitas Wholesale System, Casitas Retail System and Ojai Water System are described in the following subsections. Census data for 2020 was not available at the time this 2020 UWMP was prepared. Population projections are described in more detail in each subsection. The total population served by Casitas in 2020 is estimated at 63,718 for the combined wholesale and retail systems.

Casitas Wholesale System. The wholesale system population shown in Table 3-1 Wholesale is based on 2010 Census data and estimates the 2020 population based on compound annual growth rates (CAGR) in the Ventura County 2040 General Plan, Chapter 2 – Demographics and Economics (adopted September 2020) for Unincorporated Ventura County, and City of Ventura General Plan (adopted 2005) CAGR for City of Ventura. The population projections from 2020 to 2040 are based on annual growth rates for Ventura County in the Southern California Association of Governments (SCAG) Demographics and Growth Forecast Technical Report adopted Sept 3, 2020.

Submittal Table 3-1 Wholesale: Population - Current and Projected, Casitas Wholesale					
Population Served	2020	2025	2030	2035	2040
	45,964	46,828	47,709	48,606	49,520

Casitas Retail System. The Casitas Retail System population is based on non-wholesale customers with a direct meter from Casitas and not located within the former Golden State Water Company (Ojai) water system. The 2020 population was estimated based on 2010 census data and customer connection ratios and extrapolated for 2020. The population projections from 2020 to 2040 are based on annual growth rates for unincorporated Ventura County in the SCAG Demographics and Growth Forecast Technical Report adopted Sept 3, 2020.

There are 14 customers who are served by both the Casitas and Ojai systems; they have two separate meters. The majority of their water use was from the Casitas system, so the population of these parcels was included in Table 3-1 Casitas Retail and calculations.

Submittal Table 3-1 Retail: Population – Current and Projected, Casitas Retail					
Population Served	2020	2025	2030	2035	2040
	11,042	11,101	11,161	11,221	11,281

Ojai Water System. The Ojai Water System is comprised of those customers formerly served by Golden State Water Company in Ojai. Population for 2020 was estimated based on 2010 census data and customer connection ratios and extrapolated for 2020. The population projections from 2020 to 2040 are based on annual growth rates for Ojai in the SCAG Demographics and Growth Forecast Technical Report adopted Sept 3, 2020. Table 3-1 Ojai Retail shows the population projections for this system.

Submittal Table 3-1 Retail: Population - Current and Projected, Ojai Retail					
Population Served	2020	2025	2030	2035	2040
		6,712	6,773	6,834	6,895

3.4.2. [Other Social, Economic and Demographic Factors](#)

Information on demographics throughout Casitas’ service areas is from *Ventura County 2040 General Plan, Chapter 2 Background Report – Demographics and Economics* (Background Report) (September 2020, County of Ventura). The Census-Designated Places (CDP) within the District’s service area are the communities of Oak View, Meiners Oaks, and Mira Monte.

Regarding employment, Oak View residents had the highest unemployment rate within the service area, at 9.5 percent in 2015. More recent data is not available.

Within Casitas’ overall service area there are several designated Disadvantaged Communities (DAC) and Severely Disadvantaged Communities per the State of California Department of Water Resources Disadvantaged Communities Mapping Tool. These are shown in Figure 3-3 and are based on tracts and census blocks from DWR’s 2018 data.

The economy of Casitas’ service area is generally based on oil and gas production, agriculture, and hospitality/tourism.

3.4.3. [Land Uses Within Service Area](#)

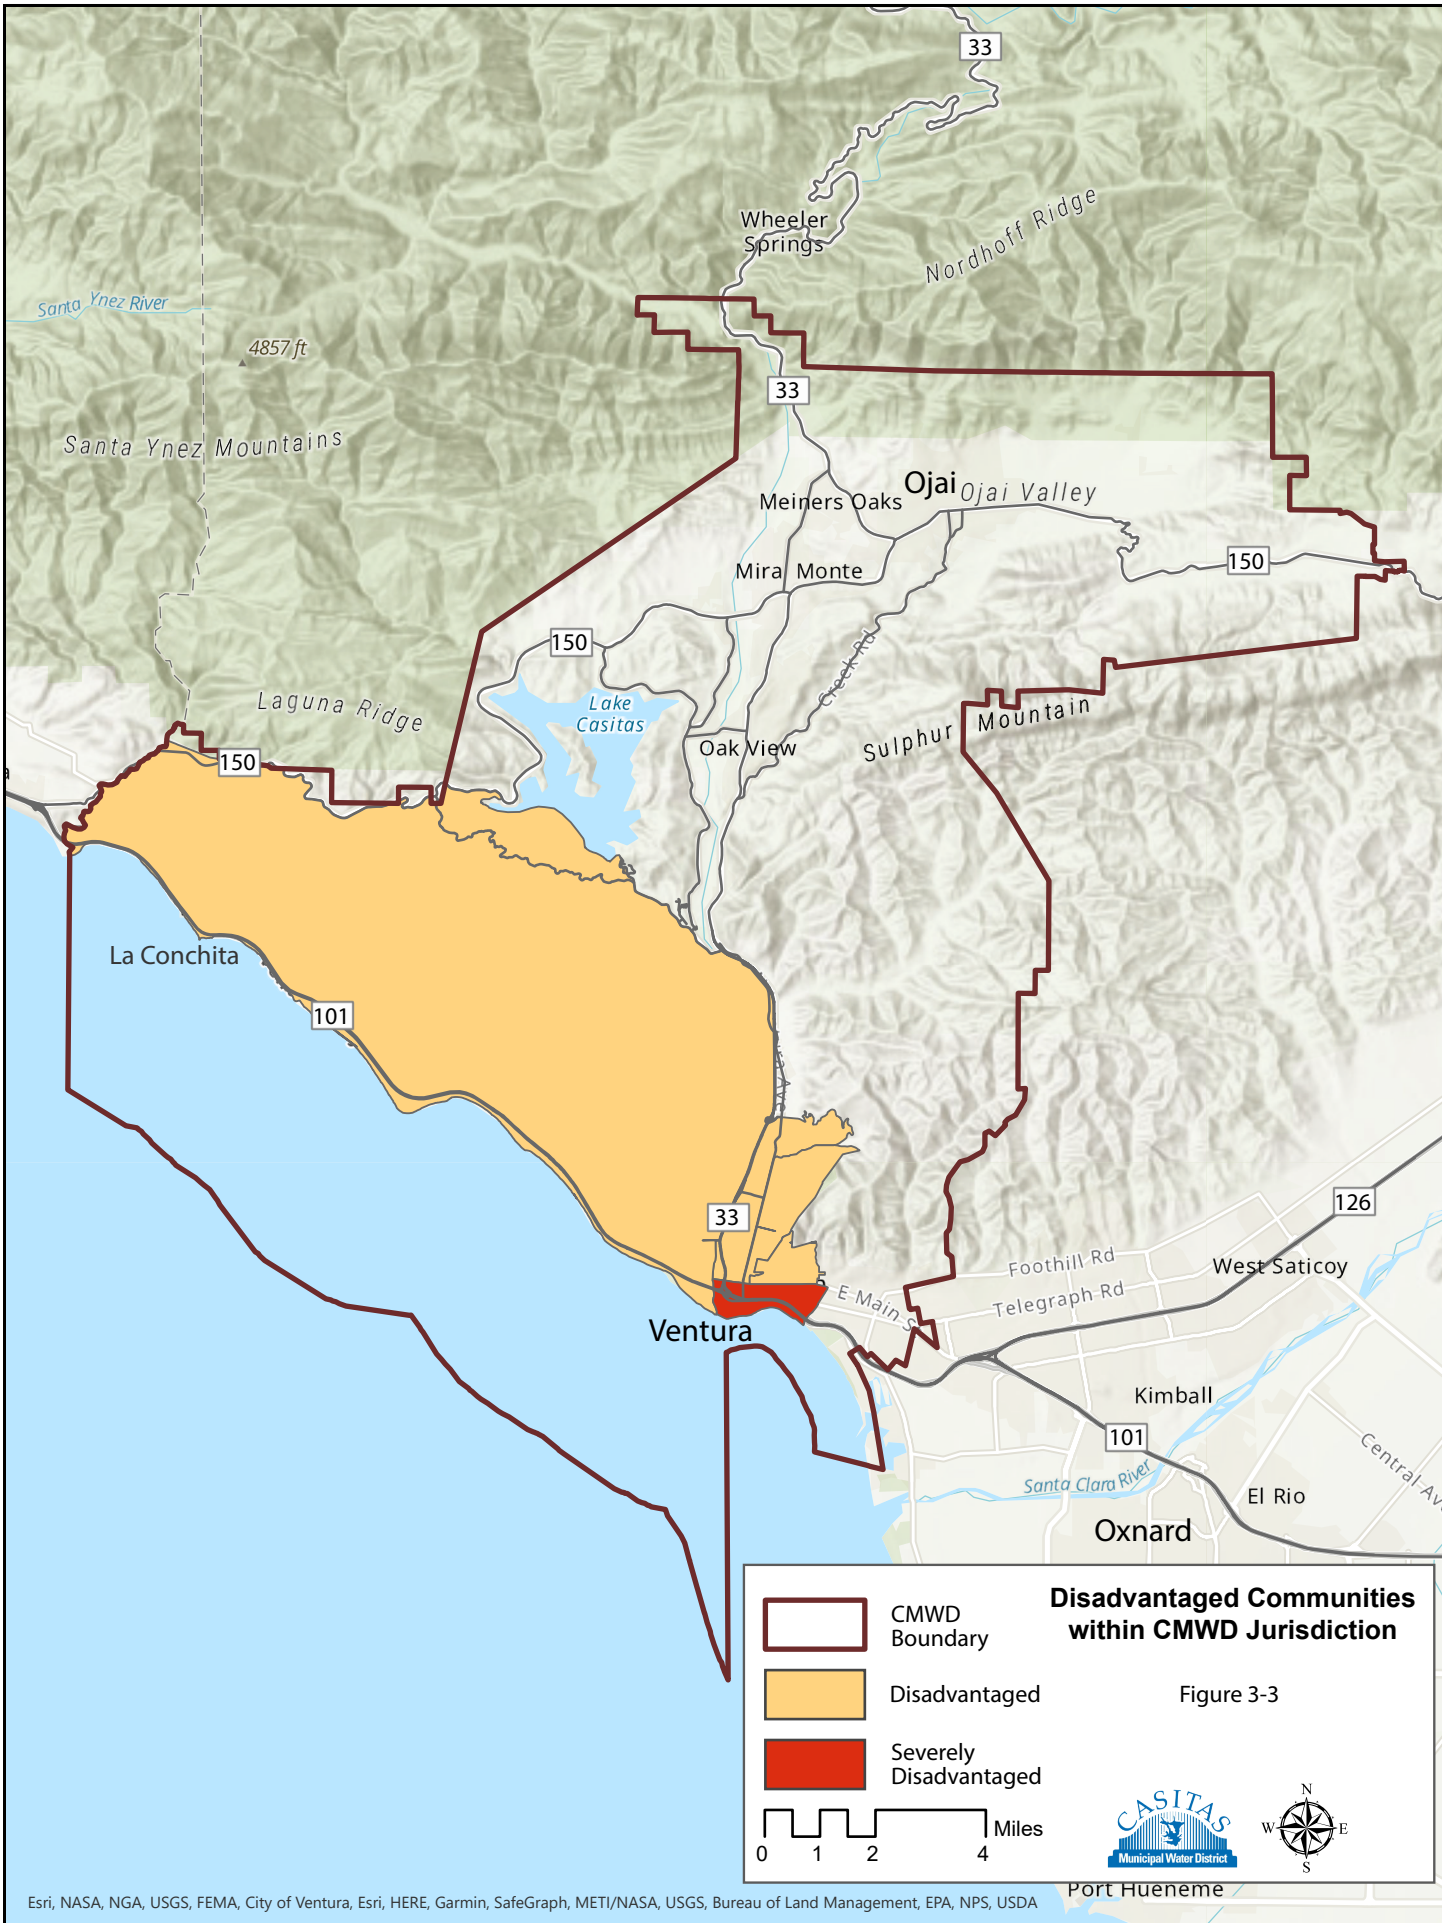

The County of Ventura adopted the 2040 General Plan in September 2020. Area Plans from the General Plan within Casitas’ area include the Coastal Area, North Ventura Avenue Area and Ojai Valley Area. The incorporated City of Ojai is entirely within Casitas boundaries. Portions of the City of Ventura on the west end are also in Casitas’ service area. Figure 3-4 shows land use designations overlain with District boundaries.

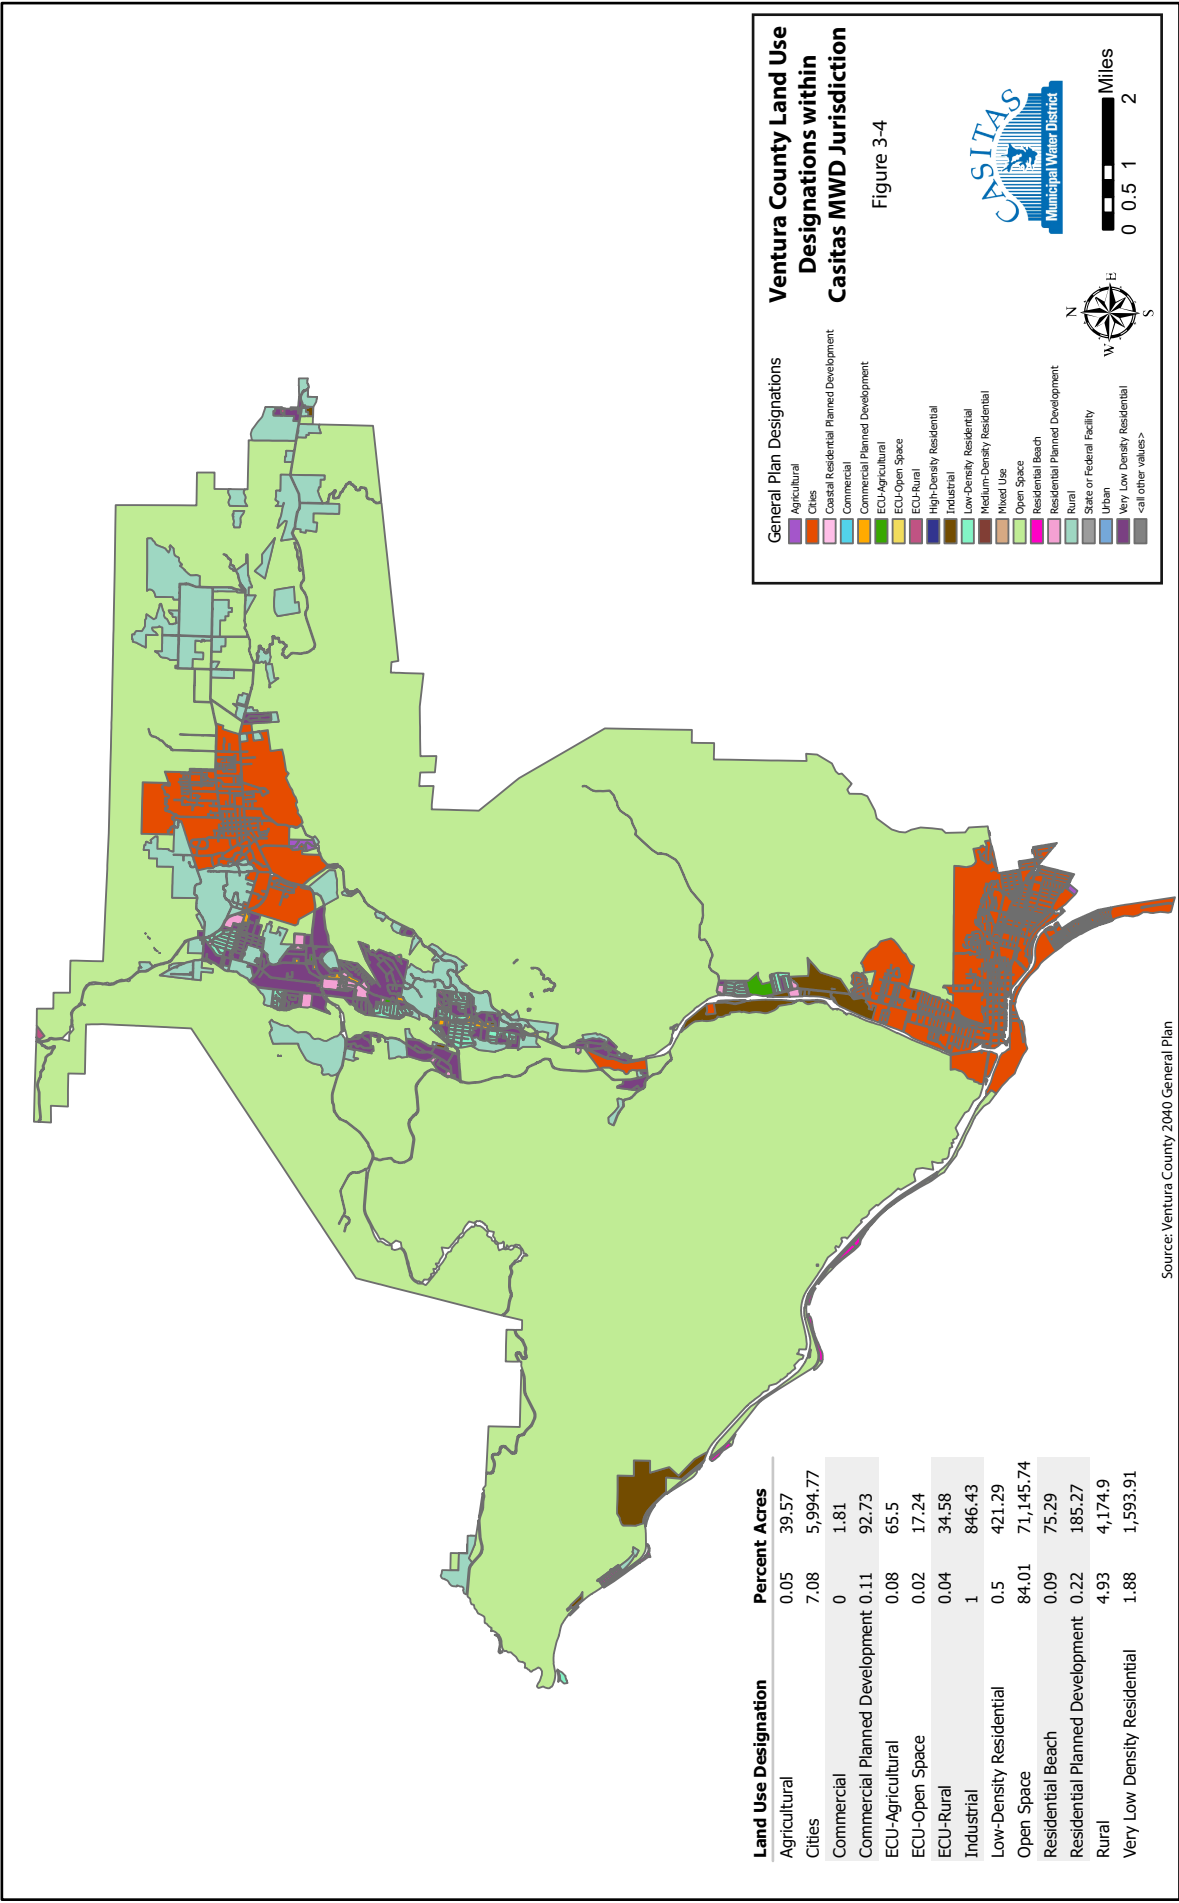

The following subsections provide more information on specific Areas.

Coastal Area (CA). The CA extends along the Pacific Coast from the Los Angeles County Line in the south to the Santa Barbara County Line in the north. Specifically, the North Coast is within Casitas’ service area and includes the communities of Rincon Point, La Conchita, Mussel Shoals, Seacliff, Faria, and Solimar.

There is also significant agriculture as well as oil wells and related facilities. Along the coast itself are recreational facilities including State and County campgrounds.

North Ventura Avenue Area (NVAA). The NVAA is located in the Ventura River Valley and is characterized by long-term oilfield and oil-related industries, as well as residential development. There are also numerous brownfield sites with potentially contaminated soils. Casitas serves a handful of retail customers in this area, but the NVAA is generally within the City of Ventura’s service area.

Source: Ventura County 2040 General Plan

Ojai Valley Area (OVA). The OVA is located in the northern section of the District’s service area and surrounds the City of Ojai. The area is considered very scenic and land uses are open space, agricultural, and rural. One of the goals of the OVA Plan is to preserve and protect the character of the area.

4. Water Use Characterization

Water usage for the wholesale and retail customers of Casitas is discussed in the following subsections.

4.1. Non-Potable Versus Potable Use

The District serves only potable water to its customers, both wholesale and retail.

4.2. Past, Current, and Projected Water Use By Sector

Past, current, and project water use by sector for Casitas wholesale, Casitas retail, and Ojai Water System retail are described in the following subsections.

4.2.1. Past Water Use

Since 2016, Casitas' service area for wholesale and retail customers, has generally decreased as shown in Figure 4-1, based on billed consumption data at customer meters. All Casitas customers have an assigned water allocation and they have responded to the ongoing drought in the service area by conserving water in a significant manner.

Casitas Wholesale System. Casitas supplies water to the resale customers listed in Section 2.6.1 and Table 2-4. Data is taken from the utility billing system.

Casitas Retail System. Demands for Casitas retail customers are obtained from the utility billing system.

Ojai Water System. Demands for Ojai Water System retail customers are obtained from the utility billing system.

4.2.2. Current Water Use

Current water use (2020) for Casitas wholesaler, Casitas retail and Ojai Water System is described in the following subsections.

Casitas Wholesale System. Table 4-1 Wholesale shows the Casitas wholesale demands. All water delivered is potable. Specific wholesale customers are listed in Table 2-4 Wholesale.

Submittal Table 4-1 Wholesale: Demands for Potable and Non-Potable Water - Actual			
Use Type	2020 Actual		
	Additional Description	Level of Treatment When Delivered	Volume
Sales to other agencies	Resale customers	Drinking Water	3,095
TOTAL			3,095
NOTES: Losses for Casitas' system cannot be separated between wholesale and retail; they are reported in Table 4-1 Casitas Retail and Table 4-1 Ojai Retail.			

Casitas Retail System. Table 4-1 Retail Demands for the Casitas System is shown below.

Submittal Table 4-1 Retail: Demands for Potable and Non-Potable Water – Actual, Casitas Retail			
Use Type	2020 Actual		
	Additional Description	Level of Treatment When Delivered	Volume
Single Family		Drinking Water	1,045
Multi-Family		Drinking Water	210
Commercial		Drinking Water	465
Industrial		Drinking Water	12
Institutional/Governmental		Drinking Water	134
Agricultural irrigation	Ag, Ag Domestic, Ag Domestic Multi	Drinking Water	5,116
Losses	See note below	Drinking Water	325
Other Potable	Other, Fire service, Temporary	Drinking Water	141
Other	Ojai Retail Demands	Drinking Water	369
TOTAL			7,817
NOTES: System losses are difficult to separate among the three systems (Casitas Wholesale, Casitas Retail, and Ojai Retail). Total losses are calculated using the AWWA Water Audit Software (v5) and apportioned to the Casitas Retail and Ojai Retail systems based on the proportional length of pipeline in each system (Casitas Retail 72% and Ojai Retail 28%).			

Ojai Water System. Table 4-1 Retail Demands for the Ojai Water System is shown below.

Submittal Table 4-1 Retail: Demands for Potable and Non-Potable Water – Actual, Ojai Retail			
Use Type	2020 Actual		
	Additional Description	Level of Treatment When Delivered	Volume
Single Family		Drinking Water	1,095
Multi-Family		Drinking Water	88
Commercial		Drinking Water	274
Industrial		Drinking Water	3
Institutional/Governmental		Drinking Water	0
Agricultural irrigation	Ag, Ag Domestic	Drinking Water	100
Losses	See note below	Drinking Water	126
Other	Other, Fire Service, Temporary	Drinking Water	65
TOTAL			1,751
NOTES: System losses are difficult to separate among the three systems (Casitas Wholesale, Casitas Retail, and Ojai Retail). Total losses are calculated using the AWWA Water Audit Software (v5) and apportioned to the Casitas Retail and Ojai Retail systems based on the proportional length of pipeline in each system (Casitas Retail 72% and Ojai Retail 28%).			

4.2.3. Projected Water Use

Demands for the period 2011 to 2020 averaged 14,525 AFY (including losses), which includes periods before and after implementation of the WEAP. On April 21, 2021, the Board adopted 14,525 AFY as the projected demand for the Casitas system to be used for planning purposes. The service area is not expected to see significant development which would cause this projected demand to increase.

Demands for the period 2011-2020 were averaged for each customer type and these percentages were used to develop the projected demands by customer class.

Casitas Wholesale System. For the period 2016 to 2020 (since the last UWMP was prepared), the wholesale customer use ranged from a low of approximately 1,626 AFY (2019) to a high of approximately 3,969 AFY (2016), with an average of 3,018 AFY.

Table 4-2 Casitas Wholesale shows the total projected water use to other agencies. These projections are based on the average demand from resale customers for the period 2011 to 2020, which is approximately 30 percent of total demand on the Casitas System.

Submittal Table 4-2 Wholesale: Use for Potable and Raw Water - Projected				
Use Type	Projected Water Use			
	2025	2030	2035	2040
Sales to other agencies	4,356	4,356	4,356	4,356
Transfers to other agencies	0	0	0	0
Exchanges to other agencies	0	0	0	0
Groundwater recharge	0	0	0	0
Saline water intrusion barrier	0	0	0	0
Agricultural irrigation	0	0	0	0
Wetlands or wildlife habitat	0	0	0	0
Retail demand for use by suppliers that are primarily wholesalers with a small volume of retail sales	0	0	0	0
Losses (see note)	0	0	0	0
Other Potable	0	0	0	0
Other Non-Potable	0	0	0	0
Other	0	0	0	0
TOTAL	4,356	4,356	4,356	4,356

NOTES: Losses are included in Table 4-2 Casitas retail and Table 4-2 Ojai Retail.

Table 4-3 shows a summary of Table 4-1 Wholesale, Table 4-2 Wholesale, and Table 6-4 Wholesale. The 2020 water use reflects mandatory conservation observed under the current Stage 3 condition.

Submittal Table 4-3 Wholesale: Total Water Use (Potable and Non-Potable)					
	2020	2025	2030	2035	2040
Potable and Raw Water <i>From Tables 4-1W and 4-2W</i>	3,095	4,356	4,356	4,356	4,356
Recycled Water Demand <i>From Table 6-4W</i>	0	0	0	0	0
TOTAL WATER DEMAND	3,095	4,356	4,356	4,356	4,356

Casitas Retail System. The projected demands by customer type for the Casitas Retail system were derived from the average percentage of demand for the period 2011 to 2020. There is little growth expected in the Casitas service area, so demands for planning purposes are not expected to increase. Table 4-2 Casitas Retail shows the projected demands in five-year increments from 2025 to 2040.

Submittal Table 4-2 Retail: Use for Potable and Non-Potable Water – Projected, Casitas Retail					
Use Type	Additional Description	Projected Water Use			
		2025	2030	2035	2040
Single Family		1,157	1,157	1,157	1,157
Multi-Family		202	202	202	202
Commercial		574	574	574	574
Industrial		23	23	23	23
Institutional/Governmental		101	101	101	101
Landscape		0	0	0	0
Groundwater recharge		0	0	0	0
Saline water intrusion barrier		0	0	0	0
Agricultural irrigation	Ag + Ag domestic + Ag domestic multi	6,496	6,496	6,496	6,496
Wetlands or wildlife habitat		0	0	0	0
Sales/Transfers/Exchanges to other agencies		0	0	0	0
Losses	See note below	954	954	954	954
Other Potable	Other + Fire service + Temporary	201	201	201	201
Other Non-Potable		0	0	0	0
Other	Ojai Retail Demands	461	461	461	461
TOTAL		10,169	10,169	10,169	10,169
NOTES: Loss is based on average percentage from 2011-2020					

Table 4-3 Casitas Retail summarizes the actual and projected demands from Table 4-1 Casitas Retail, Table 4-2 Ojai Retail and Table 6-4 Ojai Retail. The 2020 water use reflects mandatory conservation observed under the current Stage 3 condition.

Submittal Table 4-3 Retail: Total Gross Water Use (Potable and Non-Potable), Casitas Retail					
	2020	2025	2030	2035	2040
Potable Water, Raw, Other Non-potable <i>From Tables 4-1R and 4-2 R</i>	7,705	10,169	10,169	10,169	10,169
Recycled Water Demand <i>From Table 6-4</i>	0	0	0	0	0
TOTAL WATER USE	7,705	10,169	10,169	10,169	10,169

Ojai Water System. The projected demands by customer type for the Ojai Retail system were derived from the average percentage of demand for the period 2011 to 2020, as this is the data Casitas has available. There is little growth expected in the OWS service area, so demands for planning purposes are not expected to increase. Table 4-2 Ojai Retail shows the projected demands in five-year increments from 2025 to 2040.

Submittal Table 4-2 Retail: Use for Potable and Non-Potable Water – Projected, Ojai Retail					
Use Type	Additional Description	Projected Water Use <i>Report To the Extent that Records are Available</i>			
		2025	2030	2035	2040
Single Family		1,089	1,089	1,089	1,089
Multi-Family		95	95	95	95
Commercial		425	425	425	425
Industrial		2	2	2	2

Landscape		0	0	0	0
Groundwater recharge		0	0	0	0
Saline water intrusion barrier		0	0	0	0
Agricultural irrigation	Ag + Ag domestic + Ag Multi	38	38	38	38
Wetlands or wildlife habitat		0	0	0	0
Sales/Transfers/Exchanges to other agencies		0	0	0	0
Losses	See note below	130	130	130	130
Other Potable	Other + Fire service + Temporary	52	52	52	52
Other Non-Potable		0	0	0	0
Other		0	0	0	0
TOTAL		1,850	1,850	1,850	1,850
NOTES: Loss is based on average percentage from 2011-2020					

Table 4-3 Ojai Retail summarizes the actual and projected demands from Table 4-1 Ojai Retail, Table 4-2 Ojai Retail and Table 6-4 Ojai Retail. The 2020 water use reflects mandatory conservation observed under the current Stage 3 condition.

Submittal Table 4-3 Retail: Total Gross Water Use (Potable and Non-Potable), Ojai Retail					
	2020	2025	2030	2035	2040
Potable Water, Raw, Other Non-potable <i>From Tables 4-1R and 4-2 R</i>	1,751	1,850	1,850	1,850	1,850
Recycled Water Demand <i>From Table 6-4</i>	0	0	0	0	0
TOTAL WATER USE	1,751	1,850	1,850	1,850	1,850

4.2.4. Distribution System Loss

Casitas has completed water loss audits following the procedures outlined by AWWA to identify and quantify system losses. The submitted water audits for 2016 to 2020 are included as Appendix C.

System losses are difficult to separate among the three systems (Casitas Wholesale, Casitas Retail, and Ojai Retail). Water loss audits were submitted for the combined Casitas and Ojai systems. Losses are reported in the Casitas Retail and Ojai Retail systems based on the proportion of pipeline in each system (Casitas Retail 72 percent and Ojai Retail 28 percent), with the exception of 2016 which is 100 percent Casitas Retail as the Ojai system was acquired in June 2017.

As of May 2021, the State Water Resources Control Board has not adopted standards for water loss targets.

Casitas Wholesale System. Losses are only reported for Casitas Retail and Ojai Retail as discussed in the previous section.

Casitas Retail System. Table 4-4 Casitas Retail shows the proportional system loss for the Casitas Retail system.

Submittal Table 4-4 Retail: Last Five Years of Water Loss Audit Reporting, Casitas Retail	
Reporting Period Start Date)	Volume of Water Loss ¹
01/2016	1,288
01/2017	891
01/2018	724
01/2019	609
01/2020	325
¹ Taken from the field "Water Losses" (a combination of apparent losses and real losses) from the AWWA worksheet.	
NOTES: Losses are shown proportional to pipeline length of Casitas Retail (72%) and Ojai Retail (28%). For 2016, 100% is Casitas Retail as the Ojai System was acquired in 2017.	

Ojai Water System. Table 4-4 Ojai Retail shows the proportional system loss for the Ojai Retail system.

Submittal Table 4-4 Retail: Last Five Years of Water Loss Audit Reporting , Ojai Retail

Reporting Period Start Date (mm/yyyy)	Volume of Water Loss ¹
01/2016	unknown
01/2017	347
01/2018	281
01/2019	237
01/2020	126

¹ Taken from the field "Water Losses" (a combination of apparent losses and real losses) from the AWWA worksheet.

NOTES: Losses are shown proportional to pipeline length of Casitas Retail (72%) and Ojai Retail (28%). Casitas did not own the Ojai System in 2016 and does not have information available.

4.2.5. Characteristic Five-Year Water Use

Casitas declared Stage 3 of the Water Efficiency and Allocation Plan (WEAP) in June 2016 when Lake Casitas dropped below 100,000 AF in storage. Casitas remains in Stage 3. Annually, Casitas prepares a Water Supply Assessment which includes an evaluation of water supplies, demands, and effectiveness of water conservation measures over the previous fiscal year, and projects Lake Casitas levels under potential demand scenarios. Figure 4-2 shows the potential lake levels over the next five years with various demand projections. These scenarios assume no runoff additions to storage, and apply evaporation rate from 2013. Based on these projections, Casitas may enter Stage 4 of the WEAP in 12 to 14 months, and Stage 5 in 18 to 24 months. Casitas expects to revise its WEAP in the next year and will re-assess these projections in Spring 2022.

Figure 4-2

The FY 2021-2022 Casitas Water Supply and Demand Assessment is provided in Appendix D. Projected five-year supplies and demands are discussed further in Section 7.

4.3. Water Use for Lower Income Households

The projected water use demand for lower income households is included in the projections in Section 4.2.3 and Tables 4-3. This table applies to both the Casitas and Ojai Retail systems.

Submittal Table 4-5 Retail Only: Inclusion in Water Use Projections, Casitas and Ojai Retail Systems	
Are Future Water Savings Included in Projections?	Yes
If "Yes" to above, state the section or page number, in the cell to the right, where citations of the codes, ordinances, etc. utilized in demand projections are found.	Section 4.2.3
Are Lower Income Residential Demands Included In Projections?	Yes
NOTES: Casitas Retail and Ojai Retail Systems	

4.4. Climate Change Considerations

Since Casitas relies on local surface water and groundwater supplies, the impacts of climate change are magnified when rainfall is scarce or limited. The *Projected Changes in Ventura County Climate* report described in Section 3.3 highlights climatological factors which may lead to higher water demands than projected, including: more days exceeding extreme/impactful temperature thresholds; more dry days during shoulder months; and increased evapotranspiration rates. Declining lake storage level may trigger implementation of more severe water conservation stages as defined in the WEAP.

This page left intentionally blank.

5. SB X7-7 Baselines, Targets, and 2020 Compliance

With the adoption of the Water Conservation Act of 2009 (Act, also known as SB X7-7) the State of California is required to reduce urban per capita water use by 20 percent by the year 2020. In order to achieve this statewide objective, the Legislature required each retail supplier subject to the Act to develop an urban water use target to help the state collectively achieve a 20 percent reduction. The Legislature stated that the cumulative results of each retail supplier's reduction would meet the statewide legislative requirements.

Though wholesale agencies do not set per capita water use targets, wholesale agencies do play a role in water conservation and support retail agencies in achieving their demand targets. Wholesale agencies are guided by the California Water Code, CWC 10608.36, to document the programs and means by which they support retail agencies and the State in meeting water use reduction targets. These programs are described in Chapter 9.

Casitas has selected to report baselines, targets, and compliance separately for each of its retail systems. The methodology herein adheres to the California DWR "*Methodologies for Calculating Baseline and Compliance Urban Per Capita Water Use (For the Consistent Implementation of the Water Conservation Act of 2009)*" dated February 2016. Casitas has completed the SB X7-7 Verification Form, attached as Appendix E, and summarized in this chapter.

5.1. Wholesale Suppliers

Casitas Wholesale System. For the wholesale system, Casitas is not required to calculate baselines, targets, or compliance levels. Casitas' programs and policies to assist their wholesale customers achieve their 2020 Targets are described in Section 9.

5.2. SB X7-7 Baselines, Targets, and 2020 Compliance

The following subsections describes SB X7-7 compliance for the Casitas Retail and Ojai Retail systems. SB X7-7 Compliance and Verification forms are included in Appendix E.

5.2.1. [SB X7-7 Verification Form \(Baselines and Targets\)](#)

The Water Conservation Act of 2009 requires two baseline periods be evaluated for the calculation of base daily per capita water use. The two baseline periods utilized are described as follows:

- 5-year baseline period, which is used to determine whether the 2020 per capita water use target meets the legislation's minimum 5 percent reduction
- 10 year baseline period

Casitas Retail System. Casitas first reported its Baseline Per Capita Water Use and Targets in the 2010 UWMP which was prepared prior to release of 2010 Census data. The baseline use and targets herein were updated based on the DWR population tool using 2000 and 2010 Census data. The updated baseline per capita water use is presented in Table 5-0 Casitas Retail System, which shows a water use of 369 gallons per capita per day (gpcd) for the baseline 10-year average, and 355 gpcd for the 5-year average.

Table 5-0. Baseline Average Daily Per Capita Water Use, Casitas Retail System

Base Year	Population	Water Produced ¹	Resale Water Use	Agricultural Water Use	Gross Urban Retail Water Use ²	Urban Retail Per Capita Water Use	10-Year Average ³	5-Year Average ⁴
		AFY	AFY	AFY	AFY	GPCD	GPCD	GPCD
1999	11,381	20,121	7,528	7,529	5,064	397		
2000	11,349	21,588	7,054	7,611	6,923	545		
2001	11,317	17,879	6,951	5,957	4,971	392		
2002	11,285	22,116	8,822	8,718	4,576	362		
2003	11,253	16,809	6,119	7,139	3,550	282		
2004	11,221	20,477	9,214	8,033	3,230	257		
2005	11,190	17,778	7,679	6,036	4,063	324		
2006	11,158	17,457	6,267	6,917	4,273	342		
2007	11,126	21,598	8,150	8,646	4,802	385		318
2008	11,094	18,471	6,307	7,144	5,020	404	369	342
2009	11,062	17,259	6,277	6,996	3,986	322	361	355
2010	11,030	14,767	6,276	4,800	3,690	299	337	350

NOTES: This table is not a DWR-required table for 2020 UWMPs.

¹ Based on Calendar Year production from Marion Walker Water Treatment Plant and Mira Monte well.

² Gross Urban Retail Use = Water Produced – Resale Use – Agricultural Use

³ 10-year base period must end no earlier than December 31, 2004 and no later than December 31, 2010

⁴ 5-year base period must end no earlier than December 31, 2007 and no later than December 31, 2010

Casitas selected Method 1 for establishing 2020 water use targets for the Casitas retail system, which is based on 80 percent of the 10-year baseline gpcd water use. In addition, systems with a 5-year baseline per capita water use of greater than 100 gpcd must calculate a minimum water use reduction target.

The Casitas Retail system baselines and targets are summarized in Table 5-1 Casitas Retail System. The 10-year baseline average daily per capita water use was 369 gpcd. Therefore, the 2020 target water use is 295 gpcd. The 5-year average baseline daily per capita water use was 355 gpcd, resulting in a minimum water use reduction target of 338 gpcd by 2020. The confirmed target is 295 gpcd.

Submittal Table 5-1 Baselines and Targets Summary, Casitas Retail System				
Baseline Period	Start Year	End Year	Average Baseline GPCD*	Confirmed 2020 Target*
10 year	1999	2008	369	295
5 Year	2005	2009	355	
*All values are in Gallons per Capita per Day (GPCD)				

Ojai Water System. The Ojai Retail system was acquired in 2017 from Golden State Water Company. Golden State Water Company did not prepare a 2015 UWMP. Similar to the Casitas Retail system, the baseline and targets have been updated based on the DWR population tool using 2000 and 2010 Census data. The updated baseline per capita water use for the Ojai system is shown in Table 5-0 Ojai Retail System, which presents water use of 322 gpcd for the baseline 10-year average, and 316 gpcd for the 5-year average.

Base Year	Population	Water Produced ¹ AFY	Urban Retail Per Capita Water Use GPCD	10-Year Average GPCD	5-Year Average GPCD
1999	7,053	2,552	323		
2000	7,023	2,631	334		
2001	6,993	2,462	314		
2002	6,962	2,760	354		
2003	6,932	2,442	314		
2004	6,902	2,488	322		
2005	6,872	2,239	291		
2006	6,841	2,314	302		
2007	6,811	2,649	347		315
2008	6,781	2,400	316	322	316
2009	6,750	2,328	308	320	313
2010	6,720	2,007	267	314	308

NOTES: This table is not a DWR-required table for 2020 UWMP.
¹ Based on Ojai Groundwater Wells production and deliveries from the Casitas System.

For the Ojai system, Casitas selected Method 1 for establishing 2020 water use targets, which is based on 80 percent of the 10-year baseline gpcd water use. In addition, systems with a 5-year baseline per capita water use of greater than 100 gpcd must calculate a minimum water use reduction target.

The Ojai Retail system baselines and targets are summarized in Table 5-1. The 10-year baseline average daily per capita water use was 322 gpcd. Therefore, the 2020 target water use is 257 gpcd. The 5-year average baseline daily per capita water use was 316 gpcd, resulting in a minimum water use reduction target of 300 gpcd by 2020. The confirmed target is 257 gpcd.

Baseline Period	Start Year	End Year	Average Baseline GPCD*	Confirmed 2020 Target*
10 year	1999	2008	322	257
5 Year	2004	2008	316	

*All values are in Gallons per Capita per Day (GPCD)

5.2.2. [SB X7-7 2020 Compliance Form](#)

Casitas Retail System. The Casitas Retail system is in compliance with the 2020 target, with an actual 2020 water use of 195 gpcd as shown in Table 5-2 Casitas Retail. DWR has allowed for optional adjustments to the 2020 GPCD, including extraordinary events, economic adjustments, and weather normalization. Casitas did not make any adjustments to the 2020 GPCD, since compliance was achieved without these factors.

Submittal Table 5-2: 2020 Compliance From SB X7-7 2020 Compliance Form, Casitas Retail System				
2020 GPCD			2020 Confirmed Target GPCD*	Did Supplier Achieve Targeted Reduction for 2020? Y/N
Actual 2020 GPCD*	2020 TOTAL Adjustments*	Adjusted 2020 GPCD* <i>(Adjusted if applicable)</i>		
195	0	195	295	Yes
*All cells in this table populated manually from the supplier's SB X7-7 2020 Compliance Form and reported in Gallons per Capita per Day (GPCD)				

Ojai Water System. The Ojai Retail system is in compliance with the 2020 target, with an actual 2020 water use of 209 gpcd as shown in Table 5-2 Ojai Retail. DWR has allowed for optional adjustments to the 2020 GPCD, including extraordinary events, economic adjustments, and weather normalization. Casitas did not make any adjustments to the 2020 GPCD, since compliance was achieved without these factors.

Submittal Table 5-2: 2020 Compliance From SB X7-7 2020 Compliance Form, Ojai Retail				
2020 GPCD			2020 Confirmed Target GPCD*	Did Supplier Achieve Targeted Reduction for 2020? Y/N
Actual 2020 GPCD*	2020 TOTAL Adjustments*	Adjusted 2020 GPCD* <i>(Adjusted if applicable)</i>		
209	0	209	257	Yes
*All cells in this table populated manually from the supplier's SB X7-7 2020 Compliance Form and reported in Gallons per Capita per Day (GPCD)				

5.2.3. [Regional UWMP/Regional Alliance](#)

This section is not applicable to Casitas.

5.3. Baseline and Target Calculations for 2020 UWMPs

The following subsections describe additional DWR requested information related to baseline and target calculations for 2020 UWMPs.

5.3.1. Supplier Submitted 2015 UWMP, No Change to Service Area

Casitas submitted a 2015 UWMP but did not submit the SB X7-7 Verification Forms for baselines and targets, likely because the Casitas retail system did not meet the criteria of more than 3,000 customers or 3,000 AFY for retail municipal use in 2015.³

In 2017, Casitas acquired the Ojai Water System which is a retail system. Previously the OWS was served by Golden State Water Company who was a wholesale customer of Casitas. Casitas' overall service area did not change, but the retail service area now incorporates the Ojai System. The GSWC did not prepare a 2015 UWMP and did not submit the SB X7-7 Verification Forms, also likely because the Ojai system does not meet the criteria of more than 3,000 customers or 3,000 AFY for municipal use.

Since Casitas' combined retail areas now meet the criteria, the SB X7-7 Verification Forms for baselines and targets were prepared for each system and submitted as part of the 2020 UWMP. Since the Casitas retail system and the Ojai system have separate PWS numbers, the baselines and targets are reported separately.

5.3.2. Supplier Did Not Submit 2015 UWMP

This section does not apply to Casitas.

5.3.3. Supplier Newly Subject to UWMP Requirements

The Casitas Retail and Ojai Retail systems did not become subject to the SB X7-7 requirements until 2017. The SB X7-7 Verification Forms for baselines and targets were prepared for each system and submitted as part of the 2020 UWMP.

5.3.4. Distribution Area Expansion

The Casitas distribution area expanded due to the acquisition of the Golden State Water Company's Ojai Water System. The Ojai Water System has a separate PWS number and is reported separately herein.

5.3.5. Distribution Area Contraction

This section is not applicable to Casitas Retail or Ojai Retail systems.

5.3.6. Large Partial Customers Become Whole Customers

This section is not applicable to Casitas Retail or Ojai Retail systems.

5.4. Methods for Calculating Population and Gross Water Use

Population and gross water use are described in the following subsections.

5.4.1. Service Area Population

To calculate the baseline per capita water use, population within the retail service area boundaries of the Casitas Retail and Ojai Retail systems was estimated using the DWR Population Tool, which uses 2000 and 2010 United States Census populations. The remaining years prior to 2000 were interpolated based on the linear trend between 2000 and 2010 population data.

The 2020 population was estimated using the "persons-per-connection" method and 2010 Census populations. The ratio of population to number of connections in 2010 was applied to the number of connections in 2020 to estimate the 2020 population.

³ Adopted Final Urban Water Management Plan and Agricultural Management Plan 2016 Update, dated June 2016.

5.4.2. Gross Water Use

Casitas Retail System. The calculations of 2020 per capita water use are presented in Table 5-3 Casitas Retail System 2020 Per Capita Water Use Compliance. The 2020 urban retail per capita use was 195 gpcd which achieves and exceeds the target reduction of 295 gpcd.

Table 5-3. Casitas Retail System 2020 Per Capita Water Use Compliance							
Compliance Year	Population	Water Produced ¹ AFY	Resale Water Use AFY	Agricultural Water Use AFY	Gross Urban Retail Water Use ² AFY	Actual 2020 Urban Retail Per Capita Water Use GPCD	2020 Target Reduction Achieved?
2020	11,042	10,626	3,095	5,115	2,416	195	Yes
NOTES: This table is <u>not</u> a DWR-required table for 2020 UWMPs. Table format based on DWR Guidebook Table 5-2. ¹ Based on Calendar Year production from Marion Walker Treatment Plant and Mira Monte well. ² Gross Urban Retail Use = Water Produced – Resale Use – Agricultural Use							

Ojai Water System. The calculations of 2020 per capita water use are presented in Table 5-3 Ojai Retail System 2020 Per Capita Water Use Compliance. The 2020 urban retail per capita use was 209 gpcd which achieves and exceeds the target reduction of 257 gpcd.

Table 5-3. Ojai Retail System 2020 Per Capita Water Use Compliance						
Compliance Year	Population	Water Produced ¹ , AFY	Agricultural Water Use AFY	Gross Urban Retail Water Use ² AFY	Actual 2020 Urban Retail Per Capita Water Use, GPCD	2020 Target Reduction Achieved?
2020	6,712	1,669	100	1,569	209	Yes
NOTES: This table is <u>not</u> a DWR-required table for 2020 UWMPs. Table format based on DWR Guidebook Table 5-2. ¹ Based on Ojai Groundwater Wells production and deliveries from the Casitas System. ² Gross Urban Retail Water Use = Water Produced – Agricultural Use						

5.5. 2020 Compliance Daily Per-Capita Water Use (GPCD)

This section describes special factors which may affect 2020 compliance. DWR has allowed for optional adjustments to the 2020 GPCD, including extraordinary events, economic adjustments, and weather normalization. Casitas did not make any adjustments to the 2020 GPCD, since compliance was achieved without these factors.

5.5.1. 2020 Adjustments for Factors Outside Supplier’s Control

Casitas Retail System. No adjustments were made.

Ojai Water System. No adjustments were made.

5.5.2. Special Situations

Casitas Retail System. No adjustments to Casitas Retail System are included.

Ojai Water System. No adjustments to Ojai Water System are included.

5.5.3. If Supplier Does Not Meet 2020 Target

This section does not apply as both the Casitas Retail and Ojai Retail systems met the 2020 Target.

5.6. Regional Alliance

This section is not applicable to Casitas.

This page left intentionally blank.

6. Water Supply Characterization

This section describes Casitas' water supply and its characteristics.

6.1. Water Supply Analysis Overview

Casitas' water supplies are 100 percent local, consisting of groundwater wells and surface water stored in Lake Casitas. The following subsections provide more information.

6.2. Narrative Sections for Supplier's UWMP Water Supply Characterization

Figure 6-1 shows a representation of Casitas' supply sources. Current water supply sources include:

- Surface water into Lake Casitas from the surrounding watershed including Coyote Creek and Santa Ana Creek
- Surface water from the Ventura River to Lake Casitas via Robles Diversion and Robles Canal; the diversion is subject to the requirements of the 2003 non-jeopardy Biological Opinion for steelhead trout issued by the National Marine Fisheries Service)
- Groundwater from the Mira Monte Well in the Upper Ventura River Groundwater Basin
- Groundwater from the Ojai Wellfield in the Ojai Groundwater Basin

The following subsections describe the water supplies for the Casitas System (wholesale and retail), as well as the Ojai Water System.

Figure 6-1
Supply Sources Illustration

6.2.1. Purchased or Imported Water

While Casitas' water has historically come from local supplies, Casitas has contracted and paid the fixed contractual costs for the full allocation of 5,000 AFY of imported water from the State Water Project. The contracted amount of up to 5,000 AFY is referred to as "Table A" water, which is a table in the contract referring to the maximum amount to be delivered. Imported water from the SWP has not been supplied to Casitas due to lack of local infrastructure to deliver the water.

Planned, constructed, and operated by DWR, the SWP is one of the world's largest water, power, and conveyance systems. The SWP relies on a delivery system of reservoirs, aqueducts, power plants, and pumping plants that allow the movement of water from northern to southern CA and the ability to exchange and transfer water with SWP contractors throughout the state. The SWP primary delivery facilities are shown in Figure 6-2. More information on the SWP and its facilities can be found at: <https://water.ca.gov/Programs/State-Water-Project>.

In 1963, the Ventura County Flood Control District (VCFCD, now the Ventura County Watershed Protection District), contracted with the State of California for 20,000 AFY of water from the SWP. In 1971, the VCFCD assigned the administration of the Water Supply Contract to Casitas. Casitas' contractual share is 5,000 AFY, the City of Ventura has 10,000 AFY, and United Water Conservation District (UWCD) has 5,000 AFY. UWCD can access SWP through Lake Piru (via Pyramid Lake and Piru Creek), although local infrastructure is not in place to deliver the contractual share to Casitas and the City of Ventura. Infrastructure options are currently under design as discussed in Section 6.2.8 Future Water Projects.

While Casitas' SWP Table A entitlement is 5,000 AFY, this level of reliability is not expected from the State Water Project. DWR prepares a biennial report to assist SWP contractors and local planners in assessing the availability of supplies from the SWP. In August 2020, DWR issued its most recent update, the *2019 DWR State Water Project Delivery Capability Report* (DCR). The 2019 DCR includes DWR's estimates of SWP water supply availability under both existing (2020) and future (2040) conditions. According to the DCP, the long-term average delivery under existing conditions is 58 percent of Table A, and long-term average delivery under future conditions is 52 percent of Table A (2019 CDR, Appendix A Table A-1 and Appendix B Table B-3). For Casitas, this would result in a long-term average yield of 2,900 AFY under existing conditions and 2,600 AFY under future conditions.

DWR's estimates of SWP deliveries are based on a computer model that simulates monthly operations of the SWP and Central Valley Project systems. In the existing conditions model scenario, DWR applied the existing facilities; hydrologic inflows to the model based on 82 years of historical inflows (1922–2003); current regulatory and operational constraints, including 2018 Coordinated Operation Amendment, 2019 biological opinions, and 2020 Incidental Take Permit; and contractor demand at maximum Table A Amounts. The future condition study used all of the same model assumptions as the existing conditions study but reflected changes expected to occur from climate change — specifically, projected temperature and precipitation changes centered around 2035 (2020–2049) and a 45-centimeter sea-level rise.

Figure 6-2 SWP Delivery Facilities

(Source: DWR Bulletin 132, 2015)

Casitas Wholesale and Retail System. Casitas has maintained an entitlement of 5,000 AFY of SWP water; there is no infrastructure in place, however, to allow this water into Casitas’ service area.

Ojai System. Similar to the Casitas System, there is no local infrastructure currently in place to deliver imported water supply to the Ojai Water System.

6.2.2. Groundwater

Three groundwater basins are within the Casitas service area: 1) Upper Ventura River Groundwater Basin, 2) Lower Ventura River Groundwater Basin and 3) Ojai Basin. Figure 6-3 shows the boundaries of these basins. The following subsections describe each basin and current issues associated with each.

6.2.2.1. *Basin Description – Upper Ventura River Groundwater Basin*

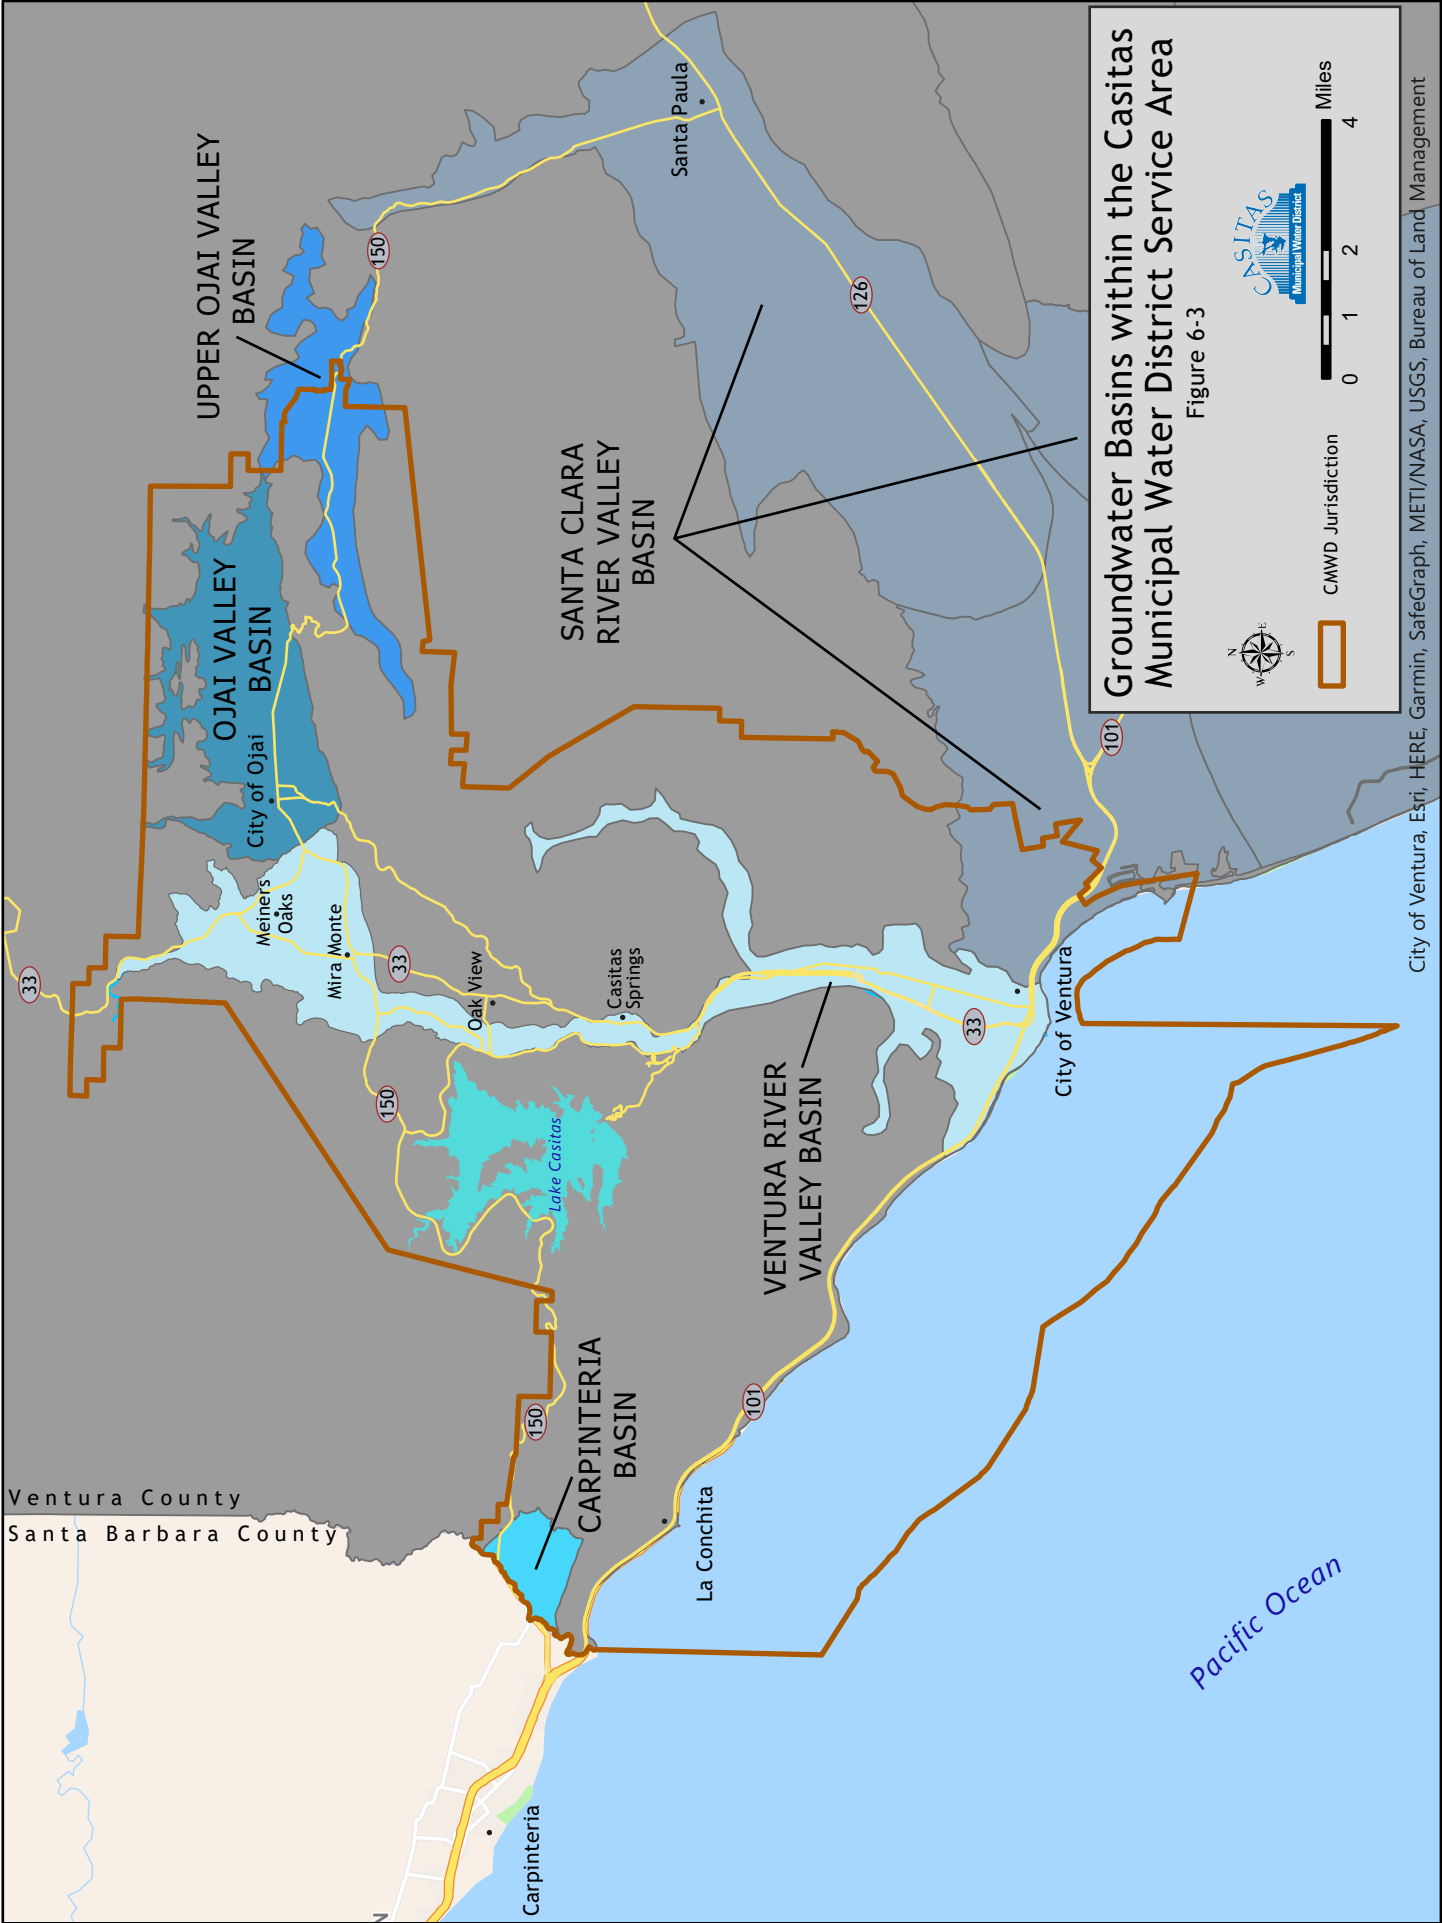

The Upper Ventura River Groundwater Basin (UVRGB) is managed by the Upper Ventura River Groundwater Agency (UVRGA). Casitas’ Robles Diversion Facility and Mira Monte Well are located within the boundaries of this watershed. The UVRGB is the largest of the groundwater basins in the Ventura River watershed. All water in the watershed is local precipitation; there are no outside or imported water sources. Similar to the overall Ventura River watershed, precipitation in the UVRGB is extremely variable.

In compliance with the Sustainable Groundwater Management Act (SGMA), the UVRGA is preparing their Groundwater Sustainability Plan (GSP) with a draft GSP scheduled for release in July 2021. Sections of the Draft GSP are available on the UVRGA website at www.uvrgroundwater.org.

Casitas Wholesale and Retail System. Casitas’ Mira Monte Well has a capacity of 300 AFY although pumping is limited due to the groundwater having high nitrate levels. Casitas blends this water with Lake Casitas to achieve water quality that is well within regulatory standards for drinking water, and the planned operational yield is 145 to 180 AFY on average.

Groundwater pumped from the Mira Monte Well enters Casitas System (Wholesale and Retail). Based on average demands from 2011 to 2020, 30 percent of water use in the Casitas system is from wholesale customers and 70 percent is from retail customers. Mira Monte Well production has been portioned out to each system based on this average. Table 6-1 Casitas Wholesale and Table 6-1 Casitas Retail show the groundwater pumped from the Mira Monte Well for the period 2016 to 2020.

Submittal Table 6-1 Wholesale: Groundwater Volume Pumped, Casitas Wholesale						
<input type="checkbox"/>	Supplier does not pump groundwater. The supplier will not complete the table below.					
<input type="checkbox"/>	All or part of the groundwater described below is desalinated.

Submittal Table 6-1 Retail: Groundwater Volume Pumped, Casitas Retail						
<input type="checkbox"/>	Supplier does not pump groundwater. The supplier will not complete the table below.					
<input type="checkbox"/>	All or part of the groundwater described below is desalinated.					
Groundwater Type	Location or Basin Name	2016	2017	2018	2019	2020
Alluvial Basin	Upper Ventura River	24	111	106	87	125
TOTAL						
NOTES: Mira Monte Well						

6.2.2.2. Basin Description – Lower Ventura River Groundwater Basin

While Casitas’ service area includes the Lower Ventura River Groundwater Basin, Casitas does not have any groundwater wells in this basin.

6.2.2.3. Basin Description – Ojai Basin

The Ojai Basin is a relatively deep, bowl-shaped basin bounded on the west and east by non-water-bearing Tertiary aged rocks, on the south by the Santa Ana fault and Black Mountain, and on the north by the Topa Topa Mountains⁴.

The Ojai Basin is managed by the OBGMA which was established in 1991 by State legislation. The OBGMA monitors, records, and reports groundwater conditions of the Ojai Valley Basin. According to the OBGMA website, approximately 60 percent of groundwater use within the basin is for agricultural demand and 40 percent is for ‘urban’ demand.

The OBGMA typically publishes an annual report each water year to describe the basin status. The most recent report was for the 2017/18 water year. OBGMA has not prepared a subsequent annual report as the agency is currently preparing a Sustainable Groundwater Management Plan in compliance with the SGMA enacted in 2014. The most recent Groundwater Management Plan is dated 2018 and can be found on the OBGMA website www.obgma.org.

Casitas’ groundwater wells for the OWS are located on the east and west sides of San Antonio Creek on the south side of Grand Avenue. Figure 6-4 shows the wellfield location. The east side is referred to as the San Antonio Wellfield and the west side is referred to as the Mutual Wellfield. The San Antonio Wellfield has three active wells. The Mutual Wellfield has two active wells. A new replacement well was drilled at the Mutual Wellfield in 2020 but has not yet been connected to the system. The well equipping is anticipated to occur in 2022. All pumped water is treated at the onsite iron and manganese treatment plant and meets state and federal drinking water requirements. Table 6-1 Ojai Retail shows the groundwater pumped from 2016 to 2020.

Alluvial Basin	Ojai Basin	944	1,381	1,378	1,548	1,300
TOTAL		944	1,381	1,378	1,548	1,300

6.2.3. Surface Water

The Ventura River Project is the primary surface water supply and consists of Casitas Dam and Reservoir (Lake Casitas), the Robles Diversion and Fish Passage Facility on the Ventura River, Robles Canal, and the water distribution system that consist of pipelines, pump plants, storage tanks and chlorination stations. Construction of the original facility was completed in 1959 and the Fish Passage Facility was constructed in 2004.

The Ventura River Project is a federal facility owned by the United States of America. Under a repayment Contract with the USBR, Casitas was assigned the responsibilities for the operation and maintenance of the Ventura River Project and the perpetual right to use all water that becomes available through the construction and operation of the Project, subject to the satisfaction of vested rights.

Casitas maintains Licenses 11834 and 10133 for Diversion and Use of Water permitted by the State Water Resources Control Board (Casitas Licenses). Under the Casitas License 11834, Casitas may divert up to 107,800 AFY from the Ventura River and other tributaries into Lake Casitas and may put up to 28,500 AFY to beneficial use; and under Casitas License 10133, Casitas may withdraw up to 4,570 AFY diverted at Matilija Dam and re-diverted at Robles Diversion and Fish Passage Facility.

The Robles Diversion is located to the northwest of the City of Ojai, and supplies water via the Robles Canal to Lake Casitas. In 2004, the Robles Fish Passage Facility was constructed to allow endangered steelhead trout the ability to bypass the diversion facility and continue their migration both upstream and downstream.

The Robles Diversion and Fish Passage Facility is operated according with a 2003 Biological Opinion for steelhead trout issued by NMFS (US Department of Commerce, National Oceanic and Atmospheric Administration) which requires minimum bypass flows of 30 cfs once a peak occurs and requires bypass flows of 50-170 cfs for 10-12 days within the fish passage season (January 1 – June 30). Operations outside this period conform to the 1959 Trial Operating Criteria in which the first 20 cfs of flow is generally released downstream.

6.2.3.1. Coyote Creek

Coyote Creek is located on the west side of Lake Casitas and its drainage area contributes directly to Lake Casitas storage. Casitas maintains a stream gaging station on Coyote Creek. Coyote Creek gaging

station was damaged during the 2017 Thomas Fire, and experienced heavy sediment transport following the fire rendering the gage unusable.

6.2.3.2. *Santa Ana Creek*

Santa Ana Creek is also a major tributary to Lake Casitas. Casitas also maintains a stream gage to monitor flow. This station was not damaged during the Thomas Fire but did experience heavy sediment transport and re-channelization following the fire, rendering poor quality flow data.

6.2.3.3. *Lake Casitas*

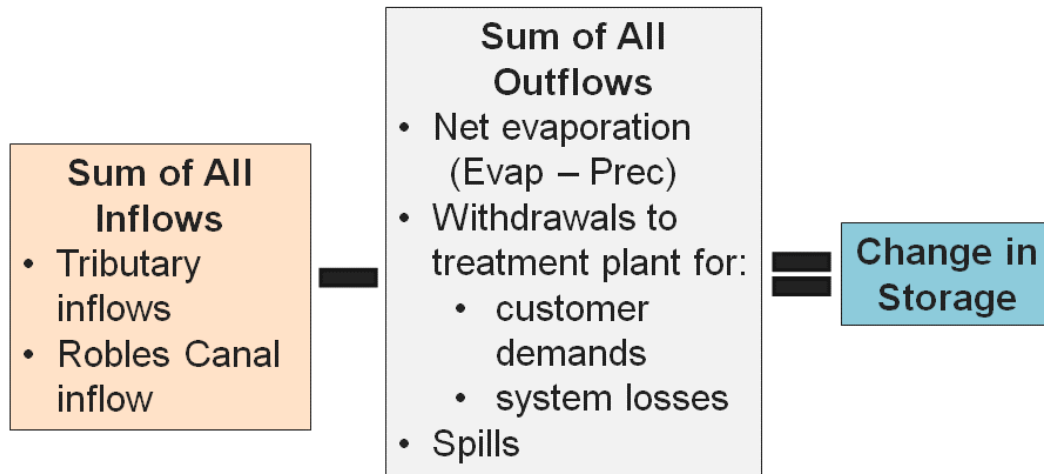

Figure 6-5 shows Lake Casitas storage for the period 1970 to 2021. When originally constructed, Lake Casitas had a design capacity of 254,000 AF. A bathymetric survey performed in 2017 shows the capacity reduced to 237,761 AF due to sedimentation. The recent drought resulted in record low storage levels in 2019 with Lake Casitas at 30 percent of storage capacity.

Figure 6-5. Historic Lake Casitas Storage Volume

The water supply availability from Lake Casitas was previously studied by the USBR in the 1954 evaluation of the Ventura River Project, and later by the District in the 1989 and 2004. In the “Water Supply and Use Status Report” (Casitas, 2004), the Safe Yield of Lake Casitas was determined to be 20,480 AFY based on a mass-balance model that tracks Lake Casitas inflows, outflows (including evaporation) and change in storage to simulate operations over a time series of assumed hydrology conditions, as illustrated in Figure 6-6.

Figure 6-6. Mass Balance Model for Estimating Lake Casitas Yield

Recently, the yield model was updated to include:

- Extended hydrologic period of record of 1945-2018 (from previous of 1945-1999)
- Incorporated results of recent Lake Casitas bathymetric survey – reduced maximum storage capacity from 254,000 AF to 237,761 AF
- Added function to compute reservoir spills
- Incorporated Robles Diversion operations based on 2003 Biological Opinion requirements and 2018 Critical Drought Protection Measures
- Reduced modeled Robles diversions based on a diversion efficiency of 70 percent, consistent with operational data since the Fish Passage Facility was constructed
- Improved method of calculating monthly net evaporation loss

On April 21, 2021, the Board of Director adopted a planned Casitas System operational yield of 15,010 AFY⁵. The new operational yield is based on the updated modeling results, a -4.3 percent climate change adjustment based on the anticipated changes to precipitation (Section 3.3), and a -15 percent supply safety factor to account for uncertainty in modeling assumptions.

Surface water from Lake Casitas is treated at the Marion Walker Water Treatment Plant using pressure filtration before it enters the transmission and distribution system.

Casitas Wholesale and Retail System. Lake Casitas serves as a primary supply for direct retail customers on the Casitas System, and as a supplemental, or backup supply, for groundwater users and wholesale users.

Ojai System. The OWS is connected to the Casitas System, and therefore receives Lake Casitas water, via two existing interconnections. The connections are used when demand in the OWS exceeds the groundwater well capacity or when well(s) are taken out of service for repair/rehabilitation.

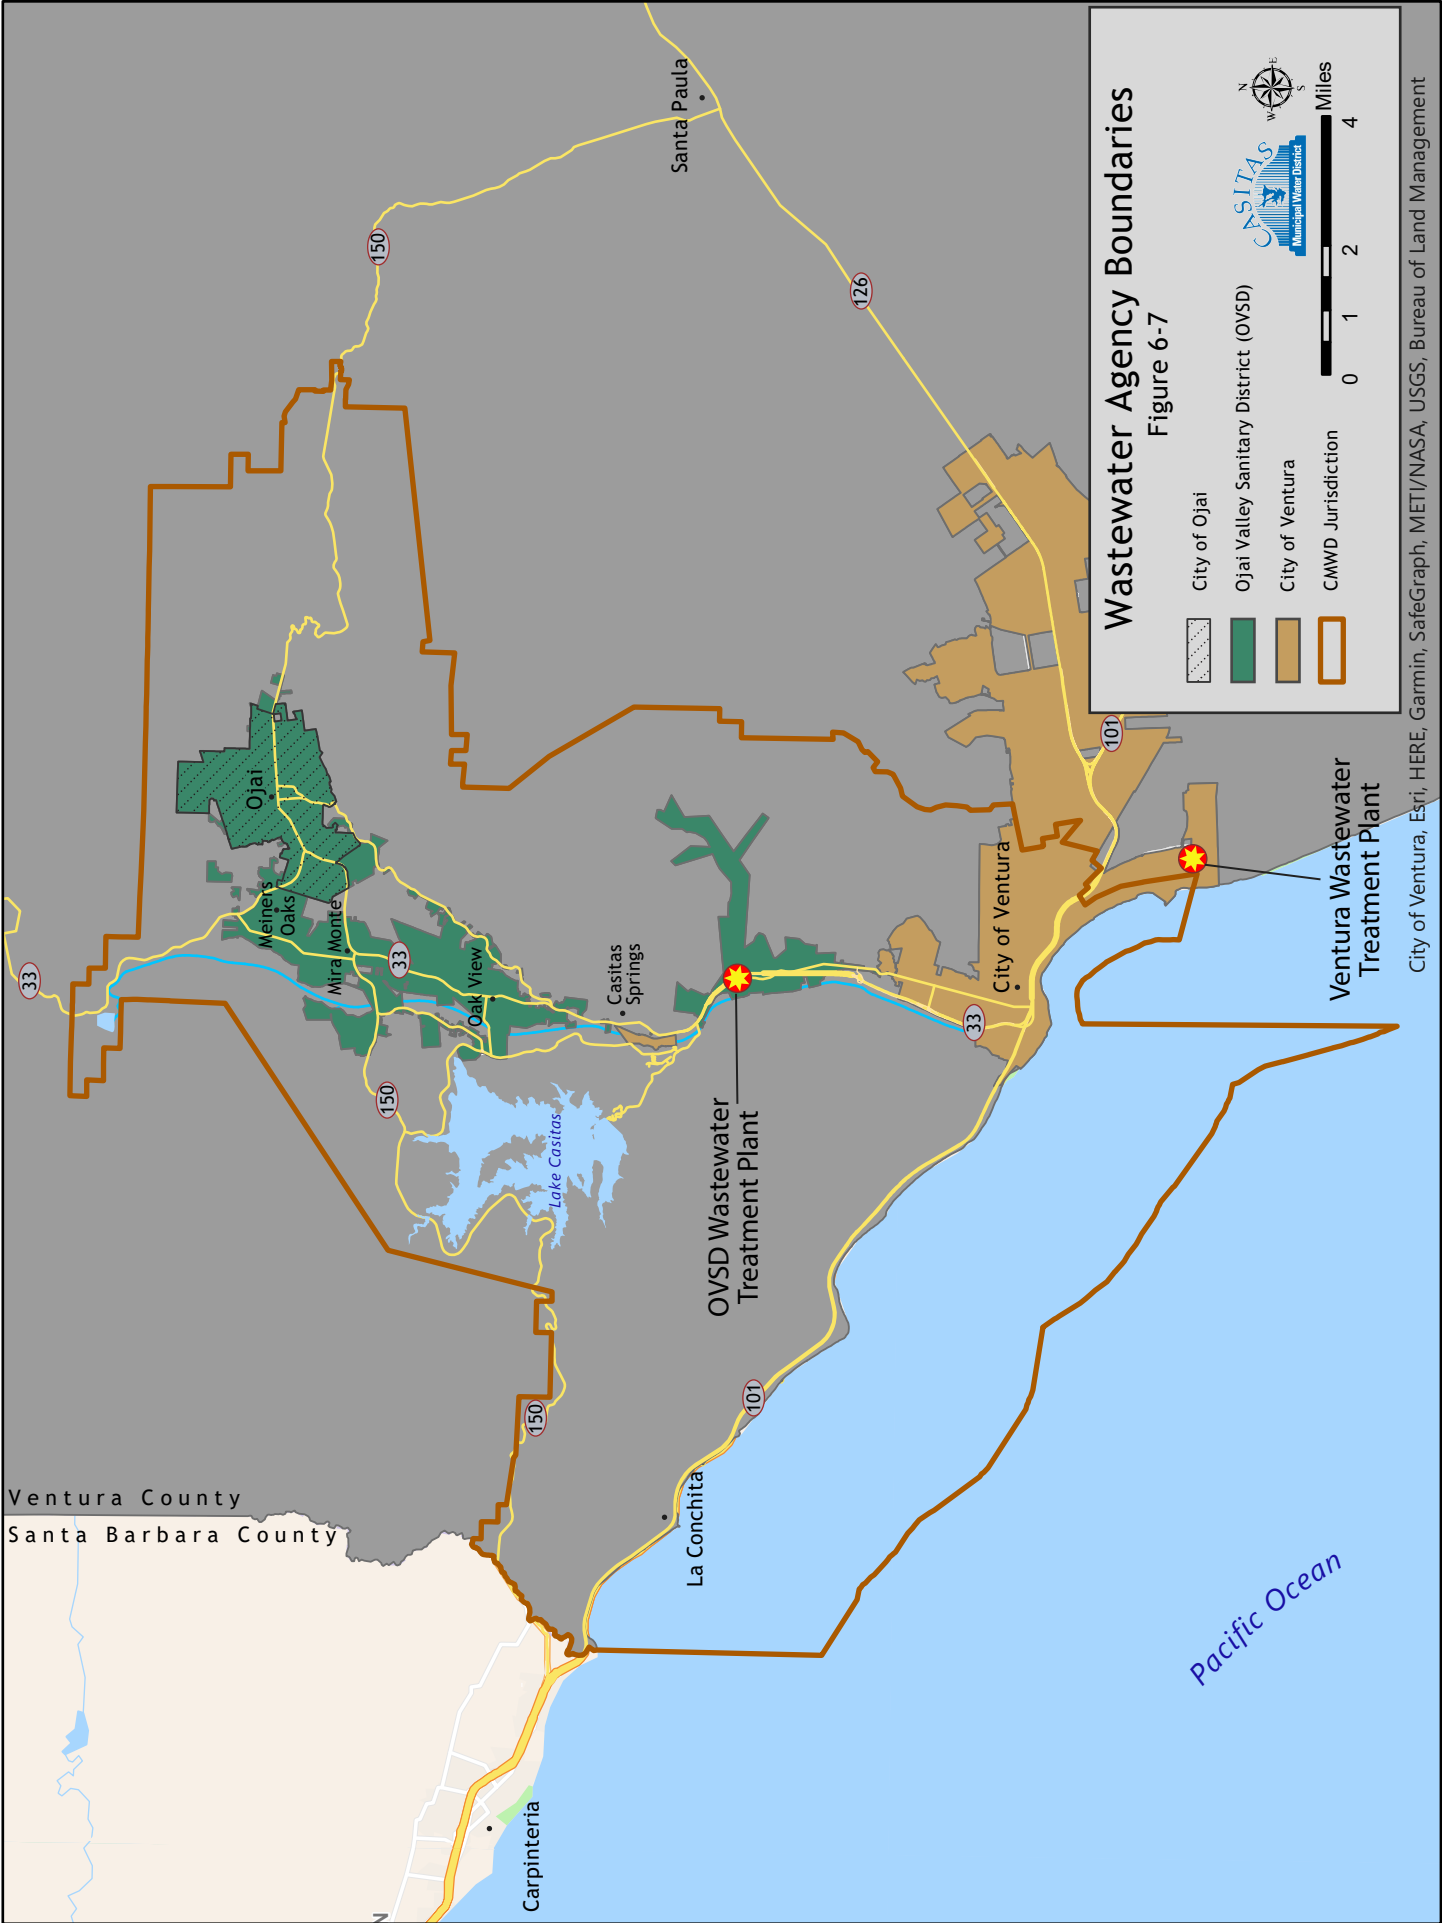

⁵ The planned operational yield is 14,865 AFY from Lake Casitas and 145 AFY from Mira Monte Well.

6.2.4. Stormwater

The District does not own, maintain, or operate any stormwater systems or facilities.

6.2.5. Wastewater and Recycled Water

Wastewater disposal and treatment within Casitas' service area is under the purview of Ojai Valley Sanitary District (OVSD) and the City of Ventura. Recycled water was evaluated by OVSD and determined infeasible due to regulatory constraints on discharges to the Ventura River. These are discussed in the following subsections. Figure 6-7 shows the boundaries of each of these agencies in relation to the Casitas service area boundaries.

Wastewater Agency Boundaries
Figure 6-7

City of Ojai
 Ojai Valley Sanitary District (OVSD)
 City of Ventura
 CMWD Jurisdiction

City of Ventura, Esri, HERE, Garmin, SafeGraph, METI/NASA, USGS, Bureau of Land Management

6.2.5.1. *Wastewater Collection, Treatment, and Disposal*

The boundaries for Ojai Valley Sanitary District (OVSD) and the City of Ventura do not readily correspond to Casitas' wholesale, retail, or Ojai water system boundaries, nor can the wastewater collected for these agencies be readily ascribed to wholesale or retail customers. The City of Ventura provides wastewater collection and treatment mainly within Casitas' wholesale service area; however the City also serves an area outside the City (within Casitas' retail system service area) under contract with Ventura County, specifically the coastal area in unincorporated Ventura County. To simplify reporting, the City of Ventura's wastewater information is provided in Table 6-2 Casitas Retail and OVSD's wastewater information is provided in Table 6-2 Ojai Retail.

Submittal Table 6-2 Retail: Wastewater Collected Within Service Area in 2020, Casitas Retail

<input type="checkbox"/>	There is no wastewater collection system. The supplier will not complete the table below.					
Wastewater Collection			Recipient of Collected Wastewater			
Name of Wastewater Collection Agency	Wastewater Volume Metered or Estimated?	Volume of Wastewater Collected from UWMP Service Area 2020	Name of Wastewater Treatment Agency Receiving Collected Wastewater	Treatment Plant Name	Is WWTP Located Within UWMP Area?	Is WWTP Operation Contracted to a Third Party?
City of Ventura	Metered	66	City of Ventura	City of Ventura	No	No
Total Wastewater Collected from Service Area in 2020:		66				
<p>NOTES: There are two agencies who provide wastewater collection within the Casitas service area, Ojai Valley Sanitary District and the City of Ventura. The boundaries for these agencies do not readily correspond to Casitas' wholesale, retail, or Ojai water system boundaries, nor can the wastewater collected for these agencies be readily ascribed to wholesale or retail customers. To simplify reporting, the City of Ventura's wastewater information is provided in Table 6-2 Casitas Retail and OVSD's wastewater information is provided in Table 6-2 Ojai Retail.</p>						

Submittal Table 6-2 Retail: Wastewater Collected Within Service Area in 2020, Ojai Retail

There is no wastewater collection system. The supplier will not complete the table below.

Wastewater Collection			Recipient of Collected Wastewater			
Name of Wastewater Collection Agency	Wastewater Volume Metered or Estimated?	Volume of Wastewater Collected from UWMP Service Area 2020	Name of Wastewater Treatment Agency Receiving Collected Wastewater	Treatment Plant Name	Is WWTP Located Within UWMP Area?	Is WWTP Operation Contracted to a Third Party?
Ojai Valley Sanitary District	Metered	1,826	Ojai Valley Sanitary District	Ojai Valley Sanitary District	Yes	No
Total Wastewater Collected from Service Area in 2020:		1,826				

NOTES: There are two agencies who provide wastewater collection within the Casitas service area, Ojai Valley Sanitary District and the City of Ventura. The boundaries for these agencies do not readily correspond to Casitas' wholesale, retail, or Ojai water system boundaries, nor can the wastewater collected for these agencies be readily ascribed to wholesale or retail customers. To simplify reporting, the City of Ventura's wastewater information is provided in Table 6-2 Casitas Retail and OVSD's wastewater information is provided in Table 6-2 Ojai Retail.

Casitas Wholesale System. Casitas does not distribute nor provide supplemental treatment to recycled water as shown in Table 6-3 Wholesale.

Submittal Table 6-3 Wholesale: Wastewater Treatment and Discharge Within Service Area in 2020, Casitas Wholesale											
<input checked="" type="checkbox"/>	Wholesale Supplier neither distributes nor provides supplemental treatment to recycled water. The Supplier will not complete the table below.

6.2.5.2. Actions to Encourage and Optimize Future Recycled Water Use

Casitas Wholesale System. This section is not applicable to wholesale agencies.

Casitas Retail System. OVSD and the City of Ventura provide wastewater collection and treatment within the service area of Casitas. The potential use of recycled water in Casitas’ service area was evaluated in numerous studies over the years. Wastewater from OVSD’s treatment plant is discharged to the Ventura River. OVSD’s treatment plant is located on land owned by the City of Ventura, a condition of which is the City has the first right of OVSD’s treated effluent.

The City of Ventura is separately pursuing an Indirect Potable Reuse (IPR) Project as a result of their settlement agreement regarding discharge to the Santa Clara River Estuary.

Casitas does not plan to implement recycled water use as shown in Table 6-6 Casitas Retail.

Submittal Table 6-6 Retail: Methods to Expand Future Recycled Water Use, Casitas Retail			
<input checked="" type="checkbox"/>	Supplier does not plan to expand recycled water use in the future. Supplier will not complete the table below but will provide narrative explanation.		
	Provide page location of narrative in UWMP		
Name of Action	Description	Planned Implementation Year	Expected Increase in Recycled Water Use
			0
Total			0

Ojai Retail System. The potential for recycled water use in the Ojai area has been studied in the past, particularly the use of packaged satellite treatment systems^{6,7} and use of OVSD’s treatment plant to produce recycled water for irrigation⁸. The analyses of these alternatives determined they are not cost-effective and not feasible to implement. Table 6-6 Ojai Retail indicates there are no plans to expand recycled water use in the future.

Submittal Table 6-6 Retail: Methods to Expand Future Recycled Water Use, Ojai Retail

6.2.6. Desalinated Water Opportunities

Desalinated water opportunities were most recently studied in the Casitas MWD Draft Comprehensive Water Resources Plan (Stantec, 2020) and were determined to not be cost-effective without regional participation. Casitas is not pursuing any desalinated water opportunities at this time.

6.2.7. Water Exchanges and Transfers

Water exchanges and transfers are discussed in the following subsections.

6.2.7.1. *SWP Exchanges*

In 2018, 2019, and 2020, Casitas did “bonafide exchanges” with the San Geronio Pass Water Agency (SGPWA), which was an exchange of a portion of Casitas’ SWP allocation in return for compensation. Casitas does not have a physical means of receiving SWP water so these exchanges were not actually delivered from the Casitas system to the SGPWA system, but rather were contractual exchanges. The total compensation to Casitas from 2018 to 2020 was approximately \$1.47 million, and the amount of water exchanged varied from year to year, as follows:

- 1,750 AF was delivered to SGPWA 2018, with a return of 700 AF to Casitas by 2028
- 650 AF was delivered to SGPWA 2019, with a return of 325 AF to Casitas by 2029
- 1000 AF was delivered to SGPWA 2020, with a return of 250 AF to Casitas by 2030

SGPWA serves the cities of Calimesa, Beaumont, and Banning, all located in Riverside County. "Bonafide Exchanges" involve a one-year transfer of Casitas MWD's State Water Project 'Table A' water allocation with an agreement that SGPWA will return 25 to 50 percent of the amount transferred to Casitas in a future year upon mutual agreement of the parties. The bonafide exchange agreements have an initial ten-year term with the option for an additional ten years upon mutual agreement of the parties.

6.2.7.2. *Carpinteria Valley Water District Exchanges*

A small portion of the Casitas service area overlaps an area in which Carpinteria Valley Water District (CVWD) has distribution facilities. In 1973, Casitas and CVWD entered into an exchange agreement (later amended in 1976) in which CVWD supplies water to Casitas customers and Casitas returns the water to CVWD at another location. From 2016 to 2020, the annual average amount of water delivered by CVWD to Casitas customers was 35 AFY. As of December 2020, the balance of water owed to CVWD was approximately 160 AF.

6.2.7.3. *Transfers*

Casitas did not transfer SWP water to other agencies from 2016 to 2020 (since the last UWMP). However, with recently approved State Water Project Contract Amendments for Water Management Tools, Casitas is now implementing a planned transfer of 250 AF in 2021 to the Central Coast Water Authority located in Santa Barbara County in return for compensation in the amount of \$175,000.

6.2.7.4. *Emergency Interties*

Casitas does not currently have any permanent emergency interties with neighboring agencies. However, Casitas has multiple one-way interties supplying water to wholesale agencies; in the event of an emergency these interties can be modified to accommodate flow into the Casitas water system. Casitas is working on design of a permanent emergency intertie, known as the Ventura-Santa Barbara County Intertie, which would supply imported water to Casitas (Section 6.2.8).

6.2.8. Future Water Projects

Casitas Wholesale System and Retail System. Casitas is pursuing future water projects as described herein and summarized in Table 6-7 Casitas Wholesale and Table 6-7 Casitas Retail. Projects to be implemented benefit Casitas Wholesale and Retail customers, as well as Ojai Retail customers. To simplify reporting, future water supply projects are allocated 30 percent to Casitas Wholesale and 70 percent to Casitas Retail based on the 2011 to 2020 average demands for these systems.

Ventura-Casitas SWP Interconnection. Casitas is participating in design of a 7-mile pipeline between Calleguas Municipal Water District and the City of Ventura. The City of Ventura is the lead agency. This project enables the City of Ventura to access its State Water Project allocation and offset their demands from Lake Casitas, resulting in a potential 'in-lieu' benefit to Casitas. The City has a 10,000 AFY SWP allocation and their Final Draft 2020 UWMP anticipates 1,300 AFY from this supply source. This project would not provide direct delivery of water to Casitas' system during emergencies.

Ventura-Santa Barbara Counties Intertie. This project includes the construction of a 6,100-foot pipeline and two booster pump stations to connect Casitas' transmission system with that of Carpinteria Valley Water District. The project would allow Casitas to access its SWP allocation and other supplemental water through a wheeling arrangement with Santa Barbara County agencies. This project provides physical delivery of water to Casitas' system to mitigate droughts and emergencies.

Matilija Formation Deep Bore. Based on preliminary analysis, the Matilija Formation could yield approximately 5,000 gallons per minute of groundwater (potentially 8,000 acre-feet per year) in the Eastern Santa Ynez Mountains via vertical boring extending 15,000 feet. Preliminary estimates indicate 29,000 to 280,000 AF of water in storage in this formation. Additional study is required regarding feasibility of this project including pilot tests to confirm well yields. This water supply may be used as an emergency supply in drought conditions. Water can be treated at the site and fed into Casitas' transmission system and/or discharged to the Robles Canal and sent to Lake Casitas.

Robles Fish Screen Improvements. This project includes a fixed backspray system to clean fish screens due to sediment deposition. The system requires filtered water supply, pumps, and piping. Implementation allows more efficient water diversions to Lake Casitas from the Ventura River at the Robles facility.

Submittal Table 6-7 Wholesale: Expected Future Water Supply Projects or Programs, Casitas Wholesale

<input type="checkbox"/>	No expected future water supply projects or programs that provide a quantifiable increase to the agency's water supply. Supplier will not complete the table below.
<input checked="" type="checkbox"/>	Some or all of the supplier's future water supply projects or programs are not compatible with this table and are described in a narrative format.

67 Provide page location of narrative in the UWMP

Name of Future Projects or Programs	Joint Project with other suppliers?		Description	Planned Implementation Year	Planned for Use in Year Type	Expected Increase in Water Supply to Supplier
	Yes or No	If Yes, Agency Name				
Ventura-Casitas SWP Interconnection ¹	Yes	City of Ventura	7-mile pipeline	2025	Multi-Dry Year	Unknown
Ventura-Santa Barbara Counties Intertie ²	Yes	Carpinteria Valley Water District	Pipeline and two booster pump stations	2025	Multi-Dry Year	600
Matilija Formation Deep Bore	No		15,000 foot vertical bore in Matilija Formation	2030	Single-Dry and Multi-Dry Year	2,400
Robles Fish Screen Improvements ³	No		Fixed backspray cleaning system	2025	All Year Types	Unknown

NOTES: Projects to be implemented benefit Casitas Wholesale and Retail customers, as well as Ojai Retail customers. Thirty percent of the projected supply is applied to the Wholesale system.
 1) Ventura's SWP allocation is 10,000 AFY; this is a possible 'in-lieu' benefit to Casitas
 2) Supply is based on available capacity in pipelines on Santa Barbara County side
 3) Difficult to quantify the supply impact to improved fish screen operation as it is dependent on storm flows

Projects to be implemented benefit Casitas Wholesale and Retail customers, as well as Ojai retail customers. Table 6-7 Casitas Retail includes 70 percent of the projected supplies for new projects based on the 2011 to 2020 average demands.

Submittal Table 6-7 Retail: Expected Future Water Supply Projects or Programs, Casitas Retail

<input type="checkbox"/>	No expected future water supply projects or programs that provide a quantifiable increase to the agency's water supply. Supplier will not complete the table below.
<input checked="" type="checkbox"/>	Some or all of the supplier's future water supply projects or programs are not compatible with this table and are described in a narrative format.

67 Provide page location of narrative in the UWMP

Name of Future Projects or Programs	Joint Project with other suppliers?		Description (if needed)	Planned Implementation Year	Planned for Use in Year Type	Expected Increase in Water Supply to Supplier
	Yes or No	If Yes, Agency Name				
Ventura-Casitas SWP Interconnection ¹	Yes	City of Ventura	7-mile pipeline	2025	Multi-Dry Year	Unknown
Ventura-Santa Barbara Counties Intertie ²	Yes	Carpinteria Valley Water District	Pipeline and two booster pump stations	2025	Multi-Dry Year	1,400
Matilija Formation Deep Bore	No		15,000 foot vertical bore in Matilija Formation	2030	Single-Dry and Multi-Dry Year	5,600
Robles Fish Screen Improvements ³	No		Fixed backspray cleaning system	2025	All Year Types	Unknown

NOTES: Projects to be implemented benefit Casitas Wholesale and Retail customers, as well as Ojai Retail customers. Thirty percent of the projected supply is applied to the Wholesale system.

- 1) Ventura's SWP allocation is 10,000 AFY; this is a possible 'in-lieu' benefit to Casitas
- 2) Supply is based on available capacity in pipelines on Santa Barbara County side
- 3) Difficult to quantify the supply impact to improved fish screen operation as it is dependent on storm flows

Ojai Water System. Casitas drilled a new replacement well in 2020 at the Ojai wellfield and intends to construct piping and electrical systems for its use within the next five years. Under OBGMA policies, groundwater in the Ojai Groundwater Basin cannot be exported out of the basin, so this supply is only available to Ojai Retail customers. While Casitas is working to improve the condition of the Ojai wells, the improved well yields are assumed to only be available when the basin is relatively full. Therefore, the increased water supply is not included in supply projections for later years of multi-year dry periods.

Submittal Table 6-7 Retail: Expected Future Water Supply Projects or Programs, Ojai Retail						
<input type="checkbox"/> No expected future water supply projects or programs that provide a quantifiable increase to the agency's water supply. Supplier will not complete the table below.						
<input checked="" type="checkbox"/> Some or all of the supplier's future water supply projects or programs are not compatible with this table and are described in a narrative format.						
59 Provide page location of narrative in the UWMP						
Name of Future Projects or Programs	Joint Project with other suppliers?		Description (if needed)	Planned Implementation Year	Planned for Use in Year Type	Expected Increase in Water Supply to Supplier
	Yes or No	If Yes, Agency Name				
Groundwater Well	No			2025	Average and Single-Dry Year	500
NOTES: Supplies from the Ojai Groundwater Basin are only available to Ojai Retail customers. Normal, Single-Year Dry, and first 3 years of a multi-year drought period.						

6.2.9. Summary of Existing and Planned Sources of Water

The supplies available to the Casitas and Ojai systems are described in the following subsections. It is difficult to separate supplies from Lake Casitas supplies for the Casitas Wholesale and Casitas Retail systems. To simplify reporting, 30 percent was attributed to Wholesale and 70 percent to Retail based on average ratios from 2011 to 2020.

Casitas Wholesale System. Table 6-8 Wholesale shows the actual volume of supplies in 2020.

Submittal Table 6-8 Wholesale: Water Supplies — Actual, Casitas Wholesale			
Water Supply	Additional Detail on Water Supply	2020	
		Actual Volume	Water Quality
Surface water (not desalinated)	Lake Casitas	3,245	Drinking Water
Groundwater (not desalinated)	Mira Monte Well	50	Drinking Water
Total		3,295	

Casitas Retail System. Table 6-8 Casitas Retail shows the actual volume of supplies for 2020.

Submittal Table 6-8 Retail: Water Supplies — Actual, Casitas Retail			
Water Supply	Additional Detail on Water Supply	2020	
		Actual Volume	Water Quality
Surface Water (not desalinated)	Lake Casitas	7,571	Drinking Water
Groundwater (not desalinated)	Mira Monte Well	129	Drinking Water
Total		7,700	

Ojai Water System. Casitas’ wells in the Ojai Groundwater Basin supply the majority of water to the Ojai Retail System. Two connections to the Casitas system are used to supplement groundwater supplies during high demand or when well(s) are non-operational.

Submittal Table 6-8 Retail: Water Supplies — Actual, Ojai Retail			
Water Supply	Additional Detail on Water Supply	2020	
		Actual Volume	Water Quality
Surface water (not desalinated)	Lake Casitas	369	Drinking Water
Groundwater (not desalinated)	Ojai Wellfield	1,300	Drinking Water
Total		1,669	

Casitas Wholesale System. Projected supplies for the Casitas Wholesale system are shown in Table 6-9 Casitas Wholesale.

Submittal Table 6-9 Wholesale: Water Supplies — Projected, Casitas Wholesale					
Water Supply	Additional Detail on Water Supply	Projected Water Supply			
		2025	2030	2035	2040
		Reasonably Available Volume	Reasonably Available Volume	Reasonably Available Volume	Reasonably Available Volume
Surface Water (not desalinated)	Lake Casitas	4,460	4,460	4,460	4,460
Groundwater (not desalinated)	Mira Monte Well	43	43	43	43
Purchased or Imported Water	Ventura-Santa Barbara Counties Intertie	600	600	600	600
Total		5,103	5,103	5,103	5,103

Casitas Retail System. Projected supplies for the Casitas Retail system are shown in Table 6-9 Casitas Retail.

Submittal Table 6-9 Retail: Water Supplies — Projected, Casitas Retail					
Water Supply	Additional Detail on Water Supply	Projected Water Supply			
		2025	2030	2035	2040
		Reasonably Available Volume	Reasonably Available Volume	Reasonably Available Volume	Reasonably Available Volume
Surface Water (not desalinated)	Lake Casitas	10,405	10,405	10,405	10,405
Groundwater (not desalinated)	Mira Monte well	102	102	102	102
Purchased or Imported Water	Ventura-Santa Barbara Counties Intertie	1,400	1,400	1,400	1,400
Total		11,907	11,907	11,907	11,907

Ojai Water System. Table 6-9 Ojai Retail shows the project water supplies for the Ojai Retail system.

Submittal Table 6-9 Retail: Water Supplies — Projected, Ojai Retail					
Water Supply	Additional Detail on Water Supply	Projected Water Supply <i>Report To the Extent Practicable</i>			
		2025	2030	2035	2040
		Reasonably Available Volume	Reasonably Available Volume	Reasonably Available Volume	Reasonably Available Volume
Surface Water (not desalinated)	Lake Casitas Supplement	461	461	461	461
Groundwater (not desalinated)	Ojai Wellfield	2,300	2,300	2,300	2,300
Total		2,761	2,761	2,761	2,761

6.2.10. Special Conditions

Special conditions which may affect Casitas' water supplies are described in the following subsections.

6.2.10.1. *Climate Change Effects*

Climate change may affect Casitas' water supplies as described in Sections 3.3 and 4.4.

6.2.10.2. *Regulatory Conditions and Project Development*

The following regulatory conditions and project development may have an impact on Casitas' water supplies in the future.

In-Stream Flow Studies. As directed by Governor Brown, the California Water Action Plan (WAP) was released in 2014 to move California toward more sustainable water management. The WAP was developed by the California Natural Resources Agency, the California Environmental Protection Agency, and the California Department of Food and Agriculture, and includes three objectives: 1) more reliable water supplies; 2) restoration of important species and habitat, and 3) a more resilient sustainable managed water resources system.

As part of the implementation activities for the WAP, the California Department of Fish and Wildlife (CDFW) is developing instream flow criteria in the Ventura River watershed that would support the endangered steelhead trout. These flow criteria will be submitted to the State Water Resources Control Board (SWRCB) to identify potential actions that may be taken to establish or enhance instream flow for steelhead. The SWRCB is developing a groundwater-surface water model of the Ventura River watershed to evaluate potential actions to achieve instream flows. These potential actions could have a significant impact on available water supplies for Casitas and its wholesale agencies. The SWRCB study is anticipated to be complete by 2022. More information can be found at:

https://www.waterboards.ca.gov/waterrights/water_issues/programs/instream_flows/cwap_enhancing

Sustainable Groundwater Management Act. In 2014 the California Legislature passed the Sustainable Groundwater Management Act (SGMA) to provide a framework for sustainable management of groundwater supplies by local agencies. The California Department of Water Resources is the jurisdictional agency for SGMA compliance. Depending on the ‘priority’ of the specific groundwater basin, preparation of a Groundwater Sustainability Plan (GSP) has a specific target date with critically-overdrafted high priority basins having the earliest deadline. More information can be found on the DWR website at <https://water.ca.gov/programs/groundwater-management/sgma-groundwater-management>

The Ojai Groundwater Basin is considered a high priority basin. The OBGMA manages the quality and quantity of groundwater within the Ojai Groundwater Basin since 1991. OBGMA is in the process of preparing its GSP. A release date is unknown.

The Ventura River Valley is considered a medium priority basin. The Upper Ventura River Groundwater Management Agency expects to release a draft of the GSP in July 2021 followed by a public workshop in August 2021. Adoption of the GSP is anticipated in December 2021.

Matilija Dam Ecosystem Restoration Project. The County of Ventura owns the Matilija Dam, located upstream of Casitas’ Robles Diversion and Fish Passage Facility. The County plans to remove Matilija Dam as it has been rendered obsolete. Casitas participates in several committees to coordinate and evaluate the “Matilija Dam Ecosystem Restoration Project”, along with numerous stakeholders. Removal of the dam will likely impact the Robles Facility due to increased sediment load. The County is currently seeking funding for the dam removal and associated downstream projects, including improvements and/or modifications to the Robles Facility. More information can be found at: <https://matilijadam.org/>

6.2.10.3. Other Local Applicable Criteria

Ventura River Watershed Groundwater Basins Adjudication. The City of Ventura initiated a water rights adjudication of four groundwater basins within the Ventura River watershed through an amended cross complaint filed with the Superior Court of California in September 2018. The basins named in the lawsuit include: Upper Ventura River Groundwater Basin, Lower Ventura River Groundwater Basin, Ojai Valley

Groundwater Basin, and Upper Ojai Valley Groundwater Basin. This action was filed by the City of Ventura and included not only Casitas but many public and private water users. The outcome of the adjudication is currently unknown. Casitas is actively defending and protecting its water rights in the case of *Santa Barbara Channelkeeper v. State Water Resources Control Board; City of San Buenaventura; City of San Buenaventura v. Duncan Abbott, et al.*, Cross-Complaint, Superior Court of the State of California, County of Los Angeles, Case No. 19STCP01176. More information can be found at: <http://www.venturariverwatershedadjudication.com>

6.3. Submittal Tables Completion Using Optional Planning Tool

Casitas has opted not to complete these tables.

6.4. Energy Use

A new requirement for 2020 UWMPs is Energy Intensity Reporting. The following subsections include required tables and discussion.

Casitas Wholesale and Retail Systems. Table O-1C shows the required energy reporting table for the “Multiple Water Delivery Products” approach, which is appropriate for the Casitas system (Wholesale and Retail). Data provided by Casitas is shown in the unshaded cells; the shaded cells are auto-calculated. Casitas’ wholesale and retail systems have an ‘energy intensity’ of 436.6 kilowatt-hours (kWh) per acre-foot.

Table O-1C: Recommended Energy Reporting - Multiple Water Delivery Products, Casitas Wholesale and Retail

Enter Start Date for Reporting Period	1/1/2020	Urban Water Supplier Operational Control							
End Date	12/31/2020								
Water Volume Units	AF	Water Management Process						Non-Consequential Hydropower (if applicable)

Narrative:				
Ojai Wellfield consists of Mutual Wells and San Antonio Wells. Pumped water is treated at the on-site iron and manganese treatment plant.				

7. Water System Reliability and Drought Risk Assessment

Section 7 describes Casitas' evaluation of water supply reliability and drought risk assessment in compliance with Water Code Section 10635.

7.1. Introduction

Water supply reliability is Casitas' mission as a water purveyor. This section describes Casitas' evaluation of potential supply constraints, demands, and drought impacts.

7.2. Water Service Reliability Assessment

The following subsections describe service reliability including constraints on water supply sources and reliability under normal year, single dry year, and multiple dry years for five consecutive years.

7.2.1. Service Reliability – Constraints on Water Sources

Casitas Wholesale and Retail Systems. As described in Section 6.2.3, the planned operational yield of Lake Casitas was recently evaluated using a model that simulates Lake Casitas inflows, outflows (including evaporation) and change in storage over a time series of assumed hydrology conditions. On April 21, 2021, the Board of Directors adopted a planned operational for the Casitas System of 15,010 AFY⁹. The operational yield for the Casitas system is sufficient to provide supplies through an extended drought period lasting 10-20 years depending on reservoir levels at the start of the dry period.

SWP water, via the future Ventura-Santa Barbara County Intertie, is limited by interconnect delivery capacity and SWP allocations from year to year. Casitas would only have access to excess delivery capacity when Santa Barbara County agencies are not fully using their facilities. For planning purposes, it is assumed that only 2,000 AFY could be delivered on average given that capacity would be limited in summer months and during times when Santa Barbara agencies have limited local supplies due to drought.

SWP allocations from DWR vary significantly from year to year due to hydrologic conditions and complex operations to meet environmental requirements. While DWR has estimated that the average SWP yield under existing conditions is about 58 percent of Table A, the most recent drought resulted in the lowest allocation in SWP history at 5 percent of Table A. For the multiple dry-year analysis, Casitas has selected 2011 to 2015, which incorporates record low rainfall in the local watershed as well as the record low SWP allocations. SWP allocations from DWR during the period 2011 to 2015 were:

- 2011 – 80%
- 2012 – 65%
- 2013 – 35%
- 2014 – 5%
- 2015 – 20%

Casitas' existing allocation of 5,000 AFY would not be affected by the allocation in 2011 or 2012 as these amounts are more than 2,000 AFY (i.e. the pipeline capacity of 2,000 AFY is the limiting factor).

However, the available SWP supply is reduced in 2013-2015. Table 7-0 shows the SWP allocation for Casitas wholesale (30 percent) and Casitas retail (70 percent) applied to a five consecutive year drought.

⁹ The planned operational yield is 14,865 AFY for Lake Casitas and 145 AFY for Mira Monte Well.

Table 7-0 State Water Project Allocation for Casitas Wholesale and Casitas Retail					
	Year 1	Year 2	Year 3	Year 4	Year 5
Casitas Wholesale	600	600	525	75	300
Casitas Retail	1,400	1,400	1,225	175	700
Notes: This is <u>not</u> a DWR-required table.					

The amounts show in Table 7-0 are used for the multiple dry year discussion in Sections 7.2.2.1 and 7.2.2.3.

Ojai Water System. The primary source for the Ojai System is groundwater from the Ojai Basin, and supplemental water is supply by the Casitas System through two interconnects. The Ojai System acquisition included several groundwater wells, with some wells over 45 years old and in need of rehabilitation and replacement. The wells acquired by GSWC were unable to produce their original design capacity of 4,404 AFY and Ojai wellfield production from 1994-2016 averaged about 1,800 AFY. Since 2017, Casitas has made progress in improving the condition of the wells, although work is still underway and not yet complete. Once complete, the anticipated yield is expected to increase by 500 AFY to 2,300 AFY. While Casitas is working to improve the condition of the Ojai wells, the improved well yields are assumed to only be available when the basin is relatively full. Therefore, the increased water supply is not included in supply projections for later years of multi-year dry periods.

7.2.2. Service Reliability – Year Type Characterization

The following subsections describe service reliability for Casitas under average year, single dry year and multiple dry year conditions. For the 2020 UWMP, the multiple dry year analysis includes five consecutive dry years; the 2015 UWMP was required to evaluate only three consecutive dry years.

7.2.2.1. Types of Years

Casitas Wholesale System. The average year (2003) was selected based on precipitation records from 1960 to 2020 as it was the year closest to the overall average during that period. Single-Dry Year represents the lowest water supply available to Casitas. Based on lake levels, 2019 is the lowest (driest) year. Five-Consecutive-Year Drought represents the driest five-year historical sequence, which for Casitas is the period from 2011 to 2015 based on precipitation records. Table 7-1 shows the analysis for the Casitas Wholesale system.

Quantification of available supply is based on the operational yield as described in Section 6.2.3. For the wholesale system, 4,460 AFY is assumed to be provided from Lake Casitas, 43 AFY from the Mira Monte Well, and 600 AFY from a future SWP connection between Casitas and Carpinteria Valley Water District, also known as the Ventura-Santa Barbara Counties Intertie project, for a total of 5,103 AFY during average year, single-dry year and the first two years of a five-year multiple dry year period. The lower availability of SWP water is factored into the last three year period.

Submittal Table 7-1 Wholesale: Basis of Water Year Data (Reliability Assessment), Casitas Wholesale			
Year Type	Base Year	Available Supplies if Year Type Repeats	
		<input type="checkbox"/>	Quantification of available supplies is not compatible with this table and is provided elsewhere in the UWMP. Location
		<input checked="" type="checkbox"/>	Quantification of available supplies is provided in this table as either volume only, percent only, or both.
		Volume Available	% of Average Supply
Average Year	2003	5,103	100%
Single-Dry Year	2019	5,103	100%
Multiple-Dry Years 1st Year	2011	5,103	100%
Multiple-Dry Years 2nd Year	2012	5,103	100%
Multiple-Dry Years 3rd Year	2013	5,028	99%
Multiple-Dry Years 4th Year	2014	4,578	90%
Multiple-Dry Years 5th Year	2015	4,803	94%
NOTES: Base volume available: Lake Casitas (4,460), Mira Monte Well (43) and Purchased/Imported (SWP) Water. SWP availability from 2013 to 2015 was factored into multiple dry years as shown in Table 7-0.			

Casitas Retail System. For the Casitas Retail system, supplies include 10,405 AFY from Lake Casitas, 102 AFY from the Mira Monte Well, and 1,400 AFY from the Ventura-Santa Barbara Counties Intertie for a total of 11,907 AFY.

The average year (2003) was selected based on precipitation records from 1960 to 2020 as it was the year closest to the overall average during that period. The year 2019 was selected as the single-dry year as this was the year in which Lake Casitas was at its lowest storage level.

The multiple dry-year period of 2011 to 2015 was selected based on the driest five-year period from 1960 to 2020 based on precipitation records at Casitas Dam. Similar to Casitas wholesale system, SWP availability was factored into the consecutive dry year volume available as shown in Table 7-0.

Submittal Table 7-1 Retail: Basis of Water Year Data (Reliability Assessment), Casitas Retail			
		Available Supplies if Year Type Repeats	
		<input type="checkbox"/>	Quantification of available supplies is not compatible with this table and is provided elsewhere in the UWMP. Location _____
		<input checked="" type="checkbox"/>	Quantification of available supplies is provided in this table as either volume only, percent only, or both.
		Volume Available	% of Average Supply
Average Year	2003	11,907	100%
Single-Dry Year	2019	11,907	100%
Consecutive Dry Years 1st Year	2011	11,907	100%
Consecutive Dry Years 2nd Year	2012	11,907	100%
Consecutive Dry Years 3rd Year	2013	11,732	99%
Consecutive Dry Years 4th Year	2014	10,682	90%
Consecutive Dry Years 5th Year	2015	11,207	94%
NOTES: Lake Casitas (10,405), Mira Monte Well (102) and Purchased/Imported Water (1,400). SWP availability from 2013 to 2015 was factored into multiple dry years.			

Ojai Water System. Ojai Water supplies are based on Ojai Wellfield capacity of 2,300 AFY plus Lake Casitas supplement of 461 AFY.

The average year (2003) was selected based on precipitation records from 1960 to 2020 as it was the year closest to the overall average during that period. The year 2019 was selected as the single-dry year as this was the year in which Lake Casitas was at its lowest storage level. The multiple dry-year period of 2011 to 2015 was selected based on the driest five-year period from 1960 to 2020 based on precipitation records at Casitas Dam. It was assumed in years 4 and 5 of a consecutive five-year dry period, the wellfield production is reduced from 2,300 AF to 1,800 AF and Lake Casitas supply is reduced by 20 percent.

Submittal Table 7-1 Retail: Basis of Water Year Data (Reliability Assessment), Ojai Retail			
Year Type	Base Year	Available Supplies if Year Type Repeats	
		<input type="checkbox"/>	Quantification of available supplies is not compatible with this table and is provided elsewhere in the UWMP. Location
		<input checked="" type="checkbox"/>	Quantification of available supplies is provided in this table as either volume only, percent only, or both.
		Volume Available	% of Average Supply
Average Year	2003	2,761	100%
Single-Dry Year	2019	2,761	100%
Consecutive Dry Years 1st Year	2011	2,761	100%
Consecutive Dry Years 2nd Year	2012	2,761	100%
Consecutive Dry Years 3rd Year	2013	2,761	100%
Consecutive Dry Years 4th Year	2014	2,169	79%
Consecutive Dry Years 5th Year	2015	2,169	79%

NOTES: Ojai Wellfield Capacity (2,300 AF) plus Lake Casitas Supplement (461 AF) in 1st three years; 1,800 AF and 369 AF, respectively, in years 4 and 5.

7.2.3. Service Reliability – Supply and Demand Comparison

The following subsections describe water supply and demand comparison under multiple scenarios including average year, single dry year and multiple dry year period of five years.

7.2.3.1. Water Service Reliability – Normal Year

Casitas Wholesale System. Table 7-2 Casitas Wholesale summarizes the normal year supply and demand for the Casitas Wholesale system.

Submittal Table 7-2 Wholesale: Normal Year Supply and Demand Comparison, Casitas				
	2025	2030	2035	2040
Supply totals (autofill from Table 6-9)	5,103	5,103	5,103	5,103
Demand totals (autofill fm Table 4-3)	4,356	4,356	4,356	4,356
Difference	747	747	747	747

Casitas Retail System. Table 7-2 Casitas Retail summarizes the normal year supply and demand for the Casitas Retail system.

Submittal Table 7-2 Retail: Normal Year Supply and Demand Comparison, Casitas Retail

Supply totals <i>(autofill from Table 6-9)</i>	11,907	11,907	11,907	11,907
Demand totals <i>(autofill from Table 4-3)</i>	10,169	10,169	10,169	10,169
Difference	1,738	1,738	1,738	1,738

Ojai Water System. Table 7-2 Ojai Retail summarizes the normal year supply and demand for the Ojai Retail system.

Submittal Table 7-2 Retail: Normal Year Supply and Demand Comparison, Ojai Retail				
	2025	2030	2035	2040
Supply totals <i>(autofill from Table 6-9)</i>	2,761	2,761	2,761	2,761
Demand totals <i>(autofill from Table 4-3)</i>	1,850	1,850	1,850	1,850
Difference	911	911	911	911

7.2.3.2. Water Service Reliability – Single Dry Year

Given that Lake Casitas and groundwater basin storage can sustain extended drought periods, a single dry year has little effect on Casitas’ supply availability. However, annual demands typically vary significantly from year to year. Unconstrained demands for water typically increase during dry period and decrease during wet periods. The demands herein reflect planned average demands and were not adjusted based on weather variations.

Casitas Wholesale System. Table 7-3 Casitas Wholesale shows the single dry year supply and demand for the Casitas wholesale system.

Submittal Table 7-3 Wholesale: Single Dry Year Supply and Demand Comparison, Casitas				
	2025	2030	2035	2040
Supply totals	5,103	5,103	5,103	5,103
Demand totals	4,356	4,356	4,356	4,356
Difference	747	747	747	747

Casitas Retail System. Table 7-3 Casitas Retail shows the single dry year supply and demand for the Casitas retail system.

Submittal Table 7-3 Retail: Single Dry Year Supply and Demand Comparison, Casitas Retail				
	2025	2030	2035	2040
Supply totals	11,907	11,907	11,907	11,907
Demand totals	10,169	10,169	10,169	10,169
Difference	1,738	1,738	1,738	1,738

Ojai Retail System. Table 7-3 Ojai Retail shows the single dry year supply and demand for the Ojai retail system.

Submittal Table 7-3 Retail: Single Dry Year Supply and Demand Comparison, Ojai Retail				
	2025	2030	2035	2040
Supply totals	2,761	2,761	2,761	2,761
Demand totals	1,850	1,850	1,850	1,850
Difference	911	911	911	911

7.2.3.3. Water Service Reliability – Five Consecutive Dry Years

Given that Lake Casitas and groundwater basin storage can sustain extended drought periods, a few dry years have little effect on Casitas’ supply availability. However, supplies can become limited during extended drought periods and Casitas implements its WEAP as a demand management tool as Lake Casitas storage declines.

Annual demands typically vary significantly from year to year. Unconstrained demands for water typically increase during dry period and decrease during wet periods. The demands herein have not been adjusted based on weather variations. However, the demands have been adjusted to reflect mandatory demand reductions with WEAP implementation in later years of a drought.

Casitas Wholesale System. Table 7-4 Casitas Wholesale shows the multiple dry year supply and demand for the Casitas wholesale system. Based on Casitas’ practices Stage 2 of the WEAP would take effect in year 5, resulting in a 20 percent decrease in demand. The surplus in Year 5 resulting from demand management helps to stretch remaining supplies for a drought lasting longer than five years.

Submittal Table 7-4 Wholesale: Multiple Dry Years Supply and Demand Comparison					
		2025	2030	2035	2040

	Difference	689	689	689	689

7.2.4. Description of Management Tools and Options

Casitas manages its local water supply with a great deal of cooperation from its customers. During drought conditions, the WEAP is a cornerstone policy for Casitas’ demand management. The WEAP describes the water demand reduction strategies and measures to address water shortage conditions, promote water conservation and the efficient use of water, and the application of a penalty to customers who waste water. The WEAP was originally developed in response to the 1987 to -1991 drought period, and is updated and modified as needed. The most recently adopted WEAP is included in Appendix F.

Future supplemental supply options are described in Section 6.

7.3. Drought Risk Assessment

The Drought Risk Assessment (DRA) is a new requirement in the 2020 UWMP. The DRA is intended to address the next five-year cycle of water supplies and demands; for the UWMP, this is the period from 2021 to 2025.

7.3.1. DRA Data, Methods, and Basis for Water Shortage Condition

Casitas declared Stage 3 of the WEAP in June 2016 when Lake Casitas dropped below 100,000 AF in storage and continues to remain in Stage 3. Annually, Casitas prepares a Water Supply Assessment which includes an evaluation of water supplies, demands, and effectiveness of water conservation measures over the previous fiscal year, and projects Lake Casitas levels assuming that dry conditions will continue. The most recent Water Supply Assessment is provided in Appendix D.

The analysis is conservative and assumes no inflows to Lake Casitas occur in the next five years. Figure 7-1 shows the potential lake levels with various demand scenarios that reflect recent usage patterns. Based on these projections, Casitas may enter Stage 4 of the WEAP in 12 to 14 months. Casitas is working to revise its WEAP and will re-assess the Stage level in Spring 2022. Projected five-year supplies and demands are discussed further in Section 7.

Figure 7-1

7.3.2. DRA Water Source Reliability

Lake Casitas. As of December 2020, Lake Casitas was at approximately 39.3 percent of capacity (93,449 AF in storage) due to the ongoing drought. Lake Casitas is wholly dependent on precipitation into the watershed and Casitas’ ability to divert water from the Ventura River. For drought planning purposes, a conservative assumption of no additional inflows is used.

Groundwater. The DRA assumes that historic pumping levels can be maintained in the next five years. Current groundwater basin conditions are described further in the most recent Water Supply Assessment (Appendix D).

State Water Project. Casitas is the design phase of the Ventura-Santa Barbara Counties Intertie project. Funding for construction is necessary and Casitas is pursuing grants and loans to implement this project by 2025, which would provide and estimated 2,000 AFY on average.

7.3.3. DRA Total Water Supply and Use Comparison

Casitas Wholesale and Retail Systems. Table 7-5 Casitas summarizes the Five-Year DRA for the Casitas System and shows the impact of conservation when the WEAP is implemented, particularly for years 2021 to 2024. Total supplies are based on recent production trends and water demands (‘gross water use’) are the unconstrained planned demands.

7.3.4. Optional Planning Tool Workbook

Casitas has opted not to use the optional planning tool workbook.

This page left intentionally blank.

8. Water Shortage Contingency Plan

Water shortages can be triggered by hydrologic limitations in supply (e.g. prolonged period of below-normal precipitation and runoff) or failure of supply, treatment, and/or conveyance infrastructure due to a catastrophic event, such as earthquake, power outage, or a toxic spill that affects water quality. Water supply limitations resulting from drought tend to develop and abate more slowly, whereas infrastructure failure tends to happen quickly and relatively unpredictably.

Casitas' Water Shortage Contingency Plan (WSCP) was developed in accordance with California Water Code Section 10632 and the California DWR UWMP Guidebook and includes:

- **Water Supply Reliability Analysis:** Summarizes Casitas' water supply analysis, and identifies any key issues that may trigger a shortage condition;
- **Annual Water Supply and Demand Assessment Procedures:** Describes the key data inputs, evaluation criteria, and methodology for assessing the system's reliability for the coming year, and the steps to formally declare any water shortage levels and response actions;
- **Standard Shortage Stages:** Establishes water shortage levels to clearly identify and prepare for shortages;
- **Shortage Response Actions:** Describes the response actions that may be implemented or considered for each stage to reduce gaps between supply and demand and to minimize social and economic impacts to the community;
- **Communication Protocols:** Describes communication protocols under each stage to ensure customers, the public, and government agencies are informed of shortage conditions and requirements;
- **Compliance and Enforcement:** Defines compliance and enforcement actions available to administer demand reductions;
- **Legal Authority:** Lists the legal documents granting Casitas the authority to declare a water shortage; and to implement and enforce response actions;
- **Financial Consequences of WSCP Implementation:** Describes the anticipated financial impacts of implementing water shortage stages and identifies mitigation strategies to offset financial burdens;
- **Monitoring and Reporting:** Summarizes the monitoring and reporting techniques to evaluate the effectiveness of shortage response actions and overall WSCP implementation, and whether response actions should be increased or reduced;
- **WSCP Refinement Procedures:** Outlines procedures for updating the WSCP;
- **Special Water Features Distinctions:** Defines ponds, lakes, fountains, pools, and spas, etc.;
- **Plan Adoption, Submittal, and Availability:** Describes the process for WSCP adoption, submittal and availability.

The WSCP is prepared as part of Casitas' 2020 UWMP, but is a stand-alone document that may be modified as needed. The WSCP is intended to provide guidance, rather than absolute direction, for Casitas' action in response to water shortages.

The WSCP is based on Casitas' currently adopted WEAP, which is included as Appendix F. The WEAP is the primary demand management tool to reduce water demands as Lake Casitas levels decline during extended drought periods, and may be modified or updated more frequently than the UWMP five-year

cycle. In addition, Casitas has an Emergency Response Plan and Casitas Dam Emergency Action Plan to provide guidance for a coordinated response to emergency conditions or catastrophic events.

8.1. Water Supply Reliability Analysis

The reliability of Casitas' water supply is described in Section 7 by comparing supply demand projections through 2040 for normal, single dry, and multiple dry years. The following is a concise narrative of the available water supplies and key issues that may create a water shortage condition.

8.1.1. Lake Casitas

Because Lake Casitas is a multi-year reservoir designed to supply water through an extended drought period, a single dry year has little effect on availability of Casitas supplies. However, when average or less rainfall continues for many years in succession, Lake Casitas storage will decline and careful management is needed in the event that dry conditions continue. Figures 8-1 and 8-2 show historical lake levels and the corresponding reduction in demands, respectively, when lake levels start to decline. The demand reductions in the post-1989 and post-2016 periods reflect implementation of the WEAP and its effectiveness as a demand management tool.

The water supply availability from Lake Casitas was previously studied by the United States Bureau of Reclamation in the 1954 evaluation of the Ventura River Project, and later by the District in the 1989 and 2004. The District recently updated its evaluation of the reliability of the Lake Casitas water supply using its Lake Casitas safe yield model, which is a mass-balance model that tracks Lake Casitas inflows, outflows (including evaporation), and change in storage to simulate operations over a time series of assumed hydrology conditions. The model evaluates the water supply vulnerability to climatic and seasonal variations in weather, changes in water demands, and changes to water supply operations. The safe yield model was recently updated to include the following improvements:

- Extended hydrologic period of record of 1945-2018 (from previous of 1945-1999)
- Incorporated results of recent Lake Casitas bathymetric survey – reduced maximum storage capacity from 254,000 AF to 237,761 AF
- Added function to compute reservoir spills
- Incorporated Robles Diversion Facility operations based on 2003 Biological Opinion requirements and 2018 Critical Drought Protection Measures
- Reduced modeled Robles diversions based on a diversion efficiency of 70 percent, consistent with operational data since the Fish Passage Facility was constructed
- Improved method of calculating monthly net evaporation loss

Upon review of updated modeling analyses on April 21, 2021, the Casitas Board adopted a revised Casitas System operational yield of 15,010 AFY¹⁰, which accounts for future climate change and hydrologic uncertainty.

¹⁰ Based on a planned yield of 14,965 AFY from Lake Casitas and 145 AFY from Mira Monte Well.

FIGURE 8-1. HISTORICAL LAKE LEVELS, INFLOW, AND DROUGHT PERIODS

FIGURE 8-2. HISTORIC WATER USE BY CUSTOMER CLASS

All data is by Fiscal Year.

8.1.2. [Water Quality Impacts on Reliability](#)

The water quality of Lake Casitas may vary significantly as the lake storage transitions from full capacity to minimum pool. Surface water supply from Lake Casitas is treated at the Marion Walker Water Treatment Plant using pressure filtration and chloramination prior to the delivery to the distribution system. The treatment process ensures the water meets all state and federal regulations. At lower levels of Lake Casitas storage there are specific and challenging water quality issues affecting Casitas' ability to treat and deliver potable water from Lake Casitas. During the condition of low lake level the water quality can unfavorably change due to the concentrating of nutrients resulting in eutrophication, increased algae blooms, reduction in dissolved oxygen, and increased turbidity during storm events that could significantly impact filtration treatment process and the rate of water production for the distribution system. Additionally, increased loading of natural organic matter results in elevated precursors that can contribute to trihalomethanes (THMs), haloacetic acids (HAAs), and other disinfection byproducts.

Casitas is also concerned about the release of organic-laden silts from Matilija Dam that, if not properly mitigated during the Matilija Dam removal, can add to the mass balance of nitrogen and phosphorous compounds and increased turbidity of water flowing into Lake Casitas.

Specific actions Casitas has considered and implemented are lake management strategies such as watershed management, intake selection (hypolimnetic withdrawal), algae control, and lake aeration. The level of the lake management implementation may increase as the problem intensifies during low storage conditions.

8.1.3. [Groundwater](#)

The Casitas System is supplied by one groundwater well located in the Upper Ventura River Groundwater Basin, with a planned average supply of 145 to 180 AFY. The well water is blended with surface water from Lake Casitas at a high ratio to ensure the maximum contaminant level (MCL) for nitrate is not exceeded. The resulting blended water is well below the MCL for nitrate. On-site treatment to eliminate the need for blending and increase well production could be a consideration in the future.

The Ojai System is supplied by six groundwater wells in the Ojai Groundwater Basin, with a planned average supply of 1,800 to 2,300 AFY. Groundwater from all six wells receives treatment at the San Antonio Groundwater Treatment Plant prior to distribution to the Ojai System, and meets all state and federal water quality requirements without blending.

Estimated yield of groundwater supply is based on historical groundwater production records. The groundwater basins are managed by the Upper Ventura River Groundwater Management Agency and the Ojai Basin Groundwater Management Agency. Both agencies are currently preparing Sustainable Groundwater Management Plans which will determine management actions to support sustainable groundwater yields.

8.1.4. [Existing Emergency Supplies](#)

In the event Lake Casitas supplies are not available, available groundwater supplies could serve the Ojai System. Groundwater supplies for the Casitas System are limited in their ability to deliver water, and interagency agreements are sought for specific and limited emergency conditions.

In addition, the Casitas System (Retail and Wholesale) and Ojai Retail System have approximately 26.3 million gallons and 2.0 million gallons, respectively, of water storage in the distribution system to provide two to three days of reserve water supply. In the event of isolated water outages, Casitas has five portable water tanks (water buffalos), 400 gallons each, for placing in residential areas. Casitas has also employed contract water trucks to provide water to residential areas during major water outages. Casitas will respond to water outages with a pipeline repair crew, contract pipeline crews, engineers, water quality and customer service personnel, and may request assistance from local, state, and federal agencies, as warranted.

8.1.5. [Potential Future Emergency Supplies](#)

Casitas is currently designing a regional emergency interconnection, known as the Ventura-Santa Barbara Counties Interconnection, which is described in Section 6.2.8. This interconnection would allow direct delivery of imported water to Casitas’ system to mitigate periods when local supplies are limited.

8.2. Annual Water Supply and Demand Assessment Procedures

New provisions in Water Code Section 10632.1 require an urban water supplier to conduct an annual water supply and demand assessment (“Annual Assessment”), on or before July 1 of each year, to be submitted to DWR. The requirement to perform the Annual Assessment begins in July 2022.

Under the adopted WEAP, Casitas has an existing annual assessment process in place that goes beyond the annual assessment requirements. Casitas prepares an Annual Supply and Demand summary, which summarizes significant or unusual events over the last year, weather conditions, status of water resources, past and current demands, current water management programs and policies in place, and recommended demand management measures.

8.2.1. [Decision-Making Process](#)

According to the most current WEAP, the General Manager shall report to the Board of Directors each year (April) with an assessment of the current water storage in Lake Casitas and local groundwater basins, current water use trends, predicted weather conditions, and an evaluation of current water use reduction goals. The time of the reporting can be each April, as the rainfall season is ending and water resources can be evaluated at the maximum for the year, or as Lake Casitas storage reaches a change in Stage action level. The Board of Directors may, at their sole discretion, declare a Stage condition of water supply in Lake Casitas exists and implement the appropriate demand reduction goals and measures in response to current and/or predicted water availability conditions. Casitas shall make such determinations public and follow with appropriate and timely notification of all customers. An action to declare and implement a Stage may occur by either an action of the Casitas Board of Directors based on unanticipated changing lake supply conditions or in accordance with the following schedule:

Target Dates	Action
June – April	Monitor water demands, rainfall, reservoir level trend, groundwater trends, and diversion and runoff amounts.
Early April	Staff presents water status report and a recommendation to the Casitas Board of Directors. Publish a notice of a public hearing if changes are recommended.
Late April	Casitas Board of Directors formally declares a Stage, and/or water shortage emergency, adopts recommendations for demand reduction actions.
May	Customer Notification of change in Stage, allocation, and overuse penalties.
June	Finalize Annual Water Assessment and submit to DWR.

Target Dates	Action
July	Stage demand reduction actions are effective and are implemented.

8.2.2. Data and Methodologies

This section provides a description of key data inputs and methodologies to evaluate the water system reliability for the coming year, assuming that subsequent years are dry with low precipitation. To evaluate reliability, the inputs described in the following subsections are considered.

8.2.2.1. Water Supply

Casitas staff estimates projected Lake Casitas storage levels over the next five years or more based on projected near-term demands, current Lake Casitas storage levels, dry year evaporation rates, and a conservative assumption of no additional rainfall or runoff. This conservative planning approach allows an evaluation of how long current available supplies will last and whether the next drought stage will be triggered within the next year. Figure 8-3 presents an example projection based on conditions and adopted management policies in Spring 2021. The estimated current releases from Lake Casitas to the treatment plant are 10,600 AFY, and two additional scenarios were evaluated based on a 10 percent variation in demands.

FIGURE 8-3. HYPOTHETICAL DECLINE IN LAKE CASITAS STORAGE WITH NO RAINFALL OR RUNOFF; 2013 EVAPORATION RATE EVERY YEAR; STARTING STORAGE AT 90,600 ACRE-FEET

Casitas staff also include groundwater basin status as a consideration in its water supply assessment. The Ojai Basin groundwater levels and storage are tracked by the OBGMA, and the Upper Ventura River groundwater levels are tracked by the Ventura River Water District and UVGMA.

Based on current conditions, projected demands and supplies are compared for both the Casitas (Retail and Wholesale) System and Ojai Retail System assuming dry conditions over the next five years.

8.2.2.2. *Infrastructure Considerations*

As part of its supply availability analysis, Casitas will evaluate how infrastructure capabilities and constraints (e.g. condition of groundwater wells) may affect the ability to access or deliver supplies to meet projected customer water demand in the coming year, as well as any capital projects anticipated to improve the capacity or ability to meet demands.

8.2.2.3. *Unconstrained Customer Demand*

The unconstrained demand reflects periods when Casitas is not in a declared water shortage stage. For purposes of the Annual Assessment to be submitted to DWR, Casitas estimates near-term demand based on recent trends, with consideration of water supplied over the last twelve months, trends from previous years, and potential increases in demands due to weather or other influencing factors.

8.2.2.4. *Planned Water Use for Current Year Considering Dry Subsequent Year.*

Casitas uses a conservative approach and assume dry conditions throughout a 5-year period for the Annual Assessment. If recent water demand trends reflect wet conditions and reduced irrigation needs, and Casitas is not in a declared water shortage stage, the planned demands used in the annual assessment are adjusted to account for increases in demand that occur during dry conditions. If previous years reflect extended dry conditions and Casitas is already in a declared water shortage stage, the effects of current restrictions on water demands are considered.

8.2.3. Evaluation Criteria

Casitas has established the implementation of various stages of action based on the amount of water in storage in Lake Casitas, as shown in Table 8-0 which reflects the most recently adopted WEAP (Appendix F). These stages apply to both the Casitas system and the Ojai system. The recommended stage will be based on whether the projected lake levels over the next year fall within the action levels.

Stage	Stage Title	Lake Casitas Storage, %	Lake Casitas Storage Action Level
1	Water Conservation	100%-50%	237,761 to 118,880
2	Water Shortage Warning	50%-40%	118,880 to 95,104
3	Water Shortage Eminent	40%-30%	95,104 to 71,328
4	Severe Water Shortage	30%-25%	71,328 to 59,440
5	Critical Water Shortage	25%-0%	59,440 to 3,000

Note: This is not a DWR-Required table

In addition, recent demand trends are evaluated to determine if they are within planned levels and whether additional demand reduction actions are recommended. During periods when Casitas is not in a declared water shortage stage, the recent demand trends are compared with the planned normal demands, which are reflected in Tables 4-2 and 4-3. During periods when Casitas is in a declared water stage, the recent demand trends are compared with the demand reduction goals outlined in Section 8.3 and the most current WEAP.

8.3. Six Standard Water Shortage Stages

Casitas water shortage planning is intended to address supply shortages ranging from a slowly developing drought to sudden and potentially catastrophic interruptions, such as earthquakes and/or failure of major system components. Stages 1 through 5 reflect the most recently adopted WEAP which primarily addresses drought conditions, and Stage 6 reflects a catastrophic emergency in which the Emergency Response Plan would be implemented. Table 8-1 reflects the DWR-required Water Shortage Contingency Plan levels and applies to both the Casitas and Ojai systems.

Submittal Table 8-1 Water Shortage Contingency Plan Levels		
Shortage Level	Complete Both	
	Percent Shortage Range ¹	Shortage Response Action
1	Up to 10%	Water Conservation: <u>Voluntary</u> conservation measures to reduce water usage by up to 20%. Follow recommended response actions in most recently adopted WEAP (Appendix F).
2	Up to 20%	Water Shortage Warning: <u>Mandatory</u> conservation measures to reduce water usage by up to 20%. Follow recommended response actions in most recently adopted WEAP (Appendix F).
3	Up to 30%	Water Shortage Eminent: <u>Mandatory</u> conservation measures to reduce water usage by up to 30%. Follow recommended response actions in most recently adopted WEAP (Appendix F).
4	Up to 40%	Severe Water Shortage: <u>Mandatory</u> conservation measures to reduce water usage by up to 40%. Follow recommended response actions in most recently adopted WEAP (Appendix F).
5	Up to 50%	Critical Water Shortage: <u>Mandatory</u> conservation measures to reduce water usage by up to 50%. Follow recommended response actions in most recently adopted WEAP. (Appendix F).
6	>50%	Catastrophic Water System Emergency: Limited to no water can be supplied due to infrastructure damage or failure. Follow recommended response actions in most recently adopted Emergency Response Plan.

¹ One stage in the Water Shortage Contingency Plan must address a water shortage of 50%.

8.4. Shortage Response Actions

This WSCP identifies various actions to be considered by the Casitas Board of Directors during the various water shortage stages, including public information, water conservation assistance, supply augmentation, water use regulations, issuance of new water meters, and demand tracking. In the event of a water shortage emergency, Casitas evaluates the cause of the emergency to help inform which response actions should be implemented. Depending on the nature of the water shortage, the Casitas can elect to implement one or several response actions to mitigate the shortage and reduce gaps

between supply and demand. Casitas acknowledges the importance of flexibility when responding to emergency conditions, and may adopt additional actions not listed here if necessary.

8.4.1. Demand Reduction

At all times, including normal and shortage conditions, Casitas implements a comprehensive water conservation program (Section 9). Public information, workshops, rebates, and tiered rates are ongoing during normal supply conditions and adjusted to meet target demand reductions during water shortage conditions.

8.4.1.1. *Stage 1-5 Demand Reduction Actions*

During drought conditions, the WEAP is a cornerstone policy for Casitas' demand management. The WEAP describes the water demand reduction strategies and measures to address water shortage conditions, promote water conservation and the efficient use of water, and the application of a penalty to customers who waste water. The WEAP was originally developed in response to the 1987-1991 drought period, and is updated and modified as needed. The collective work in 1992 set the starting point for a system of water allocation assignments and demand response criteria based on the level of water storage in Lake Casitas.

Under the WEAP, each customer is assigned an individual allocation based on reasonable use for their water use classification and property characteristics. The allocation is comprised of both essential and non-essential uses. As Lake Casitas levels decline, the non-essential portion of the allocations are reduced according to mandatory water use reductions associated with each declared water shortage stage. Casitas' customer billing system contains a database to compare actual water use against allocations on a monthly and annual basis, and the District may issue penalties for any excess water used over the allocated amount. In addition to water allocations, the District may consider additional specific water use prohibitions to augment its ongoing Water Waste Prevention Ordinance (Section 9.2.1). Implementation of the WEAP during the most recent drought has resulted in consistent overall demand reduction of approximately 50 percent (Figure 8-2).

The demand reduction actions for Stages 1-5, which pertain to declining lake levels during extended drought conditions, are summarized in the currently adopted WEAP (Appendix F, Table 6).

8.4.1.2. *Stage 6 Demand Reduction Actions*

Stage 6 reflects a catastrophic event in which limited to no water supply is available due to damaged or failed infrastructure; in which case, the District's Emergency Response Plan (ERP) is followed. The ERP includes emergency communication procedures for notifying the public about emergency water use restrictions, potential need to boil tap water before drinking, and locations where drinking water is available in the event of distribution system failure.

8.4.1.3. *Summary Table*

Table 8-2 is based on table formats required by DWR. Because the standard "drop down" lists did not include all of measures considered by Casitas, the table refers to the appropriate policy document to find more information on demand reduction actions. Table 8-2 applies to both Casitas and Ojai water systems.

Submittal Table 8-2: Demand Reduction Actions				
Shortage Level	Demand Reduction Actions	How much is this going to reduce the shortage gap?	Additional Explanation or Reference	Penalty, Charge, or Other Enforcement?
1	Other	20% Voluntary	Demand Reduction Actions are outlined in the Water Efficiency Allocation Program (Appendix F)	No
2	Other	20% Mandatory	Demand Reduction Actions are outlined in the Water Efficiency Allocation Program (Appendix F)	Yes
3	Other	30% Mandatory	Demand Reduction Actions are outlined in the Water Efficiency Allocation Program (Appendix F)	Yes
4	Other	40% Mandatory	Demand Reduction Actions are outlined in the Water Efficiency Allocation Program (Appendix F)	Yes
5	Other	50% Mandatory	Demand Reduction Actions are outlined in the Water Efficiency Allocation Program (Appendix F)	Yes
6	Other	>50% Mandatory	Catastrophic Emergency in which limited to no water is available. Response actions are outlined in Casitas' Emergency Response Plan.	Yes

8.4.2. Supply Augmentation

Historically, Casitas' water portfolio has been comprised only of local water sources, with as much as 99 percent coming from Lake Casitas, and the remaining supplies coming from a local groundwater well. In June 2017, Casitas acquired the Ojai Water System from the Golden State Water Company. The Ojai Water System is primarily fed by local groundwater wells, which are augmented by supply from Lake Casitas as needed.

While Casitas' water has historically come from local supplies, Casitas has contracted for up to 5,000 AFY of imported water from the State Water Project. Imported water has not been supplied to Casitas due to lack of local conveyance infrastructure to deliver the water. However, Casitas is planning regional interconnection projects (e.g. Ventura-Santa Barbara Counties Interconnection) to allow for delivery of supplemental water to mitigate drought and emergencies. The planned regional interconnection projects are described in UWMP Section 6.2.8. Table 8-3 summarizes Supply Augmentation and applies to both Casitas and Ojai water systems.

Submittal Table 8-3: Supply Augmentation and Other Actions			
Shortage Level	Supply Augmentation Methods and Other Actions by Water Supplier <i>Drop down list</i> <i>These are the only categories that will be accepted by the WUEdata online submittal tool</i>	How much is this going to reduce the shortage gap? <i>Include units used (volume type or percentage)</i>	Additional Explanation or Reference <i>(optional)</i>
1 through 6	Other Actions (describe)	2,000 AFY on average	Casitas is currently planning regional interconnection projects that would allow supply augmentation. These projects are further described in UWMP Section 6.2.8.

8.4.3. Operational Changes

To ensure a coordinated and consistent response across the entire organization, a Water Shortage Response Team is formed as soon as a potential shortage is identified and remains in operation until the water shortage declaration is lifted. The Water Shortage Response Team includes:

- General Manager
- Assistant General Manager
- Public Outreach and Conservation Manager
- Operations and Maintenance Manager
- Chief Financial Officer/Administrative Manager
- Engineering Manager
- Parks Services Manager
- Safety Officer
- Legal Counsel

The Water Shortage Response team may consider operational changes such as:

- Display messaging highlighting water-saving actions in key Casitas facilities, including public and communal areas such as restrooms, kitchens, and break rooms
- Limit vehicle washing
- Evaluate frequency of items laundered by laundering contractor
- Equip field staff with public information material about the drought and water use regulations, and educate staff on how to report water waste to enforcement staff
- Reduced reservoir cleaning
- Reuse plant processing water at water treatment plant
- Evaluate suspending capital improvement projects that are water intensive;
- Evaluate no-discharge flushing technologies.

8.4.4. Additional Mandatory Restrictions

This section is not applicable since mandatory water use restrictions during a declared water shortage condition are addressed in Section 8.1.1 Demand Reduction and further described in the most recently adopted WEAP (Appendix F).

8.4.5. Emergency Response Plan

Casitas has an adopted Emergency Response Plan and Casitas Dam Emergency Action Plan. In accordance with the American Water Infrastructure Act (AWIA), Casitas completed the AWIA Risk and Resilience Assessment at the end of 2020 and is on track to complete an updated Emergency Response Plan in 2021. Areas of improvement discovered during the assessment are being incorporated into the updated plan. The framework of the 2021 Emergency Response Plan is based on the AWIA Community Water Systems Emergency Response Plan and incorporates facets of the Incident Command Systems and National Incident Management Systems.

The Casitas Dam is owned by the USBR, which requires a specific Emergency Action Plan for the facility based on federal protocols and formats. USBR reviews the Casitas Dam Emergency Action Plan on annual basis with Casitas operations and engineering staff.

8.4.6. Seismic Risk Assessment and Mitigation Plan

As part of the 2015 Ventura County Multi-Hazard Mitigation Plan, Casitas evaluated seismic risk to water facilities and identified mitigation measures to reduce the risk. This plan, available at: www.vcfloodinfo.com/resources/ventura-county-hazards-mitigation-plan, meets the requirements of the federal Disaster Mitigation Act of 2000 (Public Law 106-390) as well as the requirements of Water Code Section 10644.

8.4.7. Shortage Response Action Effectiveness

Monthly monitoring of water use is part of regular procedures, during normal and water shortage conditions. Water is produced and distributed in response to customer demand and is tracked monthly as an indicator of overall demand. For demand analysis by customer class, geographic area, and usage level, Casitas' billing system provides standardized reports on monthly metered sales by bill code, as well as customized reports for specific areas of analysis.

During water shortage conditions, savings are measured in comparison to what is considered to be a normal-year demand (i.e., current customer base with approximately average rainfall) or in reference to a specific base year as may be dictated by statewide requirements.

8.5. Communication Protocols

A summary of public outreach and communication actions Casitas could potentially take during a specific shortage stage is outlined herein, although this serves as a guide rather than required actions.

8.5.1. Stage 1

To maximize the level of voluntary customer conservation the Stage 1 declaration is coupled with an enhanced public outreach campaign. Public outreach efforts focus on educating Casitas customers and the general public about current supply and demand conditions, encouraging customers to understand and commit to further reducing their water use, and providing tools and resources to customers to successfully reduce use. Information is provided on the plans for water shortage response and the importance of stretching local supplies.

Outreach activities may include:

- Press Release following Board Stage 1 Declaration
- Media interviews and inquiries
- District Newsletter – Water Supply Story, General Manager’s Message, and Water Conservation Tips
- District website – Updates to the home page, conservation, and water supply sections to provide conservation tools and tips for customers
- Ongoing social media posts with water conservation messages
- Ongoing conservation related billing statement messages
- Coordination with regional and statewide partners on messaging and outreach
- Outreach at community events (e.g., school fairs and programs, workshop with landscaping professionals, etc.)
- Outreach to hotels and restaurants to improve opportunities for customers to request daily washing of linens and water for the table, respectively
- Casitas employee outreach and education to promote consistent organizational messages related to water supply and conservation.

8.5.2. [Stage 2](#)

Public outreach efforts associated with Stage 2 focus on further educating and informing Casitas customers and the general public about current supply and demand conditions; notifying customers of new demand reduction targets and allocations, prohibited activities, and associated penalties for violations; and directing customers to tools and resources that will help them conserve water.

Outreach activities may include:

- Press Release following Board declaration of a Stage 2 Declaration
- Consider increased paid advertising — print, online, radio, TV, streaming, social media, movie theaters, buses, etc.
- Targeted outreach to customers with large landscapes regarding irrigation restrictions (i.e., schools, parks, property managers, agricultural customers, etc.)
- Postcard or letter to all District customers notifying of allocations, demand reduction programs and requirements, and penalties.
- Publish information on how to preserve most valuable landscaping (trees, edible plants, etc.), including appropriate watering systems and use of gray water
- Enlist support of business groups, such as the Chamber of Commerce, to help encourage conservation among commercial customers
- Educate customers on how to perform regular household meter reading and leak detection
- Publish “conservation stories” featuring individuals and businesses demonstrating leadership in water conservation
- Signage at Casitas public facilities to reduce water usage
- Signage or flyers posted in public places such as libraries and neighborhood centers
- Continued implementation of all other public outreach actions of Stage 1 (newsletters, website updates, social media posts, media interviews, billing statement messages, etc.).

8.5.3. [Stage 3](#)

Public outreach efforts associated with Stage 3 focus on large reductions in outdoor water use; notifying customers of heightened demand reduction targets and changes to allocations and penalties (if applicable); and directing customers to tools and resources to help them conserve water.

Outreach activities may include:

- Press Release following Board Stage 3 declaration
- Consider hiring a third party to assist with the launch of a major public outreach and education campaign
- Postcard/mailed to all customers regarding changes in allocations and penalties (if applicable)
- Expand and intensify all other public outreach actions of Stages 1 and 2 (newsletters, website updates, social media posts, media interviews, billing statement messages, etc.).

8.5.4. [Stage 4](#)

Public outreach efforts associated with Stage 4 focus on large reductions in outdoor water use, educating customers on the severity of the water supply situation, and notifying customers of heightened demand reduction targets and changes to allocations and penalties (if applicable).

Outreach activities may include:

- Press Release following Board Stage 4 declaration
- Implement major public outreach and education campaign
- Postcard/mailed to all customers regarding changes in allocations and penalties (if applicable)
- Provide regular media briefings and updates on supply situation
- Expand and intensify all other public outreach actions of Stages 1-3 (newsletters, website updates, social media posts, media interviews, billing statement messages, etc.).

8.5.5. [Stage 5](#)

Public outreach efforts associated with Stages 5 build on prior efforts and may incorporate elements of the communication plan included in the District's ERP.

Outreach activities may include:

- Press release following Board Stage 5 Declaration
- Press event at the District Headquarters
- Postcard/mailed to all customers regarding changes in allocations and penalties (if applicable)
- Continue to implement major public education campaign launched during Stage 3-4
- Contact large and critical customers notifying them of the water supply situation (hospital, medical clinics, agricultural customers, and others).

8.5.6. [Stage 6](#)

Public outreach efforts associated with Stages 6 should follow the crisis communication plan in the District's Emergency Response Plan.

Outreach activities may include:

- Press release following Board declaration of a catastrophic emergency

- Press events at the District Headquarters or other location
- Implementation of the District ERP, which includes communication procedures that would be used for notifying the public about emergency water use restrictions, potential need to boil tap water before drinking, locations where drinking water is available in the event of distribution system failure.

8.6. Compliance and Enforcement

At all times, during normal and shortage conditions, Casitas enforces a Water Waste Prohibition Ordinance (Section 9.2.1), which is part of normal Water Conservation Program activities. Customers found to be in violation are issued a written warning, and may be subject to a fine as authorized by the Ordinance 15-02 (Appendix G). During a declared water shortage condition, additional water use restrictions may be adopted, and Casitas may expand its enforcement of water waste prohibitions, including hiring additional staff as necessary.

In accordance with the WEAP, the Casitas Board of the Directors annually considers penalties applied to customers who use water in excess of their assigned water allocations. In the most recent drought, the Board adopted a penalty of \$5 per unit for any usage over the assigned allocation. District customers may appeal any decision made or fine imposed by filing a written appeal with the District.

8.7. Legal Authorities

Casitas has the legal authority to implement and enforce its WSCP. Relevant sections of the California Water Code (Water Code) include:

- **Water Code Section 100** provides that water must be put to beneficial use, the waste or unreasonable use or unreasonable method of use of water shall be prevented, and the conservation of water is to be exercised with a view to the reasonable and beneficial use thereof in the interest of the people and public welfare.
- **Water Code Sections 350-359** provide that the governing body of a distributor of a public water supply shall declare a water shortage emergency condition to prevail within the service area whenever it finds and determines that the ordinary demands cannot be satisfied without depleting water supplies to the extent that there would be insufficient water for human consumption, sanitation, and fire protection. When deemed as a water shortage emergency in accordance with Water Code 350, Casitas shall follow the procedures provided by the Water Code in the implementation of the water shortage declaration and actions.
- **Water Code Section 71640** provides Casitas the authority to restrict the use of District water during any emergency caused by drought, or other threatened or existing water shortage, and the District may prohibit the wastage of District water or the use of District water during such periods for any purpose other than household uses or such other restricted uses as Casitas determines to be necessary. Casitas may also prohibit use of District water during such periods for specific uses which it finds to be nonessential.

Pursuant to these authorities, Casitas adopted Ordinance 15-02 (Appendix G), which prohibits the waste of water and imposes water conservation requirements on customers. In addition, Casitas developed policies within its WEAP and ERP for responding to water shortage conditions and emergencies. Casitas shall declare an emergency upon its determination that such condition exists. Emergencies may exist

due to long-term diminishment of the Lake Casitas water supply; or a catastrophic interruption due to earthquake, extended regional power outage, or landslides; or other major events that impact Casitas' water supply or infrastructure. Upon declaration of an emergency, Casitas shall coordinate with any City and County within which it provides water supply service for possible proclamation of an emergency. Casitas provides water service within Ventura County, the City of Ojai, and the City of Ventura.

The State of California, through its authority under the Water Code and Government Code, may declare a water shortage emergency and require curtailment of water use above and beyond the policies outlined in the Casitas WEAP. Customers of Casitas must respond and comply with the orders of the State in a timely manner. A failure to comply may cause the State to impose fines and penalties that will be redistributed to the customers of Casitas in a manner determined by the Casitas Board of Directors.

8.8. Financial Consequences of WSCP

In the event of additional water shortage measures being implemented, revenue from water sales (volumetric charges) is expected to decline as customers comply with the declared shortage. At the same time, the majority of operating costs are fixed in nature and do not increase or decrease as water use increases or decreases.

Operating costs such as water quality testing, routine maintenance and repairs, meter reading, and customer billing continue to rise every year. Additionally, as infrastructure ages, the pipelines and facilities needed to deliver water safely and reliably require regular preventative maintenance and upgrades to avoid emergency repairs, the costs of which also rise over time.

Penalties for excess water use beyond a customer's allocation are implemented to encourage conservation. The revenue incurred from these penalties can be used to cover the shortfall created by reduced water usage; in fiscal year 2019-20 the penalties only made up 5 percent of operating revenue and does not offset the overall decline in revenue from increased conservation.

As additional water shortage measures are implemented, staff costs including enforcement of conservation measures, monitoring and evaluation of water usage, drought planning, and dealing with customer questions and complaints are expected to increase.

Lower revenue resulting from decreased water use, combined with increasing operating costs, ultimately leads to a substantial shortfall. In an effort to mitigate the shortfall of reduced revenues Casitas implements a two-rate component bill among customers. The two-rate components include: (1) fixed charge based on the size of the water meter serving a property and (2) volumetric charge based on the amount of water served to a property. The percentage of revenue from fixed and volumetric charges is shown in Table 8-4 for the period from 2016 to 2020.

Table 8-4 Percentage of Fixed and Volumetric Revenue					
	2016	2017	2018	2019	2020
Fixed Charges	25%	25%	37%	46%	37%
Volumetric Charges	75%	75%	63%	54%	63%
NOTES: This is <u>not</u> a DWR-required table.					

Other actions include the utilization of reserve funds to offset the impact of reduced revenue. However, the reserves will eventually need to be restored. Capital infrastructure projects may also have to be delayed. Possible rate increases may be needed in order to mitigate the financial impact of demand and supply management actions during water shortages.

8.9. Monitoring and Reporting

Casitas performs water use monitoring procedures throughout its service area through the Supervisory Control and Data Acquisition (SCADA) system at the Casitas Dam source, all pump plants, and reservoirs. In addition, all service connections to the Casitas distribution system are metered and monitored on a month or bi-monthly basis. Casitas can detect irregularly high water use within a pressure zone, and inquire and identify the location of the irregular water use. Significant customer increases in water use are investigated by Casitas staff. In general the monitoring of water use is performed during each stage as follows, but may be intensified if conditions warrant:

- Stages 1 through 4: Water supply conditions, production data and reservoir elevations are recorded daily. Daily and monthly totals are supplied through the Engineering Department and incorporated into the Water Supply Report. Monthly reports include usage and total allocations for each customer category. A list of individual customers whose usage exceeds their allocation is submitted to the Water Conservation Supervisor for monitoring and outreach to assist the customer in attaining the water use reduction goals.
- Stages 5 and 6: Water use monitoring will occur as in Stages 1 through 4 and water production data from the MWWTP is reported to the General Manager on a daily basis.

8.10. WSCP Refinement Procedures

Casitas will convene the following departmental staff as needed to refine the WSCP:

- General Manager
- Assistant General Manager
- Engineering Manager
- Chief Financial Officer
- Public Outreach and Conservation Manager
- Operations and Maintenance Manager

The WSCP is updated and refined as appropriate following significant changes to Casitas' supply portfolio, and no less than every five years consistent with Urban Water Management Plan Updates. Any updates to the WSCP are adopted by the Casitas Board of Directors.

8.11. Special Water Feature Distinction

The Water Code requires an urban water supplier to analyze water features that are not pools or spas separately from pools and spas. Non-pool or non-spa water features may use or be able to use recycled water, whereas pools and spas must use potable water for health and safety considerations.

Casitas does not provide services to treat and distribute recycled water sourced by the wastewater system. Therefore, all water use restrictions imposed by Casitas pertain to potable water end use. Casitas Ordinance 15-02 prohibits the operation of any ornamental fountains and decorative water features unless water for such use is re-circulated. Under the current WEAP, the filling of swimming

pools, ornamental fountains, and decorative water features may be prohibited during heightened water shortage levels (Stage 4 or higher).

8.12. Plan Adoption, Submittal, and Availability

The public hearing for the Water Shortage Contingency Plan was noticed in two local newspapers (the Ventura County Star and Ojai Valley News), as prescribed in Government Code 6066, which included the time and place of the hearing (hearing held through electronic meeting platform on June 23, 2021). Interested parties, including other local agencies, were notified of the public hearing. The 2020 WSCP was made available from the Casitas website for public inspection prior to the public hearing, so comments could be received and discussed by the Board of Directors ahead of adoption.

The final draft of the WSCP was adopted by the Board of Directors by Resolution No. 2021-14 (provided in Appendix H) and was submitted to the Department of Water Resources (DWR) within thirty days of approval. Additionally, the adopted plan will be made available per the requirements of the Water Code.

Starting in 2020, urban water suppliers are required to report and submit information related to the Water Shortage Contingency Plan in standardized tables developed by DWR. The standardized tables for the 2020 UWMP are provided as Appendix I of this document.

This page intentionally left blank.

9. Demand Management Measures

The following sections describe the demand management measures Casitas uses for the wholesale and retail systems it operates.

9.1. Demand Management Measures for Wholesale Suppliers

Demand management measures for Casitas' wholesale system are described in the following subsections.

9.1.1. [Metering](#)

Casitas' wholesale customers are fully metered and are under a reactive meter replacement program. The oldest and largest meters are typically replaced first and on an as-needed basis. Replacement triggers are typically due to accuracy meter reading issues. Current Rockwell meters are dated and parts are very difficult to locate to warrant a repair-based program. Newer and more accurate Omni meters are installed.

Annual budget allocations are included for the reactive replacement program, with an anticipated five-year timeline for all wholesale meters to be replaced.

9.1.2. [Public Education and Outreach](#)

Customers of Casitas' wholesale accounts are included in all outreach and education opportunities, and additionally are eligible to apply for all rebate programs, provided they meet the requirements. These programs are described in more detail in Section 9.2.4.

9.1.3. [Water Conservation Program Coordination and Staffing Support](#)

Casitas full-time Water Conservation staff includes a Manager, a full-time specialist, an analyst, and a technician. These positions perform multiple water conservation-related tasks including: landscape, residential, and commercial surveys; administering the allocation program and rebate programs; preparing public information programs; and hosting special events and education programs. Casitas also uses consulting firms, as needed, to assist with the implementation of all of the Water Conservation Best Practices, including public outreach and education.

9.1.4. [Other Demand Management Measures](#)

Wholesale customers pay a fixed and volumetric water rate. The volumetric-based rate structure aids in demand management. Additionally, wholesale customers have allocations assigned to assist in demand management.

9.1.5. [Asset Management](#)

The District's GIS program started in earnest in 2018 with the addition of a GIS Technician in the Engineering Department. All District assets (facilities and infrastructure) are in the GIS portal. Casitas is implementing various applications to use GIS for asset management including Leaks and Repairs, Fire Hydrant Maintenance, and Valve Maintenance. As the GIS program matures, Casitas will make use of the data to manage ongoing asset management.

Casitas is preparing to develop a Casitas System Master Plan which will identify a ten-year capital improvement program for facilities in the Casitas system.

9.1.6. Wholesale Supplier Assistance Programs

Casitas does not currently have a Wholesale Supplier Assistance Program; however the District's rebate programs are available to all customers within the Casitas service area, including wholesale agency customers. Section 9.2.4 describes rebates and free-water saving devices available.

From August 2017 to October 2019, Casitas participated in a grant-funded regional turf replacement program with other local agencies including the City of Santa Paula and City of Ventura. Casitas had 23 customers apply and successfully complete the program resulting in 34,678 square feet of turf grass removed.

9.2. Demand Management Measures for Retail Suppliers

Demand management measures for Casitas' retail customers are described in the following subsections.

9.2.1. Water Waste Prevention Ordinances

Ordinance No. 15-02 Establishing Water Waste Prohibitions is provided in Appendix G.

The District's website has a link for anonymous reporting of water waste. Notice of Water Waste door hangers are hung at customer's residences when water waste is reported. Information displayed on the door hangers includes the location, date, time, and type of water waste observed. Types of water waste prohibited and increasing violation warnings and penalties are displayed, as well as contact information to allow the customer to ask any questions or schedule a free water use survey to assist them in identifying solutions to prevent water waste and use water more efficiently.

9.2.2. Metering

All Casitas' retail customers are fully metered. Small and large retail meters in the Casitas System are replaced as needed over time through a reactive replacement program. Ojai Water System retail meters were entirely replaced upon system integration from Golden State Water Company in October 2017 with iPerl meters.

Automatic Meter Reading (AMR) is used as a drive-by method once per month. If a meter read results in an unusual recording compared with historical use data, it is flagged to be verified and checked. The customer is notified of any unusual water use.

9.2.3. Conservation Pricing

Casitas has implemented conservation pricing for decades. Currently, there is a three-tier residential rate structure supporting water conservation incentive. Casitas' current rates are included as Appendix J.

9.2.4. Public Education and Outreach

The District's public education and outreach program is managed by the Water Conservation Manager and includes marketing of rebates and giveaways.

The Water Survey Program is a free service to provide indoor and outdoor water-saving assistance, ultimately lowering customer's water bill. Casitas offers on-site surveys for indoor and outdoor water use of single-family and multi-family residential customers as well as for commercial customers in the service area. The indoor survey includes a test of showerhead and faucet flow rates, an estimate of toilet flush volumes, a review of all water-using appliances and a test for toilet leaks. The outdoor survey

includes a review of the irrigation system, irrigation design, and watering schedules. The survey also includes reading the meter to reveal possible leaks in the customer's system.

Casitas provides the following water conservation devices free of charge to all customers in the service area: earth showerhead, kitchen aerator with swivel, 1.5 gallons-per minute bathroom faucet aerator, toilet flapper, dye tablets, and shower shut-off valves.

Casitas participates in Smart Rebates, a statewide program administered by the California Water Efficiency Partnership that offers a list of measures for conservation products and appliance rebates available for eligible customers. The Smart Rebates Program is made possible with funding assistance from participating water utilities.

Smart Irrigation Controller Rebates are available to all eligible Casitas customers. The goal of the smart irrigation controller rebate program is to increase irrigation efficiency and promote healthy and attractive landscaping within Casitas' district boundaries. It saves water and lowers customer's bills.

Casitas offers a free hobby farm survey and rebate program for those customers with one to two acres of planted agriculture.

The goal of the Agricultural Rebate Program is to encourage water use efficiency for farms within Casitas boundaries. District customers who enlist in an irrigation evaluation through the Ventura County Resource Conservation District (VCRC) and who implement water use efficiency recommendations provided by the VCRC are eligible to qualify for a rebate from Casitas.

Customer water bills include a monthly usage bar chart; usage for the current year and previous year comparison; allocation section that includes the current monthly allocation, current month usage, usage under allocation, and next month's allocation; and a special message section that allows for a variety of communication topics, including conservation tips.

Event booths are provided to share water conservation information, water conservation devices, District information, and Casitas Lake levels to the public. These type of booths are available at the annual Ojai Day event and Ventura County Fair.

Tours of Casitas' facilities are scheduled periodically for District customers and interested participants to learn more about the District water facilities, supplies and important issues.

Regular Board Meetings are held twice a month and are open to the public.

A semi-annual newsletter provides project updates, conservation tips, Lake Casitas water level updates, drought updates, and current events that may have an impact on water services.

Casitas' website www.casitaswater.org is the most comprehensive source of information for Casitas' customers. Other informative websites linked on Casitas' website are:

- <http://www.gardensoft.com> partners with water districts and municipalities to educate homeowners about water conservation in the landscape.
- www.venturacountygardening.com Water Wise Gardening in Ventura County – This website resource offers customers a personalized plant database that they can develop for their specific landscape needs.

Casitas utilizes social media such as Facebook and Twitter as an additional way to communicate District news, updates and projects.

Casitas coordinates with local and county newspapers to release advertisements for water conservation, current projects, District updates, and legal notices.

9.2.5. Programs to Assess and Manage Distribution System Real Loss

System losses are described in Section 4.2.4. Leaks and breaks are repaired as soon as Casitas staff is made aware of them. The OWS has experienced a significant number of leaks and breaks, at three times the rate of the Casitas system. The Ojai Water System Improvements (OWSI) projects include pipeline replacements of aged and under-sized cast iron pipes. The District's website includes regular project updates for the community at <https://www.casitaswater.org/for-customers/your-district-at-work>.

9.3. Implementation Over the Past Five Years

Casitas' program implementation over the past five years is discussed in the following subsections.

9.3.1. Water Survey Programs

Casitas began its water survey programs for single-family and multi-family residential customers for direct retail customers and for wholesale agency customers in February 2010.

Casitas' direct survey program includes evaluating all indoor and outdoor water use. A meter check is provided to check for leaks, landscape is thoroughly inspected for irrigation efficiency and plant type. Low-flow showerheads, kitchen aerators, and bathroom aerators are provided, if needed. All toilets and faucets are inspected for leaks. The customer is provided with a report including recommendations and suggestions of how to improve their water efficiency for both indoor and outdoor use. The end of each report includes all current rebate opportunities, a list of free aerators available, and links to the water conservation page on Casitas' website.

9.3.2. Water Conservation Devices

Casitas provides free low-flow showerheads, faucet aerators, toilet flappers, leak detection kits, and automatic hose shut-off nozzles to all residents within the district boundaries. Casitas advertises these devices in the semi-annual newsletter, the Casitas website, and bill messages.

Casitas tracks the distribution of these water saving devices by keeping a log indicating:

- Type of device provided
- Which event (if any) the aerators are being distributed
- Class of service (Single-family, Multi-family, Commercial, etc)
- Which water agency they belong to within the District boundary

9.3.3. Smart Rebates: High-Efficiency Washing Machine and Toilet Rebate Program

Casitas began its washing machine rebate program in 2007. Casitas joined the Smart Rebate program which is run by the California Water Efficiency Partnership (CalWEP) and also includes high efficiency toilets. Casitas provides advertising and leaves the processing of rebates to CalWEP. Table 9-1 shows the number of washing machine rebates provided from 2016 to 2020.

Table 9-1 Washing Machine Rebates Completed					
	2016	2017	2018	2019	2020
\$ Per Rebate	\$150 Residential \$400 Commercial	\$150 Residential \$400 Commercial	\$150 Residential \$400 Commercial	\$150 Residential \$400 Commercial	\$150 Residential \$400 Commercial
# of Rebates completed	31	44	97	50	48
NOTES: This is <u>not</u> a DWR-required table.					

Table 9-2 shows the number of toilet rebates completed from 2016 to 2020.

Table 9-2 Toilet Rebates Completed					
	2016	2017	2018	2019	2020
\$ Per Rebate	\$100 Residential \$200 Commercial	\$100 Residential \$200 Commercial	\$100 Residential \$200 Commercial	\$100 Residential \$200 Commercial	\$100 Residential \$200 Commercial
# of Rebates completed	24	36	53	28	23
NOTES: This is <u>not</u> a DWR-required table.					

9.3.4. [Smart Irrigation Controller Rebates](#)

Casitas offers a rebate of up to \$250 per customer for the purchase of a smart irrigation controller from a preapproved list of manufacturer models. Smart irrigation controllers automatically adjust irrigation schedules based on actual site and real-time weather conditions. They stop irrigating when it rains and apply the most efficient amount during dry weather, including automatic cycle and soak to reduce runoff on slopes. Once a customer applies and qualifies for a smart irrigation controller rebate, a site visit by a Casitas staff member is required to ensure the device is actually installed. Table 9-3 summarizes the smart irrigation controller rebates completed from 2016 to 2020.

Table 9-3 Smart Irrigation Controller Rebates Completed					
	2016	2017	2018	2019	2020
\$ Per Rebate	Up to \$250	Up to \$250	Up to \$250	Up to \$250	Up to \$250
# of Rebates completed	7	7	7	7	6
NOTES: This is <u>not</u> a DWR-required table.					

9.3.5. [Hobby Farm Survey and Rebate Program](#)

The Hobby Farm Rebate Program encourages greater water use efficiency for small “hobby” farms under two-acres, maintained without the expectation of a primary income source. In partnership with the VCRCD, an irrigation evaluation is performed to identify water conservation opportunities from which the applicant can choose to implement. The applicant may be eligible to implement some or all of the recommendations with a rebate not to exceed 50 percent of the total receipt amount or \$400.

9.3.6. [Agricultural Rebate Program](#)

Like the Hobby Farm Survey and Rebate Program, the Agriculture Rebate Program is a partnership with the VCRCD. Customers with an Agriculture classification who wish to participate will coordinate with the

VCRCDD to schedule and complete an irrigation evaluation. Upon completion of the evaluation, the VCRCDD representative provides the customer with a complete report and recommendations. If the customer purchases and installs equipment within 60 days of receiving the recommendations, they are eligible to complete the rebate application with Casitas. Total rebate amount does not exceed 50 percent of the receipt amount or \$650. Rebates are provided on a first-come, first-served basis until all designated funds are expended.

9.3.7. Public Information & Outreach Programs

Casitas’ public information program started in 2003. It currently includes publishing a semi-annual newsletter to provide information on water conservation to all residents in the District. Water bills include information on previous usage, and every statement has a space for custom messaging to the customer. Bill inserts are often included to ensure there is consistent contact with customers on a variety of topics, including conservation. Press releases, op-eds, public notices and general ads are placed in two local print publications regularly. Casitas removed all turf from the main office and replaced it with drought tolerant plants. The office is located on a main thoroughfare within the District providing high visibility for the drought tolerant plantings and therefore sets a significant example for customers.

District staff members attend multiple community meetings throughout the year and discuss water conservation issues as part of their presentations. Casitas staff tables at community events and offers give-a-ways such as free toilet flappers, low flow showerheads, and faucet aerators. The Board of Directors hold two meetings per month that are open to the public. In 2017, Casitas implemented an increased presence on social media platforms, specifically Facebook and Twitter. Lastly, www.casitaswater.org is the primary consortium for all information related to Casitas Municipal Water District and is referred to in all published outreach material. Table 9-4 summarizes the public information and outreach programs implemented from 2016 to 2020.

	2016	2017	2018	2019	2020
Paid Advertising	Yes	Yes	Yes	Yes	Yes
Public Service Announcement	Yes	Yes	Yes	Yes	Yes
Bill inserts, Newsletters, Brochures	Yes	Yes	Yes	Yes	Yes
Bill comparing previous water usage	Yes	Yes	Yes	Yes	Yes
Demonstration Garden	Yes	Yes	Yes	Yes	Yes
Special Events, Media Events	Yes	Yes	Yes	Yes	No*
Coordination with other government entities	Yes	Yes	Yes	Yes	Yes
NOTES: This is <u>not</u> a DWR-required table.					
*Due to COVID-19 public events were cancelled					

9.3.8. Conservation Pricing

Casitas’ water bills are made up of a fixed and volumetric component, and all customers are billed monthly. The volumetric component is billed based on the amount of water used and encourages conservation. Residential and Agriculture Domestic classifications have a three tier volumetric rate

structure consisting of Tier 1 (0 – 10 units¹¹); Tier 2 (11 – 50 units); and Tier 3 (51+ units). Agriculture Domestic is a class for Agriculture customers who have a legal residential dwelling unit on the same property as their crop. They are billed a tiered Residential Rate through the first two tiers (up to 50 units), and are then charged the uniform Agriculture rate for 50+ units. All other customer classifications are billed based on uniform volumetric rate. Table 9-5 summarizes the rate structure for retail customers of the Casitas and Ojai systems, and the water rates are provided in Appendix J.

Table 9-5 Retail Volumetric Rate Structure	
Customer Type	Volumetric Water Rate Structure
Residential	Tiered Conservation Pricing
Commercial	Uniform
Industrial	Uniform
Institutional/Government	Uniform
Agricultural	Uniform
Ag-Domestic	Tiered Conservation & Uniform
Other	Uniform

Table 9-6 summarizes the wholesale volumetric water rate structure.

Table 9-6 Wholesale Volumetric Rate Structure	
Customer Type	Volumetric Water Rate Structure
Wholesale (Resale)	Uniform

9.3.9. [Water Waste Prohibition](#)

Section 22, Regulation Prohibiting Water Waste, is adopted in Casitas’ Rates and Regulations as discussed in Section 9.2.1.

9.4. Water Use Objectives (Future Requirements)

On April 7, 2017, the state of California released the “Making Water Conservation a California Way of Life, Implementing Executive Order B-37-16” Final Framework Report¹² (State Framework Report). The State Framework Report, which builds upon Governor Brown’s call for new long-term water use efficiency requirements in Executive Order (EO) B-37-16, provided the state’s proposed approach for implementing new long-term water conservation requirements. A key element of the report is the proposed new water use targets for urban water suppliers that go beyond existing SB X7-7 requirements.

On May 17, 2018, the California Legislature adopted SB 606 and AB 1668 to implement new long-term water use efficiency requirements. The legislation requires the State Water Resources Control Board, in coordination with DWR, to adopt long-term standards for the efficient use of water. The legislation establishes specified standards for per capita daily indoor residential use. In addition, the SWRCB will adopt standards for outdoor water use, CII water use, and water loss.

¹¹ A billing unit is one hundred cubic feet per month (HCF/month).

¹² California Department of Water Resources, et al. (2017). *Making Water Conservation a California Way of Life, Implementing Executive Order B-37-16*

The legislation requires each urban retail water supplier to calculate and report an urban water use objective, which is an estimate of aggregate efficient water use for the previous year based on the adopted water use efficiency standards. Urban retail water suppliers will be required to calculate and report urban water use objectives by November 1, 2023 and by November every year thereafter, and to compare actual water use to the objective for the prior year by the same date.

The bills grant SWRCB the authority to enforce compliance with the urban water use objectives, with enforcement actions ramping up over the first three years of implementation. The bills also establish a schedule for state agencies to develop the methodology for implementing the requirements, as presented in Figure 9-1.

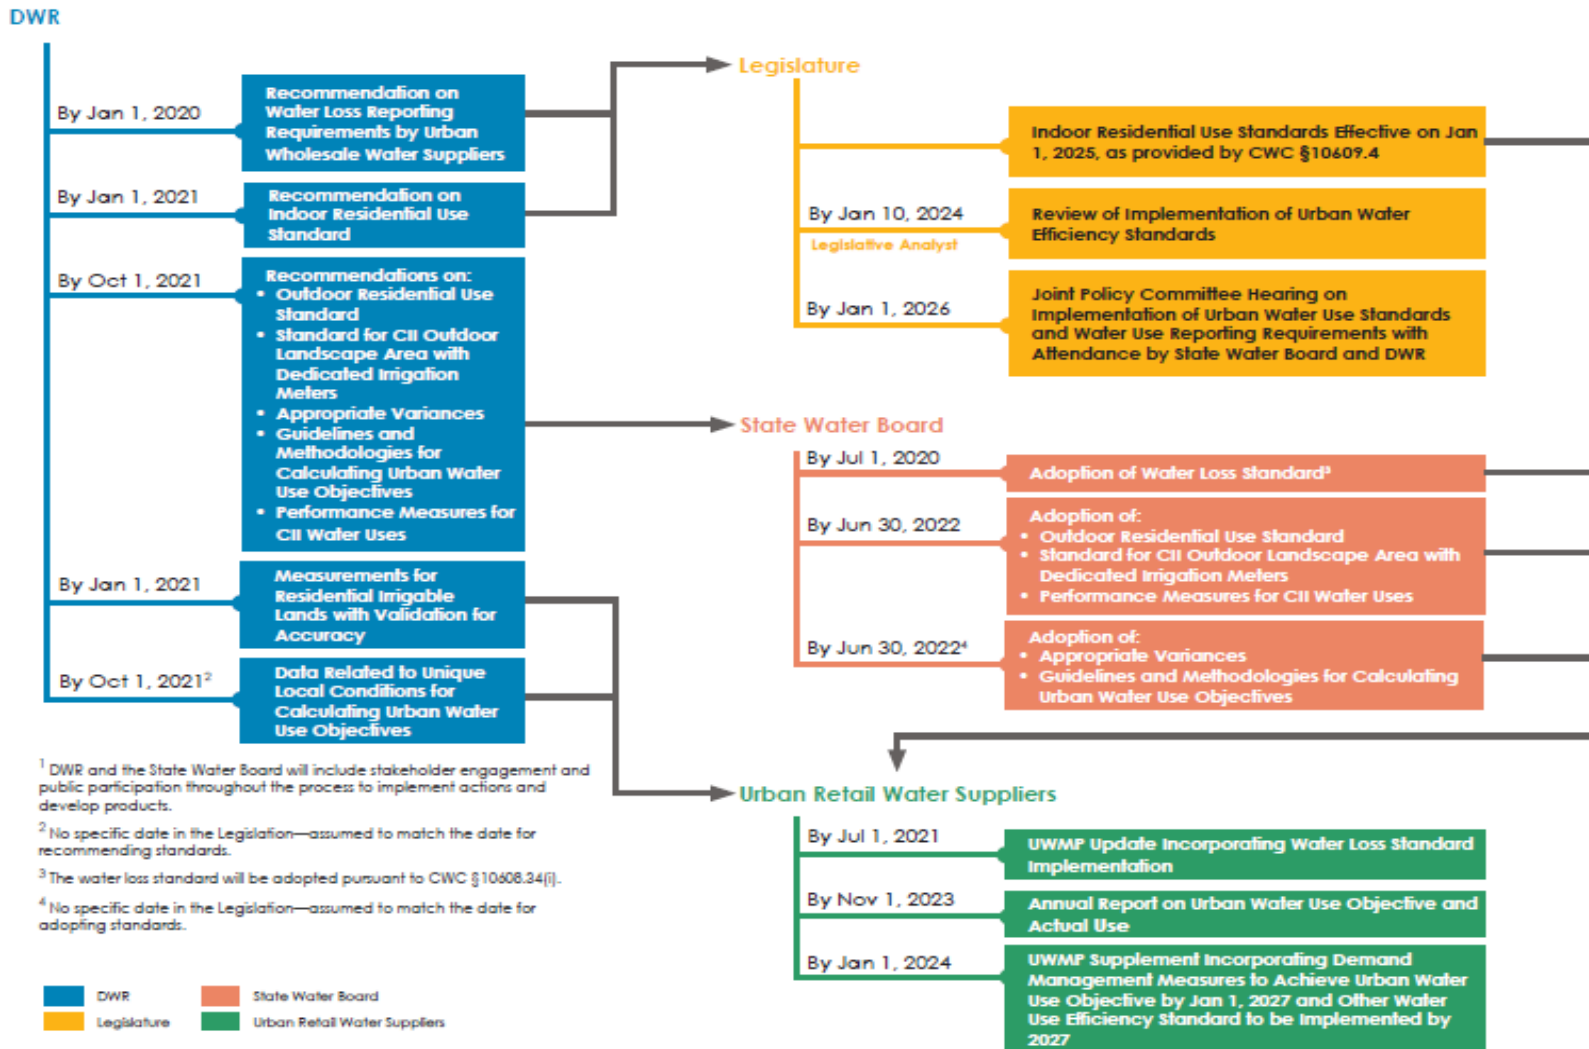

Casitas continues to track the State's development of the new water efficiency standards. Next steps in for Casitas conservation staff include:

- Engage in the State processes of establishing the urban water supplier efficiency standards as part of SB 606 and AB 1668. Casitas will review State documents, submit written comments as needed, and participate in public workshops and stakeholder groups.
- Form partnerships and apply for grants where appropriate.
- Continue to collect and analyze customer participation in conservation measures, costs, and other data to gauge successes and areas that need improvement.

With Casitas' existing WEAP, the District is well positioned to meet the State's future water use objectives. The WEAP provides a similar water use budgeting framework with an essential allocation for indoor water use and a non-essential allocation for outdoor water use (refer to Appendix F for allocation methods). A key work effort for Casitas will be to review the State's data and methodology in comparison with the District's allocation methods. In addition, Casitas will review its planned water use and WEAP policies to ensure they meet or exceed the State's water use objectives.

Figure 9-1. Major Actions Related to Making Conservation a Way of Life Legislation (SB 606 and AB 1668)¹³

Major Actions and Products Required to Implement Water Use Efficiency Standards and Urban Retail Water Supplier's Annual Reporting Requirements¹

¹³ Source: Making Conservation a Way of Life Primer of 2018 Legislation on Water Conservation and Drought Planning SB 606 and AB 1668, prepared by DWR and SWRCB, November 2018.

This page left intentionally blank.

10. Plan Adoption, Submittal, and Implementation

This section describes the public notifications and requirements for the 2020 UWMP adoption, submittal, and implementation.

10.1. Inclusion of all 2020 Data

This UWMP includes all data for calendar year 2020.

10.2. Notice of Public Hearing

This section describes notifications to Cities, Counties, and the public in compliance with the appropriate provisions of the Water Code.

10.2.1. Notice to Cities and Counties

Notice to Cities and Counties are described in the following subsections.

10.2.1.1. *60-Day Notification*

A sample letter sent to Cities and Counties is provided in Appendix B. The letter meets the requirements for 60-day notification.

10.2.1.2. *Notice of Public Hearing*

The Notice of Public Hearings for adoption of the Water Shortage Contingency Plan and the 2020 Urban Water Management Plan were provided for the Casitas Wholesale system, Casitas Retail system, and Ojai Retail system are described in the following subsections.

Casitas Wholesale System. Notifications regarding the Casitas wholesale system were sent to the City of Ventura and the County of Ventura as shown in Table 10-1.

Submittal Table 10-1 Wholesale: Notification to Cities and Counties (select one)		
<input type="checkbox"/>	Supplier has notified more than 10 cities or counties in accordance with Water Code Sections 10621 (b) and 10642. Completion of the table below is not required. Provide a separate list of the cities and counties that were notified	
<input checked="" type="checkbox"/>	Supplier has notified 10 or fewer cities or counties. Complete the table below.	
City Name	60 Day Notice	Notice of Public Hearing
City of Ventura	Yes	Yes
County Name	60 Day Notice	Notice of Public Hearing
Ventura County	Yes	Yes

Casitas Retail System. For the Casitas Retail system, notification was sent to the City of Ojai and County of Ventura as shown in Table 10-1 Casitas Retail.

Submittal Table 10-1 Retail: Notification to Cities and Counties		
City Name	60 Day Notice	Notice of Public Hearing
Ojai	Yes	Yes
County Name	60 Day Notice	Notice of Public Hearing
Ventura County	Yes	Yes

Ojai Water System. For the Ojai Retail system, notification was sent to the City of Ojai and County of Ventura as shown in Table 10-1 Ojai Retail.

Submittal Table 10-1 Retail: Notification to Cities and Counties		
City Name	60 Day Notice	Notice of Public Hearing
Ojai	Yes	Yes
County Name	60 Day Notice	Notice of Public Hearing
Ventura County	Yes	Yes

10.2.2. [Notice to the Public](#)

Notifications regarding the public hearings for adoption of the Water Shortage Contingency Plan and 2020 Urban Water Management plan were published in the Ventura County Star on June 4 and June 11, 2021. A copy of the notification and proof of publication are included in Appendix K.

10.3. [Public Hearing and Adoption](#)

This section describes Casitas compliance with the Public Hearing and Adoption requirements of Water Code Section 10642.

10.3.1. [Public Hearing](#)

The public hearing included discussion of include baseline values, water use targets and compliance, and implementation plan in compliance with SB X7-7. A copy of the presentation provided during the public hearing is provided in Appendix L.

10.3.2. [Adoption](#)

The Board of Directors considered and adopted the WSCP and 2020 UWMP at their meeting of May 26, 2021. A copy of the Resolution is provided in Appendix H.

10.4. [Plan Submittal](#)

Casitas submitted the WSCP and 2020 UWMP in accordance with Water Code Section 10621.

10.4.1. Submitting a UWMP and Water Shortage Contingency Plan to DWR

The 2020 UWMP including the WSCP was submitted to DWR within 30 days of adoption.

10.4.2. Electronic Data Submittal

The 2020 UWMP including the WSCP was submitted to DWR via the web portal

<https://wuedata.water.ca.gov>.

10.4.3. Submitting a UWMP, including WSCP, to the California State Library

The 2020 UWMP including the WSCP was submitted within 30 days of adoption via hardcopy to the California State Library at:

California State Library
Government Publications Section
Attention: Coordinator, Urban Water Management Plans
PO Box 942837
Sacramento CA 94237-0001

10.4.4. Submitting a UWMP to Cities and Counties

The 2020 UWMP including the WSCP was submitted within 30 days of adoption to the City of Ventura, City of Ojai, and County of Ventura electronically via email.

10.5. Public Availability

The adopted 2020 UWMP including WSCP was made available to the public on the District's website <https://www.casitaswater.org/about-us/engineering/engineering-reports-and-master-plans>. The District's main office is closed to the public due to the COVID-19 pandemic. When reopened, hard copies will be available in the District lobby.

10.6. Notification to Public Utilities Commission

This section does not apply to Casitas.

10.7. Amending an Adopted UWMP or Water Shortage Contingency Plan

If circumstances warrant, Casitas will amend the 2020 UWMP or Water Shortage Contingency Plan as necessary and provide such amendment(s) to DWR.

10.7.1. Amending a UWMP

In the event Casitas amends its 2020 UWMP, the steps for notification, public hearing, adoption, and submittal will be followed for the amended plan.

10.7.2. Amending a Water Shortage Contingency Plan

In the event Casitas amends its WSCP, it shall be submitted to DWR no later than 30 days after adoption through the WUE portal.

Subject: 2020 Urban Water Management Plan Update

The Casitas Municipal Water District (Casitas) is currently in the process of updating its Urban Water Management Plan (UWMP). The Urban Water Management Planning Act, Water Code Section 10610 et seq., requires every “urban water supplier” providing water for municipal purposes either directly or indirectly to more than 3,000 customers or supplying more than 3,000 acre-feet of water annually to prepare and adopt an UWMP and periodically update that plan at least every five years. The UWMP is a planning document and a source document which reports, describes and evaluates water deliveries and uses, water supply sources and conservation efforts.

As an urban water supplier, Casitas coordinates with water management agencies, relevant public agencies and other water suppliers on the preparation of the UWMP update. Casitas will be reviewing the UWMP and will make amendments and updates, as appropriate.

If you wish to contact Casitas about its review process, you may do so by contacting Julia Aranda, PE, Engineering Manager, at 805.649.2251 x107 or by email to jaranda@casitaswater.com.

Sincerely,

A handwritten signature in blue ink that reads "M. Flood".

Water Audit Report for: **Casitas Municipal Water District (5610024)**
 Reporting Year: **2016** 1/2016 - 12/2016

Please enter data in the white cells below. Where available, metered values should be used; if metered values are unavailable please estimate a value. Indicate your confidence in the accuracy of the input data by grading each component (n/a or 1-10) using the drop-down list to the left of the input cell. Hover the mouse over the cell to obtain a description of the grades

All volumes to be entered as: ACRE-FEET PER YEAR

To select the correct data grading for each input, determine the highest grade where the utility meets or exceeds all criteria for that grade and all grades below it.

WATER SUPPLIED

----- Enter grading in column 'E' and 'J' ----->

Volume from own sources:	+	?	5	14,186.158	acre-ft/yr
Water imported:	+	?	n/a	0.000	acre-ft/yr
Water exported:	+	?	n/a	0.000	acre-ft/yr

Master Meter and Supply Error Adjustments

Pcnt:	+	?	9	89.640	acre-ft/yr
	+	?	n/a	0.000	acre-ft/yr
	+	?	n/a	0.000	acre-ft/yr

Enter negative % or value for under-registration
 Enter positive % or value for over-registration

WATER SUPPLIED: **14,096.518** acre-ft/yr

AUTHORIZED CONSUMPTION

Billed metered:	+	?	7	12,796.000	acre-ft/yr
Billed unmetered:	+	?	n/a	0.000	acre-ft/yr
Unbilled metered:	+	?	n/a	0.000	acre-ft/yr

Pcnt:	+	?	0.25%	0.000	acre-ft/yr
-------	---	---	-------	-------	------------

Pcnt:	+	?	1.00%	0.000	acre-ft/yr
	+	?	0.25%	0.000	acre-ft/yr

WATER LOSSES (Water Supplied - Authorized Consumption)

1,288.148 acre-ft/yr

Apparent Losses

Unauthorized consumption:	+	?	5	35.241	acre-ft/yr
---------------------------	---	---	---	--------	------------

Default option selected for unauthorized consumption - a grading of 5 is applied but not displayed

Customer metering inaccuracies:	+	?	5	129.253	acre-ft/yr
Systematic data handling errors:	+	?	n/a	31.990	acre-ft/yr

Default option selected for Systematic data handling errors - a grading of 5 is applied but not displayed

Apparent Losses: **196.484** acre-ft/yr

Real Losses (Current Annual Real Losses or CARL)

Real Losses = Water Losses - Apparent Losses: **1,091.664** acre-ft/yr

WATER LOSSES: **1,288.148** acre-ft/yr

NON-REVENUE WATER

NON-REVENUE WATER: **1,300.518** acre-ft/yr

= Water Losses + Unbilled Metered + Unbilled Unmetered

SYSTEM DATA

Length of mains:	+	?	6	97.0	miles
Number of <u>active AND inactive</u> service connections:	+	?	9	3,197	
Service connection density:	?	n/a	n/a	33	conn./mile main

Are customer meters typically located at the curbside or property line? Yes

Average length of customer service line: **0.000** (length of service line, beyond the property boundary, that is the responsibility of the utility)

Average length of customer service line has been set to zero and a data grading score of 10 has been applied

Average operating pressure:	+	?	5	80.0	psi
-----------------------------	---	---	---	------	-----

COST DATA

Total annual cost of operating water system:	+	?	10	\$10,714,070	\$/Year
Customer retail unit cost (applied to Apparent Losses):	+	?	9	\$1.15	\$/100 cubic feet (ccf)
Variable production cost (applied to Real Losses):	+	?	5	\$131.00	\$/acre-ft

Use Customer Retail Unit Cost to value real losses

WATER AUDIT DATA VALIDITY SCORE:

***** YOUR SCORE IS: 62 out of 100 *****

A weighted scale for the components of consumption and water loss is included in the calculation of the Water Audit Data Validity Score

PRIORITY AREAS FOR ATTENTION:

Based on the information provided, audit accuracy can be improved by addressing the following components:

- 1: Volume from own sources
- 2: Customer metering inaccuracies
- 3: Variable production cost (applied to Real Losses)

FY2021-22 Casitas Water Supply and Demand Assessment

MEMORANDUM

TO: Board of Directors
From: Michael L. Flood, General Manager
RE: FY 2021-2022 Casitas Water Supply and Demand Assessment
Date: May 7, 2020

RECOMMENDATION

Adopt recommended drought-related actions and Water Efficiency Allocation Program (WEAP) revisions as contained in Section 5 of this memorandum.

1. BACKGROUND

In accordance with the direction provided in the Water Efficiency and Allocation Program, adopted April 24, 2019, specifically Section 5.2 entitled "*Water Resource Conditions and Actions*," the Board of Directors are to receive an annual assessment of local water supplies, water demands, and current effectiveness of water demand reduction measures. The information in the assessment may necessitate the consideration and direction from the Board of Directors for further actions to preserve water supply for the future.

2. ANNUAL EVENT SUMMARY

The annual event summary is to provide insight to unusual events that have occurred within the boundary of the Casitas Municipal Water District that would not otherwise be directly reported in the content of the assessment. The key events are as follows:

- a) The Casitas Municipal Water District has continued to cope with the demands of the acquisition of the Ojai Water System. The acquisition transferred to Casitas the operations and maintenance of the Ojai Water System including six groundwater wells in the Ojai Groundwater Basin which have an ongoing goal of maximizing the use of groundwater for that system through both maintenance and planning for future improvements.
- b) The Thomas Fire of December 2017 is expected to have a continuing effect on District operations primarily centered on the control of turbidity in Lake Casitas for water quality purposes and negative impacts to the operation of the Robles Fish Passage facility. With little runoff during the Fiscal Year 2021 season, there has been no impact over the last year.
- c) A groundwater adjudication commenced in the Ojai Valley area through an amended cross complaint filed with the California Superior Court on September 21, 2018. This action included not only Casitas but also many public and private water users in the Ojai Valley. This is of special significance to the District due to its operation of seven groundwater wells within the

basins under question in addition to its right to divert water from the Ventura River. There will likely be no impact on water supply for the next twelve months due to this action but may increase resale water demand.

- d) The District embarked on the development of a Comprehensive Water Resources Plan in early 2019 which was released to the public in draft form in June of 2020. The District has received public comment on the draft plan and the Board has been reviewing various aspects of the plan during the first several months of 2021. On April 21, 2021, the Board directed staff to use a planned operational yield of 15,010 Acre-Feet per Year and a planned demand of 14,525 Acre-Feet per Year for the Casitas System.

- e) The District staff are currently preparing the 2020 Urban Water Management Plan (UWMP) in compliance with the California Water Code. The UWMP is a supply and demand assessment and provides an understanding of past, current, and future water conditions and management. Casitas is a wholesale and retail water provider, and the UWMP will be prepared for 1) Casitas Wholesale, 2) Casitas System Retail, and 3) Ojai System Retail. The deadline for submission to the California Department of Water Resources (DWR) is July 1, 2021.

3. ASSESSMENTS

The assessments are to be considered in the implementation of a Water Shortage Condition Stage and the demand reduction measures for Fiscal Year 2021-22.

WEATHER CONDITIONS.

Long-term average rainfall at Matilija Dam and Casitas Dam are 28.24 and 23.74 inches, respectively, based on records dating back to the 1958-1959 Water Year. During the period of 2012 through 2021, the Ventura River watershed has been in an extreme to moderate drought condition with less than average rainfall amounts (Table 1) that have been insufficient to cause the restoration of local water resources to previous levels. Rainfall totals during the 2021 winter season were far below the long-term average rainfall for Matilija and Casitas Dam locations and have had a negative impact to District water supplies in the early months of the year.

Table 1 – Rainfall Totals for Matilija Dam and Casitas Dam (inches)

Water Year	2011	2012	2013	2014	2015	2016	2017	2018	2019	2020	2021	Avg.
Matilija Dam	40.28	14.21	11.85	14.76	17.57	13.35	31.98	16.75	37.54	16.46	6.42	20.1
Casitas Dam	35.99	15.11	10.99	9.90	11.65	11.07	30.75	9.89	24.77	13.93	6.39	16.4

The winter storms of 2021 can be described as negligible in effect. The annual rainfall total during the period of October 1, 2020 to April 15, 2021, at Matilija Dam and Casitas Dam are 6.42 and 6.39 inches respectively. These are the lowest rainfall totals during the period noted in Table 1.

Drought conditions have also affected the State of California as a whole with the majority of Ventura County be classified as being in a D4 (Extreme Drought) condition by the United States Drought Monitor as of April 20, 2021.

WATER RESOURCES

The primary water resources that provide water to Casitas MWD are collectively the groundwater basins of the Upper Ventura River and Ojai; and the surface water storage at Lake Casitas.

Groundwater Basins

The winter of 2021 brought little recovery to the local groundwater basins within Casitas' district boundaries. The few rainfall events caused continued flashy peak flows with some debris and silt from the previously burned Ventura River watershed.

The Upper Ventura River groundwater levels have seen an overall decline since April of 2019. The recent data presented by the Ventura River Water District illustrates that while groundwater levels came to within twelve feet of the May 1 static water level average, they are still well short of being completely full (see May, 2021 VRWD Ground Water Level Chart – Attachment #1). The storage in the Upper Ventura River Basin will likely continue to allow groundwater pumpers to minimize their use of Lake Casitas supply over the next twelve months.

The Ojai groundwater basin is a primary water source for the Ojai Valley's urban and agricultural water demands. The basin's groundwater storage declined an approximate 34 feet in water elevation recorded at a key well in the basin since May 25, 2020. The Ojai basin Groundwater Management Agency has reported that the Ojai basin has an estimated storage of 56,800 acre-feet (71% capacity) at this same time (See OBGMA Summary Sheet – Attachment #2). This supply should allow most groundwater pumpers in this basin to minimize their use of Lake Casitas supply during the next twelve months.

Surface Water Storage

Lake Casitas is the primary source of water supply for the Casitas Municipal Water District. Its construction in the 1950's was as a supplemental supply to local groundwater and as a primary source for areas that do not have groundwater. Figure 1 presents the annual high-low water storage fluctuations that Lake Casitas has experienced since 1970. Lake Casitas storage was last at full storage capacity in May 2006 and has since been in a declining storage trend due to drought conditions, evaporation, environmental conditions, and water use.

Figure 1 – Lake Casitas Storage Volume and Annual Rainfall Trend (1970 to April 2021)

On January 1, 2018, Casitas officially changed the storage table based on a bathymetric survey conducted at Lake Casitas. The volume stored at each designated percentage specified in the Water Efficiency and Allocation Program (WEAP) is changed to reflect the data provided by the bathymetric survey as follows:

Table 2 – WEAP Stages and Lake Casitas Volumes

Stage	<u>Stage 1</u>	<u>Stage 2</u>	<u>Stage 3</u>	<u>Stage 4</u>	<u>Stage 5</u>
Percent Storage	100%	50%	40%	30%	25%
Volume (Acre-feet)	237,975	118,988	95,190	71,393	59,494

WATER DEMAND

In FY 2013-14, the Casitas water demands from Lake Casitas reached 20,417 acre-feet, while Lake Casitas was still in a Stage 1 condition. In April 2014, the State’s Drought Emergency Declaration raised the public awareness to the on-going drought throughout California, the severe conditions in the State Water Project, and the growing scarcity of water for agriculture and communities statewide.

In April 2015, Lake Casitas storage declined to fifty percent of its storage capacity and the Casitas Board of Directors declared that a Stage 2 condition existed for the Lake Casitas supply. In doing so, the Board of Directors initiated Stage 2 mandatory water demand reduction requirements with the further adoption of a revised Water Efficiency and Allocation Plan (WEAP). A key element of the WEAP was the assignment of individual water allocations for residential, commercial and agricultural beneficial water uses, and the assignment of a conservation penalty for water use that was in exceedance of the assigned water allocation.

In June 2016, the Casitas Board of Directors declared that a Stage 3 condition existed as Lake Casitas continued to decline to 100,000 acre-feet of water in storage. The Stage 3 declaration implemented a conservation penalty of \$5.00 per unit and limited the supply available for new water use to 10 acre-feet per fiscal year.

In April 2017, the Casitas Board of Directors continued the Stage 3 declaration, pending possible further decline of Lake Casitas storage to a Stage 4 level.

From December 2018 through February 2019, the Casitas Board of Directors considered the possibility of a Stage 4 declaration but decided to forego the declaration based on the strong conservation response from the community (near a Stage 5 level) combined with rainfall that had been adding significant supply volume to Lake Casitas in early 2019.

Early April 2020 saw a moderate set of storms allowing Lake Casitas storage levels to remain above 105,000 Acre-Feet, however a Stage 3 declaration was left in place for the 2021 Fiscal Year.

Demands on Lake Casitas have increased over the last twelve months with an estimated Fiscal Year 2021 Lake Casitas demand of 10,600 Acre-Feet, an increase of 1,800 Acre-Feet over the Fiscal Year 2020 demand.

Water Demand Response

A critical function of the WEAP is to manage water supplies in such a manner that prevents Lake Casitas from reaching a minimum pool condition through the implementation of water demand response measures – the assignment of individual water allocations and the implementation of a conservation penalty for water use in excess of the allocation.

Since FY 2013-14, the demand on the Lake Casitas supply continued to decline through the 2020 Fiscal Year (Table 3) in response to the WEAP, water resource changes by large customers, and the heightened customer awareness of water resource conditions. The estimated water delivery in Fiscal Year 2020-21 is an indication of a possible reversal trend of the decline in water delivery from Lake Casitas as noted in Table 3.

Table 3 – Water Deliveries from the Lake Casitas Supply

Fiscal Year	2013-14	2014-15	2015-16	2016-17	2017-18	2018-19	2019-20	2020-21 (Estimated)
Lake Casitas Water Deliveries (AF)	20,417	17,339	15,662	13,200	12,322	9,340	8,802	10,600
% below 2013-14 Delivery	0	15	23	35	40	55	57	48
Declared Stage	1	1	2	3	3	3	3	3

Until Fiscal Year 2021, each of the listed periods since Fiscal Year 2015 exhibit the water demand reduction resulting from the public outreach, the conservation penalty, and the effects of the State’s 2014 drought declaration. (Note that the amounts in Table 3 are registered at the Marion Walker Treatment Plant and will differ from amounts reported on the District’s Monthly Consumption Reports, which don’t include system losses).

Beginning in Fiscal Year 2016, Lake Casitas demand has remained below the current Stage 3 demand reduction target of 16,736 Acre-Feet. The targeted goals for each WEAP Stage are listed in Table 4.

Table 4 – WEAP Targeted Demand Reduction Goals per Stage (Based of FY 1989-1990 Lake Casitas Demand of 23,909 Acre-Feet)

	<u>Stage 1</u> 20% Voluntary	<u>Stage 2</u> 20% Mandatory	<u>Stage 3</u> 30% Mandatory	<u>Stage 4</u> 40% Mandatory	<u>Stage 5</u> 50% Mandatory
Demand Reduction Goal (in Acre-Feet)	19,127	19,127	16,736	14,345	11,955

Supply and Demand Analysis

In consideration of an April 2021 start point of approximately 90,600 Acre-feet of storage in Lake Casitas, applying 2013 evaporation, no runoff additions to storage, and comparing three rates of water demands, Figure 2 illustrates the time for Lake Casitas to reach a particular level for the following estimated water demands:

1. A demand of **10,600 Acre-Feet/Year** reflects the estimated 2021 Fiscal Year Lake Casitas demand (middle line).
2. A demand of **9,600 Acre-Feet/Year** reflects a 10% reduction in the estimated 2021 Fiscal Year Lake Casitas demand (top line).
3. A demand of **11,700 Acre-Feet/Year** reflects a 10% increase in the estimated 2021 Fiscal Year Lake Casitas demand (bottom line).

Figure 2 – Hypothetical Decline in Lake Casitas Storage with No Rainfall or Runoff; 2013 Evaporation Rate Every Year; Starting Storage at 90,600 Acre-Feet.

Figure 2 illustrates that with the given demand rates, 2013 evaporation, with no additional rainfall and runoff, Lake Casitas could reach Stage 4 levels in 12 to 14 months, and Stage 5 levels in 18 months to nearly two years.

Given the conditions noted above, Figure 2 illustrates that Lake Casitas could decline to approximately an 83,000 Acre-Foot capacity by December of 2021.

Conservation Penalty

The District has implemented a conservation penalty for water use in excess of the individual customer's Staged allocation. The funds resulting from the conservation penalty are to be applied toward new water supply projects and the water conservation efforts of the District.

In September 2015, and for the remainder of FY 2015-16, the residential water used in excess of the monthly allocation was billed as a conservation penalty at the rate of \$1.00 per unit. Effective July 1, 2016, and continued until the present, the conservation penalty was increased to \$5.00.

Overuse of Allocations

The Revenue and Expense Report for July 1, 2020 through February 28, 2021 indicates that allocation penalties collected through February 2021 for all residential accounts equates to roughly 400 Acre-Feet of overuse in this category. This is an increase from the same period in 2020 wherein penalties had been collected on approximately 260 Acre-Feet of overuse.

Annual penalties for all other types of accounts for Fiscal Year 2021 will not be known until August but overuse for the past two Fiscal Years for these accounts equated to 30 (FY 2020) and 111 (FY 2019) Acre-Feet.

Growth

The service area of the District is experiencing extremely slow growth. Most requests that Casitas receives are related to expansions of residential housing construction. The slow growth rate is indicative of the information illustrated in Table 5. During the past ten years, Casitas has installed 27 meters and issued 31.75 acre-feet of water allocation. On the average, less than three meters have been installed per year and new or additional allocation assignments have averaged three acre-feet per year.

Table 5 – Water Service and Allocation Assignments by Casitas (CY 2012-2021)

Calendar Year	No. of Meters Issued	Allocation Issued (AF)
2012	3	2.22
2013	1	1.88
2014	6	9.85
2015	1	1.27
2016	3	2.08
2017	3	5.54
2018	0	0
2019	6	6.92
2020	3	1.49
2021	1	0.5

4. WATER MANAGEMENT POLICY AND PROGRAMS CURRENTLY IN PLACE

Management Priorities of Casitas Municipal Water District (Resolution No. 93-12)

On March 10th, 1993, the Casitas Board of Directors resolved by Resolution No. 93-12 (1) that Casitas shall manage Lake Casitas and its water supplies so that it can provide back up to other water systems and meet its direct customer demands during droughts.

Water Conservation Program - 1992

Since 1992, Casitas has actively assisted water customers throughout the district with fixture retrofits, irrigation surveys, residential and institutional water use surveys, provision of water conservation materials to local schools, public workshops and presentations on a wide variety of water conservation topics, public messaging, and financing assistance for water well improvements. The Water Conservation Program has partnered with other Ventura County agencies to obtain grants for additional water conservation measures. The Water Conservation Department has also adjusted staffing levels as needed during drought to provide increased customer assistance with meeting conservation targets.

Water Waste Prohibition Ordinance (Ordinance 15-02)

This Ordinance established water waste prohibitions and identified actions against violations of the Ordinance. Casitas staff has been actively engaged with the public reports of water waste.

Water Efficiency and Allocation Program (WEAP)

The WEAP is the key water management tool for long-term drought response and water demand. The WEAP was originally adopted by the Board of Directors in January 1992 and most-recently revised in April 2019. A critical element of the WEAP implementation is to cause water demands to be commensurate to the declared Water Shortage Stage of Lake Casitas.

State of California Drought and Conservation Measures

On April 7, 2017, Governor Brown lifted the January 17, 2014 drought declaration, leaving in place water waste prohibitions and requirements for continuing development of urban and agricultural water use standards to promote continued water conservation (Executive Order B-40-17). The State is developing new regulations to continue the conservation measures as well as measures to hold all water users accountable for their water use.

Governor Newsom recently issued a State Emergency Proclamation placing two California counties in a State of Emergency due to drought and provided all California water districts with notice of the possibility of further actions should water supply conditions worsen in the coming months.

Water Security Projects

The Casitas Municipal Water District is committed to investigating and implementing opportunities to further secure its water supply.

State Water Interties – The Casitas Municipal Water District is pursuing the development of the infrastructure and agreements needed for the direct and in-lieu drought-protection use of the State Water Project water supplies of Casitas, Calleguas MWD, the City of Ventura, and United WCD. Consideration of the fiscal impacts and funding methods of the project are also under review. This is

an opportunity for regional collaboration to address common water supply reliability needs of the entirety of Ventura County.

Additionally, Casitas and Carpinteria Valley Water District are pursuing State loan/grant funding to increase the size of a current intertie connection as well as build pump stations to provide the ability to move Casitas' State Water Project water supplies directly into Casitas' system.

The preliminary schedule for final completion of these projects is four to eight years.

Ojai Well Field Rehabilitation – This project is intended to restore the production of the Ojai Well Field wells and also drill one replacement well. The replacement well has been drilled and the equipping of the well is expected to occur in the 2022 Fiscal Year.

Comprehensive Water Resources Plan - In 2019, Casitas hired a consultant to analyze current water resources and develop a plan that will support the continued planning efforts of the District. Casitas' stakeholder input was also collected and the draft plan was released to the public in June 2020.

The Casitas Board of Directors is expected to continue to review the plan but recently reached an important planning milestone by declaring a Casitas System Operational Yield of 15,010 Acre Feet per Year and a Planned Demand of 14,525 Acre-Feet per Year.

5. RECOMMENDED WEAP ACTIONS

The following are the staff recommendations for WEAP actions to be considered for adoption by the Board of Directors at the May 12, 2021 Board Meeting:

Customer Demand Reduction Measures

1. **Reaffirm the water shortage declaration as Stage 3.** The level of Lake Casitas has declined over the last twelve months placing it within the Stage 3 lake level described in the WEAP (95,104 AF – 71,328 AF). Water demands have also increased over the last twelve months but are expected to remain below the WEAP Stage 3 demand target of approximately 16,700 Acre-Feet per Year. The enforcement of the Water Waste Prohibition Ordinance should continue under the current system of public notification of waste. Conservation staff will continue to work with customers to help them understand and implement conservation measures. The system for allocation assignment and billing will continue until such time that the Board makes a different determination. The Board reviews consumption and hydrology information monthly thus it can respond quickly to changes in customer conservation behavior or water supply conditions.
2. **Reaffirm Stage 3 reduced water allocations.** If the water demand reduction goals are not being met during the course of FY 2021-22, the conservation penalty should be increased and the Board should consider additional measures to ensure these goals are met.
3. **Landscape watering restriction.** Continue with current water use restrictions of no landscape watering between the hours of 10AM and 6PM.

Penalties and Rates.

1. **Consider and implement Conservation Penalty for water use in excess of allocation.** Maintain the current conservation penalty of \$5.00 for each unit of water that is over the monthly/annual allocation assignment for all classifications of service. Direct staff to work with customers that are repetitively in excess of the allocation assignments.
2. **Continue planned rates for revenue stabilization and cost of service.** The Board has adopted water rates to achieve revenue stabilization and cost of service that became effective July 1, 2017 and continued for the following four Fiscal Years.

A rate study is recommended to be conducted during the 2022 Fiscal Year.

3. **Provide a leak-relief program**

The Board should consider implementing a leak-relief program. This will assist customers who have excellent conservation histories with the ability to get relief from unusual situations that cause penalties to be assessed.

Issuance of Additional Allocations

1. **Continue to set an annual allocation limit for new or existing water service connections.** Adhere to the Board's prior direction to limit the volume of water to be allocated to new service connections or requests for additional allocation. Based on the Growth section above, a limit of 10 acre-feet per fiscal year appears to be a reasonable approach.

Communications

1. **Communicate the Stage 3 Condition.** Stage 3 is identified as "*a condition of a water shortage is imminent*". The Board of Directors may consider at any time however to move to a particular Water Shortage Stage based on a number of factors including conservation response, supply forecasts, current supply, etc.
2. **Continue the public information campaign.** Despite the dry conditions experienced this year, local water users have continued to conserve. The local resale agencies should also recognize that their water supplies are subject to sufficient local rainfall and they may have to rely on Lake Casitas under continuing drought conditions. Casitas needs to continue the messaging of local water supply reliability, water security project status, and responsible water use. This can be done through newsletters, website and social media posts, and public workshops (when possible).
3. **Provide regular briefings, publish monthly consumption report.** The billing system provides each customer a monthly status on their water use and the application of conservation penalties.
4. **Review and revision of WEAP for implementation for the 2022-2023 Fiscal Year.** The Board recently directed staff to use a Casitas System Yield of 15,010 Acre-Feet/Year and a Planned Demand of 14,525 Acre-Feet/Year for water supply planning purposes. This

necessitates a revision to the WEAP which is currently based on a Safe Yield of 20,840 Acre-Feet/Year and a Stage 1 demand of approximately 19,000 Acre-Feet/Year. Staff recommends that the revision be completed prior to February 2022 in order to notify customers of the change and provide assistance to those customers who require it prior to implementation on the first day of the 2022-2023 Fiscal Year (July 1, 2022).

Modification of the FY 2022 WEAP

1. **Revise Section 4.3 (Allocation Assignments to Water Service Classifications): Multi-Family Residential and Residential reflecting seasonal water use proportions.**

The Casitas MWD Water Efficiency Allocation Program (WEAP) uses seasonal proportions to adjust the monthly non-essential allocation amounts for Multi-Family Residential and Residential customer classifications.

Staff recently completed an analysis of water use patterns over the last five fiscal years (2016–2020) for residential customers and found that those patterns do not reflect what is currently defined in the WEAP. Graph 1 shows a comparison.

Graph 1 – Residential Water Use Comparison (Current WEAP, Five-Year Avg., and 2020 Avg.)

Staff recommends that the seasonal proportionality tables in Section 4.3 of WEAP for Multi-Family Residential and Residential classifications be revised as follows:

Month	July	August	Sep	Oct	Nov	Dec	Jan	Feb	Mar	Apr	May	June
% of Total Annual Allocation	.12	.11	.11	.11	.08	.08	.04	.06	.05	.05	.09	.10

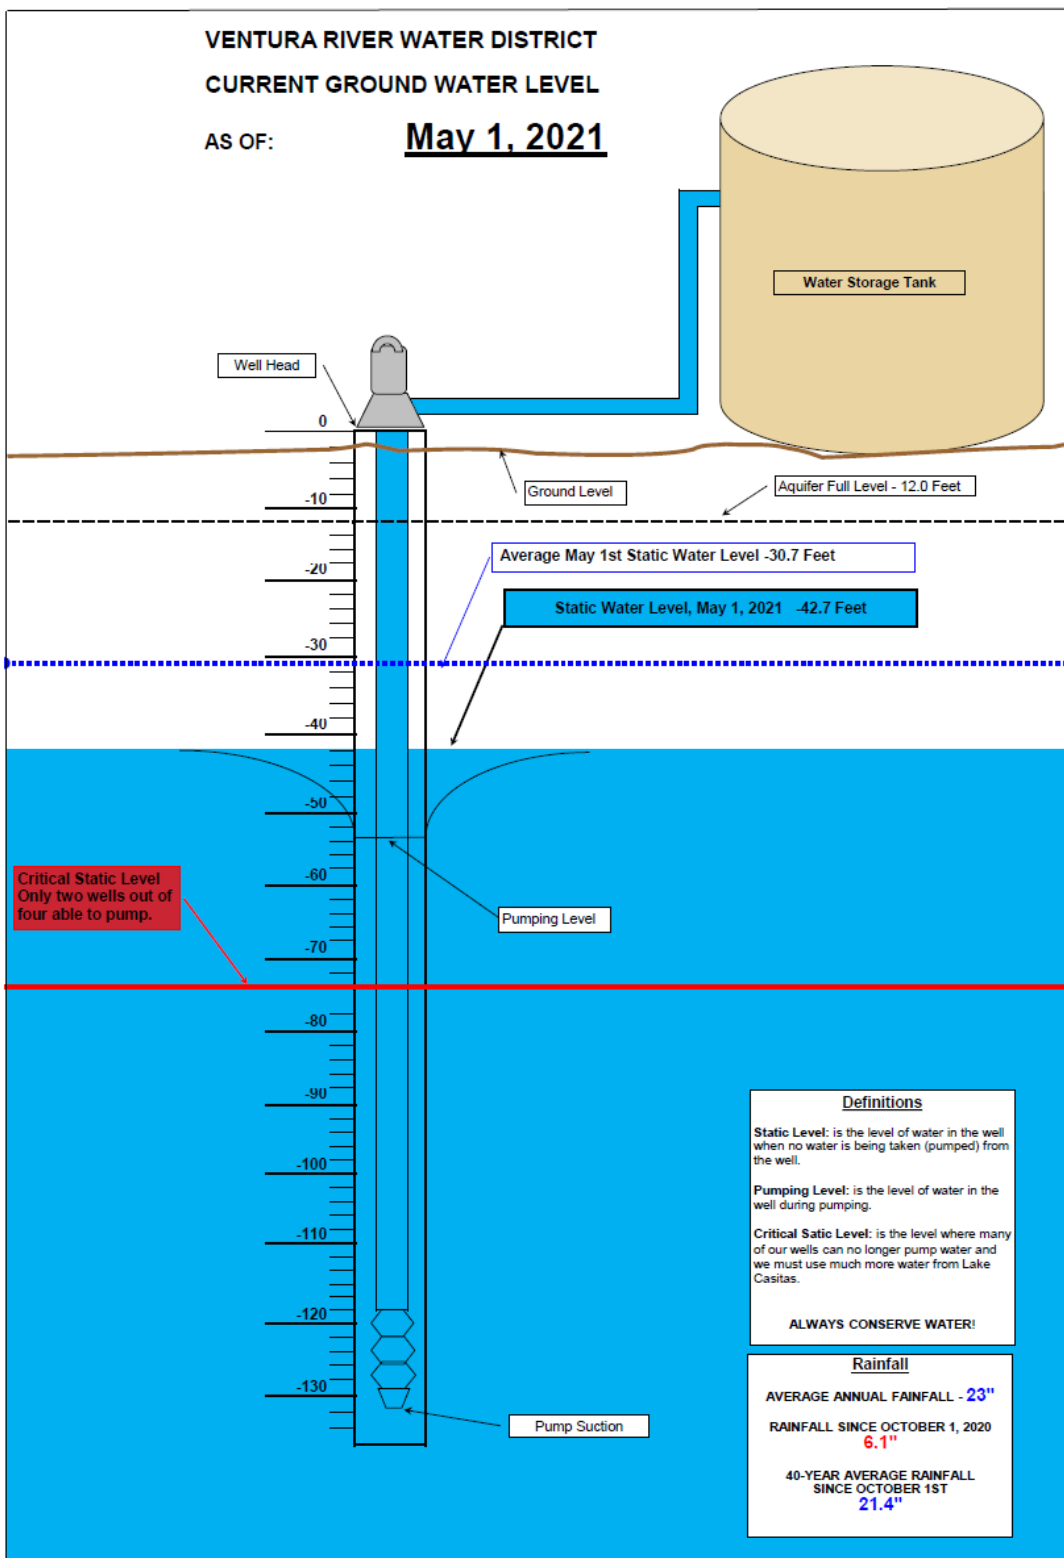

Graph 2 illustrates the recommended change to the seasonal proportionality tables:

Graph 2 - Residential Water Use Comparison (Current WEAP, Five-Year Avg., 2020 Avg., and Revised WEAP)

ATTACHMENT #1

ATTACHMENT #2

OBGMA April 2021 Summary of Ojai Groundwater Basin Conditions
(from website graphic & verbal Basin Status Report during the April 28,2021 OBGMA Board Meeting)

Key Well Level (May 25, 2020): 115.12' above mean sea level

Key Well Level (April 2021): 149.51' above mean sea level

Current Basin Volume: 56,800 Acre-Feet; 71% of capacity

SBx7-7 Compliance and Verification Forms

SB X7-7 Verification Form

The **SB X7-7 Verification Form** is for the calculation of baselines and targets. Most Suppliers will have completed this form with their 2015 UWMP and do not need to complete this form again in 2020. See Chapter 5 Section 5.3 of the UWMP Guidebook for more information regarding which Suppliers must, or may, complete this form for their 2020 UWMP. 2020 compliance calculations are done in the SB X7-7 2020 Compliance Form.

The **SB X7-7 2020 Compliance Form** is for the calculation of 2020 compliance and is a separate workbook from the SB X7-7 Verification Form. All retail suppliers must submit the SB X7-7 2020 Compliance Form. Baselines and targets are done in the SB X7-7 Verification Form.

WUE Data Portal Entry Exceptions

The data from the tables below will not be entered into WUE Data Portal tables. These tables will be submitted as separate uploads, in Excel, to WUE Data Portal.

Process Water Deduction

SB X7-7 tables 4-C, 4-C.1, 4-C.2, 4-C.3, 4-C.4 and 4-D

A supplier that will use the process water deduction will complete the appropriate tables in Excel, submit them as a separate upload to the WUE Data Portal, and include them in its UWMP.

Target Method 2

SB X7-7 Tables 7-B, 7-C, and 7-D

A supplier using Target Method 2 will complete these tables in Excel and submit them as a separate upload to the WUE Data Portal and include them in its UWMP.

Target Method 4

These tables are not in the SB X7-7 Verification Form, but are found in WUE Data Portal using the *Resources* button. A supplier using Target Method 4 will complete these tables in Excel and submit them as a separate upload to the WUE Data Portal and include them in its UWMP.

Where to Submit?

Suppliers submit the completed table data and UWMPs (including the Water Shortage Contingency Plan) electronically through the WUE Data Portal (<https://wuedata.water.ca.gov/>). The portal will be updated in Spring 2021 and will be announced to the urban listserv, DWR webpage and WUE Data Portal opening page when it is available for plan and table submittals.

Unlocking Templates (use with caution)

The templates provided in this workbook are formatted to mirror the structure of information that is submitted through the WUE Data Portal for the electronic submission of Submittal Tables in the UWMP. The tables are offered in a protected (locked) version to maintain the structure of the templates. However, for those needing to adjust the tables for their own planning needs beyond the Submittal Tables, the password to 'unprotect' each worksheet is 'dwr' (no quotes). To unprotect the worksheet, go to the Review tab, select Unprotect Sheet, and enter the password 'dwr' in the pop-up (no quotes). Preparers will still need to submit the information using the original template structure provided. To redownload the templates in their original format, visit <https://wuedata.water.ca.gov> in the Resources button of the Urban Water Management Plan section (no login necessary).

SB X7-7 Table 0: Units of Measure Used in UWMP* *(select one from the drop down list)*

Acre Feet

**The unit of measure must be consistent with Submittal Table 2-3*

NOTES: Casitas Retail System

SB X7-7 Table-1: Baseline Period Ranges

Baseline	Parameter	Value	Units
10- to 15-year baseline period	2008 total water deliveries	18,471	Acre Feet
	2008 total volume of delivered recycled water	-	Acre Feet
	2008 recycled water as a percent of total deliveries	0%	See Note 1
	Number of years in baseline period ^{1,2}	10	Years
	Year beginning baseline period range	1999	
	Year ending baseline period range ³	2008	
5-year baseline period	Number of years in baseline period	5	Years
	Year beginning baseline period range	2005	
	Year ending baseline period range ⁴	2009	

¹ If the 2008 recycled water delivery is less than 10 percent of total water deliveries, then the 10-15year baseline period is a continuous 10-year period. If the amount of recycled water delivered in 2008 is 10 percent or greater of total deliveries, the 10-15 year baseline period is a continuous 10- to 15-year period.

² The Water Code requires that the baseline period is between 10 and 15 years. However, DWR recognizes that some water suppliers may not have the minimum 10 years of baseline data.

³ The ending year for the 10-15 year baseline period must be between December 31, 2004 and December 31, 2010.

⁴ The ending year for the 5 year baseline period must be between December 31, 2007 and December 31, 2010.

NOTES: Casitas Retail System.

Total water deliveries represents water produced at the Marion Walker WTP and Mira Monte well.

SB X7-7 Table 4-C.4: Process Water Deduction Eligibility

Criteria 4

Disadvantaged Community. A “Disadvantaged Community” (DAC) is a community with a median household income less than 80 percent of the statewide average.

SELECT ONE

"Disadvantaged Community" status was determined using one of the methods listed below:

- 1. IRWM DAC Mapping tool**
<https://gis.water.ca.gov/app/dacs/>

If using the IRWM DAC Mapping Tool, include a screen shot from the tool showing that the service area is considered a DAC.

- 2. 2010 Median Income**

	California Median Household Income	Service Area Median Household Income	Percentage of Statewide Average	Eligible for Exclusion? Y/N
2010	\$60,883		0%	YES

<input type="checkbox"/>		South Coast	149	142
<input type="checkbox"/>		Colorado River	211	200
2020 Target <i>(If more than one region is selected, this value is calculated.)</i>				0
NOTES: TABLE NOT USED				

SB X7-7 Table 7-F: Confirm Minimum Reduction for 2020 Target

5 Year Baseline GPCD From SB X7-7 Table 5	Maximum 2020 Target ¹	Calculated 2020 Target ²			Confirmed 2020 Target ⁴
		As calculated by supplier in this SB X7-7 Verification Form	Special Situations ³		
			Prorated 2020 Target	Population Weighted Average 2020 Target	
355	338	295			295

¹ **Maximum 2020 Target** is 95% of the 5 Year Baseline GPCD except for suppliers at or below 100 GPCD.

² **Calculated 2020 Target** is the target calculated by the Supplier based on the selected Target Method, see SB X7-7 Table 7 and corresponding tables for agency's calculated target. Supplier may only enter one calculated target.

³ **Prorated targets and population weighted target** are allowed for special situations only. These situations are described in Appendix P, Section P.3

⁴ **Confirmed Target** is the lesser of the Calculated 2020 Target (C5, D5, or E5) or the Maximum 2020 Target (Cell B5)

NOTES: Casitas Retail System.

SB X7-7 Verification Form

The **SB X7-7 Verification Form** is for the calculation of baselines and targets. Most Suppliers will have completed this form with their 2015 UWMP and do not need to complete this form again in 2020. See Chapter 5 Section 5.3 of the UWMP Guidebook for more information regarding which Suppliers must, or may, complete this form for their 2020 UWMP. 2020 compliance calculations are done in the SB X7-7 2020 Compliance Form.

The **SB X7-7 2020 Compliance Form** is for the calculation of 2020 compliance and is a separate workbook from the SB X7-7 Verification Form. All retail suppliers must submit the SB X7-7 2020 Compliance Form. Baselines and targets are done in the SB X7-7 Verification Form.

WUE Data Portal Entry Exceptions

The data from the tables below will not be entered into WUE Data Portal tables. These tables will be submitted as separate uploads, in Excel, to WUE Data Portal.

Process Water Deduction

SB X7-7 tables 4-C, 4-C.1, 4-C.2, 4-C.3, 4-C.4 and 4-D

A supplier that will use the process water deduction will complete the appropriate tables in Excel, submit them as a separate upload to the WUE Data Portal, and include them in its UWMP.

Target Method 2

SB X7-7 Tables 7-B, 7-C, and 7-D

A supplier using Target Method 2 will complete these tables in Excel and submit them as a separate upload to the WUE Data Portal and include them in its UWMP.

Target Method 4

These tables are not in the SB X7-7 Verification Form, but are found in WUE Data Portal using the *Resources* button. A supplier using Target Method 4 will complete these tables in Excel and submit them as a separate upload to the WUE Data Portal and include them in its UWMP.

Where to Submit?

Suppliers submit the completed table data and UWMPs (including the Water Shortage Contingency Plan) electronically through the WUE Data Portal (<https://wuedata.water.ca.gov/>). The portal will be updated in Spring 2021 and will be announced to the urban listserv, DWR webpage and WUE Data Portal opening page when it is available for plan and table submittals.

Unlocking Templates (use with caution)

The templates provided in this workbook are formatted to mirror the structure of information that is submitted through the WUE Data Portal for the electronic submission of Submittal Tables in the UWMP. The tables are offered in a protected (locked) version to maintain the structure of the templates. However, for those needing to adjust the tables for their own planning needs beyond the Submittal Tables, the password to 'unprotect' each worksheet is 'dwr' (no quotes). To unprotect the worksheet, go to the Review tab, select Unprotect Sheet, and enter the password 'dwr' in the pop-up (no quotes). Preparers will still need to submit the information using the original template structure provided. To redownload the templates in their original format, visit <https://wuedata.water.ca.gov> in the Resources button of the Urban Water Management Plan section (no login necessary).

SB X7-7 Table 0: Units of Measure Used in UWMP* *(select one from the drop down list)*

Acre Feet

**The unit of measure must be consistent with Submittal Table 2-3*

NOTES: Ojai Retail System

SB X7-7 Table-1: Baseline Period Ranges

Baseline	Parameter	Value	Units
10- to 15-year baseline period	2008 total water deliveries	2,400	Acre Feet
	2008 total volume of delivered recycled water	-	Acre Feet
	2008 recycled water as a percent of total deliveries	0%	See Note 1
	Number of years in baseline period ^{1,2}	10	Years
	Year beginning baseline period range	1999	
	Year ending baseline period range ³	2008	
5-year baseline period	Number of years in baseline period	5	Years
	Year beginning baseline period range	2004	
	Year ending baseline period range ⁴	2008	

¹ If the 2008 recycled water delivery is less than 10 percent of total water deliveries, then the 10-15year baseline period is a continuous 10-year period. If the amount of recycled water delivered in 2008 is 10 percent or greater of total deliveries, the 10-15 year baseline period is a continuous 10- to 15-year period.

² The Water Code requires that the baseline period is between 10 and 15 years. However, DWR recognizes that some water suppliers may not have the minimum 10 years of baseline data.

³ The ending year for the 10-15 year baseline period must be between December 31, 2004 and December 31, 2010.

⁴ The ending year for the 5 year baseline period must be between December 31, 2007 and December 31, 2010.

NOTES: Ojai Retail System.

Total water deliveries represent Ojai Groundwater Well production and deliveries from Casitas System.

5 Year Baseline GPCD From SB X7-7 Table 5	Maximum 2020 Target ¹	Calculated 2020 Target ²			Confirmed 2020 Target ⁴
		As calculated by supplier in this SB X7-7 Verification Form	Special Situations ³		
			Prorated 2020 Target	Population Weighted Average 2020 Target	
316	300	257			257

¹ **Maximum 2020 Target** is 95% of the 5 Year Baseline GPCD except for suppliers at or below 100 GPCD.

² **Calculated 2020 Target** is the target calculated by the Supplier based on the selected Target Method, see SB X7-7 Table 7 and corresponding tables for agency's calculated target. Supplier may only enter one calculated target.

³ **Prorated targets and population weighted target** are allowed for special situations only. These situations are described in Appendix P, Section P.3

⁴ **Confirmed Target** is the lesser of the Calculated 2020 Target (C5, D5, or E5) or the Maximum 2020 Target (Cell B5)

NOTES: Ojai Retail System.

SB X7-7 2020 Compliance Form

The SB X7-7 2020 Compliance Form is for the calculation of 2020 compliance only. All retail suppliers must complete the SB X7-7 Compliance Form. Baseline and target calculations are done in the SB X 7-7 Verification Form.

The SB X7-7 Verification Form is for the calculation of baselines and targets and is a separate workbook from the SB X7-7 2020 Compliance Form. Most Suppliers will have completed the SB X7-7 Verification Form with their 2015 UWMP and do not need to complete this form again in 2020. See Chapter 5 Section 5.3 of the UWMP Guidebook for more information regarding which Suppliers must, or may, complete the SB X7-7 Verification Form for their 2020 UWMP. 2020 compliance calculations are done in the SB X7-7 2020 Compliance Form.

Process Water Deduction tables will not be entered into WUE Data Portal tables.

SB X7-7 tables 4-C, 4-C.1, 4-C.2, 4-C.3, 4-C.4 and 4-D

A supplier that will use the process water deduction will complete the appropriate tables in Excel, submit them as a separate upload to the WUE Data Portal, and include them in its UWMP.

Where to submit? Suppliers submit the completed table data and UWMPs (including the Water Shortage Contingency Plan) electronically through the WUE Data Portal (<https://wuedata.water.ca.gov/>). The portal will be updated in Spring 2021 and will be announced to the urban listserv, DWR webpage and WUE Data Portal opening page when it is available for plan and table submittals.

Unlocking templates (use with caution): The templates provided in this workbook are formatted to mirror the structure of information that is submitted through the WUE Data Portal for the electronic submission of Submittal Tables in the UWMP. The tables are offered in a protected (locked) version to maintain the structure of the templates. However, for those needing to adjust the tables for their own planning needs beyond the Submittal Tables, the password to 'unprotect' each worksheet is 'dwr' (no quotes). To unprotect the worksheet, go to the Review tab, select Unprotect Sheet, and enter the password 'dwr' in the pop-up (no quotes). Preparers will still need to submit the information using the original template structure provided. To redownload the templates in their original format, visit <https://wuedata.water.ca.gov> in the Resources button of the Urban Water Management Plan section (no login necessary).

Water Efficiency Allocation Program (WEAP)

WATER EFFICIENCY AND ALLOCATION PROGRAM

Casitas Municipal Water District

May 12, 2021

SECTION 1: INTRODUCTION

In 1992 the Casitas Municipal Water District (Casitas) adopted a series of ordinances, resolutions, and a Water Efficiency and Allocation Program (WEAP) in response to the increasing water demands and declining water storage in Lake Casitas experienced during the 1987-1991 drought period. The collective work in 1992 set the starting point for a system of water allocation assignments and demand response criteria that are based on the level of water storage in Lake Casitas. Since 1992, there has been a significant outreach by Casitas to raise the public's awareness on the importance to conserve local water supplies, changes in the water supply and demand, regulatory compliance directives pursuant to the Endangered Species Act (ESA), and system outage events that temporarily activated Casitas' emergency response plan. All of these factors, including the responses and experiences of the current drought, are considered in the update of the Water Efficiency and Allocation Program.

1.1 Purpose and Principles of the Plan.

The purpose of this update of the WEAP is to provide guidance on water supply and demand strategies that (1) conserve the water supply of the Ventura River Project, Lake Casitas and other water resources that are in the direct control of Casitas, for the greatest public benefit, (2) mitigate the effects of a water shortage on public health and safety and economic activity, (3) allocate water use so that a reliable and sustainable supply of water will be available for the most essential purposes under all water storage conditions of Lake Casitas, and (4) adapt to changing conditions of water supply demand and constraints.

The WEAP describes the water demand reduction strategies and measures to address future water shortage conditions, promote water conservation and the efficient use of water, and the application of a conservation penalty to customers who waste water.

1.2 Relationship between this Document, Water Codes, and Other Plans.

This WEAP shall be guided by State regulations and planning requirements as provided by the California Water Code that provides Casitas with broad powers to implement and enforce regulations and restrictions for managing a water shortage (§71640-71644), to implement water conservation programs (§375--378), to implement allocation-based conservation water pricing (§370-374), and to declare a water shortage emergency (§350-359).

As required by Water Code Section 10632, this WEAP shall be integrated as a part of the Casitas Urban Water Management Plan (UWMP), as amended or updated every five years. The Casitas 2010 UWMP has been accepted and approved by the State Department of Water Resources. The UWMP provides an in-depth description of the Casitas water system, water resources and demands, and water supply reliability. For the purposes of integration and lessening the conflicts due to the replication of information, the WEAP shall rely on the updates of the Water Code Sections provided in the attached Appendices and UWMP, as amended or updated every five years.

SECTION 2: WATER SUPPLY AND DEMAND CONDITIONS

2.1 Water Supply.

The water supply for Casitas is derived from (1) the watersheds that flow directly and indirectly by diversion from the Ventura River of water during wet years to carryover storage in Lake Casitas for use during dry years, and (2) groundwater to the extent that Casitas has its own groundwater supply. The watersheds of the Ventura River region are subject to an extreme variation in the weather patterns, ranging from multiple years of drought to sometimes significant wet year events that are associated with El Nino conditions that add to the uncertainty of available local water supplies.

2.1.1 Surface Water.

The primary goal of Casitas is to provide a safe and reliable water supply. Due to the uncertainty of weather conditions that provide water to the local watersheds, a safe yield modeling has been implemented to provide guidance on water supply availability. The safe yield modeling criteria for the Casitas surface water supply provides a theoretical rate of decline in available water supply during a critical drought period, that if given a specific annual extraction rate from storage, that would reduce Lake Casitas to an exhausted minimum pool.

The sizing of Lake Casitas storage volume and the determination of the annual safe yield of water from Lake Casitas was originally determined by the Bureau of Reclamation in 1954, based on the hydrologic modeling for the critical drought period that started in 1919 and continued through 1936. The storage volume of the off stream reservoir, Lake Casitas, was set to be 254,000 acre-feet and the annual safe yield was determined to be 28,000 acre-feet. In 2004, Casitas recalculated the annual safe yield of Lake Casitas for the drought period of 1944 to 1965 based on newer knowledge of the diminished value of Matilija Reservoir and its impending removal, and the change in Robles Diversion operations resulting from the 2003 Biological Opinion established by the National Marine Fisheries Service pursuant to the federal Endangered Species Act. The recalculated annual safe yield of Lake Casitas was determined to be 20,840 acre-feet per year.

The safe yield trend for the 1944-1965 critical drought period is illustrated in Figure 1, with the assumption that the critical drought period begins with a full reservoir. The modeling applies the hydrology, river diversions operations, and lake evaporation for the period (1944-1965) that contribute to the Lake Casitas storage. The safe yield is a constant extraction rate from lake storage that contribute to the decline in Lake Casitas storage during the critical drought period, taking lake storage from full capacity to a minimum pool condition. Based on the safe yield model with a continuous and steady extraction rate, or safe yield, of water at 20,840 acre-feet each year, Lake Casitas would decline from full storage to minimum pool in approximately twenty years.

Also included in Figure 1 is the Recovery Period of Lake Casitas, which illustrates the actual filling rate experienced at Lake Casitas during the 1959 to 1978 period. The recovery of the Lake Casitas volume during the Recovery Period that is illustrated in Figure 1 cannot be assumed as the normal or common sequence given the variability of the rainfall amounts in the Ventura River watershed, constraints, and other influences to Lake Casitas inflow and storage. Casitas may experience elevated water supply risks that could be associated with a delay in the start of the recovery period while at minimum pool in Lake Casitas, or there could be a condition where the critical drought period begins with a partially recovered storage level in Lake Casitas.

The availability of the Lake Casitas supply can be influenced or impacted by long-term droughts, changes to lake water quality, and/or changes to diversion and storage conditions. The safe yield of Lake Casitas and annual water availability may need to be reconsidered in the future as a result of changing conditions or new information that differs from the present conditions.

Figure 1 – Lake Casitas Safe Yield Storage and Recovery Period Trends

2.1.2 Groundwater.

Within Casitas’ district boundaries, there are several local groundwater basins that are primary and critical sources of water supply for other local water purveyors (public, mutual and private), individual residential use and agriculture. During extended periods of drought with several years of less than average rainfall (20-inches) the local groundwater basins can become depleted due to pumping, natural drainage and evapotranspiration. The Lake Casitas surface water supply serves as a back-up water supply to the groundwater supply during times of extended drought.

Table 1 – Groundwater Basins of the Ventura River Watershed

Groundwater Basin	Acres	Max. Capacity (AF)	Approx. Safe Yield (AF/Yr.)
Upper Ojai	2,840	5,681	Unavailable
Ojai Valley	6,471	85,000	5,026

Upper Ventura River	9,360	35,118	9,482
Lower Ventura River	6,090	8,743	2,130

Source: Ventura River Watershed Council

The groundwater basins have demonstrated an ability to recharge rapidly in any one year with sufficient rainfall events, upon which time groundwater becomes the preferred source for those with well pumping access to the groundwater basins.

2.2 Water Demand.

The Casitas Board of Directors has established that the average long-term demand upon Lake Casitas must not exceed the annual safe yield of Lake Casitas supply. As a result of the 1987-1991, multi-year drought that resulted in water demands exceeding the annual safe yield, Casitas implemented specific actions in 1992 to limit water demands. The actions included the declaration of a voluntary twenty percent reduction in water demand, the assignment of water allocations based on 80 percent of FY1989-90 water usage that reflects a reduction in demand that comports more closely to safe yield of the Lake Casitas Supply, the implementation of water conservation measures to assist water users in adapting to less water consumption, and the limiting of new water service connections and expansions of agricultural plantings. Table 2 provides a comparison of classification water use, from prior to the action being taken by Casitas, to the level of water use during the recent drought. The FY 1989-90 water demand is recognized as being a high extreme water demand year at the end of the four year drought period.

Table 2 – Water Use Comparison by Customer Classification

Classification	No. of Service Connections		Water Demand – Lake Casitas (AF)		
	FY 1989-90	FY 2013-14	FY 1989-90	FY 2012-13	FY 2013-14
Residential	2424	2700	1603	1678	1738
Business	93	108	821	663	724
Industrial	12	9	155	23	22
Other	33	41	530	244	255
Resale Gravity	8	8	7724	4642	5614
Resale Pumped	15	15	1027	551	1182
Irrigation	253	251	11706	7978	9385
Interdepartmental	21	21	343	120	119
Temporary			11	13	55
Total	2,859	3,153	23,909	15,899	19,094

The local groundwater resources of the Ojai Valley and Ventura River provide on average 7,385 acre-feet per year (Daniel B. Stephens, 2010) to municipal, residential and agricultural pumpers. During multiple dry years, the groundwater basins become depleted and groundwater demands are met by supplementing groundwater supply from the Lake Casitas supply. In most cases, groundwater pumpers have a water service connection to Casitas as a backup supply of water. During any year or multiple dry year sequence of less than average rainfall, Casitas can anticipate that a portion of the 7,385 acre-feet of groundwater demand may be supplemented by the Lake Casitas supply. When groundwater basins are restored by rainfall events, groundwater pumpers convert back to the less expensive groundwater supply. The demand shifts are illustrated in Table 2 and Figure 2 for various classifications of water consumers. The FY 1989-90 and FY 2013-14 water demands occurred at the end of a three-year drought sequence.

Figure 2 – Casitas Annual Demand Patterns

2.3 Priorities of Water Use.

Casitas recognizes the following priorities for potable water:

- 1) Public safety, health and sanitation;
- 2) Economic sustainability; and
- 3) Quality of life for the district’s customers.

Within each of the customer classifications there may be water uses that are considered non-essential to public health and sanitation and may have no significant impact to the economic productivity of the western Ventura County. The non-essential water uses may be asked at any time to be curtailed during times of extreme water shortages.

Casitas recognizes that the agricultural crops in western Ventura County are primarily tree orchards that require a substantial period of time before becoming productive, and if fallowed will experience several years of non-production. To maintain water supplies into the future that will meet the local water demands, Casitas and the public may be faced with additional decisions on water use reductions that may impact the agricultural classification.

SECTION 3: WATER SHORTAGE EMERGENCY ACTIONS

3.1 Urban Water Contingency Analysis.

Water Code 10632 requires that the agency’s Urban Water Management Plan provide an urban water shortage contingency analysis that includes specific elements that are within the authority of the urban water supplier. The required water shortage analysis is performed in the Casitas 2010 Urban Water Management Plan, and is further supported by this WEAP and the Casitas Emergency Response Plan, as amended.

3.2 Water Shortage Emergencies.

Water Code §350-359 provides that the governing body of a distributor of a public water supply may declare a water shortage emergency condition to prevail within the service area whenever it finds and determines that the ordinary demands cannot be satisfied without depleting water supplies to the extent that there would be insufficient water for human consumption. When deemed as a water shortage emergency in accordance with Water Code 350, Casitas shall follow the procedures provided by the Water Code in the implementation of the water shortage declaration and actions.

The State of California, through its authority under the Water Code and Government Code, may declare a water shortage emergency and require curtailment of water use that is above and beyond the requirements of the Casitas WEAP. Customers of Casitas must respond and comply with the orders of the State in a timely manner. A failure to comply may cause the State to impose fines and penalties that will be redistributed to the customers of Casitas in a manner determined by the Casitas Board of Directors.

3.3 Water Shortage Contingency Plan.

The District has prepared a Water Shortage Contingency Plan (Resolution 92-11), and further defined in the Casitas Urban Water Management Plan, that addresses emergencies under short-term, catastrophic events, and long-term water shortages that may occur as a result of a prolonged drought.

A water shortage emergency may be determined to exist in the event of a short-term interruption of water supply or as a result of long-term diminishment of the Lake Casitas water supply. A short-term interruption of water supply can be the result of earthquakes, regional power outages, landslides, or other major and minor events that impact Casitas water facilities or supply. These events are more often a short term interruption of water supplies until the water system can be restored to the customers. A long-term or district-wide condition may be the result of drought conditions or a reduction in local water supplies that will require long-term water supply-demand management.

The Casitas response to a short-term interruption of water supply may cause the implementation of the Casitas Emergency Action Plan that is structured under the State's Standardized Emergency Management System (SEMS), in coordination with federal, state and county emergency response planning that provides the framework for an organized response to catastrophic events.

3.4 Water Waste Prohibitions on Certain Uses.

Water Code § 71640 provides the District the authority to restrict the use of district water during any emergency caused by drought, or other threatened or existing water shortage, and the district may prohibit the wastage of district water or the use of district water during such periods for any purpose other than household uses or such other restricted uses as the district determines to be necessary. The District may also prohibit use of district water during such periods for specific uses which it finds to be nonessential.

SECTION 4: STRATEGY FOR MANAGED WATER SUPPLY AND DEMAND

4.1 Strategy Principles.

The communities and rural agricultural areas of western Ventura County recognize that there is a reliance on limited local groundwater and surface water supply to serve all of the beneficial uses within the District, and there is a local responsibility required to sustain those supplies during

extended drought periods. The continuous implementation of water conservation education and measures (Best Management Practices) has had a significant influence on the beneficial use and sustainability of local water supplies. Ongoing water conservation efforts can ease the impact on normal activities during drought periods, but may not completely eliminate the need for reductions in water use during periods when Lake Casitas water supplies are severely impacted by extended drought. The main mechanism to respond to water supply conditions is to rely on informed customers working in partnership with Casitas to limit water use to no more than the assigned water allocation and support the water use limitations with appropriate conservation penalties for water use in excess of the assigned, or adjusted, allocation.

To address the water shortage risk that may occur during an extended drought, the Casitas Board established in the Casitas Urban Water Management Plan of 1995 a series of five storage levels of Lake Casitas at which the Board could take actions to restrict the annual water extractions from Lake Casitas. The safe yield trend and the five stages of restrictive actions are illustrated in Figure 3.

Figure 3 – Lake Casitas Safe Yield Storage Trend and Stages for Demand Reduction

4.2 Water Allocation Principles.

Each and every water service provided by Casitas is metered and a basic water use allocation is established for each customer account that provides a reasonable amount of water for the customer’s needs and property characteristics (WC § 372). The following principles are to be followed for the Casitas water allocations:

- 1) Each Casitas water service shall be assigned either a monthly water allocation in the terms of Units or an annual water allocation in terms of Units and Acre-feet.
- 2) Allocation shall not mean an entitlement or imply water rights in favor of the customer.

- 3) The assignment of allocations shall be based on reasonable and necessary water use, the application of water conservation practices and standards, and other relevant factors associated with water use during Stage 1 conditions at Lake Casitas.
- 4) The Casitas Board of Directors reserve the right to make individual allocation assignments and to change water allocations at any time within each classification based on the changes to the availability of water stored in Lake Casitas, changes in water use that appears to compromise the reliability of the Lake Casitas water supply, and changes in water conservation practices and standards.
- 5) Water allocations provided by Casitas are assigned to property or water purveyors and are not transferrable from one property or water purveyor to another.
- 6) Casitas' water allocations shall not be sold, exported, bartered or traded by or between Casitas' customers.
- 7) Casitas water allocated shall not be transported from the property or by any agency served to any other property or agency without prior written agreement with Casitas.

4.3 Allocation Assignments to Water Service Classifications.

Casitas has established the definitions of water customer classifications as provided by the Casitas Rates and Regulations for Water Service and has made specific allocation assignments to each and every water account by either (1) written agreement, or (2) the application of historical water use data, or (3) the application of documented water use standards. Where deemed necessary by Casitas, Casitas may perform site specific water use audits and survey to determine the appropriate level of allocation to be assigned to any one service connection or customer. Water allocations may change by action of the Casitas Board of Directors based on the Lake Casitas storage level or trend, water use trends, and the performance by customer classification in meeting water consumption reduction goals.

The following subsections describe the method used to assign the water allocation for each classification of water service at **Stage 1** condition:

Business

- 1) Water allocation shall be specified as an **annual** allocation based on a fiscal year (July 1st to June 30th).
- 2) Allocation assigned by recorded agreement; or
- 3) Where not defined by recorded agreement, the lesser of the historical water consumption recorded for either the 80% of the 1989-90 water use or the Fiscal Year 2012-13 water use.

Fire

There is no water allocation for the Fire classification. This water use is for emergency only, and not a part of a continuing annual water use.

Industrial

- 1) Water allocation shall be specified as an **annual** allocation based on a fiscal year (July 1st to June 30th).
- 2) Allocation assigned by recorded agreement; or
- 3) Where not defined by recorded agreement, the lesser of historical water consumption recorded for either the 80% of the 1989-90 water use or the Fiscal Year 2012-13 water use.

Interdepartmental

- 1) Water allocation shall be specified as an annual allocation based on a fiscal year (July 1st to June 30th).
- 2) The **annual** allocations for individual Interdepartmental classification services shall be based on the Fiscal Year 2012-13 water use.

Irrigation (Commercial Agriculture)

- 1) Water allocation shall be specified as an **annual** allocation based on a fiscal year (July 1st to June 30th).
- 2) Qualifying acreage for each Irrigation account shall be limited to acreage that can be identified as under irrigation prior to March 1, 1992. There will be no allocation for irrigation acreage that has been expanded after March 1, 1992, except as otherwise approved in written and recorded agreement between Casitas and the property owner. Casitas' records and mapping will be the standard for the identification of lands in irrigation prior to March 1, 1992.
- 3) Allocation assignments to lands served by multiple meter services shall consider the proportion of the allocation that each meter is intended to serve. The aggregation of meter readings and allocations from multiple meters shall not be allowed except under the terms and conditions of an approved addendum to the Application for Water Service to provide an aggregation variance. The customer may apply for the aggregation of allocations and water volume for accounts serving contiguous parcels under a single ownership, subject to the conditions of the Casitas addendum to the Application for Water Service. The aggregation variance must be approved and on file for the current year during which the variance is applicable. The issuance of the aggregation variance is subject to the discretion of the General Manager.
- 4) The Stage 1 water allocation assigned to each Irrigation water account is the greater volume of either (1) the water use recorded at each meter service during fiscal year 2012-13 or (2) eighty (80) percent of recorded water volume metered to the account in fiscal year 1989-90, neither of which shall exceed a water volume of 3 acre-feet per acre applied to the qualifying acreage.
- 5) The residential water use for Agricultural/Domestic classification that is directly associated with the Irrigation shall be considered as Irrigation for purpose of allocation assignments and meeting the demand reduction requirements for Irrigation.

Multi-Family Residential

- 1) Stage 1 water allocations are assigned to each existing Multi-Family Residential account by either a recorded agreement or based on the standards set in 1992 by Casitas.
- 2) The Multi-Family Residential water allocation for each account shall be distributed by either a monthly or bi-monthly scheduling of the allocation.
- 3) A part of the Multi-Family Residential allocation is provided for health and sanitation and shall be set at **84 units per year per dwelling**, distributed evenly each month as 7 units per month for each dwelling.
- 4) The essential water use portion of the allocation is not subject to adjustment by the Staged Demand Reduction Program, unless otherwise deemed by the Board to be a necessity during extreme water supply conditions or during emergencies.
- 5) The part of the Multi-Family Residential allocation that is in excess of the essential allocation shall be specified as a monthly allocation and distributed proportionally to reflect varying seasonal water use, as follows:

Month	July	August	Sep	Oct	Nov	Dec	Jan	Feb	Mar	Apr	May	June
% of Total Annual Allocation	.12	.11	.11	.11	.08	.08	.04	.06	.05	.05	.09	.10

The part of the Multi-Family Residential allocation that is in excess of the essential allocation is subject to adjustment by the Staged Demand Reduction Program.

- 6) Where not previously assigned a residential allocation, a residential allocation shall be based on the following:
 - a. The essential health and sanitation portion of the residential allocation shall be set at **84 units per year per year per dwelling**, and be constant for each month of the year;
 - b. Non-essential portion of the annual residential allocation shall be based on a maximum limit of 1.99 acres (86,684 square feet) of irrigated landscape area and set as follows:
 - i. For the first 5,000 square feet of landscape area, 15 gallons per square foot;
 - ii. For the next 10,000 square feet of landscape area, 10 gallons per square foot
 - iii. For the next increment up to 71,684 square feet of landscape area, 3 gallons per square foot;

Other

- 1) Water allocation shall be specified as an **annual** allocation based on a fiscal year (July 1st to June 30th).
- 2) Allocation assigned by recorded agreement; or
- 3) Where not defined by recorded agreement, the lesser of historical water consumption of either the 80% of the 1989-90 water use or the Fiscal Year 2012-13 water use.

Resale

- 1) Water allocation shall be specified as an **annual** allocation based on a fiscal year (July 1st to June 30th).
- 2) The Stage 1 allocation for each individual Resale customer shall be mutually agreed to by each water agency and Casitas, be incorporated into a memorandum of understanding (MOU), and assigned to provide water to supplement the Resale agency's primary source of water supply. An annual adjustment to the allocation assignment may be a condition of the MOU.
- 3) An objective of a MOU is to achieve parity between the Resale agency customers and Casitas customers in applying similar overall water use restrictions and financial penalties in each Stage.
- 4) The Resale agency shall determine the reliability of its water sources and ensure that the annual water requirements from Casitas do not exceed their annual water allocation from Casitas.
- 5) The allocation assignment from Casitas shall not be used by the Resale agency for growth within the Resale service area, unless additional allocation for growth is authorized by written agreement with Casitas.
- 6) The Resale agency shall implement water conservation measures in accordance with the State's or California Urban Water Conservation Council's Best Management Practices, responsibly maintain water system metering and pipeline systems to reduce water losses, and when necessary or when asked to do so, implement water demand reduction measures similar to or more restrictive than those imposed by Casitas to assure the continued availability of water for health and safety purposes.

Residential

- 1) Stage 1 water allocations are assigned to each existing Residential account by either a recorded agreement or based on the standards set in 1992 by Casitas.

- 2) The Residential water allocation for each account shall be distributed by either a monthly or bi-monthly scheduling of the allocation.
- 3) A part of the Residential Allocation is provided for health and sanitation and shall be set at **120 units per year**, distributed evenly each month as 10 units per month for each dwelling.
- 4) The essential water use portion of the allocation is not subject to adjustment by the Staged Demand Reduction Program, unless otherwise deemed by the Board to be a necessity during extreme water supply conditions or during emergencies.
- 5) The part of the Residential Allocation that is in excess of the essential allocation shall be specified as a monthly allocation and distributed proportionally to reflect varying seasonal water use, as follows:

Month	July	August	Sep	Oct	Nov	Dec	Jan	Feb	Mar	Apr	May	June
% of Total Annual Allocation	.12	.11	.11	.11	.08	.08	.04	.06	.05	.05	.09	.10

The part of the Residential Allocation that is in excess of the essential allocation is subject to adjustment by the Staged Demand Reduction Program.

- 6) Where not previously assigned a residential allocation, a residential allocation shall be based on the following:
 - a. The essential health and sanitation portion of the residential allocation shall be set at **120 units per year**, and be constant for each month of the year;
 - b. Non-essential portion of the annual residential allocation shall be based on actual irrigated landscape area of the parcel with a maximum limit to 1.99 acres (86,684 square feet) of irrigated landscape area and set as follows:
 - i. For the first 5,000 square feet of irrigated landscape area, 15 gallons per square foot;
 - ii. For the next 10,000 square feet of irrigated landscape area, 10 gallons per square foot
 - iii. For the next increment up to 71,684 square feet of irrigated landscape area, 3 gallons per square foot;

Temporary

- 1) There is no water allocation assigned for the Temporary classification. Temporary water service is not property related on a permanent basis.
- 2) Temporary water use is limited for a short-term of six months or less, for such purposes as construction projects, or short-term water supply emergencies, or temporary backup water to non-metered agricultural parcels.
- 3) Temporary meters that are issued to serve supplemental commercial irrigation shall be temporarily allocated water based on the allocation assignment provided at the time of the application for the Temporary service based on the same water use standards as provided for the Irrigation classification, and reduced by Stage conditions,. The allocation does not extend beyond the period of the temporary water service application of six (6) months, unless the Casitas Board of Directors approves a limited continuance of the temporary service.

4.4 Allocation Adjustments.

A Casitas customer may request the reconsideration of their initial assigned Stage 1 water allocation within 60 days of the adoption of the WEAP where the request does not include a consideration for either an expansion in the area of use or new construction. The customer shall submit a water allocation adjustment application in order to have their request considered by the General Manager of

the District. The information contained on the application may be subject to an audit and, if necessary, additional documentation may be required in order to substantiate the requested adjustment.

Adjustments to water allocations that have been assigned through a recorded Water Service Agreement between the property owner, or prior property owner, and Casitas must proceed through an amendatory agreement, will be subject to the capital facility charges for the amount of water provided as the allocation adjustment, and subject to the availability of water allocations.

Adjustments to water allocations will not be granted in amounts that exceed 80 percent of the FY 1989-90 metered usage of water by the meter service account without prior Board approval.

4.5 Standards for a Water Allocation Adjustment.

Water allocation adjustments may be considered by Casitas during initiation of the WEAP that appropriately assigns a Stage 1 allocation, to ensure that the needs of the water customer are reasonably balanced against the purpose of this Plan.

Water allocations may be considered for adjustment for:

- a. Correction of irrigable area square footage;
- b. Correction of number of dwelling units (Multi-family accounts only);
- c. Exemption granted for a licensed in-home childcare or elderly care facility;

Water allocations will not be adjusted to accommodate:

- a. Pools, ponds, spas, or hot tubs;
- b. In-home businesses or hobbies that use an increased amount of water;
- c. Gardens and orchards;
- d. Homeowner's Association requirements for turf areas in excess of that water allocation specified by Casitas for a Residential classification;
- e. Where an allocation has been assigned through a recorded agreement.

Agricultural Irrigation Allocation Adjustment Standards:

- a. Limited to acreage planted in commercial agricultural production prior to March 1, 1992. Casitas shall also consider the assignment of an appropriate allocation to lands that are verified as being in a crop rotation status, or temporarily in a fallowed state, having been in a planted status prior to March 1, 1992.
- b. Comparative (same crop type and average use of various parcels) crop usage in FY2012-13 for full irrigation, not to exceed 3 AF/AC/YR, which is located within a 1-mile circumference of the parcel seeking the appeal for a change in water allocation.

4.6 Appeals Process.

Customers that are denied an adjustment of water allocation may request a review of the request by submitting a written appeal to the Casitas Water Resources Manager stating the nature of the appeal. The appeal shall be reviewed by the Casitas Water Resources Manager and a recommendation shall be reported to the General Manager. The decision of the General Manager shall be reported to the customer in written form. If the customer is not satisfied with the General Manager's decision, the customer must request within 10 days that the appeal be placed on the agenda of the Casitas Board of Directors. The determination by the Board of Directors shall be final.

4.7 Availability of Allocations.

The determination of supplies being available for issuance of new allocations of water shall be made upon staff recommendation at a regular Board of Directors meeting. The determination that water is or is not available shall be within the determination of the Board of Directors. The determination that a supply is available shall be based upon more detailed information about existing supplies, the availability of new supplies, new water supply projects, or contracts or proposed contracts for additional supplies where, in the opinion of the Board of Directors, the supply of water is definite enough to provide the assurance to the County of Ventura that there is a forty year supply.

4.8 Allocation for New or Expanded Water Uses.

A customer may request a change to a water allocation assignment for the purposes of obtaining new or expanded use of water that is associated with a new building permit, new or existing conditional use permit, or agricultural irrigation acreage expansion. The approval of an addition or change to the water allocation for new and/or expanded water allocation is subject to Casitas' discretion on the limits of available water allocation and subject to the charges for new and/or expanded water allocation.

When the Board of Directors determine that additional new water supplies are available, either from the safe yield of the existing CMWD project supply or additional new supplies, supplies shall be allocated in accordance with the following criteria:

- a) No single property owner or applicant for the given type of service (municipal, industrial or agricultural) shall receive a new water allocation greater than 10 percent of the total new available supply or the minimum standard residential allocation, whichever is greater. If the applicant's allocation requirements are not fully met, the applicant may maintain a position of priority until more water is available.
- b) All applicants seeking an allocation shall provide Casitas with a detailed description of the project, the use of water for which the water is sought, and information on peak flow and annual water requirements. Casitas shall determine meter size and amount of allocation based upon reasonable and necessary needs and Casitas' Rates and Regulations.
- c) The amount of water to be allocated shall be at Casitas' sole discretion. The assignment of an allocation shall be limited to the availability of water from the Lake Casitas safe yield, and be based on current water demand factors as adopted by the District and as amended. The amount of water required for the project may be calculated and submitted for the consideration of Casitas by a civil engineer, registered in the State of California, representing the project proponent.

SECTION 5: STAGED DEMAND REDUCTION IMPLEMENTATION

5.1 Staged Demand Reduction Principles.

The primary source of water that is available to the Casitas Municipal Water District is the amount of water stored behind Casitas Dam, forming Lake Casitas. The quantity of water stored in Lake Casitas is dependent upon the local hydrology, watershed conditions, diversions from the Ventura River, and the outflow from lake evaporation and water deliveries to beneficial uses. There may be times during which Casitas must consider implementing staged water demand reductions to ensure a sustainable water supply and prevent a complete depletion of water supply in Lake Casitas.

The District has assigned five stages of water storage in Lake Casitas that serve as a guidance to triggering the implementation of water use reduction goals and measures. The overarching goals of the Staged Demand Reduction Program are:

- 1) conserving the water supply for the greatest priority and public benefit; and
- 2) mitigating the effects of a water shortage on public health, safety, and economic activity.

5.2 Water Resource Conditions and Actions.

The General Manager shall report to the Board of Directors each year (*April*) with an assessment of the current water storage in Lake Casitas and local groundwater basins, current water use trends, predicted weather conditions, and an evaluation of current water use reduction goals. The time of the reporting can be each April, as the rainfall season is ending and water resources can be evaluated at the maximum for the year, or as Lake Casitas storage reaches a change in Stage action level. The Board of Directors may, at their sole discretion, declare that a Stage condition of water supply in Lake Casitas exists and implement the appropriate demand reduction goals and measures in response to current and/or predicted water availability conditions. Casitas shall make such determinations public and follow with appropriate and timely notification of all customers. Casitas has established the implementation of various Stages of action based on the amount of water in storage in Lake Casitas, as shown in Table 3. An action to declare and implement a Stage may be by either an action by Casitas Board of Directors based on unanticipated changing lake supply conditions or by the following schedule in Table 4.

Table 3 – Stage Conditions

Stage	Stage Title	Lake Casitas Storage - %	Lake Casitas Storage Action Level (acre-feet)
1	Water Conservation	100% - 50%	237,761 to 118,880
2	Water Shortage Warning	50% - 40%	118,880 to 95,104
3	Water Shortage Eminent	40% - 30%	95,104 to 71,328
4	Severe Water Shortage	30% - 25%	71,328 to 59,440
5	Critical Water Shortage	25% - 0%	59,440 to 3,000

Table 4 - Stage Action Schedule

<u>Target Dates</u>	<u>Action</u>
June - April	Monitor water demands, rainfall, reservoir level trend, groundwater trends, and diversion and runoff amounts.
Early April	Staff presents water status report and a recommendation to the Casitas Board of Directors. Publish a notice of a public hearing if changes are recommended.
Late April	Casitas Board of Directors formally declares a Stage, and/or water shortage emergency, adopts recommendations for demand reduction actions.
May	Customer Notification of change in Stage, allocation, and conservation surcharge.
June	Stage demand reduction actions are effective and are implemented.

5.3 Demand Reduction Goals and Measures.

The demand reduction goals and measures begin with Stage 1, where reasonable and appropriate water allocation assignments are made to each Casitas service connection and the end water users are

Demand Reduction Stage	1	2	3	4	5
Volume Range of Lake Casitas	254,000 to 127,000	127,000 to 100,000	100,000 to 75,000	75,000 to 65,000	65,000 to 3,000
% Lake Storage	100% - 50%	50% - 40%	40% - 30%	30% - 25%	25% - 0%
Water Use Reduction Response Goal	20%	20%	30%	40%	50%
Residential & Multi-Family Residential Essential Use Non-essential Use	0% 20%	0% 20%	0% 30%	0% 40%	0% 50%
Business	20%	20%	30%	40%	50%
Industrial	20%	20%	30%	40%	50%
Other	20%	20%	30%	40%	50%
Resale	20%	20%	30%	40%	50%
Irrigation	20%	20%	30%	40%	50%
Interdepartmental	20%	20%	30%	40%	50%

implementing the Best Management Practices that conform to State requirements for water conservation and water use efficiency measures. Upon determination of a Stage 2 condition and continuing through Stage 5 conditions, the primary actions to achieve the demand reduction goal is the adjustment of allocations that were made available for each classification during Stage 1 by a reduction of the allocation during the duration of the declared Stage condition.

5.4 Stage Adjustments to Allocations.

The five stages of storage in Lake Casitas and the initial guideline for water allocation adjustments for each classification at each Stage are presented in Table 5. Upon recommendation of the General Manager and approval of the Board of Directors at the onset of a specific Stage, the District shall apply appropriate demand reduction factors to the allocations for each customer classification, as deemed necessary. The Board of Directors retain the sole discretion to make allocation changes as a result of declaring a change in Stage, or during any Stage, that are more or less severe than that provided in Table 5. Examples of applying this discretion may include, but not be limited to, the change in any water resource conditions or the demand reduction goals are not being attained by the customer classification.

Table 5 – Staged Water Demand Reductions for Water Classifications

Note: Initial Stage 1 Allocations include a 20% reduction from the 1989-90 demands.

Essential Use Allocations will remain the same and not adjusted, except as otherwise determined by the Board to be a necessity to preserve water supply during extreme conditions. The measures to

achieve the demand reduction goal may be selected from a menu of options as provided in Table 6, or should water supply conditions become worse than anticipated the Casitas Board may adopt more stringent requirements as deemed necessary.

5.5 Customer Notification.

The customers of each and every classification shall be notified in a timely and appropriate manner of any and all actions to declare and implement Demand Reduction Stage. The methods of communication to the customer shall be through direct mailings, public meetings, and billing information that provides the customer the comparison of water use with allocation.

5.6 Water Rates and Conservation Penalty.

- a. The Casitas Board of Directors shall annually consider the setting or adjustment of water rates that reflect the cost of water service, consistent with State law.
 1. Casitas has implemented a tiered inclining rate structure for the Residential and Multi-family Residential classifications that represents the proportional cost of service that is attributable to the parcel that is served water.
- b. The Casitas Board of Directors shall annually set the Conservation Penalty for each classification that will be applied to each individual customer billing for each unit of water that is in excess of the customer's allocation, or the adjusted allocation pursuant to a change in Stage. The Conservation Penalty is imposed to curtail the potential for adverse effects of excessive water consumption.
- c. Upon determination of a change in the Demand Reduction Stage, or at such time the Board deems that the customer response does not appear to attain the desired demand reduction goals, the Board may consider the modification of the Conservation Penalty.
- d. Revenues recovered from the Conservation Penalty will supplement Casitas' water conservation costs, provide revenue for water shortage related projects, and cover costs associated with implementing changes to the WEAP as directed by the Board.

5.7 Appeals for Exception to Staged Adjustments of Allocation or Conservation Penalty Assessment.

- a. A Casitas customer may file an appeal for:
 1. An Exception to Staged Adjustment of Allocation, as provided in Section 5.4 above; or
 2. The assessment of a Conservation Penalty, as provided in Section 5.6 aboveby submitting a written appeal, on a form provided by Casitas, directly to the General Manager or his/her designee.
- b. The following paragraphs provide the criteria or reasons for an appeal for an Exception to Staged Adjustments of Allocation and an appeal for an Exception to Staged Adjustments of Allocation may be granted for one or more of the following reasons:

1. The staged adjustment would cause a condition affecting the health, sanitation, fire protection, or safety of the customer or the public;
 2. Strict application of the water allocation adjustment provisions imposes a severe or undue hardship on a particular business, or renders it infeasible for a business or class of business to remain in operation;
 3. The customer is a hospital or health care facility using industry best management practices;
 4. The business has already implemented environmental sustainability measures and water conservation measures reducing water consumption to the maximum extent possible.
- c. The customer must support their reason for an appeal for an Exception to Staged Adjustments of Allocation with supporting documentation or substantial evidence demonstrating the need for an exception. A failure to provide supporting documentation or evidence shall result in a denial of the appeal.
- d. The appeal for an Exception to Staged Adjustments of Allocation will be first reviewed, approved or denied, by the General Manager or his/her designee. The decision of the General Manager or his/her designee shall be reported to the customer/appellant in written form. If the customer is not satisfied with the General Manager or his/her designee's decision, the customer/appellant must request, within 10 days of the date of the General Manager or his/her designee's decision, that the appeal be placed on the agenda of the Casitas Board of Directors for their review and determination based on the criteria set forth in Section 5.7(b)(1)-(4). The determination by the Casitas Board of Directors shall be final.
- e. The following paragraphs provide the criteria and process for an appeal from a Conservation Penalty:
1. An appeal for relief of a Conservation Penalty may only be considered when a natural disaster such as a wildfire, earthquake, flood or landslide or other naturally occurring phenomenon which directly causes a leakage or leakage event.
 2. The customer must file their appeal to the Casitas Municipal Water District Board of Directors' Appeals Panel.¹ A request for review and an evidentiary hearing must be made in writing and submitted to the District within thirty (30) days of date the Casitas bill with the Conservation Penalty was issued by the District. Upon receipt by the District, a review and evidentiary hearing will be placed on the next agenda of the Appeals Panel.
 3. The appeal of a Conservation Penalty must explain why the leakage or leakage event was caused by a naturally occurring event such as wildfire, earthquake, flood or landslide.
 4. The customer/appellant must support their reason for an appeal from a Conservation Penalty with supporting documentation or substantial evidence demonstrating the circumstances for the appeal. A failure to provide supporting documentation or evidence shall result in a denial of the appeal.

¹ The Appeals Panel is a Board-appointed committee composed of three (3) Board members who are authorized to conduct evidentiary hearings, make findings and render decisions in accordance with this section of the Water Efficiency and Allocation Program. This is in accordance with California Water Code Sections 71300, 71301 and 71305.

5. The General Manager or his/her designee will review the appeal and the documentation or evidence provided by the customer supporting the appeal. The General Manager or his/her designee may request additional information from the customer. Following a review of the appeal, the General Manager shall make a recommendation to the Appeals Panel. A copy of the General Manager's recommendation will be provided to the customer/appellant.
6. If a review and evidentiary appeal hearing is properly requested before the Appeals Panel, the customer/appellant shall have an opportunity to state their case and present evidence supporting their appeal. Following the customer's presentation of the grounds for appeal, the Appeals Panel shall review the General Manager's recommendation on the conservation penalty appeal and determine whether to grant the appeal in full, apportion the penalty, or deny the appeal based on the following:
 - A. The documentation and/or evidence provided by the customer in their initial written appeal;
 - B. The basis of the General Manager's recommendation as provided in the General Manager's written explanation of the grounds for the recommendation; and
 - C. Any additional circumstances the Appeals Panel determines to be relevant during the evidentiary hearing.
7. In order to approve an appeal of a Conservation Penalty, the Appeals Panel must make the following findings:
 - A. The customer provided documentation or substantial evidence that the Conservation Penalty could not be avoided by circumstances within the customer's reasonable control;
 - B. The General Manager's written recommendation is valid or invalid in light of the customer's documentation or evidence provided; and
 - C. The reason for the appeal is not to accommodate for leakage or a leakage event within the control of the customer.
8. If the appeal for a Conservation Penalty is approved by the Appeals Panel, the Appeal Panel shall determine if the Conservation Penalty is denied in whole or in part.
9. Following the review and the evidentiary hearing, the Appeals Panel shall provide a written determination with findings to the customer within thirty (30) days of the hearing either approving, denying or apportioning the appeal. The Appeals Panel's determination is final and binding on the customer.

SECTION 6: EXPORT OF CASITAS WATER

Water Code Section 71611 authorizes Casitas to sell water under its control for use only within the jurisdictional boundaries of the Casitas Municipal Water District. The unauthorized export and use of Casitas water beyond the Casitas district boundaries can have significant negative impacts on the Casitas water supply reliability, and therefore shall be prohibited unless specifically authorized in writing by the Casitas Board of Directors. All customers receiving Casitas water into water

conveyance systems which cross Casitas boundaries shall meet the following requirements as a condition of service:

- 1) Customers shall submit to Casitas a certified report on the last day of each month that demonstrates that no Casitas water was transported or used outside Casitas boundaries during the prior month without written approval by Casitas.
- 2) Customer shall install and maintain approved metering devices and shall be required to account for all Casitas water delivered in the customer's system.
- 3) In the event Casitas water is exported during any month, the customer shall be billed for exported water at five (5) times the Casitas rate for the Temporary Service classification.
- 4) In the event the customer fails to comply with the conditions of service stated in the above (1) and/or (2), all water purchased in excess of the allocation shall be considered exported water and shall be billed in accordance with the foregoing.
- 5) This Section, Export of Casitas Water, is in effect at all times.
- 6) The exceptions to the export are during a declaration by the Board of Directors of surplus water, and limited to the surplus water or exchange agreement between the Board of Directors and other party.

Continuing or reoccurring violations of this section by any Casitas customer may result in the restriction or disconnection of water service to the customer.

Table 6 – Stage Actions and Water Demand Reduction Measures

Water Shortage Condition	Key Casitas Communications and Actions	Customer Demand Reduction Measures	Penalties And Rates
<p>Stage 1</p> <p>Supply Range 100% - 50%</p> <p>Voluntary Demand Reduction To Stage 1 Allocation</p>	<ul style="list-style-type: none"> • Initiate public information and advertising campaign. • Publicize ways to reduce water consumption. • Coordinate conservation actions with other water purveyors and cities. • Perform water audits and promote water efficient use/conversions. • Conduct water workshops. • Temporary staffing for public inquiries, as needed. 	<ul style="list-style-type: none"> • Water conservation practices requested of all customer classifications. • Adhere to Water Waste Prohibition Ordinance and State of California laws and regulations regarding water waste • Adhere to assigned water allocation or less. 	<ul style="list-style-type: none"> • Consider and implement Conservation Penalty for water use in excess of allocation. • Consider rates for revenue stabilization and cost of service.
<p>Stage 2</p> <p>Supply Range 50% - 40%</p> <p>Mandatory Demand Reduction to Stage 1 Allocation</p>	<ul style="list-style-type: none"> • Declare Stage 2 • Implement demand reductions for each customer classification. • Intensify public information campaign. • Optimize existing water resources. • Intensify leak detection. • Develop appeals staffing. • Consult with major customers to develop conservation plans and water use audits. 	<ul style="list-style-type: none"> • Continue all Stage 1 measures. • Landscape watering advised to two (2) watering days per week. • Require water audits for large water users; implement recommendations of the water audits. • Businesses display “save water” signage. • Increase public information. 	<ul style="list-style-type: none"> • Consider and implement Conservation Penalty for water use in excess of allocation – response to reduced allocation. • Consider rates for revenue stabilization and cost of service.
<p>Stage 3</p> <p>Supply Range 40% - 30%</p> <p>Demand Reduction From Stage 1 Allocation 10%</p>	<ul style="list-style-type: none"> • Declare Stage 3 • Implement demand reductions for each customer classification. • Expand and intensify public information campaign. • Provide regular briefings, publish monthly consumption report. • Hire additional temporary staff in customer service and conservation. Water waste enforcement. 	<ul style="list-style-type: none"> • Continue with Stage 1 and 2 measures. • Reduced water allocations. • Landscape watering advised to one (1) watering day per week. 	<ul style="list-style-type: none"> • Consider and implement Conservation Penalty for water use in excess of allocation – response to reduced allocation. • Consider rates for revenue stabilization and cost of service.

CASITAS MUNICIPAL WATER DISTRICT

ORDINANCE NO. 15-02

AN ORDINANCE OF THE CASITAS MUNICIPAL WATER DISTRICT ESTABLISHING WATER WASTE PROHIBITIONS

THIS ORDINANCE is adopted in light of the following facts and circumstances, which are hereby found and declared by the Casitas Municipal Water District (Casitas) Board of Directors:

WHEREAS, Article X, Section 2 of the California Constitution and Section 100 of the California Water Code declare that the general welfare requires water resources be put to beneficial use, therefore, waste or unreasonable use or unreasonable method of use of water be prevented, and conservation of water be fully exercised with a view to the reasonable and beneficial use thereof.

WHEREAS, the adoption and enforcement of this Ordinance is necessary to help manage Casitas' potable water supply and to avoid or minimize the effects of drought within the Casitas service area.

WHEREAS, Casitas has the power to perform all acts necessary to fully carry out the provisions of this Ordinance consistent with Section 71640 and Sections 10608 through 10656 of the California Water Code.

WHEREAS, this Ordinance rescinds and replaces Casitas Municipal Water District Resolution No. 08-09, Resolution Approving a Water Waste Prohibition Regulation.

BE IT ORDAINED by the Board of Directors of the Casitas Municipal Water District as follows:

1. TITLE.

This Ordinance shall be known as the Water Waste Prohibition Ordinance.

2. APPLICABILITY.

The provisions of this Ordinance shall apply to all persons, corporations, public or private entities, governmental agencies or institutions, or any other direct water customers of the Casitas Municipal Water District. The water customers of other water purveyors shall be governed by the prohibitions that are adopted by the other water purveyors.

3. PROHIBITED USES.

A. The following uses of water are permanently prohibited and are in effect year round:

- a. **General Waste:** Indiscriminate running of water or washing with water which is wasteful and without reason or purpose.
- b. **Washing of Exterior Surfaces:** The washing of hard or paved surfaces, including but not limited to sidewalks, walkways, driveways, parking areas, tennis courts, patios or alleys, except when necessary to alleviate safety or sanitary hazards or when

broom or other waterless device will not suffice. If necessary, washing may only be done with a bucket or similar container, a hose equipped with a positive shut-off nozzle, a pressure washer, a low-volume high pressure water efficient water broom, or a cleaning machine equipped to recycle the water used.

- c. **Cleaning of Structures and Vehicles:** The washing of building exteriors, mobile homes, cars, boats or recreational vehicles without the use of a positive shut-off nozzle on either the hose or pressure washer.
- d. **Watering/Irrigation Runoff Control:** The watering of grass, lawn, groundcover, shrubbery, open ground, crops and trees, including agricultural irrigation, in a manner or to an extent which allows water to run off the area being watered. Every water user is deemed to have under their control, at all times, their water distribution lines and facilities, and to know the manner and extent of their water use and run off.
- e. **Limits on Watering Hours:** The watering or irrigating of outdoor ornamental landscapes and turf areas between the hours of 10:00 a.m. and 6:00 p.m. Pacific Standard Time on any day. (Does not apply to irrigation systems that use drip-irrigation and weather-based controllers or stream rotor sprinklers that meet a 70% efficiency standard. Exceptions may be authorized by the General Manager where there is no ability to not water between 10:00 a.m. to 6:00 p.m.).
- f. **Watering During Rainfall:** The watering of grass, lawn, groundcover, shrubbery, open ground, crops and trees, including agricultural irrigation, at any time while it is raining.
- g. **Drought Restrictions:** Watering/irrigating during publicly declared curtailment period in a manner that is not compliant with drought restrictions.
- h. **Plumbing Leaks:** The escape of water through leaks, breaks, or malfunctions within the water user's plumbing or distribution system, for a substantial period of time within which such break or leak should reasonably have been discovered and corrected.
- i. **Fountains and Decorative Water Features:** The operation of any ornamental fountain using water from the District's domestic water system unless water for such use is re-circulated.
- j. **Cooling:** The use of water in mechanical equipment purchased and installed after the adoption of this Ordinance that utilizes a single pass cooling system. Water used for all cooling purposes shall be re-circulated.
- k. **Drinking Water Served Upon Request Only:** Eating and drinking establishments, including but not limited to restaurants, hotels, cafes, cafeterias, bars, clubs or other public places where food or drinks are sold or served, are prohibited from providing drinking water to customers unless expressly requested. Affected establishments must prominently display notice informing their customers of this requirement using clear and easily understood language.
- l. **Restaurant Non-water Conserving Dish Wash Spray Valves:** Food preparation establishments, such as restaurants or cafes, are prohibited from using non-water conserving dish wash spray valves.
- m. **Providing Option to Not Launder Linen and Towels Daily:** Hotels, motels, vacation rentals and other commercial lodging establishments must provide customers the option of not having towels and linen laundered daily. Commercial lodging establishments must prominently display notice of this option in each bathroom using clear and easily understood language.

- n. **Commercial Car Wash Systems:** Installation of non-recirculating water systems is prohibited in new or renovations of commercial conveyor car washes systems.
- o. **Turf Irrigation Restrictions:** Irrigating turf or ornamental landscapes during and 48 hours following measurable precipitation.

4. EXEMPTED WATER USES.

- A. All water use associated with the operation and maintenance of fire suppression equipment or employed by the District for water quality flushing and sanitation purposes shall be exempt from the provisions of this Ordinance.
- B. Use of water supplied by gray water or rainwater collection system is also exempt; however, use of water from these systems is not exempt from the applicable regulations of the State and local jurisdictions governing the use of such water.
- C. Supervised testing, adjusting, or repairing of irrigation systems is allowed any time for no more than five (5) minutes per station.

5. VIOLATIONS AND PENALTIES.

- A. Any person, who uses, causes to be used, or permits the use of water in violation of this Ordinance is guilty of an offense punishable as provided herein.
- B. **Enforcement of Violation.** Complaints of water waste will be investigated and enforced by the District in the form of a notice of violation. The following officers and employees of the Casitas Municipal Water district are hereby designated and authorized to issue citations for enforcement of this Ordinance:
 - Operations and Maintenance Manager
 - Public Affairs/Resource Manager
 - Water Conservation Coordinator
 - Utility Workers
 - Water employees designated by the General Manager
- C. **Notice of Violation.** The notice to the District water customer of a violation of this Ordinance will be issued by either a telephone call, mail, hand-delivery, or posting at the entrance of the violator's premises. The District will issue a written notice that state the time, place, and general description of the violation or repeat of violation, as well as a time frame in which the violation must be corrected. District staff may use discretion when determining the correction time.
- D. **Consequence of Violation.** Administrative fines and water service actions may be levied and applied for each violation of a provision of this Ordinance as follows:
 - 1. **Penalties:** Penalties for failure to comply with any provision of the ordinance are as follows:
 - a. **First Violation:** The District will issue a written notice to the water customer and attach a copy of this Ordinance.
 - b. **Second Violation:** If the first violation is not corrected within the time frame specified by the District, or if a second violation occurs within the following twelve (12) months after the first violation notice, a second notice of violation will be issued and an administrative fine of one hundred dollars (\$100.00) shall be levied for the second violation of this Ordinance.

- c. **Third Violation:** A third violation within the following twelve (12) months after the date of issuance of the second notice of violation is punishable by an administrative fine of two hundred fifty dollars (\$250.00).
 - d. **Fourth and Subsequent Violations:** Each day that a violation of this Ordinance occurs beyond the remedy allowance provided in the third notice of violation is a separate offense, subject to any or all of the following penalties:
 1. Water service may be turned off or flow may be restricted. Where water service is turned off or flow restricted, it shall be turned on or unrestricted upon correction of the violation and the payment of the reestablishment charges, staff time, and District material purchases per the District's Rates and Regulations for Water Service in effect at the time.
 2. A fine of not more than \$600 or imprisonment in the county jail for not more than 30 days, or both the fine and imprisonment, may be imposed upon conviction under Section 71644 of the California Water Code, or fines/ penalties as defined and allowable under Section 53069.4 of the Government Code may be imposed.
 - e. **Payment of Administrative Fines:** The water customer is responsible for the full payment of administrative fines. Each administrative fine shall be applied in the customer's regular water billing. Payment of the administrative fine will be the final responsibility of the individual named on the water account. Non-payment of fines will be subject to the same remedies as non-payment of basic water rates, in accordance with the Casitas Rates and Regulations for Water Service.
3. **Appeal:** Any customer against whom a penalty is levied pursuant to this Ordinance shall have the right to appeal as follows:
- a. The customer request for an appeal consideration must be in writing, legible, and received by the General Manager within ten (10) calendar days of the issuance of the notice of violation to the customer. Any determination not timely appealed shall be deemed final. The written request for appeal consideration shall include:
 - i. A description of the issue,
 - ii. Evidence supporting the appeal, and
 - iii. A request for resolution of the dispute.
 - b. The General Manager will review the material submitted and make an independent determination of the issue, which shall be mailed to the customer within fifteen (15) calendar days of receipt of the request for appeal.
 - c. The General Manager's determination may be appealed in writing within ten (10) calendar days of the mailing of the notice of determination. The appeal of the General Manager's determination shall be heard and considered by the Board of Directors at an upcoming regular meeting of the Board. Notice of the hearing shall be mailed to the customer at least ten (10) calendar days prior to the date of the appeal hearing. The Board may, in its discretion affirm, reverse, or modify the determination. The Board's determination is final.

6. **SEVERABILITY.** If any competent court shall find any portion of this Ordinance unconstitutional, such decision shall not affect the validity of any other portion thereof.

7. **EFFECTIVE DATE.** This Ordinance becomes effective this 22nd day of April, 2015.

PASSED AND ADOPTED at a regular meeting of the Board of Directors of the Casitas Municipal Water District held on April 22, 2015 by the following vote:

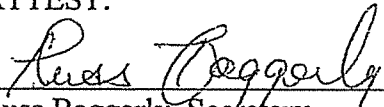

AYES: Word, Baggerly, Kaiser, Bergen
NOES: None
ABSENT: Hicks
ABSTAIN: None

APPROVED:

Mary Bergen, President
Casitas Municipal Water District

ATTEST:

Russ Baggerly, Secretary
Casitas Municipal Water District

Resolution No. 21-XX Adoption of Water Shortage Contingency Plan an Resolution of Adoption of 2020
Urban Water Management Plan

CASITAS MUNICIPAL WATER DISTRICT

Resolution No. 2021-14

**RESOLUTION ADOPTING THE WATER SHORTAGE CONTINGENCY PLAN
AND THE 2020 URBAN WATER MANAGEMENT PLAN**

WHEREAS, the California Legislature in its 1983-1984 Regular Session adopted the Urban Water Management Planning Act; and

WHEREAS, said Act requires all urban water purveyors with greater than 3,000 service connections or water use of more than 3,000 acre-feet per year served directly to consumers to prepare and submit an urban water management plan to the California Department of Water Resources every five years; and

WHEREAS, the plan shall be reviewed periodically, at least every five years, and Casitas shall make any amendments or changes to its plan which are indicated by the reviews; and

WHEREAS, the original plan was adopted and sent to the California Department of Water Resources in March 1996; and

WHEREAS, the review plan must be filed with the California Department of Water Resources within thirty days of adoption; and

WHEREAS, Casitas' Water Shortage Contingency Plan is included within the 2020 Urban Water Management Plan; and

WHEREAS, the 2020 Urban Water Management Plan addresses all state requirements for such a plan; and

NOW, THEREFORE BE IT RESOLVED by the Board of Directors of the Casitas Municipal Water District as follows:

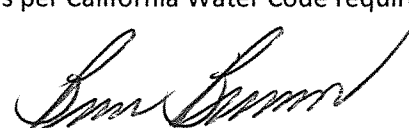

1. The Water Shortage Contingency Plan for Casitas Municipal Water District has been reviewed, modified, and is included in the 2020 Urban Water Management Plan and is hereby adopted.
2. The 2020 Urban Water Management Plan of Casitas Municipal Water District has been reviewed, modified, and is on file in Casitas' office and is hereby adopted.
3. A copy of the Final 2020 Urban Water Management Plan is to be forwarded to the California Department of Water Resources and other entities per California Water Code requirements.

APPROVED this 23rd day of June 2021

ATTEST

Neil Cole, Secretary
Casitas Municipal Water District

Brian Brennan, President
Casitas Municipal Water District

NOTES:

Submittal Table 7-1 Retail: Basis of Water Year Data (Reliability Assessment)

Year Type	Base Year If not using a calendar year, type in the last year of the fiscal, water year, or range of years, for example, water year 2019-2020, use 2020	Available Supplies if Year Type Repeats	
		<input type="checkbox"/>	Quantification of available supplies is not compatible with this table and is provided elsewhere in the UWMP. Location _____
		<input checked="" type="checkbox"/>	Quantification of available supplies is provided in this table as either volume only, percent only, or both.
		Volume Available *	% of Average Supply
Average Year	2003	11,907	100%
Single-Dry Year	2019	11907	100%
Consecutive Dry Years 1st Year	2011	11907	100%
Consecutive Dry Years 2nd Year	2012	11907	100%
Consecutive Dry Years 3rd Year	2013	11732	99%
Consecutive Dry Years 4th Year	2014	10682	90%
Consecutive Dry Years 5th Year	2015	11207	94%

Supplier may use multiple versions of Table 7-1 if different water sources have different base years and the supplier chooses to report the base years for each water source separately. If a Supplier uses multiple versions of Table 7-1, in the "Note" section of each table, state that multiple versions of Table 7-1 are being used and identify the particular water source that is being reported in each table.

***Units of measure (AF, CCF, MG) must remain consistent throughout the UWMP as reported in Table 2-3.**

NOTES: Base volume available: Lake Casitas (10,060), Mira Monte Well (145) and Purchased/Imported (SWP) Water (1,400). SWP availability from 2011 to 2015 was factored into multiple dry years.

Submittal Table 7-1 Wholesale: Basis of Water Year Data (Reliability Assessment)

Year Type	Base Year If not using a calendar year, type in the last year of the fiscal, water year, or range of years, for example, water year 1999-2000, use 2000	Available Supplies if Year Type Repeats	
		<input type="checkbox"/>	Quantification of available supplies is not compatible with this table and is provided elsewhere in the UWMP. Location _____
		<input checked="" type="checkbox"/>	Quantification of available supplies is provided in this table as either volume only, percent only, or both.
		Volume Available *	% of Average Supply
Average Year	2003	5103	100%
Single-Dry Year	2019	5103	100%
Consecutive Dry Years 1st Year	2011	5103	100%
Consecutive Dry Years 2nd Year	2012	5103	100%
Consecutive Dry Years 3rd Year	2013	5028	99%
Consecutive Dry Years 4th Year	2014	4578	90%
Consecutive Dry Years 5th Year	2015	4803	94%

Supplier may use multiple versions of Table 7-1 if different water sources have different base years and the supplier chooses to report the base years for each water source separately. If a supplier uses multiple versions of Table 7-1, in the "Note" section of each table, state that multiple versions of Table 7-1 are being used and identify the particular water source that is being reported in each table. Suppliers may create an additional worksheet for the additional tables.

***Units of measure (AF, CCF, MG) must remain consistent throughout the UWMP as reported in Table 2-3.**

NOTES: Base volume available: Lake Casitas (4,460), Mira Monte Well (43) and Purchased/Imported (SWP) Water (600). SWP availability from 2011 to 2015 was factored into multiple dry years.

measure (AF, CCF, MG) must remain consistent throughout the UWMP as reported in Table 2-3.

² Units of

NOTES: Ojai System

Submittal Table 4-3 Retail: Total Water Use (Potable and Non-Potable), Ojai Retail

	2020	2025	2030	2035	2040	2045 (opt)
Potable Water, Raw, Other Non-potable <i>From Tables 4-1R and 4-2 R</i>	1,751	1,850	1,850	1,850	1,850	0
Recycled Water Demand ¹ <i>From Table 6-4</i>	0	0	0	0	0	0
Optional Deduction of Recycled Water Put Into Long-Term Storage ²						
TOTAL WATER USE	1,751	1,850	1,850	1,850	1,850	0

¹ Recycled water demand fields will be blank until Table 6-4 is complete ²
 Long term storage means water placed into groundwater or surface storage that is not removed from storage in the same year. Supplier *may* deduct recycled water placed in long-term storage from their reported demand. This value is manually entered into Table 4-3.

NOTES: Ojai System

Submittal Table 4-4 Retail: Last Five Years of Water Loss Audit Reporting, Ojai Retail

Reporting Period Start Date (mm/yyyy)	Volume of Water Loss ^{1,2}
01/2016	unknown
01/2017	347
01/2018	281
01/2019	237
01/2020	126

¹ Taken from the field "Water Losses" (a combination of apparent losses and real losses) from the AWWA worksheet. ²

Units of measure (AF, CCF, MG) must remain consistent throughout the UWMP as reported in Table 2-3.

NOTES: Losses are shown proportional to pipeline length of Casitas Retail (72%) and Ojai Retail (28%). Casitas did not own the Ojai System in 2016.

Submittal Table 4-5 Retail Only: Inclusion in Water Use Projections, Casitas and Ojai Retail Systems

<p>Are Future Water Savings Included in Projections? (Refer to Appendix K of UWMP Guidebook) <i>Drop down list (y/n)</i></p>	<p>Yes</p>
<p>If "Yes" to above, state the section or page number, in the cell to the right, where citations of the codes, ordinances, or otherwise are utilized in demand projections are found.</p>	<p>Section 4.2.3</p>
<p>Are Lower Income Residential Demands Included In Projections? <i>Drop down list (y/n)</i></p>	<p>Yes</p>

NOTES:

**Submittal Table 5-1 Baselines and Targets Summary, Ojai Retail
From SB X7-7 Verification Form**
Retail Supplier or Regional Alliance Only

Baseline Period	Start Year *	End Year *	Average Baseline GPCD*	Confirmed 2020 Target*
10-15 year	1999	2008	322	257
5 Year	2004	2008	316	

**All cells in this table should be populated manually from the supplier's SBX7-7 Verification Form and reported in Gallons per Capita per Day (GPCD)*

NOTES:

Submittal Table 5-2: 2020 Compliance, Casitas Retail System
From SB X7-7 2020 Compliance Form
Retail Supplier or Regional Alliance Only

2020 GPCD			2020 Confirmed Target GPCD*	Did Supplier Achieve Targeted Reduction for 2020? Y/N
Actual 2020 GPCD*	2020 TOTAL Adjustments*	Adjusted 2020 GPCD* <i>(Adjusted if applicable)</i>		
209	0	209	257	Yes

**All cells in this table should be populated manually from the supplier's SBX7-7 2020 Compliance Form and reported in Gallons per Capita per Day (GPCD)*

NOTES:

Submittal Table 6-1 Retail: Groundwater Volume Pumped

Supplier does not pump groundwater.
The supplier will not complete the table below.

All or part of the groundwater described below is desalinated.

Groundwater Type <i>Drop Down List</i> May use each category multiple times	Location or Basin Name	2016*	2017*	2018*	2019*	2020*
--	------------------------	-------	-------	-------	-------	-------

Add additional rows as needed

Alluvial Basin	Ojai Basin	944	1381	1378	1548	1300
TOTAL		944	1,381	1,378	1,548	1,300

*** Units of measure (AF, CCF, MG) must remain consistent throughout the UWMP as reported in Table 2-3.**

NOTES:

Submittal Table 6-2 Retail: Wastewater Collected Within Service Area in 2020

<input type="checkbox"/>	There is no wastewater collection system. The supplier will not complete the table below.
	Percentage of 2020 service area covered by wastewater collection system <i>(optional)</i>
	Percentage of 2020 service area population covered by wastewater collection system <i>(optional)</i>

Wastewater Collection			Recipient of Collected Wastewater			
Name of Wastewater Collection Agency	Wastewater Volume Metered or Estimated? <i>Drop Down List</i>	Volume of Wastewater Collected from UWMP Service Area 2020 *	Name of Wastewater Treatment Agency Receiving Collected Wastewater	Treatment Plant Name	Is WWTP Located Within UWMP Area? <i>Drop Down List</i>	Is WWTP Operation Contracted to a Third Party? <i>(optional)</i> <i>Drop Down List</i>
Ojai Valley Sanitary District	Metered	1,826	Ojai Valley Sanitary District	Ojai Valley Sanitary District	Yes	No
Total Wastewater Collected from Service Area in 2020:		1,826				

*** Units of measure (AF, CCF, MG) must remain consistent throughout the UWMP as reported in Table 2-3 .**

NOTES: There are two agencies who provide wastewater collection and treatment within the Casitas service area, Ojai Valley Sanitary District and the City of Ventura. The boundaries for these agencies do not readily correspond to Casitas' wholesale, retail, or Ojai water system boundaries, nor can the wastewater collected for these agencies be readily ascribed to wholesale or retail customers. To simplify reporting, the City of Ventura's wastewater information is provided in Table 6-2 Casitas Retail and OVSD's wastewater information is provided in Table 6-2 Ojai Retail.

Submittal Table 6-4 Retail: Recycled Water Direct Beneficial Uses Within Service Area

Recycled water is not used and is not planned for use within the service area of the supplier.
 The supplier will not complete the table below.

Name of Supplier Producing (Treating) the Recycled Water:

Name of Supplier Operating the Recycled Water Distribution System:

Supplemental Water Added in 2020 (volume) *include units*

Source of 2020 Supplemental Water

Appendix J

Water Rates

What is changing about your water service?

Casitas periodically must assess rates for various customer groups to insure that customers are being charged fairly for the cost of their water. This means that each customer group is responsible for paying for the costs of water that relate directly to them.

Casitas recently hired an independent rate firm to conduct a comprehensive cost of service study. The study has confirmed that Casitas must adjust its rates to continue providing safe, reliable water delivery and maintain financial stability.

How are my rates calculated?

Rates for water service charges are billed monthly, and are made of two components, a variable volumetric charge and a fixed service charge.

The volumetric charge is based on the amount of water served to a property in hundred cubic feet (HCF) or one unit of water billed. One HCF equals 748 gallons. There are three proposed residential tiered rates, which impose higher rates as water consumption increases. The purpose of increasing tiered rates is to encourage water conservation. The costs are designed to recover Casitas' fixed costs to store, treat, and deliver water. They are also meant to fund Casitas' water conservation efforts.

Rates for service charges are established on the basis of the size of the water meter serving a property, and use associated with the type of customer. These rates are calculated to recover the District's fixed costs of repairs and replacement of facilities, meter reading, billing, and customer service.

Together, the two rate components are made to proportionately allocate the costs of water service among Casitas' customers.

Oak View, California 93022
www.casitaswater.org
(805) 649-2251

PUBLIC HEARING

Date: May 10, 2017
Time: 3:00 p.m.
Location: Oak View Resource Center
Gymnasium
555 Mahoney Avenue
Oak View, California 93022

NOTICE OF PROPOSED RATE CHANGES

The Board of Directors for Casitas Municipal Water District will hold a public hearing at the time, date, and location specified above to consider a proposed five-year schedule of increases to the District's water charges.

If adopted, proposed rate increases and charges will become effective on July 1, 2017; July 1, 2018; July 1, 2019; July 1, 2020; July 1, 2021, respectively. The public hearing will be conducted per California Constitution Article XIII D, Section 6 (also known as "Proposition 218"). This notice is being sent to all property owners and customers whose parcels receive water service from Casitas, who would be impacted by imposed rates and charges.

All members of the public are invited to attend the public hearing. Additionally, under California State Law, all Casitas' property owners and customers of record may submit a written protest to the proposed rate changes. Only one protest per parcel is permitted. Please refer to the "How Can I Participate?" section of this document for instructions on submitting a formal written protest against the proposed action. You may also appear at the public hearing at the date and time specified above. More information, including a rate estimator, is available online at: www.casitaswater.org.

Este documento contiene información importante sobre sus tarifas de agua. Para más información ó traducción, visite www.casitaswater.org o llame al (805) 649-2251.

Why have I received this notice?

Casitas Municipal Water District is proposing changes to its water rates. District customers who may be impacted by these changes are receiving this notice. The District is dedicated to providing safe, reliable, cost-effective water deliveries at rates that do not exceed the cost of service. We are seeking feedback to help our Board of Directors make the right choice for the District and its ratepayers.

Why are rate increases needed?

According to the rate study, there are a few key issues that are dramatically impacting CMWD's financial outlook, forcing the District to consider rate increases to generate more revenue from water deliveries.

External Escalating Costs

Operating expenses, such as the electricity needed to pump water through the delivery system and chemicals to treat it, continue to rise.

Maintenance and repairs

As infrastructure ages, the system of pipelines and facilities needed to deliver water safely and reliably requires regular preventative maintenance and upgrades to keep it functioning and avoid more expensive emergency repairs.

Drought

Customers have done a great job of conserving water over the last five years of historic drought, but it is impacting finances. The hidden cost of drought is lost revenues, which is depleting Casitas' reserves.

Fiscal Responsibility

Current rates are near the lowest in Southern California, but unfortunately these rates are not sustainable. It has been four years since Casitas last had a rate increase. Casitas is committed to economical pricing and intends to maintain rates that are competitive with other regional water providers.

Did you know?

As a public agency, the district cannot earn a profit from the services it provides, and must charge no more than the actual costs associated with providing services to its customers.

How can I participate?

We want you to join in the conversation and make your voice heard, as part of a collaborative process between the District and its water users to determine the best way forward.

Call or Visit. The Water Rate Study and other information on the proposed adjustments and increases are available for review at Casitas' office and on our website: www.casitaswater.org. If you have additional questions, please call the District office and ask for Ron Merckling, Public Affairs Manager at (805) 649-2251 Extension 118.

Write. Written protests may be mailed or delivered in-person to Casitas Municipal Water District, Attn: Clerk to the Board, 1055 Ventura Avenue, California 93022 using the form below:

First Name:	Last Name:	
Street Address:	City:	Zip Code:
Water Account #	Or, APN #	

Please check one:

I am the property owner I am the customer of record

I oppose Casitas Municipal Water District's proposed water rate/charge increase.

I declare under penalty of perjury under the laws of the State of California that the foregoing information is true and accurate and contains no omissions of materials or facts.

Signature:	Date:
Name (Printed—must be legible):	

Emailed or other electronically sent protests will not be classified as formal written protests. All written protests must be received prior to the conclusions of the public hearing. There will be only one protest per parcel allowed.

Attend the Public Hearing. Written protests may also be submitted at the Public Hearing **May 10, 2017, at 3:00 p.m.** in the **gymnasium at the Oak View Resource Center at 555 Mahoney Avenue, Oak View, California.** All members of the public will have an opportunity to speak and give testimony regarding the proposed water and rate adjustments at the Public Hearing; however, only written protests will count toward a majority protest. Written protests must be received before the conclusion of the Public Hearing.

Public Hearing Process. At the time of the Public Hearing, the Board will hear and consider all protests and objections to the proposed increases. **Protests submitted by email or other electronic means do not count as formal written protests; oral comments do not qualify as a formal protest unless accompanied by a written protest.** Upon conclusion of the hearing, the Board will evaluate the protests and consider the adoption of the proposed rates and charges. The Board is authorized to adopt proposed rates and charges if written protests against the proposed rates and charges, as outlined above, do not represent at least a majority of owners or customers of identified parcels impacted by proposed rates and charges. If adopted as proposed, the increased rates and charges become effective on **July 1, 2017, July 1, 2018, July 1, 2019, July 1, 2020 and July 1, 2021.**

Public Hearing Notification and Proof of Publication

NOTICE OF PUBLIC HEARING

Casitas Municipal Water District will hold a Public Hearing on Wednesday, June 23, 2021 at 5:00 p.m. via conference call and Zoom meeting on the Water Shortage Contingency Plan and 2020 Urban Water Management Plan. At the same meeting, the Board will also consider adoption of these two documents in compliance with Water Code Section 10642. Call-in information will be posted on the District's website for the Regular Board meeting at: <https://www.casitaswater.org/about-us/board-of-directors/-folder-125>

The Water Shortage Contingency Plan is included in Section 8 of the 2020 Urban Water Management Plan, which is available to review on the District's website at: <https://www.casitaswater.org/about-us/engineering/engineering-reports-and-master-plans>

Comments or questions may be directed to Julia Aranda, PE, Engineering Manager at jaranda@casitaswater.com or 805.649.2251 x107.

WATER SHORTAGE CONTINGENCY PLAN (WSCP)

Submittal Table 8-1 Water Shortage Contingency Plan Levels

Shortage Level	Percent Shortage Range	Shortage Response Actions
1	Up to 10%	Water Conservation: Voluntary conservation measures to reduce water usage by up to 20%. Follow recommended response actions in most recently adopted WEAP
2	Up to 20%	Water Shortage Warning: Mandatory conservation measures to reduce water usage by up to 20%. Follow recommended response actions in most recently adopted WEAP
3	Up to 30%	Water Shortage Eminent: Mandatory conservation measures to reduce water usage by up to 30%. Follow recommended response actions in most recently adopted WEAP
4	Up to 40%	Severe Water Shortage: Mandatory conservation measures to reduce water usage by up to 40%. Follow recommended response actions in most recently adopted WEAP
5	Up to 50%	Critical Water Shortage: Mandatory conservation measures to reduce water usage by up to 50%. Follow recommended response actions in most recently adopted WEAP
6	>50%	Catastrophic Water System Emergency: Limited to no water can be supplied due to infrastructure damage or failure. Follow recommended response actions in most recently adopted Emergency Response Plan.

ACTION ITEMS

- Hold public hearing on WSCP and 2020 UWMP
- Adopt WSCP and 2020 UWMP (Resolution) (as prepared or as modified)
- Upload 2020 UWMP to DWR portal no later than 7/1/21
- Send hardcopies to Cities, County, and California State Library within 30 days of adoption
- Upload 2020 UWMP to District website

QUESTIONS?

Stage 3 Drought - What does it mean for you?

Casitas Municipal Water District's Board of Directors declared Stage 3 water supply conditions on April 27, 2016, in response to five years of historic drought conditions.

Western Ventura County relies exclusively on local water supplies and is in the grip of one of the driest periods in recorded history. In January of 2019, Lake Casitas level hit a historic low at 30% of its capacity. The storms that marched through since then have added a boost to Lake Casitas' volume. As of June 2019, Lake Casitas stands at approximately 45% of its capacity.

Stage 3 drought condition remains in effect and the following demand measures are in place:

- All residential landscape irrigation is restricted to: before 10:00AM and after 6:00PM
 - Note: Exceptions to the irrigation restriction times include using greywater/rainwater or hand watering using a hose with a shut-off nozzle
- Water waste is prohibited, such as:
 - Irrigation run-off from the property or onto hard surfaces
 - Irrigation during non-designated times

All customers' individual allocations are reduced by 10%

- Note: The 10% reduction in allocations for residential customers applies only to their non-essential outdoor allocation. Residential essential allocations for indoor usage will continue to be 10 units per month for all residents.
- The 10% reduction in non-essential customer allocations, assists Casitas to meet the 30% Water Use Reduction Response Goal associated with a Stage 3 drought condition. Stage 3 is a 30% reduction from historical usage.

Casitas encourages constituents throughout the District to use their water wisely through an active water conservation campaign, offering water-saving workshops, rebates, and free residential, commercial, and agricultural water surveys. Anyone interested in finding out more about these programs is encouraged to explore our [water conservation page](#) or to call Kiran at (805) 649-2251 Extension 128.

Foreword

November 12, 2019

To: Applicants Filing Proponent’s Environmental Assessments for Energy Infrastructure Projects at the California Public Utilities Commission (CPUC or Commission)

From: Merideth Sterkel (Program Manager, Infrastructure Planning and Permitting) and Mary Jo Borak and Lon Maier, Supervisors, Infrastructure Permitting and California Environmental Quality Act, Energy Division, CPUC

Subject: Introducing revisions to the Pre-filing Guidelines for Energy Infrastructure Projects and a Unified and Updated Electric and Gas PEA Checklist

We are pleased to release a 2019 revision to the California Environmental Quality Act (CEQA) Proponent’s Environmental Assessments (PEA) Checklist. This substantially revised document is now entitled “Guidelines for Energy Project Applications Requiring CEQA Compliance: Pre-filing and Proponent’s Environmental Assessments” (Guidelines). Future updates to this document will be made as determined necessary. The CPUC’s Rules of Practice and Procedure Sections 2.4 provide that all applications to the CPUC for authority to undertake projects that are not statutorily or categorically exempt from CEQA requirements shall include an Applicant-prepared PEA.

Updates Overview

Prior versions of the Working Draft PEA Checklist were published in 2008 and 2012. For this 2019 update, extensive revisions were made to all sections based on our experience with the prior checklist versions. All electric and natural gas projects are now addressed in a single PEA Checklist, and the following updates were made:

- **CEQA Statute and Guidelines 2019 Updates:** The PEA Checklist is updated pursuant to the 2019 CEQA Statutes and Guidelines, including new energy and wildfire resource areas.
- **Pre-filing Consultation Guidelines:** Pre-filing guidelines are now provided since the pre-filing and PEA development processes are intertwined.
- **Unified PEA Checklist for Energy Projects:** All electric and natural gas projects are now addressed in a single PEA Checklist.
- **Additional CEQA Impact Questions:** Questions are included for the following PEA Checklist sections: 5.4, Biological Resources; 5.6, Energy; 5.9, Hazards, Hazardous Materials, and Public Safety; 5.16, Recreation; 5.17, Transportation; and 5.19, Utilities and Service Systems.
- **CPUC Draft Environmental Measures:** Draft measures are provided in PEA Checklist Attachment 4 for Aesthetics, Air Quality, Cultural Resources, Greenhouse Gas Emissions, Utilities and Service Systems and Wildfire.

Purpose of the Guidelines Document

The purpose and objective of the PEA Checklist included within this Guidelines document has not changed, which is to provide project Proponents (Applicants) with detailed guidance about information our CEQA Unit Staff expect in sufficient PEAs. The document details the information Applicants must provide the CPUC to complete environmental reviews that satisfy CEQA requirements. Specifically, the Pre-filing Consultation Guidelines and PEA Checklist, together, are intended to achieve the following objectives:

1. Provide useful guidance to Applicants, CPUC staff, and outside consultants regarding the type and detail of information needed to quickly and efficiently deem an application complete;

2. Ensure PEAs provide reviewers with a detailed project description and associated information sufficient to deem an application complete, avoid lengthy review periods and numerous data requests for the purpose of augmenting a PEA, and avoid unnecessary PEA production costs;
3. Increase the level of consistency between PEAs submitted and provide for more consistent review by CPUC CEQA Unit Staff and outside consultants; and
4. Promote transparency and reduce the potential for conflicts between utility and CPUC Staff about the types, scope, and thoroughness of data expected for data adequacy purposes.

The Guidelines document provides detailed instructions to Applicants for use during the Pre-filing process and PEA development. The document is intended to fully inform Applicants and focus the role of outside consultants, thus, enabling Applicants to submit more complete, useful, and immediately data-adequate PEAs.

Benefits of High Quality and Complete PEAs

CPUC CEQA Unit Staff seek to complete the environmental review process required under CEQA as quickly and efficiently as possible. Table 1 shows the average duration in months of CPUC applications that require CEQA documents. While there are tensions between speed and quality in all project management, the achievement of expeditious environmental reviews can result in lower project costs to ratepayers. Our staff have reviewed the timelines for 108 past CPUC applications that required review pursuant to CEQA and determined that the average length of time from application filing to PEA deemed complete is four months, regardless of the type of CEQA document. The goal for our agency is to deem PEAs complete within 30 days. The faster PEAs are deemed complete, the sooner staff can prepare the CEQA document. With each delay to PEA completeness, the fundamental project purpose and need and baseline circumstances may shift, requiring refreshing of the data. The Guidelines document will improve the initial accuracy of PEAs and reduce the time required to deem PEAs complete. Once an application is formally filed, the Applicant will receive a notification letter from CPUC CEQA Unit Staff when the PEA is deemed complete.

Table 1. Average Duration in Months of CPUC Applications that Require CEQA Documents (1996–2019)

	I: Application Filed to PEA Deemed Complete	II: PEA Deemed Complete to Draft Environmental Document Circulated	III: Draft Environmental Document to Final Released	IV: Final Released to Proposed Decision	V: Proposed Decision to Final Decision (with Certification of CEQA Document)	I-V: Overall Duration ⁽¹⁾
Environmental Impact Report (EIR; n=49)	5	13	7	5	2	29
Initial Study/ Mitigated Negative Declaration (IS/MND; n=56)	4	8	3	4	1	19
All Document Types (n=108)	4	8	4	5	2	23
Range: All Document Types	1-9	5-18	2-10	1-7	1-2	12-38

Note:

(1) The overall duration is not a sum of the average durations for each step. The overall duration was calculated using “n,” the number of applications with data available for the date of application filing and final decision date. Not all projects had data available for each step. The data include several instances where the CEQA document was developed in conjunction with a NEPA document, e.g., an EIR/Environmental Impact Statement or IS/MND/Environmental Assessment/Finding of No Significant Impact was prepared instead of an EIR or MND, respectively. The above data is not inclusive of projects that had averages and ranges that are statistically abnormal.

Lessons Learned about the PEA Process

In the past, Applicants have filed PEAs using the checklist to ensure the correct information was provided but have not followed the format and organization of the PEA checklist and sometimes chose not to engage in Pre-filing activities with our staff. To achieve the objectives and benefits listed above, Applicants will file all future PEAs in the same organizational format as the updated checklist and adhere to the Pre-filing Consultation Guidelines in coordination with CPUC CEQA Unit Staff.

The Guidelines document describes the level effort required for the assessments necessary to not only finalize a CEQA document but ensure its legal defensibility. While final design and survey information is preferred, the PEA may incorporate preliminary design and survey data as appropriate and in consultation with CEQA Unit Staff during Pre-filing. We recognize that projects are fact specific, and deviations from the Pre-filing Consultation Guidelines and PEA Checklist are inevitable but providing concise and accurate information as soon as possible is paramount. Any deviations from these Guidelines must include clear justification and should be discussed and submitted during the Pre-filing Consultation process to avoid subsequent delays.

The PEA Checklist is written with the assumption that an Environmental Impact Report will be prepared, however, a Mitigated Negative Declaration or other form of CEQA document (e.g., exemption) may be appropriate. This determination, however, must be made in consultation with CPUC CEQA Unit Staff during Pre-filing and prior to submittal of the Draft PEA.

Future Modifications and Improvements

Like the predecessor PEA checklists, this is a working document that will be modified over time based on experience and changes to the CEQA Statute and Guidelines. To meet the above stated objectives and maintain consistency with CEQA. We expect Applicants, their consultants, CPUC consultants, and the CPUC to engage in a regular and ongoing dialogue about specific improvements to the CEQA process overall, and these Guidelines in particular.

We look forward to working with Applicants during the Pre-filing Consultation process to ensure that the level of effort that goes into preparing PEAs can be effectively and efficiently transferred into the CEQA document prepared by CPUC Staff and consultants. Applicants are invited to debrief with our staff about the efficacy of these Guidelines.

Pre-Filing Consultation Guidelines

The following Pre-filing Consultation Guidelines apply to all PEAs filed with applications to the CPUC and outline a process for Applicants to engage with CPUC CEQA Unit Staff about upcoming projects that will require environmental review pursuant to CEQA. The CPUC is typically the Lead Agency for large projects by investor-owned gas and electric utilities. The CPUC's CEQA Unit Staff are experienced with developing robust CEQA documents for long, linear energy projects. The PEA Checklist, starting in the next section, is based upon that experience.

Pre-filing Consultation Process

During Pre-filing Consultation, Applicants and CPUC Staff meet to discuss the upcoming application. Successful projects will commence Pre-filing Consultation no less than six months prior to application filing at the CPUC. When the application is formally filed at the CPUC, the Application and the PEA are submitted to the CPUC Docket Office.

1. Meetings with CPUC Staff

To initiate Pre-filing Consultation, Applicants will request and attend a meeting with CPUC CEQA Unit Staff at least six months prior to application filing.

- a. Applicants can request a Pre-Filing Consultation meeting via email or letter. Initial contact via telephone may occur, but staff request written documentation of Pre-filing Consultation commencement.
- b. For the initial meeting, Applicants will provide staff with a summary of the proposed project including maps and basic GIS data at least one week prior to the meeting.
- c. Applicants will receive initial feedback on the scope of the proposed project and PEA. Staff will work with Applicants to establish a schedule for subsequent Pre-filing meetings and milestones.

2. Consultant Resources

CPUC CEQA Unit Staff will initiate the consultant contract immediately following the initial Pre-filing Consultation meeting. CPUC's consultant contract resources will be executed prior to Applicant filing of the Draft PEA. The consultant contract is critical to the Pre-filing Consultation process. Applicants are encouraged to request updates about the status of the contract. The CPUC may use its on-call consulting resources contract for these purposes. If CEQA Unit Staff determine that their on-call consulting resources are not appropriate due to the anticipated project scope, staff may initiate a request for proposals process to engage consulting resources, and the resulting contracting process will be completed and consultant contract in place prior to Draft PEA filing.

3. Draft PEA Provided Prior to PEA Filing

A complete Draft PEA will be filed at least three months prior to application filing. CPUC CEQA Unit Staff and the CPUC consultant team will review and provide comments on the Draft PEA to the Applicant early in the three-month period to allow time for Applicant revisions to the PEA.

4. Project Site Visits

One or more site visits will be scheduled with CPUC CEQA Unit Staff and their consultant at the time of Draft PEA filing (or prior). Appropriate federal, state, and local agencies will also be engaged at this time.

5. Consultation with Public Agencies

The Applicant and CPUC CEQA Unit Staff will jointly reach out and conduct consultation meetings with public agencies and other interested parties in the project area. CPUC CEQA Unit Staff may also choose to conduct separate consultation meetings if needed.

If a federal agency will be a co-lead pursuant to the National Environmental Policy Act and coordinating with the CPUC during the environmental review process, the Applicant and CPUC CEQA Unit Staff will ensure that the agency has the opportunity to comment on the Draft PEA and participate jointly with the CPUC throughout the application review process. Applicant and Commission CEQA Unit Staff coordination with the federal agency (if applicable) will likely need to occur more than six months in advance of application filing.

6. Alternatives Development

PEAs will be drafted with the assumption that an Environmental Impact Report (EIR) will be prepared. Applicants will include a reasonable range of alternatives in the PEA (even though a Mitigated Negative Declaration [MND] may ultimately be prepared), including sufficient information about each alternative. In some situations, CPUC CEQA Unit Staff and project Applicants may agree during Pre-filing Consultation that an MND is likely and a reasonable range of alternatives is not required for the PEA. This determination, however, must be made in consultation with CEQA Unit Staff during Pre-filing and is not final. The type of document to be prepared may change based on public scoping results and other findings during the environmental review process.

CEQA Unit Staff will provide feedback on the range of alternatives prior to Draft PEA filing (if possible) based on their review of the Draft PEA. It is critical that Applicants receive feedback from CEQA Unit Staff about the range of alternatives prior to filing the PEA. Applicants will ensure that each alternative is described and evaluated in the PEA with an equal level of detail as the proposed project unless otherwise instructed in writing by CEQA Unit Staff.

7. Format of PEA Submittal

Each PEA submittal will include the completed PEA Checklist tables. Each PEA submittal will be formatted and organized as shown in the Example PEA Table of Contents provided in the PEA Checklist unless otherwise directed by CPUC CEQA Unit Staff in writing prior to application filing. The example PEA Table of Contents is modeled after typical CPUC EIRs.

8. Transmission and Distribution System Information

A key component of CEQA projects analyzed during CPUC environmental reviews is the context of the project within the larger transmission and distribution system. Detailed descriptions of the regional transmission system, including GIS data, to which the proposed project would interconnect are required. The required level of detail about interconnecting systems is project specific and will be specified by CEQA Unit Staff in writing during Pre-filing Consultation. Detailed distribution system information may also be required.

9. Data and Technical Adequacy

Applicants will focus PEA development efforts on providing thorough, up-to-date data and technical reports required for CPUC CEQA Unit Staff to complete the environmental document and alternatives analysis.

The Applicant-drafted PEA Executive Summary, Introduction, Project Description, Description of Alternatives, and other chapters typically found in past CPUC EIRs and Initial Study/MNDs will be *thorough*—emulate the level of detail provided in typical CPUC EIRs. The setting sections provided for

PEA Chapter 5, Environmental Analysis, will also be thorough. Applicants will ensure that the PEA text, graphics, and file formats can be efficiently converted into CPUC's CEQA document with minimal revision, reformatting, and redevelopment by CPUC Staff and consultants.

The impact analyses and determinations provided for Chapter 5, Environmental Analysis, and Chapter 6, Comparison of Alternatives, need not be as thorough as those to be prepared by the CPUC for its CEQA document. These two sections are expected to be revised and redeveloped by CPUC Staff and consultants. Other sections of the CEQA document will only be revised and redeveloped by CPUC Staff and consultants if determined to be necessary after PEA filing.

10. Applicant Proposed Measures

The Pre-filing Consultation process can support the development Applicant Proposed Measures (APMs); measures that Applicants incorporate into the PEA project description to avoid or reduce what otherwise may be considered significant impacts. APMs that use phrases, such as, "as practicable," "as needed," or other conditional language will be superseded by Mitigation Measures if required to avoid or reduce a potentially significant impact. CPUC CEQA Unit Staff and their consultant team may review and provide comments on the Draft PEA APMs during Pre-filing Consultation.

Applicants will carefully consider each CPUC Draft Environmental Measure identified in Chapter 5 of this PEA Checklist. The measures may be applied to the proposed project if appropriate and may be subject to modification by the CPUC during its environmental review.¹

11. PEA Checklist Deviations

CPUC CEQA Unit Staff understand that the PEA Checklist requires Applicants to develop a significant quantity of information. There are times when it is appropriate to deviate from the PEA Checklist. Deviations to the Pre-Filing Consultation Guidelines or the PEA Checklist contents may be approved by the CPUC's CEQA Unit Staff. Staff approval will be in writing and will occur prior to Applicant filing of the Draft PEA. Note that any deviations approved in writing by staff during the Pre-filing period may be reversed or modified after application and PEA filing and at any time throughout the environmental review period at the discretion of CPUC CEQA Unit Staff.

12. Submittal of Confidential Information

CPUC Staff are available during Pre-filing Consultation to discuss concerns that Applicants may have about confidentiality. However, the CEQA process requires public disclosure about projects, and such disclosure can often appear to conflict with Applicant requests for confidentiality. CPUC CEQA Unit Staff will rely on CPUC adopted confidentiality procedures to resolve confidentiality concerns. Applicants that expect aspects of a PEA filing to be confidential must follow CPUC confidentiality procedures. Applicants may mark information as confidential if allowed pursuant to General Order 66 or latest applicable Commission rule (e.g., see Public Records Act Proceeding Rulemaking (R.14-11-001)).

13. Additional CEQA Impact Questions

Additional CEQA Impact Questions that are specific to the types of projects evaluated by the Commission's CEQA Unit are identified in the PEA Checklist to be considered in addition to the checklist items in CEQA Guidelines Appendix G.

The next section of this Guidelines document provides the PEA Checklist for all energy project applications that require CEQA compliance.

¹ At this time, the CPUC environmental measures are in draft format, see PEA Checklist Attachment 4. They may be formally incorporated into Chapter 5 of future versions of the PEA Checklist.

Proponent's Environmental Assessment (PEA) Checklist

The PEA Checklist provides project Applicants (e.g., projects involving electric transmission lines, electric substations or switching stations, natural gas transmission pipelines, and underground natural gas storage facilities) with detailed guidance regarding the level of detail CPUC CEQA Unit Staff expect to deem PEAs complete. Applicants will prepare their PEAs using the same section headers and numbering as provided in the PEA Checklist. Applicants will also provide supporting data that is specific to each item within the PEA Checklist. As noted in the Pre-Filing Consultation Guidelines, the PEA Checklist is written with the assumption that an EIR will be prepared. PEA contents may not need to support the development of an EIR, but this determination can only be made in consultation with CPUC CEQA Unit Staff as described in the Pre-Filing Consultation Guidelines.

Formatting and Basic PEA Data Needs, Including GIS Data

1. Provide **editable and fully functional source files** in electronic format for all PDF files, hardcopies, maps, images, and diagrams. Files will be provided in their original file format as well as the output file format. All Excel and other spreadsheet files or modeling files will include all underlying formulas/modeling details. All modeling files must be fully functional.
2. Details about the types of **GIS data and maps** to be submitted are provided in Attachment 1. GIS data not specified in this checklist may also be requested depending on the Proposed Project and alternatives.
3. The Applicant is responsible for ensuring that all project features, including project components and temporary and permanent work areas, are included within all **survey boundaries** (e.g., biological and cultural resources).
4. Excel spreadsheets with **emissions calculations** will be provided that are complete with all project assumptions, values, and formulas used to prepare emissions calculations in the PEA. Accompanying PDF files with the same information will be provided as Appendix B to the PEA (see List of Appendices below).
5. Applicants will provide in an Excel spreadsheet a comprehensive **mailing list** that includes the names and addresses of all affected landowners and residents, including unit numbers for multi-unit properties for both the proposed project and alternatives.
 - a. An affected resident or landowner is defined as one whose place of residence or property is:
 - i. Crossed by or abuts any component of the proposed project or an alternative including any permanent or temporary disturbance area (either above or below ground) and any extra work area (e.g., staging or parking area); or
 - ii. Located within approximately 1,000 feet² of the edge of any construction work area.
 - b. Include in the following information for each resident in a spreadsheet, at minimum: parcel APN number, owner name and mailing address, and parcel physical address. If individual occupant names, facility names, or business names are available, also provide these names and addresses in the spreadsheet. A sample mailing list format is provided in Table 2.

² Notice to all property owners within 300 feet of a Proposed Project is required at the time of application filing under GO 131-D. Commission notices of CEQA document preparation may be mailed to residents and property owners greater than 300 feet from a Proposed Project to ensure adequate notification (e.g., 1,000 feet) and the extent of notification will be determined on a project specific basis. Appropriate notice expectations will be discussed during Pre-filing (e.g., with respect to visual impact areas and other types of impacts specific to the Proposed Project and its study area).

Table 2. Sample Project Mailing List

Category	Company/ Agency	Name	Mailing Address	Phone Number	Email	APN	Source
State Agency	California Resources Agency	John Doe	1234 California Street City, CA 98765	(333) 456-7899	john.doe@email.com	123-456-789	County Assessor
Individual	n/a	Jane Doe	222 Main Street City, CA 97531	(909) 876-5432	jane.doe@email.com	101-202-303	Public meeting on Month, Day 2019

6. **PEA Organization:** This PEA Checklist is organized to include each of the chapters and sections found in typical CPUC EIRs. The following sections will serve as the outline for all Draft PEAs submitted during Pre-filing and all PEAs filed with the CPUC Docket Office. PEAs will include each chapter and section identified (in matching numerical order) unless otherwise directed by CPUC CEQA Unit Staff in writing prior to filing.

Proponent Name (the Applicant)	
Name of the proposed project ³	
Technical subheading summarizing the type of project and its major components, in one sentence or about 40 words, for example: A new 1,120 MVA, 500/115kV substation, 10 miles of new singled-circuit 500kV transmission lines, 25 miles of new and replaced double-circuit 115kV power lines, and upgrades at three existing substations are proposed.	
Location of the proposed project (all counties and municipalities or map figure for the cover that shows the areas crossed)	
Proceeding for which the PEA was prepared and CPUC Docket number (if known) or simply leave a blank where the Docket number would go	
Primary Contact's name, address, telephone number, and email address for both the project Applicant(s) and entities that prepared the PEA	
See example PEA cover in Figure 1.	

³ If approved by the California Independent System Operator (CAISO), the project name listed will match the name specified in the CAISO approval. If multiple names apply, list all versions.

Figure 1. Example PEA Cover

Proponent's Environmental Assessment for California Utility Company's Evergreen Electric Substation and Transmission Line Project

May 1, 2019 (PEA filing date)

A new 230 kV substation, 10 miles of new single-circuit 230kV transmission lines, and upgrades at two existing substations are proposed.

The Proposed Project would be located primarily in __ County but would also cross __ and __ counties and areas within the City of __.

Application A.19-05-01 to the California Public Utilities Commission

Table of Contents

Sections

Order	The format of the PEA will be organized as follows:	Applicant Notes, Comments
--	Cover	
--	Table of Contents, List of Tables, List of Figures, List of Appendices	
1	Executive Summary	
2	Introduction	
3	Proposed Project Description	
4	Description of Alternatives	
5	Environmental Analysis	
5.1	Aesthetics	
5.2	Agriculture and Forestry	
5.3	Air Quality	
5.4	Biological Resources	
5.5	Cultural Resources	
5.6	Energy	
5.7	Geology, Soils, and Paleontological Resources	
5.8	Greenhouse Gas Emissions	
5.9	Hazards, Hazardous Materials, and Public Safety	
5.10	Hydrology and Water Quality	
5.11	Land Use and Planning	
5.12	Mineral Resources	
5.13	Noise	
5.14	Population and Housing	
5.15	Public Services	
5.16	Recreation	
5.17	Transportation	
5.18	Tribal Cultural Resources	
5.19	Utilities and Service Systems	
5.20	Wildfire	
5.21	Mandatory Findings of Significance	
6	Comparison of Alternatives	

7	Cumulative Impacts and Other CEQA Considerations	
8	List of Preparers	
9	References ⁴	
--	Appendices	

Required PEA Appendices and Supporting Materials

Order	Title	Applicant Notes, Comments
Appendix A	Detailed Maps and Design Drawings	
Appendix B	Emissions Calculations	
Appendix C	Biological Resources Technical Reports (see Attachment 2)	
Appendix D	Cultural Resources Studies (see Attachment 3)	
Appendix E	Detailed Tribal Consultation Report ⁵	
Appendix F	Environmental Data Resources Report, Phase I Environmental Site Assessment, or similar hazardous materials report	
Appendix G	Agency Consultation and Public Outreach Report and Records of Correspondence	
Appendix H	Construction Fire Prevention Plan ⁶	

Potentially Required⁷ Appendices and Supporting Materials

Order	Title	Applicant Notes, Comments
Appendix I	Noise Technical Studies	
Appendix J	Traffic Studies	
Appendix K	Geotechnical Investigations (may preliminary at time of PEA filing)	
Appendix L	Hazardous Substance Control and Emergency Response Plan / Hazardous Waste and Spill Prevention Plan	

⁴ References will be organized by section but contained in a single chapter called, "References."

⁵ Include summary and timing of all correspondence to and from any Tribes and the State Historic Preservation Office/Native American Heritage Commission, including Sacred Lands File search results, and full description of any issues identified by Tribes in their interactions with the Applicant.

⁶ The Construction Fire Prevention Plan will be provided to federal, state, and local fire agencies for review and comment as applicable to where components of the proposed project would be located. CPUC will approve the final Construction Fire Prevention Plan. Record of the request for review and comment and any comments received from these agencies will be provided to CPUC CEQA Unit Staff.

⁷ Anticipated Appendix and study requirements should be discussed with CPUC CEQA Unit Staff during Pre-filing.

Appendix M	Erosion and Sedimentation Control Best Management Practice Plan / Draft Storm Water Pollution Prevention Plan (may be preliminary at time of PEA filing)	
Appendix N	FAA Notice and Criteria Tool Results	
Appendix O	Revegetation or Site Restoration Plan	
Appendix P	Health and Safety Plan	
Appendix Q	Existing Easements ⁸	
Appendix R	Blasting Plan (may be preliminary at time of PEA filing)	
Appendix S	Traffic Control/Management Plan (may be preliminary at time of PEA filing)	
Appendix T	Worker Environmental Awareness Program (may preliminary at time of PEA filing)	
Appendix U	Helicopter Use and Safety Plan (may be preliminary at time of PEA filing)	
Appendix V	Electric and Magnetic Fields Management Plan (may be part of the Application rather than the PEA)	

⁸ Easements should be provided military lands, conservation easements, or other lands where the real estate agreement specifies the range of activities that can be conducted

1 Executive Summary

This section will include, but is not limited to, the following:	PEA Section and Page Number ⁹	Applicant Notes, Comments
1.1: Proposed Project Summary. Provide a summary of the proposed project and its underlying purpose and basic objectives.		
1.2: Land Ownership and Right-of-Way Requirements. Provide a summary of the existing and proposed land ownership and rights-of-way for the proposed project.		
1.3: Areas of Controversy. Identify areas of anticipated controversy and public concern regarding the project.		
1.4: Summary of Impacts <ul style="list-style-type: none"> a) Identify all impacts expected by the Applicant to be potentially significant. Identify and discuss Applicant Proposed Measures here and provide a reference to the full listing of Applicant Proposed Measures provided in the table described in Section 3.11 of this PEA Checklist. b) Identify any significant and unavoidable impacts that may occur. 		
1.5: Summary of Alternatives. Summarize alternatives that were considered by the Applicant and the process and criteria that were used to select the proposed project.		
1.6: Pre-filing Consultation and Public Outreach Summary. Briefly summarize Pre-filing consultation and public outreach efforts that occurred and identify any significant outcomes that were incorporated into the proposed project.		
1.7: Conclusions. Provide a summary of the major PEA conclusions.		
1.8: Remaining Issues. Describe any major issues that must still be resolved.		

⁹ The *PEA Section and Page Number* column and *Applicant Notes, Comments* column are intended to be filled out and provided with PEA submittals. The PEA Checklist is provided in Word to all Applicants to allow column resizing as appropriate to reduce PEA checklist length when completed for submittal. Landscape formatting may also be appropriate for completed PEA Checklist tables.

2 Introduction

2.1 Project Background

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
<p>2.1.1: Purpose and Need</p> <ul style="list-style-type: none"> a) Explain why the proposed project is needed. b) Describe localities the proposed project would serve and how the project would fit into the local and regional utility system. c) If the proposed project was identified by the California Independent System Operator (CAISO), thoroughly describe the CAISO's consideration of the proposed project and provide the following information: <ul style="list-style-type: none"> i. Include references to all CAISO Transmission Planning Processes that considered the proposed project. ii. Explain if the proposed project is considered an economic, reliability, or policy-driven project or a combination thereof. iii. Identify whether and how the Participating Transmission Owner recommended the project in response to a CAISO identified need, if applicable. iv. Identify if the CAISO approved the original scope of the project or an alternative and the rationale for their approval either for the original scope or an alternative. v. Identify how and whether the proposed project would exceed, combine, or modify in any way the CAISO identified project need. vi. If the Applicant was selected as part of a competitive bid process, identify the factors that contributed to the selection and CAISO's requirements for in-service date. d) If the project was not considered by the CAISO, explain why. 		
<p>(Natural Gas Storage Only)</p> <ul style="list-style-type: none"> e) Provide storage capacity or storage capacity increase in billion cubic feet. If the project does not increase capacity, make this statement. f) Describe how existing storage facilities will work in conjunction with the proposed project. Describe the purchasing process (injection, etc.) and transportation arrangements this facility will have with its customers. 		
<p>2.1.2: Project Objectives</p> <ul style="list-style-type: none"> a) Identify and describe the basic project objectives.¹⁰ The objectives will include reasons for constructing the project based on its 		

¹⁰ Tangential project goals should not be included as basic project objectives, such as, minimizing environmental impacts, using existing ROWs and disturbed land to the maximum extent feasible, ensuring safety during construction and operation, building on property already controlled by the Applicant/existing site control. Goals of this type do not describe the underlying purpose or basic objectives but, rather, are good general practices for all projects.

<p>purpose and need (i.e., address a specific reliability issue). The description of the project objectives will be sufficiently detailed to permit CPUC to independently evaluate the project need and benefits to accurately consider them in light of the potential environmental impacts. The basic project objectives will be used to guide the alternatives screening process, when applicable.</p> <p>b) Explain how implementing the project will achieve the basic project objectives and underlying purpose and need.</p> <p>c) Discuss the reasons why attainment of each basic objective is necessary or desirable.</p>		
<p>2.1.3: Project Applicant(s). Identify the project Applicant(s) and ownership of each component of the proposed project. Describe each Applicant’s utility services and their local and regional service territories.</p>		

2.2 Pre-filing Consultation and Public Outreach¹¹

<p>This section will include, but is not limited to, the following:</p>	<p>PEA Section and Page Number</p>	<p>Applicant Notes, Comments</p>
<p>2.2.1: Pre-filing Consultation and Public Outreach</p> <p>a) Describe all Pre-filing consultation and public outreach that occurred, such as, but not limited to:</p> <ul style="list-style-type: none"> i. CAISO ii. Public agencies with jurisdiction over project areas or resources that may occur in the project area iii. Native American tribes affiliated with the project area iv. Private landowners and homeowner associations v. Developers for large housing or commercial projects near the project area vi. Other utility owners and operators vii. Federal, state, and local fire management agencies <p>b) Provide meeting dates, attendees, and discussion summaries, including any preliminary concerns and how they were addressed and any project alternatives that were suggested.</p> <p>c) Clearly identify any significant outcomes of consultation that were incorporated into the proposed project.</p> <p>d) Clearly identify any developments that could coincide or conflict with project activities (i.e., developments within or adjacent to a proposed ROW).</p>		
<p>2.2.2: Records of Consultation and Public Outreach. Provide contact information, notification materials, meeting dates and materials, meeting notes, and records of communication organized by entity as an Appendix to the PEA (Appendix G).</p>		

¹¹ CPUC CEQA Unit Staff request that consultation and public outreach that occurs during the Pre-filing period and throughout environmental review include the assigned CPUC Staff person and CPUC consultant.

2.3 Environmental Review Process

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
2.3.1: Environmental Review Process. Provide a summary of the anticipated environmental review process and schedule.		
<p>2.3.2: CEQA Review</p> <ul style="list-style-type: none"> a) Explain why CPUC is the appropriate CEQA Lead agency. b) Identify other state agencies and any federal agencies that may have discretionary permitting authority over any aspect of the proposed project. c) Identify all potential involvement by federal, state, and local agencies not expected to have discretionary permitting authority (i.e., ministerial actions). d) Summarize the results of any preliminary outreach with these agencies as well as future plans for outreach. 		
2.3.3: NEPA Review (if applicable). If review according to the National Environmental Policy Act (NEPA) is expected, explain the portions of the project that will require the NEPA review process. Discuss which agency is anticipated to be the NEPA Lead agency if discretionary approval by more than one federal agency is required.		
2.3.4: Pre-filing CEQA and NEPA Coordination. Describe the results of Pre-filing coordination with CEQA and NEPA review agencies (refer to CPUC’s Pre-Filing Consultation Guidelines). Identify major outcomes of the Pre-filing coordination process and how the information was incorporated into the PEA, including suggestions on the type of environmental documents and joint or separate processes based on discussions with agency staff.		

2.4 Document Organization

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
2.4: PEA Organization. Summarize the contents of the PEA and provide an annotated list of its sections.		

3 Proposed Project Description¹²

3.1 Project Overview

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
<p>3.1: Project Overview</p> <ul style="list-style-type: none"> a) Provide a concise summary of the proposed project and components in a few paragraphs. b) Described the geographical location of the proposed project (i.e., county, city, etc.). c) Provide an overview map of the proposed project location. 		

3.2 Existing and Proposed System

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
<p>3.2.1: Existing System</p> <ul style="list-style-type: none"> a) Identify and describe the existing utility system that would be modified by the proposed project, including connected facilities to provide context. Include detailed information about substations, transmission lines, distribution lines, compressor stations, metering stations, valve stations, nearby renewable generation and energy storage facilities, telecommunications facilities, control systems, SCADA systems, etc. b) Provide information on users and the area served by the existing system features. c) Explain how the proposed project would fit into the existing local and regional systems. d) Provide a schematic diagram of the existing system features. e) Provide detailed maps and associated GIS data for existing facilities that would be modified by the proposed project. 		
<p>3.2.2: Proposed Project System</p> <ul style="list-style-type: none"> a) Describe the whole of the proposed project by component, including all new facilities and any modifications, upgrades, or expansions to existing facilities and any interrelated activities that are part of the whole of the action. b) Clearly identify system features that would be added, modified, removed, disconnected and left in place, etc. c) Identify the expected capacities of the proposed facilities, highlighting any changes from the existing system. If the project would not change existing capacities, make this statement. For electrical projects, provide the anticipated capacity increase in amps or megawatts or in the typical units for the types of facilities proposed. For gas projects, provide the total volume of gas to be 		

¹² Applicant review of the Administrative Draft Project Description or sections of the Administrative Draft Project Description prepared for the CEQA document may be requested by CPUC CEQA Unit Staff to ensure technical accuracy.

<p>delivered by the proposed facilities, anticipated system capacity increase (typically in million cubic feet per day), expected customers, delivery points and corresponding volumes, and the anticipated maximum allowable operating pressure(s).</p> <p>d) Describe the initial buildout and eventual full buildout of the proposed project facilities. For example, if an electrical substation or gas compressor station would be installed to accommodate additional demand in the future, then include the designs for both the initial construction based on current demand and the design for all infrastructure that could ultimately be installed within the planned footprint of an electric substation or compressor station.</p> <p>e) Explain whether the electric line or gas pipeline will create a second system tie or loop for reliability.</p> <p>f) Provide information on users and the area served by the proposed system features, highlighting any differences from the existing system.</p> <p>g) Provide a schematic diagram of the proposed system features.</p> <p>h) Provide detailed maps and associated GIS data for proposed facilities that would be installed, modified, or relocated by the proposed project.</p>		
<p>3.2.3: System Reliability. Explain whether the electric line or gas pipeline will create a second system tie or loop for reliability. Clearly explain and show how the proposed project relates to and supports the existing utility systems.</p>		
<p>3.2.4: Planning Area. Describe the system planning area served or to be served by the project. Clearly define the Applicant’s term for the planning area (e.g., Electrical Needs Area or Distribution Planning Area).</p>		

3.3 Project Components

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
Required for all Project Types		
3.3.1: Preliminary Design and Engineering		
<p>a) Provide preliminary design and engineering information for all above-ground and below-ground facilities for the proposed project. The approximate locations, maximum dimensions of facilities, and limits of areas that would be needed to construction and operate the facilities should be clearly defined.¹³</p> <p>b) Provide preliminary design drawings for project features and explain the level of completeness (i.e., percentage).</p> <p>c) Provide detailed project maps (approximately 1:3,000 scale) and associated GIS data of all facility locations and boundaries with attributes and spatial geometry that corresponds to information in the Project Description.</p>		

¹³ Refer to Attachment 1 for mapping and GIS data requirements for the project layout and design.

<p>3.3.2: Segments, Components, and Phases</p> <ul style="list-style-type: none"> a) Define all project segments, components, and phases for the proposed project. b) Provide the length/area of each segment or component, and the timing of each development phase. c) Provide an overview map showing each segment and provide associated GIS data (may be combined with other mapping efforts). 		
<p>3.3.3: Existing Facilities</p> <ul style="list-style-type: none"> a) Identify the types of existing facilities that would be removed or modified by the proposed project (i.e., conductor/cable, poles/towers, substations, switching stations, gas storage facilities, gas pipelines, service buildings, communication systems, etc.). b) Describe the existing facilities by project segment and/or component, and provide information regarding existing dimensions, areas/footprints, quantities, locations, spans, etc. c) Distinguish between above-ground and below-ground facilities and provide both depth and height ranges for each type of facility. For poles/towers, provide the installation method (i.e., foundation type or direct bury), and maximum above-ground heights and below-ground depths. d) Explain what would happen to the existing facilities. Would they be replaced, completely removed, modified, or abandoned? Explain why. e) Identify the names, types, materials, and capacity/volumes ranges (i.e., minimum and maximum) of existing facilities that would be installed or modified by the proposed project. f) Provide diagrams with dimensions representing existing facilities to provide context on how the proposed facilities would be different. g) Briefly describe the surface colors, textures, light reflectivity, and any lighting of existing facilities. 		
<p>3.3.4: Proposed Facilities</p> <ul style="list-style-type: none"> a) Identify the types of proposed facilities to be installed or modified by the proposed project (e.g., conductor/cable, poles/towers, substations, switching stations, gas storage facilities, gas pipelines, service buildings, communication systems). b) Describe the proposed facilities by project segment and/or component, and provide information regarding maximum dimensions, areas/footprints, quantities, locations, spans, etc. c) Distinguish between above-ground and below-ground facilities and provide both depth and height ranges for each type of facility. For poles/towers, provide the installation method (i.e., foundation type or direct bury), and maximum above-ground heights and below-ground depths. 		

<ul style="list-style-type: none"> d) Identify where facilities would be different (e.g., where unique or larger poles would be located, large guy supports or snub poles). e) Provide details about civil engineering requirements (i.e., permanent roads, foundations, pads, drainage systems, detention basins, spill containment, etc.). f) Distinguish between permanent facilities and any temporary facilities (i.e., poles, shoo-fly lines, mobile substations, mobile compressors, transformers, capacitors, switch racks, compressors, valves, driveways, and lighting). g) Identify the names, types, materials, and capacity/volumes ranges (i.e., minimum and maximum) of proposed facilities that would be installed or modified by the proposed project. h) Provide diagrams with dimensions representing existing facilities. i) Briefly describe the surface colors, textures, light reflectivity, and any lighting of proposed facilities. 		
3.3.5: Other Potentially Required Facilities		
<ul style="list-style-type: none"> a) Identify and describe in detail any other actions or facilities that may be required to complete the project. For example, consider the following questions: <ul style="list-style-type: none"> i. Could the project require the relocation (temporary or permanent), modification, or replacement of unconnected utilities or other types of infrastructure by the Applicant or any other entity? ii. Could the project require aviation lighting and/or marking? iii. Could the project require additional civil engineering requirements to address site conditions or slope stabilization issues, such as pads and retaining walls, etc.? b) Provide the location of each facility and a description of the facility. 		
3.3.6: Future Expansions and Equipment Lifespans		
<ul style="list-style-type: none"> a) Provide detailed information about the current and reasonably foreseeable plans for expansion and future phases of development. b) Provide the expected usable life of all facilities. c) Describe all reasonably foreseeable consequences of the proposed project (e.g., future ability to upgrade gas compressor station to match added pipeline capacity). 		
Required for Certain Project Types		
3.3.7: Below-ground Conductor/Cable Installations (as Applicable)		
<ul style="list-style-type: none"> a) Describe the type of line to be installed (e.g., single circuit cross-linked polyethylene-insulated solid-dielectric, copper-conductor cables). b) Describe the type of casing the cable would be installed in (e.g., concrete-encased duct bank system) and provide the dimensions of the casing. 		

<p>c) Describe the types of infrastructure would likely be installed within the duct bank (e.g., transmission, fiber optics, etc.).</p>		
<p>3.3.8: Electric Substations and Switching Stations (as Applicable)</p> <p>a) Provide the number of transformer banks that will be added at initial and full buildout of the substation. Identify the transformer voltage and number of each transformer type.</p> <p>b) Identify any gas insulated switchgear that will be installed within the substation.</p> <p>c) Describe any operation and maintenance facilities, telecommunications equipment, and SCADA equipment that would be installed within the substation.</p>		
<p>3.3.9: Gas Pipelines (as Applicable). For each segment:</p> <p>a) Identify pipe diameter, number and length of exposed sections, classes and types of pipe to be installed, pressure of pipe, and cathodic protection for each linear segment.</p> <p>b) Describe new and existing inspection facilities (e.g., pig launcher sites).</p> <p>c) Describe system cross ties and laterals/taps.</p> <p>d) Identify the spacing between each valve station.</p> <p>e) Describe the compressor station, if needed, for any new or existing pipeline.</p> <p>f) Describe all pipelines and interconnections with existing and proposed facilities:</p> <ul style="list-style-type: none"> i. Number of interconnections and locations and sizes; ii. All below-ground and above-ground installations; and iii. All remote facility locations for metering, telemetry, control. 		
<p>3.3.10: Gas Storage Facilities – Background and Resource Information (as Applicable)</p> <p>a) Provide detailed background information on the natural gas formation contributing to the existing or proposed natural gas facility, including the following:</p> <ul style="list-style-type: none"> i. Description of overlying stratigraphy, especially caps ii. Description of production, injection, and intervening strata iii. Types of rock iv. Description of types of rocks in formation, including permeability or fractures v. Thickness of strata <p>b) Provide a graphic and/or table showing formation thicknesses.</p> <p>c) Identify and describe any potential gas migration pathways, such as faults, permeable contacts, abandoned wells, underground water or other pipelines.</p> <p>d) Provide a summary and detailed cross-section diagrams of the geologic formations and structures of the oil/gas field or area.</p> <p>e) Provide the first well drilling and production history, abandonment procedures, inspections, etc.</p> <p>f) Describe production zones, including depth, types of formations, and characteristics of field/area.</p>		

<p>g) Describe the existing and proposed storage capacity and limiting factors, such as injection or withdrawal capacities.</p> <p>h) Describe existing simulation studies that were used to predict the reservoir pressure response under gas injection and withdrawal operations, and simulation studies for how the system would change as proposed. Provide the studies as a PEA Appendix.</p> <p>i) Provide the history of the oil/gas field or area.</p>		
<p>3.3.11: Gas Storage Facilities – Well-Head Sites (as Applicable). Describe the location, depth, size and completion information for all existing, abandoned, proposed production and injection, monitoring, and test wells.</p>		
<p>3.3.12: Gas Storage Facilities – Production and Injection (as Applicable)</p> <p>a) Provide the proposed storage capacity of production and injection wells.</p> <p>b) Provide production and injection pressures, depths, and rates.</p> <p>c) Provide production and injection cycles by day, week, and year.</p> <p>d) Describe existing and proposed withdrawal/production wells (i.e., size, depth, formations, etc.).</p> <p>e) Describe existing and proposed cushion gas requirements.</p> <p>f) Describe any cushion gas injection—formation the well is completed in (cushion gas formation), and injection information.</p>		
<p>3.3.13: Gas Storage Facilities – Electrical Energy (as Applicable). Describe all existing and proposed electric lines, telecommunications facilities, and other utilities/facilities (e.g., administrative offices, service buildings, and non-hazardous storage), and chemical storage associated with the proposed project.</p>		
<p>3.3.14: Telecommunication Lines (as Applicable)</p> <p>a) Identify the type of cable that is proposed and length in linear miles by segment.</p> <p>b) Identify any antenna and node facilities that are part of the project.</p> <p>c) For below-ground telecommunication lines, provide the depth of cable and type of conduit.</p> <p>d) For above-ground telecommunication lines, provide:</p> <ul style="list-style-type: none"> i. Types of poles that will be installed (if new poles are required) ii. Where existing poles will be used iii. Any additional infrastructure (e.g., guy wires) or pole changes required to support the additional cable on existing poles 		

3.4 Land Ownership, Rights-of-Way, and Easements

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
<p>3.4.1: Land Ownership. Describe existing land ownership where each project component would be located. State whether the proposed</p>		

project would be located on property(ies) owned by the Applicant or if additional property would be required.		
<p>3.4.2: Existing Rights-of-Way or Easements</p> <p>a) Identify and describe existing rights-of-way (ROWs) or easements where project components would be located. Provide the approximately lengths and widths in each project area.</p> <p>b) Clearly state if project facilities would be replaced, modified, or relocated within existing ROWs or easements.</p>		
<p>3.4.3: New or Modified Rights-of-Way or Easements</p> <p>a) Describe new permanent or modified ROWs or easements that would be required. Provide the approximately lengths and widths in each project area.</p> <p>b) Describe how any new permanent or modified ROWs or easements would be acquired.</p> <p>c) Provide site plans identifying all properties/parcels and partial properties/parcels that may require acquisition and the anticipated ROWs or easements. Provide associated GIS data.</p> <p>d) Describe any development restrictions within new ROWs or easements, e.g., building clearances and height restrictions, etc.</p> <p>e) Describe any relocation or demolition of commercial or residential property/structures that may be necessary.</p>		
<p>3.4.4: Temporary Rights-of-Way or Easements</p> <p>f) Describe temporary ROWs or easements that would be required to access project areas, including ROWs or easements for temporary construction areas (i.e., staging areas or landing zones).</p> <p>g) Explain where temporary construction areas would be located with existing ROWs or easements for the project or otherwise available to the Applicant without a temporary ROW or easement.</p> <p>h) Describe how any temporary ROWs or easements would be acquired.</p>		

3.5 Construction

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
3.5.1 Construction Access (All Projects)		
<p>3.5.1.1: Existing Access Roads</p> <p>a) Provide the lengths, widths, ownership details (both public and private roads), and surface characteristics (i.e., paved, graveled, bare soil) of existing access roads that would be used during construction. Provide the area of existing roads that would be used (see example in Table 3 below).</p> <p>b) Describe any road modifications or stabilization that would be required prior to construction, including on the adjacent road</p>		

shoulders or slopes. Identify any roads that would be expanded and provide the proposed width increases. c) Describe any procedures to address incidental road damage cause by project activities following construction. d) Provide detailed maps and associated GIS data for all existing access roads.		
---	--	--

Table 3. Access Roads

Type of Road	Description	Area Proposed Project
Existing Dirt Road	Typically double track. May have been graded previously. No other preparation required, although a few sections may need to be re-graded and crushed rock applied in very limited areas for traction.	_____ acres
New Permanent	Would be xx feet wide, bladed. No other preparation required although crushed rock may need to be applied in very limited areas for traction.	_____ acres
Overland Access	No preparation required. Typically grassy areas that are relatively flat. No restoration would be necessary.	_____ acres

<p>3.5.1.2: New Access Roads</p> a) Identify any new access roads that would be developed for project construction purposes, such as where any blading, grading, or gravel placement could occur to provide equipment access outside of a designated workspace. ¹⁴ b) Provide lengths, widths, and development methods for new access roads. c) Identify any temporary or permanent gates that would be installed. d) Clearly identify any roads that would be temporary and fully restored following construction. Otherwise it will be assumed the new access road is a permanent feature. e) Provide detailed maps and associated GIS data for all new access roads.		
<p>3.5.1.3: Overland Access Routes</p> a) Identify any overland access routes that would be used during construction, such as where vehicles and equipment would travel over existing vegetation and where blading, grading, or gravel placement would occur. b) Provide lengths and widths for new access roads. c) Provide detailed maps and associated GIS data for all overland access routes.		
<p>3.5.1.4: Watercourse Crossings</p> a) Identify all temporary watercourse crossings that would be required during construction. Provide specific methods and procedures for temporary watercourse crossings.		

¹⁴ Temporary roads that would not require these activities should be considered an overland route.

<ul style="list-style-type: none"> b) Describe any bridges or culverts that replacement or installation of would be required for construction access. c) Provide details about the location, design and construction methods. 		
<p>3.5.1.5: Helicopter Access. If helicopters would be used during construction:</p> <ul style="list-style-type: none"> a) Describe the types and quantities of helicopters that would be used during construction (e.g., light, medium, heavy, or sky crane), and a description of the activities that each helicopter would be used for. b) Identify areas for helicopter takeoff and landing. c) Describe helicopter refueling procedures and locations. d) Describe flight paths, payloads, and expected hours and durations of helicopter operation. e) Describe any safety procedures or requirements unique to helicopter operations, such as but not limited to obtaining a Congested Area Plan from the Federal Aviation Administration (FAA). 		
<p>3.5.2 Staging Areas (All Projects)</p>		
<p>3.5.2.1: Staging Area Locations</p> <ul style="list-style-type: none"> a) Identify the locations of all staging area(s). Provide a map and GIS data for each.¹⁵ b) Provide the size (in acres) for each staging area and the total staging area requirements for the project. 		
<p>3.5.2.2: Staging Area Preparation</p> <ul style="list-style-type: none"> a) Describe any site preparation required, if known, or generally describe what might be required (i.e., vegetation removal, new access road, installation of rock base, etc.). b) Describe what the staging area would be used for (i.e., material and equipment storage, field office, reporting location for workers, parking area for vehicles and equipment, etc.). c) Describe how the staging area would be secured. Would a fence be installed? If so, describe the type and extent of the fencing. d) Describe how power to the site would be provided if required (i.e., tap into existing distribution, use of diesel generators, etc.). e) Describe any temporary lightning facilities for the site. f) Describe any grading activities and/or slope stabilization issues. 		

¹⁵ While not all potential local site staging areas will be known prior to selection of a contractor, it is expected that approximate area and likely locations of staging areas be disclosed. The identification of extra or optional staging areas should be considered to reduce the risk of changes after project approval that could necessitate further CEQA review.

3.5.3 Construction Work Areas (All Projects)		
3.5.3.1: Construction Work Areas		
<p>a) Describe known work areas that may be required for specific construction activities (e.g., pole assembly, hillside construction)¹⁶</p> <p>b) Describe the types of activities that would be performed at each work area. Work areas may include but are not necessarily limited to:</p> <ul style="list-style-type: none"> i. Helicopter landing zones and touchdown areas ii. Vehicle and equipment parking, passing, or turnaround areas iii. Railroad, bridge, or watercourse crossings iv. Temporary work pads for facility installation, modification, or removal v. Excavations and associated equipment work areas vi. Temporary guard structures vii. Pull-and-tension/stringing sites viii. Jack and bore pits, drilling areas and pull-back areas for horizontal directional drills ix. Retaining walls 		
3.5.3.2 Work Area Disturbance		
<p>a) Provide the dimensions of each work area including the maximum area that would be disturbed during construction (e.g., 100 feet by 200 feet) (see example in Table 4 below).</p> <p>b) Provide a table with temporary and permanent disturbance at each work area (in square feet or acres), and the total area of temporary and permanent disturbance for the entire project (in acres).</p>		
3.5.3.3: Temporary Power. Identify how power would be provided at work area (i.e., tap into existing distribution, use of diesel generators, etc.). Provide the disturbance area for any temporary power lines.		
3.5.4 Site Preparation (All Projects)		
3.5.4.1: Surveying and Staking. Describe initial surveying and staking procedures for site preparation and access.		
3.5.4.2: Utilities		
<p>a) Describe the process for identifying any underground utilities prior to construction (i.e., underground service alerts, etc.).</p> <p>b) Describe the process for relocating any existing overhead or underground utilities that aren't directly connected to the project system.</p> <p>c) Describe the process for installing any temporary power or other utility lines for construction.</p>		

¹⁶ Understanding that each specific work area may not be determined until the final work plan is submitted by the construction contractor, estimate total area likely to be disturbed.

Table 4. Work Areas

Proposed Project (approximate metrics)	
Pole Diameter:	
• Wood	_____ inches
• Self-Supporting Steel	_____ inches
Lattice Tower Base Dimension:	
• Self-Supporting Lattice Structure	_____ feet
Auger Hole Depth:	
• Wood	_____ to _____ feet
• Self-Supporting Steel	_____ to _____ feet
Permanent Footprint per Pole/Tower:	
• Wood	_____ sq. feet
• Self-Supporting Steel	_____ sq. feet
• Self-Supporting Steel Tower	_____ sq. feet
Number of Poles/Towers:	
• Wood	_____
• Self-Supporting Steel	_____
• Self-Supporting Steel Tower	_____
Average Work Area around Pole/Towers (e.g., for old pole removal and new pole installation):	
• Tangent structure work areas	_____ sq. feet
• Dead End / Angle structure work areas	_____ sq. feet
Total Permanent Footprint for Poles/Towers	
	Approximately _____ acres

<p>3.5.4.3: Vegetation Clearing</p> <p>a) Describe what types of vegetation clearing may be required (e.g., tree removal, brush removal, flammable fuels removal) and why (e.g., to provide access, etc.).</p> <p>b) Provide calculations of temporary and permanent disturbance of each vegetation community and include all areas of vegetation removal in the GIS database. Distinguish between disturbance that would occur in previously developed areas (i.e., paved, graveled, or otherwise urbanized), and naturally vegetated areas.</p> <p>c) Describe how each type of vegetation removal would be accomplished.</p> <p>d) Describe the types of equipment that would be used for vegetation removal.</p>		
<p>3.5.4.4: Tree Trimming Removal</p> <p>a) For electrical projects, distinguish between tree trimming as required under CPUC General Order 95-D and tree removal.</p> <p>b) Identify the types, locations, approximate numbers, and sizes of trees that may need to be removed or trimmed substantially.</p> <p>c) Identify potentially protected trees that may be removed or substantially trimmed, such as but not limited to riparian trees, oaks trees, Joshua trees, or palm trees.</p>		

<p>d) Describe the types of equipment that would typically be used for tree removal.</p>		
<p>3.5.4.5: Work Area Stabilization. Describe the processes to stabilize temporary work areas and access roads including the materials that would be used (e.g., gravel).</p>		
<p>3.5.4.6: Grading</p> <p>a) Describe any earth moving or substantial grading activities (i.e., grading below a 6-inch depth) that would be required and identify locations where it would occur.</p> <p>b) Provide estimated volumes of grading (in cubic yards) including total cut, total fill, cut that would be reused, cut that would be hauled away, and clean fill that would be hauled to the site.</p>		
<p>3.5.5 Transmission Line Construction (Above Ground)</p>		
<p>3.5.5.1: Poles/Towers</p> <p>a) Describe the process and equipment for removing poles, towers, and associated foundations for the proposed project (where applicable). Describe how they would be disconnected, demolished, and removed from the site. Describe backfilling procedures and where the material would be obtained.</p> <p>b) Describe the process and equipment for installing or otherwise modifying poles and towers for the proposed project. Describe how they would be put into place and connected to the system. Identify any special construction methods (e.g., helicopter installation) at specific locations or specific types of poles/towers.</p> <p>c) Describe how foundations, if any, would be installed. Provide a description of the construction method(s), approximate average depth and diameter of excavation, approximate volume of soil to be excavated, approximate volume of concrete or other backfill required, etc. for foundations. Describe what would be done with soil removed from a hole/foundation site.</p> <p>d) Describe how the poles/towers and associated hardware would be delivered to the site and assembled.</p> <p>e) Describe any pole topping procedures that would occur, identify specific locations and reasons, and describe how each facility would be modified. Describe any special methods that would be required to top poles that may be difficult to access.</p>		
<p>3.5.5.2: Aboveground and Underground Conductor/Cable</p> <p>a) Provide a process-based description of how new conductor/cable would be installed and how old conductor/cable would be removed, if applicable.</p> <p>b) Identify where conductor/cable stringing/installation activities would occur.</p> <p>c) Provide a diagram of the general sequencing and equipment that would be used.</p> <p>d) Describe the conductor/cable splicing process.</p>		

<p>e) Provide the general or average distance between pull-and-tension sites. Describe the approximate dimensions and where pull-and-tension sites would generally be required (as indicated by the designated work areas), such as the approximate distance to pole/tower height ratio, at set distances, or at significant direction changes. Describe the equipment that would be required at these sites.</p> <p>f) For underground conductor/cable installations, describe all specialized construction methods that would be used for installing underground conductor or cable. If vaults are required, provide their dimensions and location/spacing along the alignment. Provide a detailed description for how the vaults would be delivered to the site and installed.</p> <p>g) Describe any safety precautions or areas where special methodology would be required (e.g., crossing roadways, stream crossing).</p>		
<p>3.5.5.3: Telecommunications. Identify the procedures for installation of proposed telecommunication cables and associated infrastructure.</p>		
<p>3.5.5.4: Guard Structures. Identify the types of guard structures that would be used at crossings of utility lines, roads, railroads, highways, etc. Describe the different types of guard structures or methods that may be used (i.e., buried poles and netting, poles secured to a weighted object, bucket trucks, etc.). Describe any pole installation and removal procedures associated with guard structures. Describe guard structure installation and removal process and duration that guard structures would remain in place.</p>		
<p>3.5.5.5: Blasting</p> <p>a) Describe any blasting that may be required to construct the project.</p> <p>b) If blasting may be required, provide a Blasting Plan that identifies the blasting locations; types and amounts of blasting agent to be used at each location; estimated impact radii; and, noise estimates. The Blasting Plan should be provided as an Appendix to the PEA.</p> <p>c) Provide a map identifying the locations where blasting may be required with estimated impact radii. Provide associated GIS data.</p>		
<p>3.5.6 Transmission Line Construction (Below Ground)</p>		
<p>3.5.6.1: Trenching</p> <p>a) Describe the approximate dimensions of the trench (e.g., depth, width).</p> <p>b) Provide the total approximate volume of material to be removed from the trench, the amount to be used as backfill, and any amount to subsequently be removed/disposed of offsite in cubic yards.</p> <p>c) Describe the methods used for making the trench (e.g., saw cutter to cut the pavement, backhoe to remove, etc.).</p> <p>d) Provide off-site disposal location, if known, or describe possible option(s).</p> <p>e) Describe if dewatering would be anticipated and if so, how the trench would be dewatered, the anticipated flows of the water,</p>		

<p>whether there would be treatment, and how the water would be disposed of.</p> <ul style="list-style-type: none"> f) Describe the process for testing excavated soil or groundwater for the presence of pre-existing environmental contaminants that could be exposed from trenching operations. g) If a pre-existing hazardous waste were encountered, describe the process of removal and disposal. h) Describe the state of the ground surface after backfilling the trench. i) Describe standard Best Management Practices to be implemented. 		
<p>3.5.6.2: Trenchless Techniques (Microtunnel, Jack and Bore, Horizontal Directional Drilling)</p>		
<ul style="list-style-type: none"> a) Identify any locations/features for which the Applicant expects to use a trenchless (i.e., microtunneling, jack and bore, horizontal directional drilling) crossing method and which method is planned for each crossing. b) Describe the methodology of the trenchless technique. c) Provide the approximate location and dimensions of the sending and receiving pits. d) Describe the methodology of excavating and shoring the pits. e) Provide the total volume of material to be removed from the pits, the amount to be used as backfill, and the amount subsequently to be removed/disposed of offsite in cubic yards. f) Describe process for safe handling of drilling mud and bore lubricants. g) Describe the process for detecting and avoiding “fracturing-out” during horizontal directional drilling operations. h) Describe the process for avoiding contact between drilling mud/lubricants and stream beds. i) If engineered fill would be used as backfill, indicate the type of engineered backfill and the amount that would be typically used (e.g., the top 2 feet would be filled with thermal-select backfill). j) Describe if dewatering is anticipated and, if so, how the pits would be dewatered, the anticipated flows of the water, whether there would be treatment, and how the water would be disposed of. k) Describe the process for testing excavated soil or groundwater for the presence of pre-existing environmental contaminants. Describe the process of disposing of any pre-existing hazardous waste that is encountered during excavation. l) Describe any standard BMPs that would be implemented for trenchless construction. 		
<p>3.5.7 Substation, Switching Stations, Gas Compressor Stations</p>		
<p>3.5.7.1: Installation or Facility Modification. Describe the process and equipment for removing, installing, or modifying any substations, switching stations, or compressor stations including:</p> <ul style="list-style-type: none"> a) Transformers/ electric components b) Gas components c) Control and operation buildings d) Driveways 		

<ul style="list-style-type: none"> e) Fences f) Gates g) Communication systems (SCADA) h) Grounding systems 		
<p>3.5.7.2: Civil Works. Describe the process and equipment required to construct any slope stabilization, drainage, retention basins, and spill containment required for the facility.</p>		
<p>3.5.8 Gas Pipelines</p>		
<p>3.5.8.1: Gas Pipeline Construction. Describe the process for proposed pipeline construction including site development, trenching and trenchless techniques, pipe installation, and backfilling.</p>		
<p>3.5.8.2: Water Crossings. Describe water feature crossings that will occur during trenching, the method of trenching through stream crossings, and the process for avoiding impacts to the water features required for pipeline construction. Identify all locations where the pipeline will cross water features. Cite to any associated geotechnical or hydrological investigations completed and provide a full copy of each report as an Appendix to the PEA.¹⁷</p>		
<p>3.5.8.3: Gas Pipeline Other Requirements</p> <ul style="list-style-type: none"> a) Describe hydrostatic testing process including pressures, timing, source of flushing water, discharge of water. b) Describe energy dissipation basin, and the size and length of segments to be tested. c) Describe pig launching locations and any inline inspection techniques used during or immediately post construction. 		
<p>3.5.9 Gas Storage Facilities</p>		
<p>3.5.9.1: Gas Storage Construction</p> <ul style="list-style-type: none"> a) Describe the process for constructing the gas storage facility including constructing well pads and drilling wells. b) Describe the specific construction equipment that would be used, such as the type of drill rig (i.e., size, diesel, electric, etc.), depth of drilling, well-drilling schedule and equipment. 		
<p>3.5.9.2: Drilling Muds and Fluids. Describe the use of any drilling muds, fluids, and other drilling materials. Provided estimated types and quantities.</p>		
<p>3.5.10 Public Safety and Traffic Control (All Projects)</p>		
<p>3.5.10.1: Public Safety</p> <ul style="list-style-type: none"> a) Describe specific public safety considerations during construction and best management practices to appropriately manage public safety. Clearly state when and where they each safety measure would be applied. 		

¹⁷ If a geotechnical study is not available at the time of PEA filing, provide the best information available.

<p>b) Identify procedures for managing work sites in urban areas, covering open excavations securely, installing barriers, installing guard structures, etc.</p> <p>c) Identify specific project areas where public access may be restricted for safety purposes and provide the approximate durations and timing of restricted access at each location.</p>		
3.5.10.2: Traffic Control		
<p>a) Describe traffic control procedures that would be implemented during construction.</p> <p>b) Identify the locations, process, and timing for closing any sidewalks, lanes, roads, trails, paths, or driveways to manage public access.</p> <p>c) Identify temporary detour routes and locations.</p> <p>d) Provide a preliminary Traffic Control Plan(s) for the project.</p>		
<p>3.5.10.3: Security. Describe any security measures, such as fencing, lighting, alarms, etc. that may be required. State if security personnel will be stationed at project areas and anticipated duration of security.</p>		
<p>3.5.10.4: Livestock. Describe any livestock fencing or guards that may be necessary to prevent livestock from entering project areas. State if the fencing would be electrified and if so, how it would be powered.</p>		
3.5.11 Dust, Erosion, and Runoff Controls (All Projects)		
<p>3.5.11.1: Dust. Describe specific best management practices that would be implemented to manage fugitive dust.</p>		
<p>3.5.11.2: Erosion. Describe specific best management practices that would be implemented to manage erosion.</p>		
<p>3.5.11.3: Runoff. Describe specific best management practices that would be implemented to manage stormwater runoff and sediment.</p>		
3.5.12 Water Use and Dewatering (All Projects)		
<p>3.5.12.1: Water Use. Describe the estimated volumes of water that would be used by construction activity (e.g., dust control, compaction, etc.). State if recycled or reclaimed water would be used and provide estimated volumes. Identify the anticipated sources where the water would be acquired or purchased. Identify if the source of water is groundwater and the quantity of groundwater that could be used.</p>		
<p>3.5.12.2: Dewatering</p> <p>a) Describe dewatering procedures during construction, including pumping, storing, testing, permitted discharging, and disposal requirements that would be followed.</p> <p>b) Describe the types of equipment and workspace considerations to be used to dewater, store, transport, or discharge extracted water.</p>		
3.5.13 Hazardous Materials and Management (All Projects)		
3.5.13.1: Hazardous Materials		
<p>a) Describe the types, uses, and volumes of all hazardous materials that would be used during construction.</p> <p>b) State if herbicides or pesticides may be used during construction.</p>		

<p>c) If a pre-existing hazardous waste were encountered, describe the process of removal and disposal.</p>		
<p>3.5.13.2: Hazardous Materials Management</p>		
<p>a) Identify specific best management practices that would be followed for transporting, storing, and handling hazardous materials. b) Identify specific best management practices that would be followed in the event of an incidental leak or spill of hazardous materials. c) Provide a Hazardous Substance Control and Emergency Response Plan / Hazardous Waste and Spill Prevention Plan as an Appendix to the PEA, if appropriate.</p>		
<p>3.5.14 Waste Generation and Management (All Projects)</p>		
<p>3.5.14.1: Solid Waste</p>		
<p>a) Describe solid waste streams from existing and proposed facilities during construction. b) Identify procedures to be implemented to manage solid waste, including collection, containment, storage, treatment, and disposal. c) Provide estimated total volumes of solid waste by construction activity or project component. d) Describe the recycling potential of solid waste materials and provide estimated volumes of recyclable materials by construction activity or project component. e) Identify the locations of appropriate disposal and recycling facilities where solid wastes would be transported.</p>		
<p>3.5.14.2: Liquid Waste</p>		
<p>a) Describe liquid waste streams during construction (i.e., sanitary waste, drilling fluids, contaminated water, etc.) b) Describe procedures to be implemented to manage liquid waste, including collection, containment, storage, treatment, and disposal. c) Provide estimated volumes of liquid waste generated by construction activity or project component. d) Identify the locations of appropriate disposal facilities where liquid wastes would be transported.</p>		
<p>3.5.14.3: Hazardous Waste</p>		
<p>a) Describe potentially hazardous waste streams during construction and procedures to be implemented to manage hazardous wastes, including collection, containment, storage, treatment, and disposal. b) If large volumes of hazardous waste are anticipated, such as from a pre-existing contaminant in the soil that must be collected and disposed of, provide estimated volumes of hazardous waste that would be generated by construction activity or project component. c) Identify the locations of appropriate disposal facilities where hazardous wastes would be transported.</p>		
<p>3.5.15 Fire Prevention and Response (All Projects)</p>		
<p>3.5.15.1: Fire Prevention and Response Procedures. Describe fire prevention and response procedures that would be implemented during</p>		

construction. Provide a Construction Fire Prevention Plan or specific procedures as an Appendix to the PEA.		
3.5.15.2: Fire Breaks. Identify any fire breaks (i.e., vegetation clearance) requirements around specific project activities (i.e., hot work). Ensure that such clearance buffers are included in the limits of the defined work areas, and the vegetation removal in that area is attributed to Fire Prevention and Response (refer to 3.5.4.3: Vegetation Clearing).		

3.6 Construction Workforce, Equipment, Traffic, and Schedule

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
<p>3.6.1: Construction Workforce</p> <p>a) Provide the estimated number of construction crew members. In the absence of project-specific data, provide estimates based on past projects of a similar size and type.</p> <p>b) Describe the crew deployment. Would crews work concurrently (i.e., multiple crews at different sites); would they be phased? How many crews could be working at the same time and where?</p> <p>c) Describe the different types of activities to be undertaken during construction, the number of crew members for each activity (i.e. trenching, grading, etc.), and number and types of equipment expected to be used for the activity. Include a written description of the activity. See example in Table 5.</p>		
<p>3.6.2: Construction Equipment. Provide a tabular list of the types of equipment expected to be used during construction of the proposed project including the horsepower. Define the equipment that would be used by each phase as shown in the example table below (Table 5).</p>		

Table 5. Construction Equipment and Workforce

Work Activity				Activity Production				
Equipment Description	Estimated Horse-power	Probable Fuel Type	Equipment Quantity	Estimated Workforce	Estimated Start Date	Estimated End Date	Duration of Use (Hrs./Day)	Estimated Production
Survey				4	January 2020	December 2020		358 Miles
1-Ton Truck, 4x4	300	Diesel	2		January 2020	December 2020	10	1 Mile/Day
Staging Yards				5	DOP			
1-Ton Truck, 4x4	300	Diesel	1		Duration of Project			4
R/T Forklift	350	Diesel	1					5
Boom/Crane Truck	350	Diesel	1					5
Water Truck	300	Diesel	2					10
Jet A Fuel Truck	300	Diesel	1					4
Truck, Semi-Tractor	500	Diesel	1					6
Road Work				6	January 2020	March 2020		426 Miles
1-Ton Truck, 4x4	300	Diesel	2		January 2020	March 2020	5	
Backhoe/Front Loader	350	Diesel	1		January 2020	March 2020	7	
Track Type Dozer	350	Diesel	1		January 2020	March 2020	7	
Motor Grader	350	Diesel	1		January 2020	March 2020	5	
Water Truck	300	Diesel	2		January 2020	March 2020	10	
Drum Type Compactor	250	Diesel	1		January 2020	March 2020	5	
Excavator	300	Diesel	1		January 2020	February 2020	7	
Lowboy Truck/Trailer	500	Diesel	1		January 2020	February 2020	4	

<p>3.6.3: Construction Traffic</p> <ul style="list-style-type: none"> a) Describe how the construction crews and their equipment would be transported to and from the proposed project site. b) Provide vehicle type, number of vehicles, and estimated hours of operation per day, week, and month for each construction activity and phase. c) Provide estimated vehicle trips and vehicles miles traveled (VMT) for each construction activity and phase. Provide separate values for construction crews commuting, haul trips, and other types of construction traffic. 		
<p>3.6.4: Construction Schedule</p> <ul style="list-style-type: none"> a) Provide the proposed construction schedule (e.g., month and year) for each segment or project component, and for each construction activity and phase. b) Provide and explain the sequencing of construction activities, and if they would or would not occur concurrently. c) Provide the total duration of each construction activity and phase in days or weeks. d) Identify seasonal considerations that may affect the construction schedule, such as weather or anticipated wildlife restrictions, etc. The proposed construction should account for such factors. 		
<p>3.6.5: Work Schedule</p> <ul style="list-style-type: none"> a) Describe the anticipated work schedule, including the days of the week and hours of the day when work would occur. Clearly state if work would occur at night or on weekends and identify when and where this could occur. b) Provide the estimated number of days or weeks that construction activities would occur at each type of work area. For example, construction at a stationary facility or staging area may occur for the entire duration of construction, but construction at individual work areas along a linear project would be limited to a few hours, days or weeks, and only a fraction of the total construction period. 		

3.7 Post-Construction

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
<p>3.7.1: Configuring and Testing. Describe the process and duration for post-construction configuring and testing of facilities. Describe the number of personnel and types of equipment that would be involved.</p>		
<p>3.7.2: Landscaping. Describe any landscaping that would be installed. Provide a conceptual landscape plan that identifies the locations and types of plantings that will be used. Identify whether plantings will include container plants or seeds. Include any water required for landscaping in the description of water use above.</p>		

3.7.3 Demobilization and Site Restoration		
3.7.3.1: Demobilization. Describe the process for demobilization after construction activities, but prior to leaving the work site. For example, describe final processes for removing stationary equipment and materials, etc.		
3.7.3.2: Site Restoration. Describe how cleanup and post-construction restoration would be performed (i.e., personnel, equipment, and methods) on all project ROWs, sites, and extra work areas. Things to consider include, but are not limited to, restoration of the following: <ul style="list-style-type: none"> a) Restoring natural drainage patterns b) Recontouring disturbed soil c) Removing construction debris d) Vegetation e) Permanent and semi-permanent erosion control measures f) Restoration of all disturbed areas and access roads, including restoration of any public trails that are used as access, as well as any damaged sidewalks, agricultural infrastructure, or landscaping, etc. g) Road repaving and striping, including proposed timing of road restoration for underground construction within public roadways 		

3.8 Operation and Maintenance

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
3.8.1: Regulations and Standards <ul style="list-style-type: none"> a) Identify and describe all regulations and standards applicable to operation and maintenance of project facilities. b) Provide a copy of any applicable Wildfire Management Plan and describe any special procedures for wildfire management. 		
3.8.2: System Controls and Operation Staff <ul style="list-style-type: none"> a) Describe the systems and methods that the Applicant would use for monitoring and control of project facilities (e.g., on-site control rooms, remote facilities, standard monitoring and protection equipment, pressure sensors, automatic shut-off valves, and site and equipment specific for monitoring and control such as at natural gas well pads). b) If new full-time staff would be required for operation and/or maintenance, provide the number of positions and purpose. 		
3.8.3: Inspection Programs <ul style="list-style-type: none"> a) Describe the existing and proposed inspection programs for each project component, including the type, frequency, and timing of scheduled inspections (i.e., aerial inspection, ground inspection, pipeline inline inspections). b) Describe any enhanced inspections, such as within any High Fire Threat Districts consistent with applicable Wildfire Management Plan requirements. 		

<p>c) Describe the inspection processes, such as the methods, number of crew members, and how access would occur (i.e., walk, vehicle, all-terrain vehicle, helicopter, drone, etc.). If new access would be required, describe any restoration that would be provided for the access roads.</p>		
<p>3.8.4: Maintenance Programs</p> <p>a) Describe the existing and proposed maintenance programs for each project component.</p> <p>b) Describe scheduled maintenance or facility replacement after the designated lifespan of the equipment.</p> <p>c) Identify typical parts and materials that require regular maintenance and describe the repair procedures.</p> <p>d) Describe any access road maintenance that would occur.</p> <p>e) Describe maintenance for surface or color treatment.</p> <p>f) Describe cathodic protection maintenance that would occur.</p> <p>g) Describe ongoing landscaping maintenance that would occur.</p>		
<p>3.8.5: Vegetation Management Programs</p> <p>a) Describe vegetation management programs within and surrounding project facilities. Distinguish between any different types of vegetation management.</p> <p>b) Describe any enhanced vegetation management, such as within any High Fire Threat Districts consistent with any applicable Wildfire Management Plan requirements. Identify the areas where enhanced vegetation management would be conducted.</p>		

3.9 Decommissioning

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
<p>3.9.1: Decommissioning. Provide detailed information about the current and reasonably foreseeable plans for the disposal, recycling, or future abandonment of all project facilities.</p>		

3.10 Anticipated Permits and Approvals

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
<p>3.10.1: Anticipated Permits and Approvals. Identify all necessary federal, state, regional, and local permits that may be required for the project. For each permit, list the responsible agency and district/office representative with contact information, type of permit or approval, and status of each permit with date filed or planned to file. For example:</p> <p>a) Federal Permits and Approvals</p> <ul style="list-style-type: none"> i. U.S. Fish and Wildlife Service ii. U.S. Army Corps of Engineers iii. Federal Aviation Administration iv. U.S. Forest Service 		

<ul style="list-style-type: none"> v. U.S. Department of Transportation – Office of Pipeline Safety vi. U.S. Environmental Protection Agency (Resource Conservation and Recovery Act; Comprehensive Environmental Response, Compensation, and Liability Act) <p>b) State and Regional Permits</p> <ul style="list-style-type: none"> i. California Department of Fish and Wildlife ii. California Department of Transportation iii. California State Lands Commission iv. California Coastal Commission v. State Historic Preservation Office, Native American Heritage Commission vi. State Water Resources Control Board vii. California Division of Oil, Gas and Geothermal Resources viii. Regional Air Quality Management District ix. Regional Water Quality Control Board (National Pollutant Discharge Elimination System General Industrial Storm Water Discharge Permit) x. Habitat Conservation Plan Authority (if applicable) <p>See also Table 6 of example permitting requirements and processes.</p>		
<p>3.10.2: Rights-of-Way or Easement Applications. Demonstrate that applications for ROWs or other proposed land use have been or soon will be filed with federal, state, or other land-managing agencies that have jurisdiction over land that would be affected by the project (if any). Discuss permitting plans and timeframes and provide the contact information at the federal agency(ies) approached.</p>		

3.11 Applicant Proposed Measures

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
<p>3.11 Applicant Proposed Measures</p> <ul style="list-style-type: none"> a) Provide a table with the full text of any Applicant Proposed Measure. Where applicable, provide a copy of Applicant procedures, plans, and standards referenced in the Applicant Proposed Measures. b) Within Chapter 5, describe the basis for selecting a particular Applicant Proposed Measure and how the Applicant Proposed Measure would reduce the impacts of the project.¹⁸ c) Carefully consider each CPUC Draft Environmental Measure identified in Chapter 5 of this PEA Checklist. The CPUC Draft Environmental Measures will be applied to the proposed project where applicable. 		

¹⁸ Applicant Proposed Measures that use phrases, such as, “as practicable” or other conditional language are not acceptable and will be superseded by Mitigation Measures if required to avoid or reduce a potentially significant impact.

Table 6. Example Permitting Requirements and Processes

Note: In addition to the CPCN or PTC, the applicant may also be required to secure resource agency permits for the project.

Disclaimer: Below is a general list of permits required for transmission projects. Permit requirements for individual projects may vary slightly depending on project conditions.

Agency	Permit	Regulation	Protected Resource	Trigger	Application Process	Timing
<i>Federal</i>						
Army Corps of Engineers	404 Permit	Clean Water Act	Waters of the United States (including wetlands)	Placement of dredge or fill material into waters of the U.S., including wetlands. If project impacts less than 0.5 acres a nationalwide permit (NWP) is typically issued	NWP: prepare a preconstruction notification (PCN) along with the draft Corps's application (Engineer Form 4345). Information in the PCN includes, but is not limited to: results of wetland delineation including areas of waters of the U.S.; temporary and permanent impacts to waters of the U.S. and discussion of avoidance; construction techniques, timeline, and equipment that would be used; special status species that potentially occur in the project area, and discussion of mitigation (if applicable) to replace wetlands	NWP: takes approximately nine months from the date of application submittal (depending on level of impacts and level of consultation required by other agencies). Initial review is 30 days after which application is deemed complete or additional information is requested.
				If project would impact more than 0.5 acres a regional or individual permit may be required.	Regional or Individual Permit: Same requirements as NWP as well as preparation and submittal of 404(b)(1) Alternatives analysis which identifies the Least Environmentally Damaging Practicable Alternative (LEDPA). Public notice also required	Regional or Individual Permit: An additional three to six months may be required on top of the nine months expected for an NWP. A 30 day public notice is also required to inform the public about the project before the Corps issues the permit.
USFWS	Section 7 Consultation	Federal Endangered Species Act	Federally Listed Species	Potential impact to a federally listed threatened or endangered species	Biological Assessment (BA) prepared and submitted to Corps. BA contains information on each species and describes potential for "take" of species and/or habitat.	The timeline for processing and receiving a formal Biological Opinion (BO) from USFWS can be six months to a year from when the Corps has initiated consultation and depending on the level of impact to listed species. The typical timeline for issuance of a BO is no less than 135 days after acceptance of the BA as complete.
US Department of Agriculture, Forest Service	Special Use Authorization	National Forest Management Act/NEPA	National Forest lands	Use of federal lands managed by the USDA Forest Service for a transmission line. Typically constitutes a Major Federal Action which in turn triggers NEPA analysis.	Special Use Authorization Application: prepare a special use application for consideration by the Forest Service. Prior to submitting a proposal, applicant is required to arrange a preapplication meeting at the local Forest Service office. Application typically includes project plan, operating plans, liability insurance, licenses/registrations and other documents. If it is determined that NEPA is required either an EA or EIS would be prepared. The NEPA document may be prepared jointly with the CEQA document.	Review of Special Use Authorization applications is often dependent upon what level of NEPA analysis is required. An EA is typically 9-12 months, and EIS is generally 18 months. NEPA process may occur concurrently with CEQA process.
US Department of the Interior, Bureau of Land Management	Right-of-Way Grant	Federal Land Policy and Management Act/NEPA	Federal Lands	Use of federal lands managed by the BLM for a transmission line. Typically constitutes a Major Federal Action which in turn triggers NEPA analysis.	Right-of-Way Application: Contact the BLM office with management responsibility. Obtain an application form "Application for Transportation and Utility Systems and Facilities on Federal Lands". Arrange a pre-application meeting with a BLM Realty Specialist or appropriate staff member. Submit completed application to the appropriate BLM office. If it is determined that NEPA is required either an EA or EIS would be prepared. The NEPA document may be prepared jointly with the CEQA document.	BLM attempts to review completed applications within 60 days of submittal. Full timing is often dependent upon what level of NEPA analysis is required. An EA is typically 9-12 months, and EIS is generally 18 months. NEPA process may occur concurrently with CEQA process.

Guidelines for Energy Project Applications Requiring CEQA Compliance: Pre-filing and PEAs
November 12, 2019

Agency	Permit	Regulation	Protected Resource	Trigger	Application Process	Timing
<i>State (continued)</i>						
State Historic Preservation Officer (SHPO)	Section 106 National Historic Preservation Act (NHPA)	National Historic Preservation Act	Cultural and/or historical resources	Required if there are potential impacts to cultural and/or historical resources that are listed or eligible for listing on the National Register of Historic Places.	Information on cultural and historical resources gathered during the draft CEQA document preparation is included in a 106 Technical Report and submitted to the Corps along with the Area of Potential Effect (APE) map. The information is then evaluated by the Corps' cultural resources evaluator for potential adverse effects within the APE. Depending upon the level of potential adverse effect, the Corps then forwards its finding to SHPO for concurrence or begins the process for a Memorandum of Agreement (MOA). Native American consultation is also mandatory for the 106 process but can begin during preparation of the environmental document. All letters and correspondence for the Native American consultation must be provided to the Corps. Consultation with federally-recognized tribes may require a more extensive consultation.	Once SHPO has received the Corps' determination, it has approximately 60 days to agree or request additional information. However, SHPO has recently become more involved in projects and this timeframe is only an estimate and if a potential adverse effect to cultural or historical resources could occur, the SHPO process can take up to a year or more. Depending on the level of impacts to cultural resources, the Corps may determine no effect and issue the permit before receiving concurrence from SHPO.
California State Lands Commission (CSLC)	Right of Way Lease Agreement	Division 6 of the California Public Resources Code	California Sovereign Lands	May be triggered if the transmission line crosses state lands under the jurisdiction of the CSLC, which includes the beds of 1) more than 120 rivers, streams and sloughs; 2) nearly 40 non-tidal navigable lakes, such as Lake Tahoe and Clear Lake; 3) the tidal navigable bays and lagoons; and 4) the tide and submerged lands adjacent to the entire coast and offshore islands of the State from the mean high tide line to three nautical miles offshore.	Leases or permits may be issued to qualified applicants and the Commission shall have broad discretion in all aspects of leasing including category of lease or permit and which use, method or amount of rental is most appropriate, whether competitive bidding should be used in awarding a lease, what term should apply, how rental should be adjusted during the term, whether bonding and insurance should be required and in what amounts, whether an applicant is qualified based on what it deems to be in the best interest of the State.	Most coordination should be done concurrently with the CEQA process to ensure that any CSLC-required issues are addressed under CEQA. Once a final route/alternative is selected, the lease process may take two to three months for final Commission approval.
<i>Local / Other</i>						
Air Quality Management District or Air Pollution Control District	Permit to Construct	Federal Clean Air Act	Air Quality	Depends on the air district involved; may not be required for most transmission projects. Some air districts have a trigger level based on disturbed acreage.	Application forms need to be prepared and submitted to the local AQMD or APCD	Typically 30 to 90 days after submittal of a complete application.

¹⁹ Permitting is project specific. This table is provided for discussion purposes.

3.12 Project Description Graphics, Mapbook, and GIS Requirements

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
<p>3.12.1: Graphics. Provide diagrams of the following as applicable:</p> <ul style="list-style-type: none"> a) All pole, tower, pipe, vault, conduit, and retaining wall types b) For poles, provide typical drawings with approximate diameter at the base and tip; for towers, estimate the width at base and top. c) A typical detail for any proposed underground duct banks and vaults d) All substation, switchyard, building, and facility layouts e) Trenching, drilling, pole installation, pipe installation, vault installation, roadway construction, facility removal, helicopter uses, conductor installation, traffic control, and other construction activities where a diagram would assist the reader in visualizing the work area and construction approach f) Typical profile views of proposed aboveground facilities and existing facilities to be modified within the existing and proposed ROW (e.g., typical cross-section of existing and proposed facilities by project segment). g) Photos of representative existing and proposed structures 		
<p>3.12.2: Mapbook. Provide a detailed mapbook on an aerial imagery basemap at a scale between 1:3000 and 1:6000 (or as appropriate and legible) that show mileposts, roadways, and all project components and work areas including:</p> <ul style="list-style-type: none"> a) All proposed above-ground and underground structure/facility locations (e.g., poles, conductor, substations, compressor stations, telecommunication lines, vaults, duct bank, lighting, markers, etc.) b) All existing structures/facilities that would be modified or removed c) Identify by milepost where existing ROW will be used and where new ROW or land acquisition will be required. d) All permanent work areas including permanent facility access e) All access roads including, existing, temporary, and new permanent access f) All temporary work areas including staging, material storage, field offices, material laydown, temporary work areas for above ground (e.g., pole installation) and underground facility construction (e.g., trenching and duct banks), helicopter landing zones, pull and tension sites, guard structures, shoo flies etc. g) Areas where special construction methods (e.g., jack and bore, HDD, blasting, retaining walls etc.) may need to be employed 		

<ul style="list-style-type: none"> h) Areas where vegetation removal may occur i) Areas to be heavily graded and where slope stabilization measures would be employed including any retaining walls 		
<p>3.12.3: GIS Data. Provide GIS data for all features and ROW shown on the detailed mapbook.</p>		
<p>3.12.4: GIS Requirements. Provide the following information for each pole/tower that would be installed and for each pole/tower that would be removed:</p> <ul style="list-style-type: none"> a) Unique ID number and type of pole (e.g., wood, steel, etc.) or tower (e.g., self-supporting lattice) both in a table and in the attributes of the GIS data provided b) Identify pole/tower heights and conductor sizes in the attributes of the GIS data provided. 		
<p>3.12.5: Natural Gas Facilities GIS Data. For natural gas facilities, provide GIS data for system cross ties and all laterals/taps, valve stations, and new and existing inspection facilities (e.g., pig launcher sites).</p>		

4 Description of Alternatives

All Applicants will assume that alternatives will be required for the environmental analysis and that an EIR will be prepared unless otherwise instructed by CPUC CEQA Unit Staff in writing prior to application filing. See PEA Requirements at the beginning of this checklist document. The consideration and discussion of alternatives will adhere to CEQA Guidelines Section 15126.6. The description of alternatives will be provided in this chapter of the PEA, and the comparison of each alternative to the proposed project is provided in PEA Chapter 6. The amount of detail required for the description of various alternatives to the proposed project and what may be considered a reasonable range of alternatives will be discussed with CPUC during Pre-filing.

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
<p>4.1 Alternatives Considered. Identify alternatives to the proposed project.²⁰ Include the following:</p> <ul style="list-style-type: none"> a) All alternatives to the proposed project that were suggested, considered, or studied by the CAISO or by CAISO stakeholders b) Alternatives suggested by the public or agencies during public outreach efforts conducted by the Applicant c) Reduced footprint alternatives, including, e.g., smaller diameter pipelines and space for fewer electric transformers d) Project phasing options (e.g., evaluate the full build out for environmental clearance but consider an initial, smaller buildout that would only be expanded [in phases] if needed) e) Alternative facility and construction activity sites (e.g., substation, compressor station, drilling sites, well-head sites, staging areas) f) Renewable, energy conservation, energy efficiency, demand response, distributed energy resources, and energy storage alternatives g) Alternatives that would avoid or limit the construction of new transmission-voltage facilities or new gas transmission pipelines h) Other technological alternatives (e.g., conductor type) i) Route alternatives and route variations j) Alternative engineering or technological approaches (e.g., alternative types of facilities, or materials, or configurations) k) Assign an identification label and brief, descriptive title to each alternative described in this PEA chapter (e.g., Alternative A: No Project; Alternative B: Reduced Footprint 500/115-kV Substation; Alternative C: Ringo Hills 16-inch Pipeline Alignment; Alternative D1: Lincoln Street Route Variation; etc.). Each alternative will be easily identifiable by reading the brief title. <p>Provide a description of each alternative. The description of each alternative will discuss to what extent it would be potentially feasible,</p>		

²⁰ Reduced footprint alternatives; siting alternatives; renewable, energy conservation, energy efficiency, demand response, distributed energy resources, and energy storage alternatives; and non-wires alternatives (electric projects only) are typically required. For linear projects, route alternatives and route variations are typically required as well.

<p>meet the project’s underlying purpose, meet most of the basic project objectives, and avoid or reduce one or more potentially significant impacts. If the Applicant believes that an alternative is infeasible or the implementation is remote and speculative (CEQA Guidelines Section 15126.6(f)(3), clearly explain why.</p> <p>If significant environmental effects are possible without mitigation, alternatives will be provided in the PEA that are capable of avoiding or reducing any potentially significant environmental effects, even if the alternative(s) substantially impede the attainment of some project objectives or are costlier.²¹</p>		
<p>4.2 No Project Alternative. Include a thorough description of the No Project Alternative. The No Project Alternative needs to describe the range of actions that are reasonably foreseeable if the proposed project is not approved. The No Project Alternative will be described to meet the requirements of CEQA Guidelines Section 15126.6(e).</p>		
<p>4.3 Rejected Alternatives. Provide a detailed discussion of all alternatives considered by the Applicant that were not selected by the Applicant for a full description in the PEA and analysis in PEA Chapter 5. The detailed discussion will include the following:</p> <ul style="list-style-type: none"> a) Description of the alternative and its components b) Map of any alternative sites or routes c) Discussion about the extent to which the alternative would meet the underlying purpose of the project and its basic objectives d) Discussion about the feasibility of implementing the alternative e) Discussion of whether the alternative would reduce or avoid any significant environmental impacts of the proposed project f) Discussion of any new significant impacts that could occur from implementation of the alternative g) Description of why the alternative was rejected h) Any comments from the public or agencies about the alternative during PEA preparation 		
<p>For Natural Gas Storage Projects:</p>		
<p>4.4 Natural Gas Storage Alternatives. In addition to the requirements included above, alternatives to be considered for proposed natural gas storage projects include the following, where applicable:</p> <ul style="list-style-type: none"> a) Alternative reservoir locations considered for gas storage including other field locations and other potential storage areas b) Alternative pipelines, road, and utility siting c) Alternative suction gas requirements, and injection/withdrawal options 		

²¹ CPUC CEQA Unit Staff will determine whether an alternative could *substantially* reduce one or more potentially significant impacts of the proposed project (CEQA Guidelines Section 15125.5). Applicants are strongly advised to provide more rather than less alternatives for CPUC’s consideration or as determined during Pre-filing.

5 Environmental Analysis

Include a description of the environmental setting, regulatory setting, and impact analysis for each resource area. The resource areas addressed will include each environmental factor (resource area) identified in the most recent adopted version of the CEQA Guidelines Appendix G checklist and any additional relevant resource areas and impact questions that are defined in this PEA checklist.

1. Environmental Setting
 - a. For each resource area, the PEA will include a detailed description of the natural and built environment in the vicinity of the proposed project area (e.g., topography, land use patterns, biological environment, etc.) as applicable to the resource area. Both regional and local environmental setting information will be provided.
 - b. All setting information provided will relate in some way to the impacts of the proposed project discussed in the PEA's impacts analysis, however CPUC's impacts analysis may be more thorough, which may necessitate additional setting information than the Applicant might otherwise provide.
2. Regulatory Setting
 - a. Organized by federal, State, regional, and local sections
 - b. Describe the policy or regulation and briefly explain why it is applicable to the proposed project.
 - i. Identify in the setting all laws, regulations, and policies that would be applicable for CPUC's exclusive jurisdiction over the siting and design of electric and gas facilities. Public utilities under CPUC's jurisdiction are expected to consult with local agencies regarding land use matters. Local laws, regulations, and policies will be considered for the consideration of potential impacts during CPUC's CEQA review (e.g., encroachment, grading, erosion control, scenic corridors, overhead line undergrounding, tree removal, fire protection, permanent and temporary noise limits, zoning requirements, general plan polices, and all local and regional laws, regulations, and policies).
3. Impact Questions
 - a. Includes all impact questions in the current version of CEQA Guidelines, Appendix G.
 - b. Additional impact questions that are frequently relevant to utility projects are provided in Attachment 4, CPUC Draft Environmental Measures.
4. Impact Analyses
 - a. Discussion organized by CEQA Guidelines, Appendix G impact items and any Additional CEQA Impact Questions in the PEA Checklist. Assess all potential environmental impacts and make determinations, such as, No Impact, Less than Significant, Less than Significant with Mitigation, Significant and Unavoidable, or Beneficial Impact with respect to construction, operations, and maintenance activities.
 - b. The impact analyses provided in PEA Chapter 5, Environmental Analysis, need not be as thorough as those to be prepared by CPUC for the CEQA environmental document. A preliminary determination will be provided but with only brief justification unless otherwise directed by CPUC Staff in writing during Pre-filing.
5. CPUC Draft Environmental Measures
 - a. CPUC Draft Environmental Measures are provided for some of the resource areas in Attachment 4, CPUC Draft Environmental Measures. The measures may be applied to the proposed project as written or modified by the CPUC during its environmental review if the measure would avoid or reduce a potentially significant impact.

- b. The CPUC Draft Environmental Measures should be discussed with the CPUC’s CEQA Unit Staff during Pre-filing, especially with respect to the development of Applicant Proposed Measures.
- c. In general, impact avoidance is preferred to the reduction of potentially significant impacts.

Additional requirements specific to each resource area are identified in the following sections.

5.1 Aesthetics

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
5.1.1 Environmental Setting		
5.1.1.1: Landscape Setting. Briefly described the regional and local landscape setting.		
5.1.1.2: Scenic Resources. Identify and describe any vistas, scenic highways, national scenic areas, or other scenic resources within and surrounding the project area (approximately 5-mile buffer but may be greater if necessary). Scenic resources may also include but are not limited to historic structures, trees, or other resources that contribute to the scenic values where the project would be located.		
<p>5.1.1.3: Viewshed Analysis</p> <ul style="list-style-type: none"> a) Conduct a viewshed analysis for the project area (approximately 5-mile buffer but may be greater if necessary). b) Describe the project viewshed, including important visibility characteristics for the project site, such as viewing distance, viewing angle, and intervening topography, vegetation, or structures. c) Provide a supporting map (or maps) showing project area, landscape units, topography (i.e., hillshade), and the results of the viewshed analysis. Provide associated GIS data. 		
5.1.1.4: Landscape Units. Identify and describe landscape units (geographic zones) within and surrounding the project area (approximately 5-mile buffer but may be greater if necessary) that categorizes different landscape types and visual characteristics, with consideration to topography, vegetation, and existing land uses. Landscape units should be developed based on the existing landscape characteristics rather than the project’s features or segments.		
5.1.1.5: Viewers and Viewer Sensitivity. Identify and described the types of viewers expected within the viewshed and landscape units. Describe visual sensitivity to general visual change based on viewing conditions, use of the area, feedback from the public about the project, and landscape characteristics.		

<p>5.1.1.6: Representative Viewpoints</p> <p>a) Identify representative viewpoints from publicly accessible locations (up to approximately 5-mile buffer but may be greater if appropriate). The number and location of the viewpoints must represent a range of views of the project site from major roads, highways, trails, parks, vistas, landmarks, and other scenic resources near the project site. Multiple viewpoints should be included where the project site would be visible from sensitive scenic resources to provide context on different viewing distances, perspectives, and directions.</p> <p>b) Provide the following information for each viewpoint:</p> <ul style="list-style-type: none"> i. Number, title, and brief description of the location ii. Types of viewers iii. Viewing direction(s) and distance(s) to the nearest proposed project features iv. Description of the existing visual conditions and visibility of the project site as seen from the viewpoint and shown in the representative photographs <p>c) Provide a supporting map (or maps) showing project features and representative viewpoints with arrows indicating the viewing direction(s). Provide associated GIS data (may be combined with GIS data request below for representative photographs).</p>		
<p>5.1.1.7: Representative Photographs</p> <p>a) Provide high resolution photographs taken from the representative viewpoints in the directions of all proposed project features.²² Multiple photographs should be provided where project features may be visible in different viewing directions from the same location.</p> <p>b) Provide the following information for each photograph:</p> <ul style="list-style-type: none"> i. Capture time and date ii. Camera body and lens model iii. Lens focal length and camera height when taken <p>c) Provide GIS data associated with each photograph location that includes coordinates (<1 meter resolution), elevations, and viewing directions, as well as the associated viewpoint.</p>		
<p>5.1.1.8: Visual Resource Management Areas</p> <p>a) Identify any visual resource management areas within and surrounding the project area (approximately 5-mile buffer).</p> <p>b) Describe any project areas within visual resource management areas.</p>		

²² All representative photographs should be taken using a digital single-lens reflex camera with standard 50-millimeter lens equivalent, which represents an approximately 40-degree horizontal view angle. The precise photograph coordinates and elevations should be collected using a high accuracy GPS unit.

c) Provide a supporting map (or maps) showing project features and visual resource management areas. Provide associated GIS data.		
5.1.2 Regulatory Setting		
5.1.2.1: Regulatory Setting. Identify applicable federal, state, and local laws, policies, and standards regarding aesthetics and visual resource management.		
5.1.3 Impact Questions		
5.1.3.1: Impact Questions. The impact questions include all aesthetic impact questions in the current version of CEQA Guidelines, Appendix G. 5.1.3.2: Additional CEQA Impact Questions: None.		
5.1.4 Impact Analysis		
5.1.4.1: Visual Impact Analysis. Provide an impact analysis for each checklist item identified in CEQA Guidelines Appendix G for this resource area and any additional impact questions listed above.		
The following information will be included in the PEA or a technical Appendix to support the aesthetic impact analysis:		
5.1.4.2: Analysis of Selected Viewpoints. Identify the methodology and assumptions that were applied in selecting key observation points for visual simulation. It is recommended that viewpoints are selected where viewers may be sensitive to visual change (public views) and in areas that are visually sensitive, or heavily trafficked or visited. ²³		
5.1.4.3: Visual Simulation		
a) Identify methodology and assumptions for completing the visual simulations. The simulations should include photorealistic 3-D models of project features and any land changes within the KOP view. The visual simulations should depict conditions: <ul style="list-style-type: none"> i. Immediately following construction, and ii. After vegetation establishment in all areas of temporary impact to illustrate the visual impact from vegetation removal. b) Provide high resolution images for the visual simulations.		
5.1.4.4: Analysis of Visual Change		
a) Identify the methodology and assumptions for completing the visual change analysis. ²⁴ The methodology should be consistent with applicable visual resource management criteria. b) Provide a description of the visual change for each selected viewpoint. Describe any conditions that would change over time, such as vegetation growth.		

²³ The KOP selection process should be discussed with CPUC during Pre-filing

²⁴ The visual impact assessment methodology should be discussed with CPUC during Pre-filing

c) Describe the effects of visual change that would result in the entire project area, as indicated by the selected viewpoints that were simulated and analyzed.		
5.1.4.5: Lighting and Marking. Identify all new sources of permanent lighting. Identify any proposed structures or lines that could require FAA notification. Identify any structures or line segments that could require lighting and marking based on flight patterns and FAA or military requirements. Provide supporting documentation in an Appendix (e.g., FAA notice and criteria tool results).		
5.1.5 CPUC Draft Environmental Measures		
Refer to Attachment 4, CPUC Draft Environmental Measures.		

5.2 Agriculture and Forestry Resources

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
5.2.1 Environmental Setting		
5.2.1.1: Agricultural Resources and GIS		
a) Identify all agricultural resources that occur within the project area including: <ul style="list-style-type: none"> i. Areas designated as Prime Farmland, Unique Farmland, or Farmland of Statewide Importance ii. Areas under Williamson Act contracts and provide information on the status of the Williamson Act contract iii. Any areas zoned for agricultural use in local plans iv. Areas subject to active agricultural use b) Provide GIS data for agricultural resources within the proposed project area.		
5.2.1.2: Forestry Resources and GIS		
a) Identify all forestry resources within the project area including: <ul style="list-style-type: none"> i. Forest land as defined in Public Resources Code 12220(g)25 ii. Timberland as defined in Public Resource Code section 4526 iii. Timberland zoned Timberland Production as defined in Government Code section 51104(g) b) Provide GIS data for all forestry resources within the proposed project area.		
5.2.2 Regulatory Setting		
5.2.2: Agriculture and Forestry Regulations. Identify all federal, state, and local policies for protection of agricultural and forestry resources that apply to the proposed project.		

²⁵ Forest land is defined in Public Resources Code as, “land that can support 10 percent native tree cover of any species, including hardwoods, under natural conditions, and that allows for management of one or more forest resources, including timber, aesthetics, fish and wildlife, biodiversity, water quality, recreation, and other public benefits.”

5.2.3 Impact Questions		
5.2.3.1: Agriculture and Forestry Impact Questions. The impact questions include all agriculture and forestry impact questions in the current version of CEQA Guidelines, Appendix G.		
5.2.3.2: Additional CEQA Impact Questions: None.		
5.2.4 Impact Analyses		
5.2.4.1: Agriculture and Forestry Impacts. Provide an impact analysis for each checklist item identified in CEQA Guidelines Appendix G for this resource area and any additional impact questions listed above.		
Incorporate the following discussions into the analysis of impacts:		
5.2.4.2: Prime Farmland Soil Impacts. Calculate the acreage of Prime Farmland soils that would be affected by construction and operation and maintenance.		
5.2.4.3. Williamson Act Impacts. Describe the approach to resolve potential conflicts with Williamson Act contract (if applicable)		
5.2.5 CPUC Draft Environmental Measures		
Refer to Attachment 4, CPUC Draft Environmental Measures.		

5.3 Air Quality

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
5.3.1 Environmental Setting		
5.3.1.1: Air Quality Plans Identify and describe all applicable air quality plans and attainment areas. Identify the air basin(s) for the project area. If the project is located in more than one attainment area and/or air basin, provide the extent in each attainment area and air basin.		
5.3.1.2: Air Quality. Describe existing air quality in the project area. a) Identify existing air quality exceedance of National Ambient Air Quality Standards and California Ambient Air Quality Standards in the air basin. b) Provide the number of days that air quality in the area exceeds state and federal air standards for each criteria pollutant that where air quality standards are exceeded. c) Provide air quality data from the nearest representative air monitoring station(s).		
5.3.1.3: Sensitive Receptor Locations. Identify the location and types of each sensitive receptor locations ²⁶ within 1,000 feet of the project area. Provide GIS data for sensitive receptor locations.		

²⁶ Sensitive Receptor locations may include hospitals, schools, and day care centers, and such other locations as the air district board or California Air Resources Board may determine (California Health and Safety Code § 42705.5(a)(5)).

5.3.2 Regulatory Setting		
5.3.2.1: Regulatory Setting. Identify applicable federal, state, and local laws, policies, and standards regarding aesthetics and visual resource management.		
5.3.2.2: Air Permits. Identify and list all necessary air permits.		
5.3.3 Impact Questions		
5.3.3.1: Impact Questions. The impact questions include all air quality impact questions in the current version of CEQA Guidelines, Appendix G.		
5.3.3.2: Additional CEQA Impact Questions: None.		
5.3.4 Impact Analysis		
5.3.4.1: Impact Analysis. Provide an impact analysis for each checklist item identified in CEQA Guidelines Appendix G for this resource area and any additional impact questions listed above.		
The following information will be presented in the PEA or a technical Appendix to support the air quality impact analysis:		
5.3.4.2: Air Quality Emissions Modeling. Model project emissions using the most recent version of CalEEMod and/or a current version of other applicable modeling program. Provide all model input and output data sheets in Microsoft Excel format to allow CPUC to evaluate whether project data was entered into the modeling program accurately. The assumptions used in the air quality modeling must be consistent with all PEA information about the project’s schedule, workforce, and equipment. The following information will be addressed in the emissions modeling, Air Quality Appendix, and PEA:		
<ul style="list-style-type: none"> a) Quantify the expected emissions of criteria pollutants from all project-related sources. Quantify emissions for both construction and operation (e.g., compressor equipment). b) Identify manufacturer’s specifications for all proposed new emission sources. For proposed new, additional, or modified compressor units, include the horsepower, type, and energy source. c) Describe any emission control systems that are included in the air quality analysis (e.g., installation of filters, use of EPA Tier II, III, or IV equipment, use of electric engines, etc.). d) When multiple air basins may be affected by the project, model air emissions within each air basin and provide a narrative (supported by calculations) that clearly describes the assumptions around the project activities considered for each air basin. Provide modeled emissions by attainment area or air basin (supported by calculations). 		

5.3.4.3: Air Quality Emissions Summary. Provide a table summarizing the air quality emissions for the project and applicable thresholds for each applicable attainment area. Include a summary of uncontrolled emissions (prior to application of any APMs) and controlled emissions (after application of APMs). Clearly identify the assumptions that were applied in the controlled emissions estimates.		
5.3.4.4: Health Risk Assessment. Complete a Health Risk Assessment when air quality emissions have the potential to lead to human health impacts ²⁷ . If health impacts are not anticipated from project emissions, the analysis should clearly describe why emissions would not lead to health impacts.		
5.3.5 CPUC Draft Environmental Measures		
Refer to Attachment 4, CPUC Draft Environmental Measures.		

5.4 Biological Resources

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
5.4.1 Environmental Setting		
5.4.1.1: Biological Resources Technical Report. Provide a Biological Resources Technical Report as an Appendix to the PEA that includes all information specified in Attachment 2.		
The following biological resources information will be presented in the PEA:		
5.4.1.2: Survey Area (Local Setting). Identify and describe the biological resources survey area as documented in the Biological Resources Technical Report. All temporary and permanent project areas must be within the survey area.		
5.4.1.3: Vegetation Communities and Land Cover a) Identify, describe, and quantify vegetation communities and land cover types within the biological resources survey area. b) Clearly identify any sensitive natural vegetation communities that meet the definition of a biological resource under CEQA (i.e., rare, designated, or otherwise protected), such as, but not limited to, riparian habitat. c) Provide a supporting map (or maps) showing project features and vegetation communities and land cover type.		

²⁷ Refer to Office of Environmental Health Hazard Assessment (OEHHA) most recent guidance for preparation of Health Risk Assessments to determine whether a Health Risk Assessment is required for the project. The need for an HRA should also be discussed with CPUC during Pre-filing.

<p>5.4.1.4: Aquatic Features</p> <ul style="list-style-type: none"> a) Identify, describe, and quantify aquatic features within the biological resources survey area that may provide potentially suitable aquatic habitat for rare and special-status species. b) Identify and quantify potentially jurisdictional aquatic features and delineated wetlands, according to the Wetland Delineation Report and Biological Resources Technical Report. c) Provide a supporting map (or maps) showing project features and aquatic resources. 		
<p>5.4.1.5: Habitat Assessment. Identify rare and special-status species with potential to occur in the project region (approximately a 5-mile buffer but may be larger if necessary). For each species, provide the following information:</p> <ul style="list-style-type: none"> a) Common and scientific name b) Status and/or rank c) Habitat characteristics (i.e., vegetation communities, elevations, seasonal changes, etc.) d) Blooming characteristics for plants e) Breeding and other dispersal (range) behavior for wildlife f) Potential to occur within the survey area (i.e., Present, High Potential, Moderate Potential, Low Potential, or Not Expected), with justification based on the results of the records search, survey findings, and presence of potentially suitable habitat g) Specific types and locations of potentially suitable habitat that correspond to the vegetation communities and land cover and aquatic features 		
<p>5.4.1.6: Critical Habitat</p> <ul style="list-style-type: none"> a) Identify and describe any critical habitat for rare or special-status species within and surrounding the project area (approximately a 5-mile buffer). b) Provide a supporting map (or maps) showing project features and critical habitat. 		
<p>5.4.1.7: Native Wildlife Corridors and Nursery Sites</p> <ul style="list-style-type: none"> a) Identify and describe regional and local wildlife corridors within and surrounding the project area (approximately a 5-mile buffer), including but not limited to, landscape and aquatic features that connect suitable habitat in regions otherwise fragmented by terrain, changes in vegetation, or human development. b) Identify and describe regional and local native wildlife nursery sites within and surrounding the project area (approximately a 5-mile buffer), as identified through the records search, surveys, and habitat assessment. 		

c) Provide a supporting map (or maps) showing project features, native wildlife corridors, and native nursery sites.		
5.4.1.8: Biological Resource Management Areas		
<p>a) Identify any biological resource management areas (i.e., conservation or mitigation areas, HCP or NCCP boundaries, etc.) within and surrounding the project area (approximately 5-mile buffer).</p> <p>b) Identify and quantify any project areas within biological resource management areas.</p> <p>c) Provide a supporting map (or maps) showing project features and biological resource management areas.</p>		
5.4.2 Regulatory Setting		
5.4.2.1: Regulatory Setting. Identify applicable federal, state, and local laws, policies, and standards regarding biological resources.		
5.4.2.2: Habitat Conservation Plan. Provide a copy of any relevant Habitat Conservation Plan.		
5.4.3 Impact Questions		
<p>5.4.3.1: Impact Questions. The impact questions include all biological resource impact questions in the current version of CEQA Guidelines, Appendix G.</p> <p>5.4.3.2: Additional CEQA Impact Question:</p> <p>Would the project create a substantial collision or electrocution risk for birds or bats?</p>		
5.4.4 Impact Analysis		
5.4.4.1: Impact Analysis Provide an impact analysis for each checklist item identified in CEQA Guidelines, Appendix G for Biological Resources and any additional impact questions listed above.		
The following information will be included in the impact analysis:		
<p>5.4.4.2: Quantify Habitat Impacts. Provide the area of impact in acres by each habitat type. Quantify temporary and permanent impacts. For all temporary impacts provide the following:</p> <p>a) Description of the restoration and revegetation approach</p> <p>b) Vegetation species that would be planted within the area of temporary disturbance</p> <p>c) Procedures to reduce invasive weed encroachment within areas of temporary disturbance</p> <p>d) Expected timeframe for restoration of the site</p>		
5.4.4.3: Special-Status Species Impacts. Identify anticipated impacts on special-status species. Identify any take permits that are anticipated for the project. If an existing habitat conservation plan (HCP) or natural communities conservation plan (NCCP) would be used for the project, provide current accounting of take coverage included in the HCP/NCCP		

to demonstrate that there is sufficient habitat coverage remaining under the existing permit.		
<p>5.4.4.4: Wetland Impacts. Quantify the area (in acres) of temporary and permanent impacts on wetlands. Include the following details:</p> <ul style="list-style-type: none"> a) Provide a table identifying all wetlands, by milepost and length, crossed by the project and the total acreage of each wetland type that would be affected by construction. b) Discuss construction and restoration methods proposed for crossing wetlands. c) If wetlands would be filled or permanently lost, describe proposed measures to compensate for permanent wetland losses. d) If forested wetlands would be affected, describe proposed measures to restore forested wetlands following construction. 		
<p>5.4.4.5: Avian Impacts. Describe avian obstructions and risk of electrocution from the project. Describe any standards that will be implemented as part of the project to reduce the risk of collision and electrocution.</p>		
5.4.5 CPUC Draft Environmental Measures		
Refer to Attachment 4, CPUC Draft Environmental Measures.		

5.5 Cultural Resources²⁸

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
5.5.1 Environmental Setting		
<p>5.5.1.1: Cultural Resource Reports. Provide a cultural resource inventory and evaluation report that addresses the technical requirement provided in Attachment 3.</p>		
<p>5.5.1.2: Cultural Resources Summary. Summarize cultural resource survey and inventory results and survey methods. Do not provide any confidential cultural resource information within the PEA chapter.</p>		
<p>5.5.1.3: Cultural Resource Survey Boundaries. Provide a map with mileposts showing the boundaries of all survey areas in the report. Provide the GIS data for the survey area. Provide confidential GIS data for the resource locations and boundaries separately under confidential cover.</p>		
5.5.2 Regulatory Setting		
<p>5.5.2.1: Regulatory Setting. Identify applicable federal and state regulations for protection of cultural resources.</p>		

²⁸ For a description and evaluation of cultural resources specific to Tribes, see Section 5.18, Tribal Cultural Resources.

5.5.3 Impact Questions		
5.5.3.1: Impact Questions. The impact questions include all cultural resource impact questions in the current version of CEQA Guidelines, Appendix G.		
5.5.3.2: Additional CEQA Impact Questions: None.		
5.5.4 Impact Analysis		
5.5.4.1: Impact Analysis. Provide an impact analysis for each checklist item identified in CEQA Guidelines, Appendix G for this resource area and any additional impact questions listed above.		
Include the following information in the impact analysis		
5.5.4.2: Human Remains. Describe the potential for encountering human remains or grave goods during the trenching or any other phase of construction. Describe the procedures that would be used if human remains are encountered.		
5.5.4.3: Resource Avoidance. Describe avoidance procedures that would be implemented to avoid known resources.		
5.5.5 CPUC Draft Environmental Measures		
Refer to Attachment 4, CPUC Draft Environmental Measures.		

5.6 Energy

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
5.6.1 Environmental Setting		
5.6.1.1: Existing Energy Use. Identify energy use of existing infrastructure if the proposed project would replace or upgrade an existing facility.		
5.6.2 Regulatory Setting		
5.6.2.1: Regulatory Setting. Identify applicable federal, state, or local regulations or policies applicable to energy use for the proposed project.		
5.6.3 Impact Questions		
5.6.3.1: Impact Questions: The impact questions include all energy impact questions in the current version of CEQA Guidelines, Appendix G.		
5.6.3.2: Additional CEQA Impact Question: Would the project add capacity for the purpose of serving a non-renewable energy resource?		

5.6.4 Impact Analysis		
5.6.4.1: Impact Analysis. Provide an impact analysis for each checklist item identified in CEQA Guidelines Appendix G for this resource area and any additional impact questions listed above.		
Include the following information in the impact analysis:		
5.6.4.2: Nonrenewable Energy. Identify renewable and non-renewable energy projects that may interconnected to or be supplied by the proposed project.		
5.6.4.3: Fuels and Energy Use		
<ul style="list-style-type: none"> a) Provide an estimation of the amount of fuels (gasoline, diesel, helicopter fuel, etc.) that would be used during construction and operation and maintenance of the project. Fuel estimates should be consistent with Air Quality calculations supporting the PEA. b) Provide the following information on energy use: <ul style="list-style-type: none"> i. Total energy requirements of the project by fuel type and end use ii. Energy conservation equipment and design features iii. Identification of energy supplies that would serve the project 		
5.6.5 CPUC Draft Environmental Measures		
Refer to Attachment 4, CPUC Draft Environmental Measures.		

5.7 Geology, Soils, and Paleontological Resources

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
5.7.1 Environmental Setting		
5.7.1.1: Regional and Local Geologic Setting. Briefly describe the regional and local physiography, topography, and geologic setting in the project area.		
5.7.1.2: Seismic Hazards		
<ul style="list-style-type: none"> a) Provide the following information on potential seismic hazards in the project area: <ul style="list-style-type: none"> i. Identify and describe regional and local seismic risk including any active faults within and surrounding the project area (will be a 10-mile buffer unless otherwise instructed in writing by CEQA Unit Staff during Pre-filing) ii. Identify any areas that are prone to seismic-induced landslides iii. Provide the liquefaction potential for the project area b) Provide a supporting map (or maps) showing project features and major faults, areas of landslide risk, and areas at high risk of liquefaction. Provide GIS data for all faults, landslides, and areas of high liquefaction potential. 		

<p>5.7.1.3: Geologic Units. Identify and describe the types of geologic units in the project area. Include the following information for each geologic unit:</p> <ul style="list-style-type: none"> a) Summarize the geologic units within the project area. b) Identify any previous landslides in the area and any areas that are at risk of landslide. c) Identify any unstable geologic units. d) Provide a supporting map (or maps) showing project features and geologic units. Clearly identify any areas with potentially hazardous geologic conditions. Provide associated GIS data. 		
<p>5.7.1.4: Soils. Identify and describe the types of soils in the project area.</p> <ul style="list-style-type: none"> a) Summarize the soils within the project area. b) Clearly identify any soils types that could be unstable (e.g., at risk of lateral spreading, subsidence, liquefaction, or collapse). c) Provide information on erosion susceptibility for each soil type that occurs in the project area. d) Provide a supporting map (or maps) showing project features and soils. Provide associated GIS data. 		
<p>5.7.1.5: Paleontological Report. Provide a paleontological report that includes the following:</p> <ul style="list-style-type: none"> a) Information on any documented fossil collection localities within the project area and a 500-foot buffer. b) A paleontological resource sensitivity analysis based on published geological mapping and the resource sensitivity of each rock type. c) Supporting maps and GIS data. 		
<p>5.7.2 Regulatory Setting</p>		
<p>5.7.2.1: Regulatory Setting. Identify applicable federal, state, and local laws, policies, and standards regarding geology, soils, and paleontological resources.</p>		
<p>5.7.3 Impact Questions</p>		
<p>5.7.3.1: Impact Questions. The impact questions include all geology, soils, and paleontological resource impact questions in the current version of CEQA Guidelines, Appendix G.</p> <p>5.7.3.2: Additional CEQA Impact Questions: None.</p>		
<p>5.7.4 Impact Analysis</p>		
<p>5.7.4.1: Impact Analysis. Provide an impact analysis for each checklist item identified in CEQA Guidelines, Appendix G for this resource area and any additional impact questions listed above.</p>		
<p>Include the following information in the impact analysis:</p>		

5.7.4.2: Geotechnical Requirements. Identify any geotechnical requirements that would be implemented to address effects from unstable geologic units or soils. Describe how the recommendation would be applied (i.e., when and where).		
5.7.4.3: Paleontological Resources. Identify the potential to disturb paleontological resources based on the depth of proposed excavation and paleontological sensitivity of geologic units within the project area.		
5.7.5 CPUC Draft Environmental Measures		
Refer to Attachment 4, CPUC Draft Environmental Measures.		

5.8 Greenhouse Gas Emissions

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
5.8.1 Environmental Setting		
5.8.1.1: GHG Setting. Provide a description of the setting for greenhouse gases (GHGs). The setting should consider any GHG emissions from existing infrastructure that would be upgraded or replaced by the proposed project.		
5.8.2 Regulatory Setting		
5.8.2.1: Regulatory Setting. Identify applicable federal, state, and local laws, policies, and standards for greenhouse gases.		
5.8.3 Impact Questions		
5.8.3.1 Impact Questions. The impact questions include all greenhouse gas impact questions in the current version of CEQA Guidelines, Appendix G.		
5.8.3.2: Additional CEQA Impact Questions: None.		
5.8.4 Impact Analysis		
5.8.4.1: Impact Analysis. Provide an impact analysis for each checklist item identified in CEQA Guidelines, Appendix G for this resource area and any additional impact questions listed above.		
Include the following information in the impact analysis:		
5.8.4.2: GHG Emissions. Provide a quantitative assessment of GHG emissions for construction and operation and maintenance of the proposed project. Provide model results and all model files. Modeling will be conducted using the latest version of the emissions model at the time of application filing (e.g., most recent version of CalEEMod). GHG emissions will be provided for the following conditions: <ul style="list-style-type: none"> a) Uncontrolled emissions (before APMs are applied) b) Controlled emissions considering application of APMs <ul style="list-style-type: none"> i. Based on the modeled GHG emissions, quantify the project’s contribution to and analyze the project’s effect on 		

<p>climate change. Identify and provide justification for the timeframe considered in the analysis.</p> <p>ii. Discuss any programs already in place to reduce GHG emissions on a system-wide level. This includes the Applicant’s voluntary compliance with the EPA SF6 reduction program, reductions from energy efficiency, demand response, LTPP, etc.</p> <p>iii. For any significant impacts, identify potential strategies that could be employed by the project to reduce GHGs during construction or operation and maintenance consistent with OPR Advisory on CEQA and Climate Change.</p>		
Natural Gas Storage		
5.8.4.3: Natural Gas Storage Accident Conditions. In addition to the requirements above, identify the potential GHG emissions that could result in the event of a gas leak.		
5.8.4.4: Monitoring and Contingency Plan. Provide a comprehensive monitoring plan that would be implemented during project operation to monitor for gas leaks. The plan should identify a monitoring schedule, description of monitoring activities, and actions to be implemented if gas leaks are observed.		
5.8.5 CPUC Draft Environmental Measures		
Refer to Attachment 4, CPUC Draft Environmental Measures.		

5.9 Hazards, Hazardous Materials, and Public Safety²⁹

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
5.9.1 Environmental Setting		
5.9.1.1: Hazardous Materials Report. Provide a Phase I Environmental Site Assessment or similar hazards report for the proposed project area. Describe any known hazardous materials locations within the project area and the status of the site.		
5.9.1.2: Airport Land Use Plan. Identify any airport land use plan(s) within the project area.		
5.9.1.3: Fire Hazard. Identify if the project occurs within federal, state, or local fire responsibility areas and identify the fire hazard severity rating for all project areas, including temporary work areas and access roads.		
5.9.1.4: Metallic Objects. For electrical projects, identify any metallic pipelines or cables within 25 feet of the project.		

²⁹ For fire risk specific to state responsibility areas or lands classified as very high fire hazard severity zones, see Section 5.20, Wildfire.

<p>5.9.1.5: Pipeline History (for Natural Gas Projects). Provide a narrative describing the history of the pipeline system(s) to which the project would connect, list of previous owner and operators, and detailed summary of the pipeline systems’ safety and inspection history.</p>		
<p>5.9.2 Regulatory Setting</p>		
<p>5.9.2.1: Regulatory Setting. Identify applicable federal, state, and local laws, policies, and standards for hazards, hazardous materials, and public safety.</p>		
<p>5.9.2.2: Touch Thresholds. Identify applicable standards for protection of workers and the public from shock hazards.</p>		
<p>5.9.3 Impact Questions</p>		
<p>5.9.3.1: Impact Questions. The impact questions include all hazards and hazardous materials impact questions in the current version of CEQA Guidelines, Appendix G.</p> <p>5.9.3.2: Additional CEQA Impact Questions:</p> <ul style="list-style-type: none"> a) Would the project create a significant hazard to air traffic from the installation of new power lines and structures? b) Would the project create a significant hazard to the public or environment through the transport of heavy materials using helicopters? c) Would the project expose people to a significant risk of injury or death involving unexploded ordnance? d) Would the project expose workers or the public to excessive shock hazards? 		
<p>5.9.4 Impact Analysis</p>		
<p>5.9.4.1: Impact Analysis. Provide an impact analysis for each checklist item identified in CEQA Guidelines Appendix G for this resource area and any additional impact questions listed above.</p>		
<p>Include the following information in the impact analysis:</p>		
<p>5.9.4.2: Hazardous Materials. Identify the hazardous materials (i.e., chemicals, solvents, lubricants, and fuels) that would be used during construction and operation of the project. Estimate the quantity of each hazardous material that would be stored on site during construction and operation.</p>		
<p>5.9.4.3: Air Traffic Hazards. If the project involves construction of above-ground structures (including structure replacement) within the airport land use plan area, provide a discussion of how the project would or would not conflict with height restrictions identified in the airport land use plan and how the project would comply with any FAA or military requirements for the above ground facilities.</p>		
<p>5.9.4.4: Accident or Upset Conditions. Describe how the project facilities would be designed, constructed, operated, and maintained to</p>		

minimize potential hazard to the public from the failure of project components as a result of accidents or natural catastrophes.		
5.9.4.5: Shock Hazard. For electricity projects, identify infrastructure that may be susceptible to induced current from the proposed project. Describe strategies (e.g., cathodic protection) that the project would employ to reduce shock hazards and avoid electrocution of workers or the public.		
For Natural Gas and Gas Storage:		
5.9.4.6: Health and Safety Plan. Include in the Health and Safety Plan, plans for addressing gas leaks, fires, etc. Identify sensitive receptors, methods of evacuation, and protection measures. The Plan will be provided as an Appendix to the PEA.		
5.9.4.7: Health Risk Assessment. Provide a Health Risk Assessment including risk from potential gas leaks, fires, etc. Identify sensitive receptors that would be affected and potential impacts on them if there is a gas release. ³⁰		
5.9.4.8: Gas Migration. Describe potential for and effects of gas migration through natural and manmade pathways. a) Provide Applicant Proposed Measures for avoiding gas emissions at the surface from gas migration pathways. b) Provide Applicant Proposed Measures for avoiding emissions of mercaptan and/or other odorizing agents.		
5.9.5 CPUC Draft Environmental Measures		
Refer to Attachment 4, CPUC Draft Environmental Measures.		

5.10 Hydrology and Water Quality

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
5.10.1 Environmental Setting		
5.10.1.1: Waterbodies. Identify by milepost all ephemeral, intermittent, and perennial surface waterbodies crossed by the project. For each, list its water quality classification, if applicable.		
5.10.1.2: Water Quality. Identify any downstream waters that are on the state 303(d) list and identify whether a total maximum daily load (TMDL) has been adopted or the date for adoption of a TMDL. Identify existing sources of impairment for downstream waters. Describe any management plans that are in place for downstream waters.		
5.10.1.3: Groundwater Basin. Identify all known EPA and state groundwater basins and aquifers crossed by the project.		

³⁰Refer to the requirements for Health Risk Assessments in Section 5.3.4.4.

<p>5.10.1.4: Groundwater Wells and Springs. Identify the locations of all known public and private groundwater supply wells and springs within 150 feet of the project area.</p>		
<p>5.10.1.5: Groundwater Management. Identify the groundwater management status of any groundwater resources in the project area and any groundwater resources that may be used by the project. Describe if groundwater resources in the basin have been adjudicated. Identify any sustainable groundwater management plan that has been adopted for groundwater resources in the project area or describe the status of groundwater management planning in the area.</p>		
<p>5.10.2 Regulatory Setting</p>		
<p>5.10.2.1: Regulatory Setting. Identify applicable federal, state, and local laws, policies, and standards regarding hydrologic and water quality.</p>		
<p>5.10.3 Impact Questions</p>		
<p>5.10.3.1: Impact Questions. The impact questions include all hydrology and water quality impact questions in the current version of CEQA Guidelines, Appendix G.</p>		
<p>5.10.3.2: Additional CEQA Impact Questions: None.</p>		
<p>5.10.4 Impact Analysis</p>		
<p>5.10.4.1: Impact Analysis. Provide an impact analysis for each checklist item identified in the current version of CEQA Guidelines, Appendix G for this resource area and any additional impact questions listed above.</p>		
<p>Include the following information in the impact analysis:</p>		
<p>5.10.4.2: Hydrostatic Testing. Identify all potential sources of hydrostatic test water, quantity of water required, withdrawal methods, treatment of discharge, and any waste products generated.</p>		
<p>5.10.4.3: Water Quality Impacts. Describe impacts to surface water quality, including the potential for accelerated soil erosion, downstream sedimentation, and reduced surface water quality.</p>		
<p>5.10.4.4: Impermeable Surfaces. Describe increased run-off and impacts on groundwater recharge due to construction of impermeable surfaces. Provide the acreage of new impermeable surfaces that will be created as a result of the project.</p>		
<p>5.10.4.5: Waterbody Crossings. Identify by milepost all waterbody crossings. Provide the following information for crossing:</p> <ul style="list-style-type: none"> a) Identify whether the waterbody has contaminated waters or sediments. b) Describe the waterbody crossing method and any approaches to avoid the waterbody. c) Describe typical additional work area and staging area requirements at waterbody and wetland crossings. 		

d) Describe any dewatering or water diversion that will be required during construction near the waterbody. Identify treatment methods for any dewatering.		
e) Describe any proposed restoration methods for work near or within the waterbody.		
5.10.4.6: Groundwater Impacts. If water would be obtained from groundwater supplies, evaluate the project’s consistency with any applicable sustainable groundwater management plan.		
5.10.5 CPUC Draft Environmental Measures		
Refer to Attachment 4, CPUC Draft Environmental Measures.		

5.11 Land Use and Planning

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
5.11.1 Environmental Setting		
5.11.1.1: Land Use. Provide a description of land uses within the area traversed by the project route as designated in the local General Plan (e.g., residential, commercial, agricultural, open space, etc.).		
5.11.1.2: Special Land Uses. Identify by milepost and segment all special land uses within the project area including: a) All land administered by federal, state, or local agencies, or private conservation organizations b) Any designated coastal zone management areas c) Any designated or proposed candidate National or State Wild and Scenic Rivers crossed by the project d) Any national landmarks		
5.11.1.3: Habitat Conservation Plan. Provide a copy of any Habitat Conservation Plan applicable to the project area or proposed project. Also required for Section 5.4, Biological Resources.		
5.11.2 Regulatory Setting		
5.11.2.1: Regulatory Setting. Identify applicable federal, state, and local laws, policies, and standards for land use and planning.		
5.11.3 Impact Questions		
5.11.3.1: Impact Questions. The impact questions include all land use questions in the current version of CEQA Guidelines, Appendix G.		
5.11.3.2: Additional CEQA Impact Questions: None.		
5.11.4 Impact Analysis		
5.11.4.1: Impact Analysis. Provide an impact analysis for each checklist item identified in CEQA Guidelines, Appendix G for this resource area and any additional impact questions listed above.		

5.11.5 CPUC Draft Environmental Measures		
Refer to Attachment 4, CPUC Draft Environmental Measures.		

5.12 Mineral Resources

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
5.12.1 Environmental Setting		
5.12.1.1: Mineral Resources. Provide information on the following mineral resources within 0.5 mile of the proposed project area: a) Known mineral resources b) Active mining claims c) Active mines d) Resource recovery sites		
5.12.2 Regulatory Setting		
5.12.2.1: Regulatory Setting. Identify applicable federal, state, and local laws, policies, and standards for minerals.		
5.12.3 Impact Questions		
5.12.3.1: Impact Questions. The impact questions include all mineral resource impact questions in the current version of CEQA Guidelines, Appendix G. 5.12.3.2: Additional CEQA Impact Questions: None.		
5.12.4 Impact Analysis		
5.12.4.1: Impact Analysis. Provide an impact analysis for each checklist item identified in CEQA Guidelines, Appendix G for this resource area and any additional impact questions listed above.		
5.12.5 CPUC Draft Environmental Measures		
Refer to Attachment 4, CPUC Draft Environmental Measures.		

5.13 Noise

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
5.13.1 Environmental Setting		
5.13.1.1: Noise Sensitive Land Uses. Identify all noise sensitive land uses within 1,000 feet of the proposed project. Provide GIS data for sensitive receptors within 1,000 feet of the project.		
5.13.1.2: Noise Setting. Provide the existing noise levels (Lmax, Lmin, Leq, and Ldn sound level and other applicable noise parameters) at noise sensitive areas near the proposed project. All noise measurement data and the methodology for collecting the data will be provided in a noise study as an Appendix to the PEA.		

5.13.2 Regulatory Setting		
5.13.2.1: Regulatory Setting. Identify applicable state, and local laws, policies, and standards for noise.		
5.13.3 Impact Questions		
5.13.3.1 Impact Questions. The impact questions include all noise questions in the current version of CEQA Guidelines, Appendix G.		
5.13.3.2: Additional CEQA Impact Questions: None.		
5.13.4 Impact Analysis		
5.13.4.1: Impact Analysis. Provide an impact analysis for each checklist item identified in CEQA Guidelines, Appendix G for this resource area and any additional impact questions listed above.		
Include the following information in the impact analysis:		
5.13.4.2: Noise Levels		
<ul style="list-style-type: none"> a) Identify noise levels for each piece of equipment that could be used during construction. b) Provide a table that identifies each phase of construction, the equipment used in each construction phase, and the length of each phase at any single location (see example in Table 7 below). c) Estimate cumulative equipment noise levels for each phase of construction. d) Include phases of operation if noise levels during operation have the potential to frequently exceed pre-project existing conditions. e) Identify manufacturer’s specifications for equipment and describe approaches to reduce impacts from noise. 		

Table 7. Construction Noise Levels

Equipment Required	Equipment Noise Levels (Leq; 50 feet)	Phase Noise Level (Leq; 50 feet)	Phase Duration at Each Location	Receptor Nearest to Construction Phase	Noise Level at Nearest Receptor (Leq)	Exceeds Noise Standard at Nearest Receptor?	Distance to Not Exceed Standard
Site Preparation/Grading							
Dozer	78 dBA	82 dBA	5 days	Residence on Main Street; 100 feet from Substation Site	76 dBA	Yes	112 feet
Gradall	79 dBA						
Dump Truck	73 dBA						
Construct Tower Foundation							
Auger Rig	77 dBA	82 dBA	11 days	School on Education Avenue; 130 feet from Tower A12	73 dBA	No	N/A
Dump Truck	73 dBA						
Excavator	77 dBA						
Concrete Truck	75 dBA						

For Natural Gas:		
5.13.4.3: Compressor Station Noise. Provide site plans of compressor stations or other noisy, permanent equipment, showing the location of the nearest noise sensitive areas within 1 mile of the proposed ROW. If new compressor station sites are proposed, measure or estimate the existing ambient sound environment based on current land uses and		

activities. For existing compressor stations (operated at full load), include the results of a sound level survey at the site property line and nearby noise-sensitive areas. Include a plot plan that identifies the locations and duration of noise measurements.		
5.13.5 CPUC Draft Environmental Measures		
Refer to Attachment 4, CPUC Draft Environmental Measures.		

5.14 Population and Housing

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
5.14.1 Environmental Setting		
5.14.1.1: Population Estimates. Identify population trends for the areas (county, city, town, census designated place) where the project would take place.		
5.14.1.2: Housing Estimates. Identify housing estimates and projections in areas where the project would take place.		
5.14.1.3: Approved Housing Developments a) Provide the following information for all housing development projects within 1 mile of the proposed project that have been recently approved or may be approved around the PEA and application filing date: <ul style="list-style-type: none"> i. Project name ii. Location iii. Number of units and estimated population increase iv. Approval date and construction status v. Contact information for developer (provided in the public outreach Appendix) b) Ensure that the project information provided above is consistent with the PEA analysis of cumulative project impacts.		
5.14.2 Regulatory Setting		
5.14.2.1: Regulatory Setting. Identify any applicable federal, state or local laws or regulations that apply to the project.		
5.14.3 Impact Questions		
5.14.3.1: Impact Questions. The impact questions include all population and housing impact questions in the current version of CEQA Guidelines, Appendix G.		
5.14.3.2: Additional CEQA Impact Questions: None.		
5.14.4 Impact Analysis		
5.14.4.1: Impact Analysis. Provide an impact analysis for each checklist item identified in CEQA Guidelines, Appendix G for this resource area and any additional impact questions listed above.		

Include the following information in the impact analysis:		
5.14.4.2: Impacts to Housing. Identify if any existing or proposed homes occur within the footprint of any proposed project elements or right-of-way. Describe housing impacts (e.g., demolition and relocation of residents) that may occur as a result of the proposed project.		
5.14.4.3: Workforce Impacts. Describe on-site manpower requirements, including the number of construction personnel who currently reside within the impact area, who would commute daily to the site from outside the impact area or would relocate temporarily within the impact area. Chapter 4 of this document can be referenced as applicable. Identify any permanent employment opportunities that would be create by the project and the workforce conditions in the area that the jobs would be created.		
5.14.4.4: Population Growth Inducing. Provide information on the project’s growth inducing impacts, if any. The information will include, but is not necessarily limited to, the following: a) Any economic or population growth in the surrounding environment that will directly or indirectly result from the project b) Any obstacles to population growth that the project would remove c) Any other activities directly or indirectly encouraged or facilitated by the project that would cause population growth leading to a significant effect on the environment, either individually or cumulatively		
5.14.5 CPUC Draft Environmental Measures		
Refer to Attachment 4, CPUC Draft Environmental Measures.		

5.15 Public Services

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
5.15.1 Environmental Setting		
5.15.1.1 Service Providers a) Identify the following service providers that serve the project area and provide a map showing the service facilities that could serve the project: i. Police ii. Fire (identify service providers within local and state responsibility areas) iii. Schools iv. Parks v. Hospitals		

b) Provide the documented performance objectives and data on existing emergency response times for service providers in the area (e.g., police or fire department response times).		
5.15.2 Regulatory Setting		
5.15.2.1 Regulatory Setting. Identify any applicable federal, state or local laws or regulations for public services that apply to the project.		
5.15.3 Impact Questions		
5.15.3.1: Impact Questions. The impact questions include all public services impact questions in the current version of CEQA Guidelines, Appendix G.		
5.15.3.2: Additional CEQA Impact Questions: None.		
5.15.4 Impact Analysis		
5.15.4.1 Impact Analysis. Provide an impact analysis for each checklist item identified in CEQA Guidelines, Appendix G for this resource area and any additional impact questions listed above.		
Include the following information in the impact analysis:		
5.15.4.2: Emergency Response Times		
<ul style="list-style-type: none"> a) Describe whether the project would impede ingress and egress of emergency vehicles during construction and operation. b) Include an analysis of impacts on emergency response times during project construction and operation, including impacts during any temporary road closures. Describe approaches to address impacts on emergency response times. 		
5.15.4.3: Displaced Population. If the project would create permanent employment or displace people, evaluate the impact of the new employment or relocated people on governmental facilities and services and describe plans to reduce the impact on public services.		
5.15.5 CPUC Draft Environmental Measures		
Refer to Attachment 4, CPUC Draft Environmental Measures.		

5.16 Recreation

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
5.16.1 Environmental Setting		
5.16.1.1: Recreational Setting		
<ul style="list-style-type: none"> a) Describe the regional and local recreation setting in the project area including: <ul style="list-style-type: none"> i. Any recreational facilities or areas within and surrounding the project area (approximately 0.5-mile buffer) including the recreational uses of each facility or area 		

<ul style="list-style-type: none"> ii. Any available data on use of the recreational facilities including volume of use b) Provide a map (or maps) showing project features and recreational facilities and provide associated GIS data. 		
5.16.2 Regulatory Setting		
5.16.2.1: Regulatory Setting. Identify applicable federal, state, and local laws, policies, and standards regarding recreation.		
5.16.3 Impact Questions		
5.16.3.1: Impact Questions. The impact questions include all recreation impact questions in the current version of CEQA Guidelines, Appendix G.		
5.16.3.2: Additional CEQA Impact Questions:		
<ul style="list-style-type: none"> a) Would the project reduce or prevent access to a designated recreation facility or area? b) Would the project substantially change the character of a recreational area by reducing the scenic, biological, cultural, geologic, or other important characteristics that contribute to the value of recreational facilities or areas? c) Would the project damage recreational trails or facilities? 		
5.16.4 Impact Analysis		
5.16.4.1: Impact Analysis: Provide an impact analysis for each checklist item identified in CEQA Guidelines, Appendix G for this resource area and any additional impact questions listed above.		
5.16.4.2: Impact Details. Clearly identify the maximum extent of each impact, and when and where the impacts would or would not occur. Organize the impact assessment by project phase, project component, and/or geographic area, as necessary.		
5.16.5 CPUC Draft Environmental Measures		
Refer to Attachment 4, CPUC Draft Environmental Measures.		

5.17 Transportation

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
5.17.1 Environmental Setting		
5.17.1.1: Circulation System. Briefly describe the regional and local circulation system in the project area, including modes of transportation, types of roadways, and other facilities that contribute to the circulation system.		
5.17.1.2: Existing Roadways and Circulation		
<ul style="list-style-type: none"> a) Identify and describe existing roadways that may be used to access the project site and transport materials during 		

<p>construction or are otherwise adjacent to or crossed by linear project features. Provide the following information for each road:</p> <ul style="list-style-type: none"> i. Name of the road ii. Jurisdiction or ownership (i.e., State, County, City, private, etc.) iii. Number of lanes in both directions of travel iv. Existing traffic volume (if publicly available data is unavailable or significantly outdated, then it may be necessary to collect existing traffic counts for road segments where large volumes of construction traffic would be routed or where lane or road closures would occur) v. Closest project feature name and distance <p>b) Provide a supporting map (or maps) showing project features and the existing roadway network identifying each road described above. Provide associated GIS data. The GIS data should include all connected road segments within at least 5 miles of the project.</p>		
<p>5.17.1.3: Transit and Rail Services</p> <ul style="list-style-type: none"> a) Identify and describe transit and rail service providers in the region. b) Identify any rail or transit lines within 1,000 feet of the project area. c) Identify specific transit stops, and stations within 0.5 mile of the project. Provide the frequency of transit service. d) Provide a supporting map (or maps) showing project features and transit and rail services within 0.5 mile of the project area. Provide associated GIS data. 		
<p>5.17.1.4: Bicycle Facilities</p> <ul style="list-style-type: none"> a) Identify and describe any bicycle plans for the region. b) Identify specific bicycle facilities within 1,000 feet of the project area. c) Provide a supporting map (or maps) showing project features and bicycle facilities. Provide associated GIS data. 		
<p>5.17.1.5: Pedestrian Facilities</p> <ul style="list-style-type: none"> a) Identify and describe important pedestrian facilities near the project area that contribute to the circulation system, such as important walkways. b) Identify specific pedestrian facilities that would be near the project, including on the road segments identified per 5.17.1.2. c) Provide a supporting map (or maps) showing project features and important pedestrian facilities. Provide associated GIS data. 		

<p>5.17.1.6: Vehicle Miles Traveled (VMT). Provide the average VMT for the county(s) where the project is located.</p>		
<p>5.17.2 Regulatory Setting</p>		
<p>5.17.2.1: Regulatory Setting. Identify applicable federal, state, and local laws, policies, and standards regarding transportation.</p>		
<p>5.17.3 Impact Questions</p>		
<p>5.17.3.1: Impact Questions. All impact questions for this resource area in the current version of CEQA Guidelines, Appendix G.</p> <p>5.17.3.2: Additional CEQA Impact Questions:</p> <p>a) Would the project create potentially hazardous conditions for people walking, bicycling, or driving or for public transit operations?</p> <p>b) Would the project interfere with walking or bicycling accessibility?</p> <p>c) Would the project substantially delay public transit?</p>		
<p>5.17.4 Impact Analysis</p>		
<p>5.17.4.1: Impact Analysis. Provide an impact analysis for each significance criteria identified in Appendix G of the CEQA Guidelines for transportation and any additional impact questions listed above³¹.</p>		
<p>Include the following information in the impact analysis:</p>		
<p>5.17.4.2: Vehicle Miles Traveled (VMT)</p> <p>a) Identify whether the project is within 0.5 mile of a major transit stop or a high-quality transit corridor.</p> <p>b) Identify the number of vehicle daily trips that would be generated by the project during construction and operation by light duty (e.g., worker vehicles) and heavy-duty vehicles (e.g., trucks). Provide the frequency of trip generation during operation.</p> <p>c) Quantify VMT generation for both project construction and operation.</p> <p>d) Provide an excel file with the VMT assumptions and model calculations, including all formulas and values.</p> <p>e) Evaluate the project VMT relative to the average VMT for the area in which the project is located.</p>		
<p>5.17.4.3: Traffic Impact Analysis. Provide a traffic impact study. The traffic impact study should be prepared in accordance with guidance from the relevant local jurisdiction or Caltrans, where appropriate.</p>		
<p>5.17.4.4: Hazards. Identify any traffic hazards that could result from construction and operation of the project. Identify any lane closures and traffic management that would be required to construct the project.</p>		

³¹ Discuss with CPUC during Pre-filing whether a traffic study is needed.

5.17.4.5: Accessibility. Identify any closures of bicycle lanes, pedestrian walkways, or transit stops during construction or operation of the project.		
5.17.4.6: Transit Delay. Identify any transit lines that could be delayed by construction and operation of the project. Provide the maximum extent of the delay in minutes and the duration of the delay.		
5.17.5 CPUC Draft Environmental Measures		
Refer to Attachment 4, CPUC Draft Environmental Measures.		

5.18 Tribal Cultural Resources³²

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
5.18.1 Environmental Setting		
5.18.1.1: Outreach to Tribes. Provide a list of all tribes that are on the Native American Heritage Commission (NAHC) list of tribes that are affiliated with the project area. Provide a discussion of outreach to Native American tribes, including tribes notified, responses received from tribes, and information of potential tribal cultural resources provided by tribes. Any information of potential locations of tribal cultural resources should be submitted in an Appendix under clearly marked confidential cover. Provide copies of all correspondence with tribes in an Appendix.		
5.18.1.2: Tribal Cultural Resources. Describe tribal cultural resources (TCRs) that are within the project area. a) Summarize the results of attempts to identify possible TCRs using publicly available documentary resources. The identification of TCRs using documentary sources should include review of archaeological site records and should begin during the preparation of the records search report (see Attachment 3). During the inventory phase, a formal site record would be prepared for any resource identified unless tribes object. b) Summarize attempts to identify TCRs by speaking directly with tribal representatives.		
5.18.1.3: Ethnographic Study. The ethnographic study should document the history of Native American use of the area and oral history of the area.		
5.18.2 Regulatory Setting		
5.18.2.1: Regulatory Setting. Identify any applicable federal, state or local laws or regulations for tribal cultural resources that apply to the project.		

³² For a description of historical resources and requirements for cultural resources that are not tribal cultural resources, refer to Section 5.5 Cultural Resources.

5.18.3 Impact Questions		
5.18.3.1: Impact Questions. The impact questions include all tribal cultural resources impact questions in the current version of CEQA Guidelines, Appendix G.		
5.18.3.2: Additional CEQA Impact Questions: None.		
5.18.4 Impact Analysis		
5.18.4.1: Impact Analysis. Provide an impact analysis for each checklist item identified in CEQA Guidelines, Appendix G for this resource area and any additional impact questions listed above.		
Include the following information in the impact analysis:		
5.18.4.2: Information Provided by Tribes. Include an analysis of any impacts that were identified by the tribes during the Applicant’s outreach.		
5.18.5 CPUC Draft Environmental Measures		
Refer to Attachment 4, CPUC Draft Environmental Measures.		

5.19 Utilities and Service Systems

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
5.19.1 Environmental Setting		
5.19.1.1: Utility Providers. Identify existing utility providers and the associated infrastructure that serves the project area.		
5.19.1.2: Utility Lines. Describe existing utility infrastructure (e.g., water, gas, sewer, electrical, stormwater, telecommunications, etc.) that occurs in the project ROW. Provide GIS data and/or as-built engineering drawings to support the description of existing utilities and their locations.		
5.19.1.3: Approved Utility Projects. Identify utility projects that have been approved for construction within the project ROW but that have not yet been constructed. ³³		
5.19.1.4: Water Supplies. Identify water suppliers and the water source (e.g., aqueduct, well, recycled water, etc.). For each potential water supplier, provide data on the existing water capacity, supply, and demand.		
5.19.1.5: Landfills and Recycling. Identify local landfills that can accept construction waste and may service the project. Provide documentation of landfill capacity and estimated closure date. Identify any recycling centers in the area and opportunities for construction and demolition waste recycling.		

³³ Note that this project information should be consistent with the cumulative project description included in Chapter 7.

5.19.2 Regulatory Setting		
5.19.2.1: Regulatory Setting. Identify any applicable federal, state or local laws or regulations for utilities that apply to the project.		
5.19.3 Impact Questions		
5.19.3.1: Impact Questions. All impact questions for this resource area in the current version of CEQA Guidelines, Appendix G.		
5.19.3.2: Additional CEQA Impact Question: Would the project increase the rate of corrosion of adjacent utility lines as a result of alternating current impacts?		
5.19.4 Impact Analysis		
5.19.4.1: Impact Analysis. Provide an impact analysis for each checklist item identified in CEQA Guidelines, Appendix G for this resource area and any additional impact questions listed above.		
Include the following information in the impact analysis:		
5.19.4.2: Utility Relocation. Identify any project conflicts with existing utility lines. If the project may require relocation of existing utilities, identify potential relocation areas and analyze the impacts of relocating the utilities. Provide a map showing the relocated utility lines and GIS data for all relocations.		
5.19.4.3: Waste		
<ul style="list-style-type: none"> a) Identify the waste generated by construction, operation, and demolition of the project. b) Describe how treated wood poles would be disposed of after removal, if applicable. c) Provide estimates for the total amount of waste materials to be generated by waste type and how much of it would be disposed of, reused, or recycled. 		
5.19.4.4: Water Supply		
<ul style="list-style-type: none"> a) Estimate the amount of water required for project construction and operation. Provide the potential water supply source(s). b) Evaluate the ability of the water supplier to meet the project demand under a multiple dry year scenario. c) Provide a discussion as to whether the proposed project meets the criteria for consideration as a project subject to Water Supply Assessment Requirements under Water Code Section 10912. d) If determined to be necessary under Water Code Section 10912, submit a Water Supply Assessment to support conclusions that the proposed water source can meet the project’s anticipated water demand, even in multiple dry year scenarios. Water Supply Assessments should be approved by 		

the water supplier and consider normal, single-dry, and multiple-dry year conditions.		
5.19.4.5: Cathodic Protection. Analyze the potential for existing utilities to experience corrosion due to proximity to the proposed project. Identify cathodic protection measures that could be implemented to reduce corrosion issues and where the measures may be applied.		
5.19.5 CPUC Draft Environmental Measures		
Refer to Attachment 4, CPUC Draft Environmental Measures.		

5.20 Wildfire

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
5.20.1 Environmental Setting		
5.20.1.1: High Fire Risk Areas and State Responsibility Areas <ul style="list-style-type: none"> a) Identify areas of high fire risk or State Responsibility Areas (SRAs) within the project area. Provide GIS data for the Wildland Urban Interface (WUI) and Fire Hazard Severity Zones (FHSZ) mapping along the project alignment. Include areas mapped by CPUC as moderate and high fire threat districts as well as areas mapped by CalFire. b) Identify any areas the utility has independently identified as High FHSZ known to occur within the proposed project vicinity. 		
5.20.1.2: Fire Occurrence. Identify all recent (within the last 10 years) large fires that have occurred within the project vicinity. For each fire, identify the following: <ul style="list-style-type: none"> a) Name of the fire b) Location of fire c) Ignition source and location of ignition d) Amount of land burned e) Boundary of fire area in GIS 		
5.20.1.3: Fire Risk. Provide the following information for assessment of baseline fire risk in the area: <ul style="list-style-type: none"> a) Provide fuel modeling using Scott Burgan fuel models, or other model of similar quality. b) Provide values of wind direction and speed, relative humidity, and temperature for representative weather stations along the alignment for the previous 10 years, gathered hourly. c) Digital elevation models for the topography in the project region showing the relationship between terrain and wind patterns, as well as localized topography to show the effects of terrain on wind flow, and on a more local area to show effect of slope on fire spread. 		

d) Describe vegetation fuels within the project vicinity and provide data in map format for the project vicinity. USDA Fire Effects Information System or similar data source should be consulted to determine high-risk vegetation types. Provide the mapped vegetation fuels data in GIS format.		
5.20.1.4: Values at Risk. Identify values at risk along the proposed alignment. Values at risk may include: Structures, improvements, rare habitat, other values at risk, (including utility-owned infrastructure) within 1000 feet of the project. Provide some indication as to its vulnerability (wood structures vs. all steel features). Communities and/or populations near the project should be identified with their proximity to the project defined.		
5.20.1.5: Evacuation Routes. Identify all evacuation routes that are adjacent to or within the project area. Identify any roads that lack a secondary point of access or exit (e.g., cul-de-sacs).		
5.20.2 Regulatory Setting		
5.20.2.1: Regulatory Setting. Identify applicable federal, state, and local laws, policies, and standards for wildfire.		
5.20.2.2: CPUC Standards. Identify any CPUC standards that apply to wildfire management of the new facilities.		
5.20.3 Impact Questions		
5.20.3.1: Impact Questions. All impact questions for this resource area in the current version of CEQA Guidelines, Appendix G.		
5.20.3.2: Additional CEQA Impact Questions: None.		
5.20.4 Impact Analysis		
5.20.4.1: Impact Analysis. Provide an impact analysis for each checklist item identified in CEQA Guidelines, Appendix G for this resource area and any additional impact questions listed above.		
Include the following information in the impact analysis:		
5.20.4.2: Fire Behavior Modeling. For any new electrical lines, provide modeling to support the analysis of wildfire risk.		
5.20.4.3: Wildfire Management. Describe approaches that would be implemented during operation and maintenance to manage wildfire risk in the area. Provide a copy of any Wildfire Management Plan.		
5.20.5 CPUC Draft Environmental Measures		
Refer to Attachment 4, CPUC Draft Environmental Measures.		

5.21 Mandatory Findings of Significance³⁴

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
<p>5.21.1: Impact Assessment for Mandatory Findings of Significance. Provide an impact analysis for each of the mandatory findings of significance provided in Appendix G of the CEQA Guidelines. The impact analysis can reference relevant information and conclusion from the biological resources, cultural resources, air quality, hazards, and cumulative sections of the PEA, where applicable.</p>		

6 Comparison of Alternatives

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
<p>6.1: Alternatives Comparison</p> <p>a) Compare the ability of each alternative described in Chapter 4 against the proposed project in terms of its ability to avoid or reduce a potentially significant impact. The alternatives addressed in this section will each be:</p> <ul style="list-style-type: none"> i. Potentially feasible ii. Meet the underlying purpose of the proposed project iii. Meet most of the basic project objectives, and iv. Avoid or reduce one or more potentially significant impacts. <p>b) The relative effect of the various potentially significant impacts may be compared using the following or similar descriptors and an accompanying analysis:</p> <ul style="list-style-type: none"> i. Short-term versus long-term impacts ii. Localized versus widespread impacts iii. Ability to fully mitigate impacts <p>c) Impacts that the Applicant believes would be less than significant with mitigation may also be included in the analysis, but only if the steps listed above fail to distinguish among the remaining few alternatives.</p>		
<p>6.2: Alternatives Ranking. Provide a detailed table that summarizes the Applicant's comparison results and ranks the alternatives in order of environmental superiority.³⁵</p>		

³⁴ PEAs need only include a Mandatory Findings of Significance section if CPUC CEQA Unit Staff determine that a Mitigated Negative Declaration may be the appropriate type of document to prepare for the project, as determined through Pre-filing consultation. If no such determination has been made, then a Mandatory Findings of Significance section and the requirements below are not required.

³⁵ If the proposed project does not rank #1 on the list, the Applicant should provide the rationale for selecting the proposed project.

7 Cumulative and Other CEQA Considerations

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
7.1 Cumulative Impacts		
<p>7.1.1: List of Cumulative Projects</p> <p>a) Provide a detailed table listing past, present, and reasonably foreseeable future projects within and surrounding the project area (approximately 2-mile buffer)³⁶. The following information should be provided for each project in the table:</p> <ul style="list-style-type: none"> i. Project name and type ii. Brief description of the project location(s) and associated actions iii. Distance to and name of the nearest project component iv. Project status and anticipated construction schedule v. Source of the project information and date last checked (for each individual project), including links to any public websites where the information was obtained so it can be reviewed and updated (the project information should be current when the PEA is filed) <p>b) Provide a supporting map (or maps) showing project features and cumulative project locations and/or linear features. Provide associated GIS data.</p>		
<p>7.1.2: Geographic Scope. Define the geographic scope of analysis for each resource topic. The geographic scope of analysis for each resource topic should consider the extent to which impacts can be cumulative. For example, the geographic scope for cumulative noise impacts would be more limited in scale than the geographic scope for biological resource impacts because noise attenuates rapidly with distance. Explain why the geographic scope is appropriate for each resource.</p>		
<p>7.1.3: Cumulative Impact Analysis. Provide an analysis of cumulative impacts for each resource topic included in Chapter 5. Evaluate whether the proposed project impacts are cumulatively considerable³⁷ for any significant cumulative impacts.</p>		
7.2 Growth-Inducing Impacts		
<p>7.2.1: Growth-Inducing Impacts. Provide an evaluation of the following potential growth-inducing impacts:</p>		

³⁶ Information on cumulative projects may be obtained from federal, state, and local agencies with jurisdiction over planning, transportation, and/or resource management in the area. Other projects the Applicant is involved in or aware of in the area should be included.

³⁷ "Cumulatively considerable" means that the incremental effects of an individual project are significant when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects.

<ul style="list-style-type: none"> a) Would the proposed project foster any economic or population growth, either directly or indirectly, in the surrounding environment? b) Would the proposed project cause any increase in population that could further tax existing community service facilities (i.e., schools, hospitals, fire, police, etc.)? c) Would the proposed project remove any obstacles to population growth? d) Would the proposed project encourage and facilitate other activities that would cause population growth that could significantly affect the environment, either individually or cumulatively? 		
---	--	--

8 List of Preparers

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
8.1: List of Preparers. Provide a list of persons, their organizations, and their qualifications for all authors and reviewers of each section of the PEA.		

9 References

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
9.1: Reference List		
<ul style="list-style-type: none"> a) Organize all references cited in the PEA by section within a single chapter called "References." b) Within the References chapter, organize all of the Chapter 5 references under subheadings for each resource area section. 		
9.2: Electronic References		
<ul style="list-style-type: none"> a) Provide complete electronic copies of all references cited in the PEA that cannot be readily obtained for free on the Internet. This includes any company-specific documentation (e.g., standards, policies, and other documents). b) If the reference can be obtained on the Internet, the Internet address will be provided. 		

PEA Checklist Attachments

Attachment 1: GIS Data Requirements

This Attachment includes specific requirements and format of GIS data that is intended to be applicable to all PEAs. The specific GIS data requirements may be updated on a project-specific basis during Pre-filing coordination with CPUC's CEQA Unit Staff.

1. GIS data will be provided in an appropriate format (i.e., point, line, polygon, raster) and scale to adequately verify assumptions in the PEA and supporting materials and determine the level of environmental impacts. At a minimum, all GIS data layers will include the following metadata properties:
 - a. The source (e.g., report reference), date, title, and preparer (name or company)
 - b. Description of the contents and any limitations of the data
 - c. Reference scale and accuracy of the data
 - d. Complete attributes that correspond to the detailed mapbook, project description, and figures presented in the PEA and/or supporting application materials, including unique IDs, labels, geometry, and other appropriate project details
2. Where precise boundaries of project features may change (e.g., staging areas and temporary construction work areas), the Applicant will provide GIS data layers with representative boundaries to evaluate potential environmental impacts as a worst-case scenario.
3. Provide GIS data for:
 - a. All proposed and alternative project facilities including but not limited to existing and proposed/alternative ROWs; substations and switching stations; pole/tower locations; conduit; vaults, pipelines; valves; compressor stations; metering stations; valve stations, gas wellheads; other project buildings, facilities, and components (both temporary and permanent); telecommunication and distribution lines modifications or upgrades related to the project; marker ball and lighting locations; and mileposts, facility perimeters, and other demarcations or segments as applicable
 - b. All proposed areas required for construction and construction planning, including all proposed and alternative disturbance areas (both permanent and temporary); access roads; geotechnical work areas; extra work areas (e.g., staging areas, parking areas, lay-down areas, work areas at and around specific pole/tower sites, pull and tension sites, helicopter landing areas); airport landing areas; underground installation areas (e.g. trenches, vaults, underground work areas); horizontal directional drilling, jack and bore, or tunnel areas; blasting areas; and any areas where special construction methods may need to be employed
 - c. Within the PEA checklist there are also specific requirements for environmental resources within Chapter 5. All environmental resource GIS data must meet the minimum mapping standards specified in this Attachment.

Attachment 2: Biological Resource Technical Report Standards

Definitions

The following biological resources will be considered within the scope of the PEA and the Biological Resources Technical Report:

Sensitive Vegetation Communities and Habitats

- a) Sensitive vegetation communities/habitats identified in local or regional plans, policies, or regulations, or designated by CDFW³⁸ or USFWS
- b) Areas that provide habitat for locally unique biotic species/communities (e.g., oak woodlands, grasslands, and forests)
- c) Habitat that contains or supports rare, endangered, or threatened wildlife or plant species as defined by CDFW and USFWS
- d) Habitat that supports CDFW Species of Special Concern
- e) Areas that provide habitat for rare or endangered species and that meet the definition in CEQA Guidelines Section 15380
- f) Existing game and wildlife refuges and reserves
- g) Lakes, wetlands, estuaries, lagoons, streams, and rivers
- h) Riparian corridors

Special-Status Species

- a) Species listed or proposed for listing as threatened or endangered under the federal Endangered Species Act (ESA) (50 CFR § 17.12 [listed plants], 17.11 [listed animals] and various notices in the Federal Register [proposed species])
- b) Species that are candidates for possible future listing as threatened or endangered under the federal ESA (61 FR § 40, February 28, 1996)
- c) Species listed or proposed for listing by the State of California as threatened or endangered under the California ESA (14 CCR § 670.5)
- d) Plants listed as rare or endangered under the California Native Plant Protection Act (California Fish and Game Code, Section 1900 et seq.)
- e) Species that meet the definitions of rare and endangered under CEQA. CEQA Guidelines Section 15380 provides that a plant or animal species may be treated as “rare or endangered” even if not on one of the official lists.
- f) Plants considered by the California Native Plant Society (CNPS) to be “rare, threatened or endangered in California” (California Rare Plant Rank 1A, 1B, 2A, and 2B) as well as California Rare Plant Rank 3 and 4 plant species
- g) Species designated by CDFW as Fully Protected or as a Species of Special Concern
- h) Species protected under the Federal Bald and Golden Eagle Protection Act
- i) Birds of Conservation Concern or Watch List species
- j) Bats considered by the Western Bat Working Group to be “high” or “medium” priority (Western Bat Working Group 2015)

³⁸ CDFW’s Rarity Ranking follows NatureServe’s Heritage Methodology (Faber-Langendoen, et al. 2016) in which communities are given a G (global) and S (state) rank based on their degree of imperilment (as measured by rarity, trends, and threats). Communities with a Rarity Ranking of S1 (critically imperiled), S2 (imperiled), or S3 (vulnerable) are considered sensitive by CDFW.

Biological Resource Technical Report Minimum Requirements

Report Contents

The Biological Resource Technical Report will include the following information at a minimum.

- a) **Preliminary Agency Consultation.** Describe any pre-survey contact with agencies. Describe any agency approvals that were required for biologists or agency protocols that were applied to the survey effort. Provide copies of correspondence and meeting notes with the names and contact information for agency staff and the dates of consultation as an appendix to the Biological Resources Technical Report.
- b) **Records Search.** Provide the results of all database and literature searches for biological resources within and surrounding the project area. Identify all sources reviewed (e.g., CNDDDB, CNPS, USFWS, etc.).
- c) **Biological Resource Survey Method.** Identify agency survey requirements and protocols applicable to each biological survey that was conducted. Identify the areas where each survey occurred. Identify any limitations for the surveys (e.g., survey timing or climatic conditions) that could affect the survey results.
- d) **Vegetation Communities and Land Cover.** Identify all vegetation communities or land cover types (e.g., disturbed or developed) within the biological survey area. The biological survey area should include a 1,000-foot buffer from project facilities to support CPUC's evaluation of indirect effects.
- e) **Aquatic Resources.** Identify any wetlands, streams, lakes, reservoirs, estuarine, or other aquatic resources within the biological survey area. Provide a wetland delineation and all data sheets including National Wetlands Inventory maps (or the appropriate state wetland maps, if National Wetlands Inventory maps are not available) that show all proposed facilities and include milepost locations for proposed pipeline routes. Provide a copy of agency verification of the wetland delineation if the delineation has been verified by the U.S. Army Corps of Engineers or CDFW. If the delineation has not been verified, describe the process and timing for obtaining agency verification.
- f) **Habitat Assessments.** Evaluate the potential for suitable habitat in the biological survey area for each species identified in the database and literature search.
- g) **Native Wildlife Corridors and Nursery Sites.** Identify any wildlife corridors or nursery sites that occur within the biological survey area.
- h) **Survey Results.** Describe all survey results and include a copy of any focused (e.g., rare plant, protocol special-status wildlife) biological resources survey reports.

Mapping and GIS Data

Provide detailed maps (at approximately 1:3,000 scale or similar), and all associated GIS data for the Biological Resources Technical Report and any supporting biological survey reports, including:

- a) Biological survey area for each survey that was conducted
- b) Vegetation communities and land cover types
- c) Aquatic resource delineation
- d) Special-status plant locations
- e) Special-status wildlife locations
- f) Avian point count locations
- g) Critical habitat
- h) California Coastal Commission or Bay Conservation and Development Commission jurisdictional areas

Attachment 3: Cultural Resource Technical Report Standards

Cultural Resource Inventory Report

Provide a cultural resource inventory report that includes archaeological, unique archaeological, and built-environment resources within all areas that could be affected by the proposed project including areas of indirect effect. The inventory report will include the results of both a literature search and pedestrian survey. The contents will address the requirements in *Archaeological Resource Management Reports: Recommended Contents and Guidelines*. The methodology and results of the inventory should be sufficient to provide the reader with an understanding of the nature, character, and composition of newly discovered and previously identified cultural resources so that the required recommendations about the resource(s) CRHR eligibility are clearly understood. No information regarding the location of the cultural resources will be included in these descriptions. The required Department of Parks and Recreation (DPR) 523 forms, including location information and photographs of the resources, are to be included in a removable confidential appendix to the report.³⁹

The inventory report will meet the following requirements:

- a) The report should clearly discuss the methods used to identify unique archaeological resources (e.g., how the determination was made about the resources' eligibility).
- b) The report should identify large resources such as districts and landscapes where resources indicate their presence, even if federal agencies disagree. It is understood that often only a few contributing elements may be in the project area, and that the boundaries of the large resource may need to be revisited as part of future projects. It is acknowledged that boundaries of districts and landscapes can be difficult to define and there is not always good recorded data on these resources.
- c) In the case of archaeological resources, the report should discuss whether each one is also a unique archaeological resource and explain why or why not.
- d) Descriptions of resources should include spatial relationships to other nearby resources, raw materials sources, and natural features such as water sources and mountains.
- e) The evidence that indicates a particular function or age for a resource should be explicitly described with a clear explanation, not simply asserted.

Cultural Resource Evaluation Report

Provide a cultural resource evaluation report. The report contents required by the state of California are outlined in the *Archaeological Resource Management Reports: Recommended Contents and Guidelines*. The evaluation report should also include:

- a) Resource descriptions and evaluations together, and not in separate volumes or report sections. This will facilitate understanding of each resource.
- b) An evaluation of each potential or eligible California Register of Historical Resources (CRHR) resource within the public archaeology laboratory (PAL) for all seven aspects of integrity⁴⁰ using specific examples for each resource. This evaluation needs to be included in the evaluation

³⁹ Any aspect of the PEA and associated data that Applicants believe to be confidential will be provided in full but may be marked confidential if allowed pursuant to General Order 66 or latest applicable Commission rule (e.g., see Public Records Act Proceeding R.14-11-001).

⁴⁰ The seven aspects of integrity are location, design, setting, materials, workmanship, feeling, and association, as defined in “*Types of Historical Resources and Criteria for Listing in the California Register of Historical Resources*” [14 CCR 4852(c)].

- report for all resources that could be affected by the project even if the resources were not previously evaluated. Previous evaluations should be reviewed to address change over time.
- c) An evaluation of each potential or eligible CRHR resource within the PAL under all four criteria using specific examples for each resource. This evaluation needs to be included in the evaluation report for all resources that could be affected by the project even if the resources were not previously evaluated. The cultural resources professional should make their own recommendation regarding eligibility, which does not need to agree with previous recommendations for CRHR or NRHP, as long as it is clearly explained.
 - d) For **prehistoric archaeological resources**, Criteria 1, 2 and 341 should be explicitly considered. Research efforts to search for important events and persons related to the resource must be described. This evaluation needs to be included in the evaluation report for all resources that could be affected by the project even if the resources were not previously evaluated. The cultural resources professional should make their own recommendation, which does not need to agree with previous recommendations for CRHR or NRHP eligibility, as long as it is clearly explained.
 - e) While **potential unique archaeological resources** could be identified in the records search report or inventory report, the justification for each individual resource to be considered a resource under CEQA should be presented in this report.
 - f) If surface information collected during survey is sufficient to make an eligibility recommendation, this reasoning should be outlined explicitly for each resource. This is particularly the case for resources that are believed to have buried subsurface components.
 - g) If archaeological testing or additional historical research was required in order to evaluate a resource, the evaluation report will be explicit about why the work was required, the results for each resource, and the subsequent eligibility recommendation.
 - h) For large projects with multiple similar resources where the eligibility justifications for similar resources are essentially identical, it is acceptable to discuss these resources as a group. However, eligibility justifications for each individual resource is preferred, so if the grouping strategy is used, the criteria used to group resources must be clearly justified.
 - i) Large resources such as districts and landscapes may be challenging to fully evaluate in the context of a single project. CPUC encourages the identification and evaluation of these resources with the understanding that often only a few contributing elements may be located within the project area, and that the boundaries of the large resource may need to be revisited as part of future projects. It is understood that a full evaluation of the resource may be beyond the scope of one project. Regardless, the potential for the project to affect any resources within a district or landscape must be defined.

⁴¹ Criteria for Designation on the California Register are as follows (defined in http://ohp.parks.ca.gov/?page_id=21238):

- Criterion 1: Associated with events that have made a significant contribution to the broad patterns of local or regional history or the cultural heritage of California or the United States.
- Criterion 2: Associated with the lives of persons important to local, California or national history.
- Criterion 3: Embodies the distinctive characteristics of a type, period, region or method of construction or represents the work of a master or possesses high artistic values.
- Criterion 4: Has yielded, or has the potential to yield, information important to the prehistory or history of the local area, California or the nation.

Attachment 4: CPUC Draft Environmental Measures

About this Attachment: The following CPUC Draft Environmental Measures are provided for consideration during PEA development. They should be discussed with the CPUC's CEQA Unit Staff during Pre-filing, especially with respect to the development of Applicant Proposed Measures. The CPUC Draft Environmental Measures may form the basis for mitigation measures in the CEQA document if appropriate to the analysis of potentially significant impacts. These and other CPUC Draft Environmental Measures may be formally incorporated into Chapter 5 of future versions of the PEA Checklist.

5.1 Aesthetics

Aesthetics Impact Reduction During Construction

All project sites will be maintained in a clean and orderly state. Construction staging areas will be sited away from public view where possible. Nighttime lighting will be directed away from residential areas and have shields to prevent light spillover effects. Upon completion of project construction, project staging and temporary work areas will be returned to pre-project conditions, including re-grading of the site and re-vegetation or re-paving of disturbed areas to match pre-existing contours and conditions.

5.3 Air Quality

Dust Control During Construction

The Applicant shall implement measures to control fugitive dust in compliance with all local air district(s) standards. Dust control measures shall include the following at a minimum:

- All exposed surfaces with the potential of dust-generating shall be watered or covered with coarse rock to reduce the potential for airborne dust from leaving the site.
- The simultaneous occurrence of more than two ground disturbing construction phases on the same area at any one time shall be limited. Activities shall be phased to reduce the amount of disturbed surfaces at any one time.
- Cover all haul trucks entering/leaving the site and trim their loads as necessary.
- Use wet power vacuum street sweepers to sweep all paved access road, parking areas, staging areas, and public roads adjacent to project sites on a daily basis (at minimum) during construction. The use of dry power sweeping is prohibited.
- All trucks and equipment, including their tires, shall be washed off prior to leaving project sites.
- Apply gravel or non-toxic soil stabilizers on all unpaved access roads, parking areas, and staging areas at project sites.
- Water and/or cover soil stockpiles daily.
- Vegetative ground cover shall be planted in disturbed areas as soon as possible and watered appropriately until vegetation is established.
- All vehicle speeds shall be limited to fifteen (15) miles per hour or less on unpaved areas.
- Implement dust monitoring in compliance with the standards of the local air district.
- Halt construction during any periods when wind speeds are in excess of 50 mph.

5.5 Cultural Resources

Human Remains (Construction and Maintenance)

Avoidance and protection of inadvertent discoveries that contain human remains shall be the preferred protection strategy with complete avoidance of such resources ensured by redesigning the project. If human remains are discovered during construction or maintenance activities, all work shall be diverted from the area of the discovery, and the CPUC shall be informed immediately. The Applicant shall contact the County Coroner to determine whether or not the remains are Native American. If the remains are determined to be Native American, the Coroner will contact the Native American Heritage Commission (NAHC). The NAHC will then identify the person or persons it believes to be the most likely descendant of the deceased Native American, who in turn would make recommendations for the appropriate means of treating the human remains and any associated funerary objects.

If the remains are on federal land, the remains shall be treated in accordance with the Native American Graves Protection and Repatriation Act (NAGPRA). If the remains are not on federal land, the remains shall be treated in accordance with Health and Safety Code Section 7050.5, CEQA Section 15064.5(e), and Public Resources Code Section 5097.98.

5.8 Greenhouse Gas Emissions

Greenhouse Gas Emissions Reduction During Construction

The following measures shall be implemented to minimize greenhouse gas emissions from all construction sites:

- If suitable park-and-ride facilities are available in the project vicinity, construction workers shall be encouraged to carpool to the job site.
- The Applicant shall develop a carpool program to the job site.
- On road and off-road vehicle tire pressures shall be maintained to manufacturer specifications. Tires shall be checked and re-inflated at regular intervals.
- Demolition debris shall be recycled for reuse to the extent feasible.
- The contractor shall use line power instead of diesel generators at all construction sites where line power is available.
- The contractor shall maintain construction equipment per manufacturing specifications.

5.19 Utilities and Service Systems

Notify Utilities with Facilities Above and Below Ground

The Applicant shall notify all utility companies with utilities located within or crossing the project ROW to locate and mark existing underground utilities along the entire length of the project at least 14 days prior to construction. No subsurface work shall be conducted that would conflict with (i.e., directly impact or compromise the integrity of) a buried utility. In the event of a conflict, areas of subsurface excavation or pole installation shall be realigned vertically and/or horizontally, as appropriate, to avoid other utilities and provide adequate operational and safety buffering. In instances where separation between third-party utilities and underground excavations is less than 5 feet, the Applicant shall submit the intended construction methodology to the owner of the third-party utility for review and approval at least 30 days prior to construction. Construction methods shall be adjusted as necessary to assure that the integrity of existing utility lines is not compromised.

5.20 Wildfire

Construction Fire Prevention Plan

A project-specific Construction Fire Prevention Plan for both construction and operation of the project shall be submitted for review prior to initiation of construction. A draft copy of the Plan shall be provided to the CPUC and state and local fire agencies at least 90 days before the start of any construction activities in areas designated as Very High or High Fire Hazard Severity Zones. Plan reviewers shall also include

federal, state, or local agencies with jurisdiction over areas where the project is located. The final Plan shall be approved by the CPUC at least 30 days prior to the initiation of construction activities. The Plan shall be fully implemented throughout the construction period and include the following at a minimum:

- The purpose and applicability of the Plan
- Responsibilities and duties
- Preparedness training and drills
- Procedures for fire reporting, response, and prevention that include:
 - Identification of daily site-specific risk conditions
 - The tools and equipment needed on vehicles and to be on hand at sites
 - Reiteration of fire prevention and safety considerations during tailboard meetings
 - Daily monitoring of the red-flag warning system with appropriate restrictions on types and levels of permissible activity
- Coordination procedures with federal and local fire officials
- Crew training, including fire safety practices and restrictions
- Method(s) for verifying that all Plan protocols and requirements are being followed

A project Fire Marshal or similar qualified position shall be established to enforce all provisions of the Construction Fire Prevention Plan as well as perform other duties related to fire detection, prevention, and suppression for the project. Construction activities shall be monitored to ensure implementation and effectiveness of the Plan.

Fire Prevention Practices (Construction and Maintenance)

The Applicant shall implement ongoing fire patrols during the fire season as defined each year by local, state, and federal fire agencies. These dates vary from year to year, generally occurring from late spring through dry winter periods. During Red Flag Warning events, as issued daily by the National Weather Service, all construction/maintenance activities shall cease, with an exception for transmission line testing, repairs, unfinished work, or other specific activities which may be allowed if the facility/equipment poses a greater fire risk if left in its current state.

All construction/maintenance crews and inspectors shall be provided with radio and cellular telephone access that is operational in all work areas and access routes to allow for immediate reporting of fires. Communication pathways and equipment shall be tested and confirmed operational each day prior to initiating construction/maintenance activities at each work site. All fires shall be reported to the fire agencies with jurisdiction in the area immediately upon discovery of the ignition.

All construction/maintenance personnel shall be trained in fire-safe actions, initial attack firefighting, and fire reporting. All construction/maintenance personnel shall be trained and equipped to extinguish small fires in order to prevent them from growing into more serious threats. All construction/maintenance personnel shall carry at all times a laminated card and be provided a hard hat sticker that list pertinent telephone numbers for reporting fires and defining immediate steps to take if a fire starts. Information on laminated contact cards and hard hat stickers shall be updated and redistributed to all construction/maintenance personnel and outdated cards and hard hat stickers shall be destroyed prior to the initiation of construction/maintenance activities on the day the information change goes into effect.

Construction/maintenance personnel shall have fire suppression equipment on all construction vehicles. Construction/maintenance personnel shall be required to park vehicles away from dry vegetation. Water tanks and/or water trucks shall be sited or available at active project sites for fire protection during construction. The Applicant shall coordinate with applicable local fire departments prior to construction/maintenance activities to determine the appropriate amounts of fire equipment to be carried on vehicles and, should a fire occur, to coordinate fire suppression activities.

**Gold Coast Recycling
& Transfer Station**

I N C O R P O R A T E D

Still leading the way, since 1989

(<https://goldcoastrecycling.com/>)

THE RECYCLING PROCESS

Gold Coast's upgraded operation improves efficiency and precision.

The new, state-of-the-art recyclable material sorting system uses screens and optical sensor air technology to separate materials. Additional updated systems prepare the materials for transport.

1. Bulk recycling material is brought in to Gold Coast Recycling on trucks and gathered for loading into the hopper.

2. Loaders dump the unsorted recycling material into the hopper for initial sorting and inspection.

3. First-line sorters clear out single-use plastic bags, large metal objects, trash and any dangerous items, to prep the lines for the first round of rollers.

4. Rollers separate cardboard from the other recyclables, which are then sent to their respective sections of the recycling plant for further processing.

5. Plastics, paper, aluminum, tin cans and small cardboard recyclables are further separated as they go through the process.

6. Gold Coast's improved service is largely owed to its new sorting facility, retrofitted to accommodate the growing need for purer recyclables.

7. For the final inspection, paper line sorters further remove any missed plastics and undesirable items.

8. Conveyors take the different recyclables to final stages of processing in the plant.

9. Crushed glass for resale is looked over a final time, for anything amiss.

10. A worker uses a specially designed tool to clear out any noncardboard recyclables along bailing conveyors.

11. Workers take sorted recyclables and condense the material into large bales.

12. The huge bales of specially sorted plastics, paper and aluminum recyclables are stacked for loading onto Gold Coast transport trucks.

13. Nonrecyclable materials are taken to local landfills for proper disposal.

Construction, Demolition and Roll-off Recycling

Innovative programs featured at the facility

Recyclable materials are picked off the commercial picking line from construction and demolition loads. The heaviest roll-off materials are sorted on the Gold Coast

commercial picking line. All construction and demolition material is recycled and meets all diversion requirements for building permits required by some cities and the County of Ventura. Certified recycling numbers are given to the contractor. For further information, call 805-642-9236.

E-waste

Electronic waste – commonly called e-waste – is loaded for international markets.

E-waste includes computers and computer monitors, printers, televisions, stereos, DVD players and VCRs, cell phones and small kitchen appliances. (No smoke detectors.)

Commercial Services

E.J. Harrison & Sons provides complete commercial trash and recycling services for businesses, including weekly collection and a variety of bin sizes. Roll-off and oversized bin rentals are also available.

Residential Services

Weekly curbside collection of trash, recycling and yard waste is standard for all our residential customers. Additional free residential services include bulky item pickup.

[Translate »](#)

Request Services

How can we help you?

Fill out a **service request** form below and one of our customer service agents will get back to you promptly.

Translate »

Commercial Services

Our commercial truck fleet handles a variety of industrial, storefront and apartment waste and recycling services throughout Ventura County.

Service frequency and container size can be custom tailored to meet your specific needs.

Bins are available in sizes ranging from 1.5 to 3 cubic yards.

Bins include lightweight plastic lids.

Locking containers are available in all sizes.

For commercial pricing and billing questions, to start or stop commercial service, and for bin exchanges and size changes, call 805-647-1414.

Residential Services

Our fleet handles the weekly curbside collection of all our residential customers' carts, for trash, recycling and yard waste.

Residential cart sizes can be custom tailored to meet specific needs.

Additional residential services include bulky item pickups.

To inquire about residential trash, recycling and yard waste services in unincorporated Ventura County and in the cities of Fillmore, Ventura, Ojai, Thousand Oaks and Carpinteria, call 800-41-TRASH or 805-647-1414.

If you live in Camarillo, for new service and barrel exchanges, please call 805-388-5325 or visit www.cityofcamarillo.org

Roll-Off and Temporary Bins

Roll-off containers and temporary bins are available for rent.

Depending on size, these large containers are invaluable for a variety of uses, including construction sites, special events, remodeling, clean-up projects, disaster scenes, industrial plants, office complexes, recycle projects, demolition and agriculture.

Container size options:

3-yard bin

At approximately 6'9" wide by 3'6" deep by 4'3" high, these bins are suited **for home, garage and yard cleanup**. They come with plastic lids and wheels and can hold up to 700 pounds of materials.

10-yard roll-off*

At approximately 16'x8'x2', these containers are designed **for concrete/wash-out, dirt, asphalt, sod and heavy materials**.

Translate »

25-yard roll-off*

40-yard roll-off*

At approximately 22'x8'x4', this container is designed to support construction, roofing, land clearing, demolition, weed abatement, and residential construction appliances.

At approximately 22'x8'x6', this container is designed to support construction, roofing, land clearing, demolition, weed abatement, and residential construction appliances.

We enable contractors to easily meet recycling requirements.

Special recycle rates are available on request.

Free estimates are available.

To request or inquire about roll-off and temporary bin rentals, call 800-41-TRASH or fill out the service request form below.

Service Request Form

Ventura, CA 93002

K/J Project No. 2044229*00

Table of Contents

List of Tables.....	v
List of Figures.....	vi
List of Appendices.....	vi
Acronyms.....	vi

Section 1: Introduction/Lay Description..... 1-1

1.1	Overview	1-1
1.2	Purpose	1-1
	1.2.1 Relationship to the City’s Annual Comprehensive Water Resources Report.....	1-2
1.3	Structure and Organization of the Plan	1-3
1.4	Implementation of the Plan.....	1-4
	1.4.1 Joint Preparation of the Plan.....	1-4
	1.4.2 Plan Adoption.....	1-8
	1.4.3 Public Outreach.....	1-9
1.5	System Description	1-9
1.6	Land Use	1-11
1.7	Population	1-12
1.8	Social, Economic and Demographic Factors Affecting Water Management	1-13
1.9	Climate	1-14
1.10	Potential Effects of Climate Change.....	1-14
1.11	Fundamental Findings of the Urban Water Management Plan	1-15

Section 2: Water Demands 2-1

2.1	Overview	2-1
2.2	Historical Water Use.....	2-2
2.3	Water Loss	2-3
2.4	Existing and Target Per Capita Water Use	2-3
	2.4.1 Base Daily Per Capita Water Use for SBX7-7 Reduction	2-4
	2.4.2 2015 and 2020 Targets	2-5
	2.4.3 Achievement of Target.....	2-6
2.5	Projected Water Use	2-6
	2.5.1 Normal Year	2-8
	2.5.2 Dry Years	2-9
	2.5.3 Weather Effects on Water Usage.....	2-9
2.6	Low Income Projected Water Demands.....	2-10

Section 3: Water Resources 3-1

Table of Contents (cont'd)

3.1	Overview	3-1
3.1.1	Management of Supplies	3-1

Section 1: Introduction/Lay Description

1.1 Overview

This volume presents the Urban Water Management Plan 2020 (Plan) for the City of San Buenaventura and its Ventura Water Department (the City or Ventura Water) service area, which includes the City boundary as well as unincorporated areas within the City’s Sphere of Influence. This chapter describes the general purpose of the Plan, discusses Plan implementation, and provides general information about the service area characteristics. A list of acronyms and abbreviations is provided at the end of the table of contents.

1.2 Purpose

An Urban Water Management Plan (UWMP) is a planning tool that generally guides the actions of water management agencies. It provides managers and the public with a broad perspective on a number of water supply issues. It is not a substitute for project-specific planning documents, nor was it intended to be when mandated by the State Legislature. For example, the Legislature mandated that a plan includes a section which “describes the opportunities for exchanges or water transfers on a short-term or long-term basis.” (California Urban Water Management Planning Act, Article 2, Section 10630(d).) The identification of such opportunities, and the inclusion of those opportunities in a general water service reliability analysis, neither commits a water management agency to pursue a particular water exchange/transfer opportunity, nor precludes a water management agency from exploring exchange/transfer opportunities not identified in the plan. When specific projects are chosen to be implemented, detailed project plans are developed, environmental analysis, if required, is prepared, and financial and operational plans are detailed.

In short, this Plan is a management tool, providing a framework for action, but not functioning as a detailed project development or action. It is important that this Plan be viewed as a long-term, general planning document, rather than as an exact blueprint for supply and demand management. Water management in California is not a matter of certainty and planning projections may change in response to a number of factors. From this perspective, it is appropriate to look at the Plan as a general planning framework, not a specific action plan. It is an effort to generally answer a series of planning questions including:

- What are the potential sources of supply and what is the reasonable probable yield from them?
- What is the probable demand, given a reasonable set of assumptions about growth and implementation of good water management practices?
- How well do supply and demand figures match up, assuming that the various probable supplies will be pursued by the implementing agency?

Using these “framework” questions and resulting answers, the implementing agency will pursue feasible and cost-effective options and opportunities to meet demands.

The California Urban Water Management Planning Act (Act) requires preparation of a plan that:

- Accomplishes water supply planning over a 20-year period in five-year increments (the City is going beyond the requirements of the Act by developing a plan which spans 25 years.)
- Identifies and quantifies adequate water supplies, including recycled water, for existing and future demands, in normal, single-dry, and multiple-dry years.
- Implements conservation and efficient use of urban water supplies.

State legislation, Senate Bill 7 of Special Extended Session 7 (SBX7-7) was signed into law in November 2009, which calls for progress towards a 20 percent reduction in per capita water use statewide by 2020. The legislation mandated each urban retail supplier develop and report an interim 2015 water use target, their baseline daily per capita use and 2020 compliance daily per capita use, along with the basis for determining those estimates. This UWMP reports on Ventura Water's final progress in meeting the SBX7-7 targets.

In short, the Plan answers the question: *Will there be enough water for the area served by the City in future years, and what mix of programs should be explored for making this water available?*

It is the stated goal of the City to deliver a reliable and high-quality water supply for customers, even during dry periods. The analysis in this Plan documents that it is necessary for the City to implement planned water supply projects in order to meet normal and dry-year demands. In the near term (2020-2026) until such time as planned supplies come on-line, anticipated supplies in a multiple-dry year are insufficient and the City would have to call on existing customers to undertake extraordinary conservation. After planned water supplies are available the potential for a water supply shortage is lessened.

1.2.1 Relationship to the City's Annual Comprehensive Water Resources Report

The Urban Water Management Plan is required by the California State Water Code. The UWMP is a long-term planning tool that provides water purveyors and their customers a broad perspective on water supply issues over a 20-year period (this plan goes further and looks at 25 years). The UWMP is a management tool, providing the framework for action but not functioning as a detailed project development plan.

In 2013 the City Council directed Ventura Water and the Community Development Department to work together to develop a short-term balance of water supply and demand. The result of this collaboration is the annual Comprehensive Water Resources Report (CWRR). The CWRR specifically focuses on water demand of approved (entitled) projects only. The CWRR focuses on a short timeframe and on near-term demand changes. The CWRR estimates demands from approved projects whereas the UWMP estimates demands from population projections. In the latest 2021 CWRR the estimated demand of approved projects would be fully vested by year 2025. This latest CWRR estimates demand to the year 2030 using a growth rate of 0.54 percent (the Department of Finance historical data for City of San Buenaventura population growth).

Understanding and monitoring water supply and demand is essential to planning for and managing a stable and reliable water system to support the community and economic growth. The City's supply and demand play an important role and dramatically influence the planning for, development of, and investment of significant dollars in capital improvements, maintaining current water supply and investing in new water supplies. Therefore, the annual CWRR is an important tool that the City utilizes to update the City's annual projected water supply and demand.

1.3 Structure and Organization of the Plan

This plan is organized as follows:

- Introduction
- Water Demand
 - SBX7-7 Reduction
- Water Resources
- Recycled Water
- Water Quality
- Reliability Planning
- Demand Management Measures
- References
- Appendices

Appendix A contains a checklist documenting how this UWMP meets the requirements of the Urban Water Management Planning Act and SBX7-7. Starting with the 2015 UWMP, urban water suppliers are required to report and submit information in standardized tables developed by the Department of Water Resources (DWR). These standardized tables are provided as Appendix B of this document.

This plan is being prepared for Ventura Water, a Department of the City, and is an individual rather than Regional Urban Water Management Plan. Data provided in this plan are reported in calendar years rather than fiscal years. To the extent possible water volumes are reported in acre-feet (AF). Tables 1-1 and 1-2 document the structure of this plan.

**TABLE 1-1
PUBLIC WATER SYSTEM COVERED BY THIS PLAN**

Public Water System Number	Public Water System Name	# of Municipal Connections 2020	Volume of Water Supplied 2020 (AF)*

Hundred Cubic Feet (CCF)

1.4 Implementation of the Plan

Preparation of UWMP 2020 was coordinated by Ventura Water. Ventura Water staff met with and coordinated the development of the UWMP with various City Departments as well as the Ventura Water Commission. Based on the City's 2005 General Plan, Sustainable Infrastructure, Policy 5B, Ventura Water has adopted guidelines which require that adequate water supply, system capacities, and wastewater collection system and treatment capacities are available before new development can be approved by the Community Development Department. This subsection provides the cooperative framework within which the Plan will be implemented including agency coordination, public outreach, and resources maximization.

1.4.1 Joint Preparation of the Plan

The UWMP Act requires a water supplier to coordinate the preparation of its plan with other appropriate agencies in the area. This includes other water suppliers that share a common source, water management agencies, and relevant public agencies, to the extent practicable. Various agencies are involved in supplying water to the City or having jurisdiction over a portion of the water resources. This section briefly discusses each one. Table 1-3 summarizes the efforts the City has taken to include the various City Departments, agencies, and citizens in the preparation of this document.

**TABLE 1-3
AGENCY COORDINATION SUMMARY**

	Participated in UWMP Development	Commented on the Draft	Attended Public Meetings	Contacted for Assistance	Received Copy of Draft	Sent Notice of Intention to Adopt	Not Involved / No Information

United Water Conservation District						X	
Santa Paula Basin Technical Advisory Committee						X	
Upper Ventura River Groundwater Agency						X	
Mound Basin Groundwater Sustainability Agency						X	
Ojai Valley Sanitary District						X	
Ventura County Local Agency Formation Commission						X	

- **City of San Buenaventura Community Development Department**
The Community Development Department is responsible for planning and zoning, economic development, housing and redevelopment for the City of San Buenaventura. The department works with various city departments, city commissions, and the City Council to guide and provide advice regarding growth in the city. The Community Development Department works with the community and City Council to create and document the vision for land use in the city and the various policies and regulations applicable to redevelopment and new development. The Community Development Department was consulted regarding changes in population and economic activity in the service area which may affect water demands.
- **City of Oxnard Public Water Works Division**
The City of Oxnard is a neighboring jurisdiction that was contacted to be given the opportunity to provide input to the 2020 UWMP.
- **Ventura County Resource Management Agency**
Ventura Water serves a very minor amount of water to connections outside the City limits within the unincorporated County. These connections must meet the City's policy for water connections (Municipal Code Section 22.110.055). Ventura Water notified the County Resource Management Agency of the UWMP Update and the methods by which the County could provide input to the plan. In December 2015, the County of Ventura started an update to its General Plan; Ventura Water participated in the General Plan Update. The 2040 General Plan Update was adopted in October of 2020.
- **Fox Canyon Groundwater Management Agency (FCGMA)**
The FCGMA was created by state legislation in 1982 to manage local groundwater basins and resources in a manner to reduce overdraft of the Oxnard Plain and stop seawater intrusion. A major goal of the FCGMA is to regulate and reduce future extractions of groundwater from the Oxnard Plain aquifers, in order to operate the basin at a safe yield. Ventura Water withdraws water from the Oxnard Plain Groundwater Basin and is subject to the management policies of the FCGMA. Ventura Water notified FCGMA of the 2020 UWMP Update and the methods by which the FCGMA could provide input to the plan.
- **United Water Conservation District (United)**
United is primarily a groundwater recharger and a wholesale purveyor in central Ventura County and does not provide any water directly to the City. However, all of the City's groundwater wells within the Mound, Oxnard Plain, and Santa Paula groundwater basins are within United's boundaries and are subject to United's semi-annual extraction fees. Ventura Water notified United of the 2020 UWMP Update and the methods by which United could provide input to the plan.
- **Santa Paula Basin Technical Advisory Committee (TAC)**
The Santa Paula Basin is subject to a stipulated judgment and is managed by the Santa Paula Basin Technical Advisory Committee (TAC) with equal representation from United Water Conservation District (UWCD), the Santa Paula Basin Pumpers Association (SPBPA), and Ventura Water. The TAC is charged with establishing a program to "monitor conditions in the basin, including but not necessarily limited to verification of future pumping amounts, measurements of groundwater levels, estimates of inflow to

and outflow from the basin, increases and decreases in groundwater storage, and analyses of groundwater quality.” The Judgment also allows for the development of a management plan for the operation of the basin and empowers the TAC to determine the safe yield of the basin. Ventura Water notified the Santa Paula Basin TAC of the 2020 UWMP Update and the methods by which the TAC could provide input to the plan.

- **Upper Ventura River Groundwater Agency (UVRGA)**

The Upper Ventura River Groundwater Agency was created in 2016 by several agencies using a Joint Powers Agreement. In 2017, the Agency became a Groundwater Sustainability Agency. The UVRGA is managed by a seven-member Board of Directors – five public agency directors, including Ventura Water, and two stakeholder directors that represent environmental and agricultural interests.¹

Ventura Water notified the UVRGA of the 2020 UWMP Update and the methods by which the UVRGA could provide input to the plan.

- **Mound Basin Groundwater Sustainability Agency (MBGSA)**

The Mound Basin Groundwater Sustainability Agency (MBGSA) was created in 2017 by several agencies using a Joint Power Agreement and became a Groundwater Sustainability Agency in June 2017. The MBGSA includes United Water Conservation District, the County of Ventura, the City of San Buenaventura, the Mound Basin Ag Water Group (agricultural stakeholder), and an environmental stakeholder. “United is authorized under the California Water Code to conduct water resource investigations, acquire water rights, build facilities to store and recharge water, construct wells and pipelines for water deliveries, commence actions involving water rights and water use, and prevent interference with or diminution of stream/river flows and their associated natural subterranean supply of water (California Water Code, section 74500 et al.). The County of Ventura exercises water management and land use authority on land overlying the entire county including Fillmore and Piru Basins. The City of [San Buenaventura] is a local municipality that exercises water supply, water management, and land use authority within the city’s boundaries.”²

Ventura Water notified the MBGSA of the 2020 UWMP Update and the methods by which the MBGSA could provide input to the plan.

- **Ojai Valley Sanitary District (OVSD)**

The OVSD is an adjacent district that collects and treats wastewater from a population of approximately 20,000 across the City of Ojai, the unincorporated Ojai Valley, and the north Ventura Avenue area. Ventura Water notified the OVSD of the 2020 UWMP Update and the methods by which the OVSD could provide input to the plan.

- **Ventura County Local Agency Formation Commission**

The Ventura Local Agency Formation Commission (LAFCo) was formed and operates under the provisions of state law, specifically what is now known as the Cortese-Knox-

¹ Upper Ventura River Groundwater Agency, <https://uvrgroundwater.org/about/>

² Mound Basin Groundwater Sustainability Agency, <https://www.moundbasingsa.org/about-us/>

Hertzberg Local Government Reorganization Act of 2000 (California Government Code Section 56000 et seq.). State law provides for LAFCoS to be formed as independent agencies in each county in California. LAFCoS implement state law requirements and state and local policies relating to boundary changes for cities and most special districts, including spheres of influence, incorporations, annexations, reorganizations and other changes of organization. In this capacity the Ventura LAFCo is the boundary agency for cities and most special districts in Ventura County.

All LAFCoS have general objectives such as to, 1) encourage the orderly formation and expansion of local government agencies, 2) preserve agricultural land resources, 3) discourage urban sprawl. Additionally, all LAFCoS have authorities such as to, 1) regulate boundary changes, 2) establish spheres of influence – the probable physical boundaries and service area of a city or special district, and 3) conduct reviews of public services and special studies, 4) initiate special district consolidations or dissolutions, and 5) act on out of agency service agreements between public agencies and between public agencies and private parties.³

Ventura Water notified the LAFCo of the 2020 UWMP Update and the methods by which the LAFCo could provide input to the plan.

- **Casitas Municipal Water District (Casitas)**

Casitas is a wholesaler of treated surface water from Lake Casitas to the City under the terms and conditions of the 2017 Agreement. Casitas' service area is in Western Ventura County, including the City of Ojai, Upper Ojai, the Ventura River Valley area, the City of Ventura to Mills Road, and the Rincon and beach area to the ocean and Santa Barbara County Line. Casitas supplies water to 60,000-70,000 people and to hundreds of farms. The western portion of the City of San Buenaventura is within the Casitas service area⁴. Ventura Water notified Casitas of the 2020 UWMP Update and the methods by which Casitas could provide input to the Plan.

1.4.2 Plan Adoption

The City began preparation of this Plan in August 2020. A draft of the plan was presented to and reviewed by the City Water Commission on April 27 and May 25, 2021. The final draft of the Plan was adopted by the City Council on June 14, 2021 by Resolution No. 2021-051 (Appendix C) and submitted to DWR within 30 days of City Council approval. This plan includes all information necessary to meet the requirements of Water Conservation Act of 2009 (Wat. Code, §§ 10608.12-10608.64) and the Urban Water Management Planning Act (Wat. Code, §§ 10610-10656). Additionally, the plan has also been submitted to all appropriate entities and made available for public review per the requirements of the Urban Water Management Planning Act.

³ Ventura Local Agency Formation Commission, <https://www.ventura.lafco.ca.gov/about-us-2/>

⁴ Casitas Municipal Water District, <https://www.casitaswater.org/about-us/about-casitas-water>

1.4.3 Public Outreach

Urban water agencies preparing plans are required to hold a public hearing on the UWMP prior to its adoption. In response to these requirements, a public hearing was conducted June 14, 2021 by the City to receive public comment and input on the UWMP. Table 1-4 presents a timeline for public participation during the development of the Plan. A copy of the public outreach materials, including paid advertisements, newsletter covers, website postings, and invitation letters are attached in Appendix D.

**TABLE 1-4
PUBLIC PARTICIPATION TIMELINE**

Public Workshops and Hearings	Date	Public Participation Task
UWMP Status Update	March 23, 2021	Presentation at City Water Commission
UWMP Administrative Draft	April 27, 2021	Presentation at City Water Commission
UWMP Final Draft, Final Draft Available for Public Review	May 25, 2021	Presentation to City Water Commission, Available for Public Review
Public Hearing and Adoption	June 14, 2021	City Council Meeting

1.5 System Description

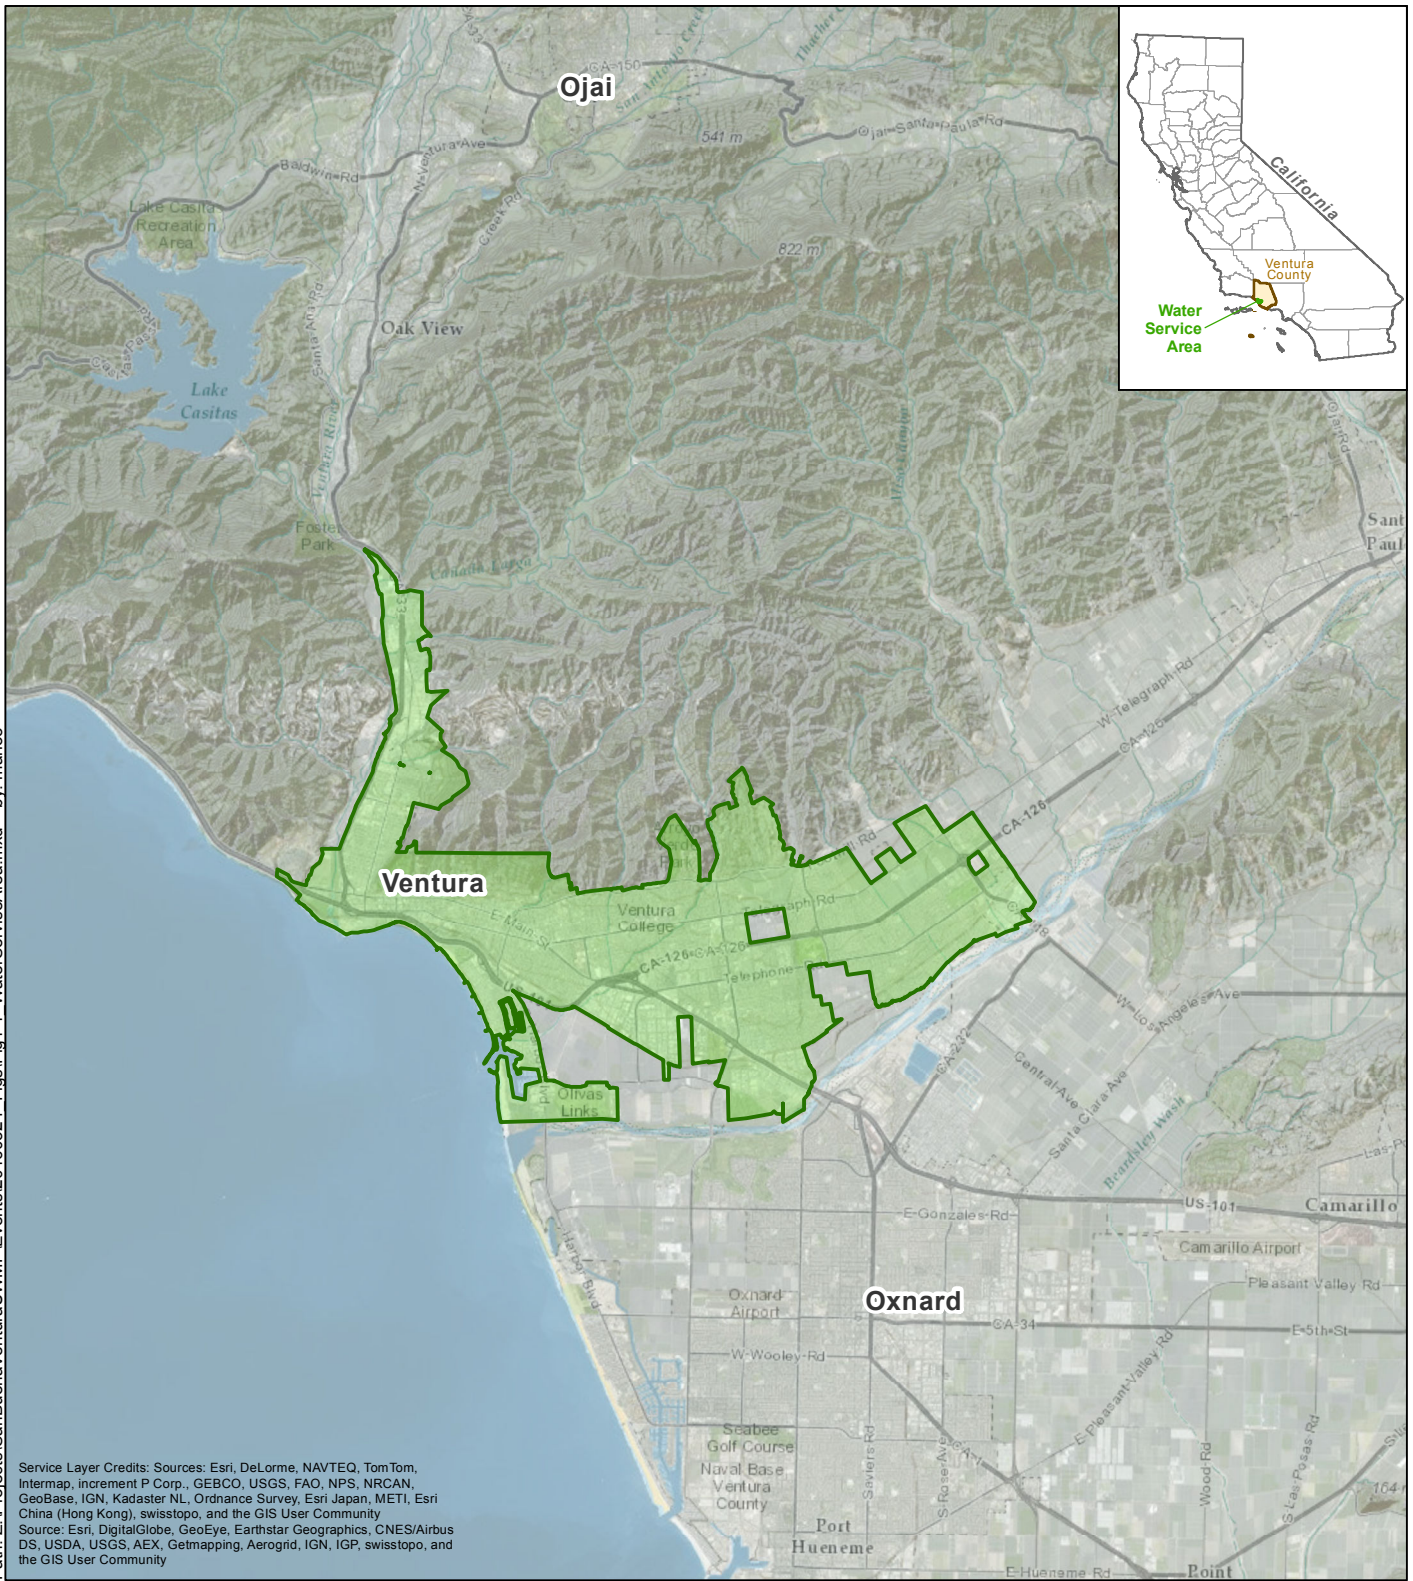

The City is located 62 miles north of Los Angeles and 30 miles south of Santa Barbara along the California coastline. The City's planning area is bounded by the Ventura River on the west, Foster Park on the north, Franklin Barranca and the Santa Clara River to the east, with the Pacific Ocean as the southern boundary. The total planning area encompasses approximately 40 square miles. The City water service area is shown on Figure 1-1.

The City developed as a result of the ninth and last mission founded in California by Father Junipero Serra in 1782. In 1866, the City incorporated an area of about one square mile around the original Mission San Buenaventura. Since that time, the City has grown. An estimated population of 113,500⁵ is currently supplied water from the City's water system. This includes several unincorporated County areas, such as the upper North Ventura Avenue area to the north and developing areas east of the City boundary.

The City Charter provides for a City Council-Manager form of government. A seven-member City Council is elected at large for four-year terms, with the Mayor selected by the City Council for a two-year term. The City of San Buenaventura Water Commission was formed in 2015 to provide policy guidance on water and wastewater issues to City Council as representatives of the community and Ventura Water customers. The Water Commission reviews and makes advisory recommendations regarding water rates, water resources infrastructure projects in the

⁵ This population estimate is based the 2021 Comprehensive Water Resources Report. Current (2020) population as estimated by the DWR Population Tool (described in section 2.3.20) is 115,815. The calculation of gallons per capita per day targets in section 2.3 uses the population as estimated by the DWR Population Tool.

five-year capital improvement program, the integrated water resources management plan, water supply options, the Urban Water Management Plan approval process, a water dedication and in-lieu fee requirement, and other water resource issues.

The Spanish Fathers of Mission San Buenaventura developed the first water system for the City. It consisted of an aqueduct (now abandoned) to convey water from the Ventura River, near San Antonio Creek, to a reservoir located behind the Mission.

During subsequent development around the Mission, additional groundwater was obtained from wells in the Ventura and Santa Clara River basins. Water facilities were developed and operated for the City by several individuals and companies over the period of 1869 to 1923. In 1923, the City acquired the water system, along with its water rights from the Ventura River, from the Southern California Edison Company and assumed the responsibility of providing water to City residents. In years following, the City developed additional sources of surface and groundwater, including wells and improvements to the surface water diversion from the Ventura River. Also, since 1960, the City has purchased surface water from Casitas Municipal Water District to supplement its water supplies. As the City boundaries expanded east, the City took over other water systems such as Mound Water Company and Saticoy Water Company. As development occurs on the east side of the City, additional groundwater facilities have also been completed to meet increasing demands.

Currently, the City's water system serves approximately 32,285 water service connections, which includes the population of the City plus some additional areas outside the City boundaries. The western portion of the City is within the Casitas Municipal Water District service area. The mid and eastern portion of the City are within United Water Conservation District's boundaries. Water service is provided to all residential, commercial, industrial and irrigation customers, including fire protection users.

The City water system is a geographically complex system of 16 pressure zones, 10 active wells, 19 booster stations, approximately 385 miles of pipelines ranging from 4-inches to 36-inches in diameter, and a total storage capacity of approximately 52 million gallons (MG) in 27 tanks and reservoirs. The system delivers water from sea level to a maximum elevation of over 1,000 feet. The City operates three purification facilities, including one membrane filtration treatment plant for surface water sources on the west side of the City, and two iron/manganese removal treatment plants for groundwater sources on the east side (City of San Buenaventura 2011). The City also maintains and operates the Ventura Water Reclamation Facility for wastewater treatment and reclamation. See Section 4 for further description of the Reclamation Facility.

1.6 Land Use

The City's 2005 General Plan is the basis for understanding land use in the Ventura Water service area. Each year as part of the CWRR, Ventura Water updates the land use information from the 2005 General Plan to reflect projects built in the past year. Table 1-5 provides a summary of land uses in the water service area as estimated through 2020. Based on the "build-out" envisioned in the 2005 General Plan Table 1-5 provides a summary of remaining developable land.

**TABLE 1-5
SUMMARY EXISTING LAND USE – DECEMBER 2020**

Land Use	As of December 2020	Potential Remaining Development
Residential (units)	3,230	5,088
Retail (sf)	447,026	794,351
Office (sf)	474,521	738,693
Industrial (sf)	1,191,437	1,043,696
Hotel (sf)	25,360	504,640

1.7 Population

The City water service area is an established community comprised primarily of residential areas with opportunities for infill development. Large commercial and industrial areas exist along Main Street, Harbor Boulevard, Telephone Road, Ventura Avenue, Telegraph Road and Victoria Avenue (City of San Buenaventura 2011). In 2005, the City adopted the 2005 Ventura General Plan to redirect future growth toward ‘Infill First’ with an emphasis on encouraging more dense development of housing alongside commercial uses in the above-mentioned commercial corridors, as well as Johnson Drive and Wells Road. The City’s estimated population growth for the water service area is shown in Table 1-6. The population numbers reflect both the population within the City limits as well as the minor number of customers in the unincorporated county.

Future projections for areas within the City reflect a 0.54 percent annual growth rate through 2030⁶. From 2030-2045, the future projections for areas within the City also reflect a 0.54 percent annual growth rate⁷. Population estimates were extrapolated to fit five-year increments. It is important to note that these figures are not intended to represent support for, nor reflect any commitment to, this level of growth. Rather, it is to provide a safe margin in planning for long-term water improvements that might be needed given the amount of growth that could be allowed under the City’s 2005 updated General Plan as assessed in the certified EIR.

**TABLE 1-6
POPULATION PROJECTIONS**

	2020	2025	2030	2035	2040	2045
Ventura Water Service Area	113,500	116,598	119,780	123,049	126,408	129,858

⁶ Projections were provided by the 2021 Comprehensive Water Resources Report.

⁷ Maximum historic growth rate that the City of Ventura saw prior to Thomas Fire (2010-2018).

1.8 Social, Economic and Demographic Factors Affecting Water Management

The following information has been taken from the 2019 Local Profile for San Buenaventura prepared by the Southern California Association of Governments. The 2019 Local Profile was the most recent information that could be obtained for the City.

Between 2000 and 2018, the total population of the City of San Buenaventura increased by 10,353 to 111,269. During this 18-year period, the city's population growth rate was lower than the Ventura County rate. The city, while the County seat, makes up 13 percent of the total population of Ventura County. Between 2000 and 2018, the 55-64 age group experienced the largest increase in share of the city's population, growing from 8.3 to 13.7 percent. Conversely the 35-54 age group declined as percent of the population from 32 to 25.6 percent. In this same timeframe, the share of Hispanic population in the city increased from 24.3 percent to 35.4 percent and the share of Non-Hispanic White population in the city decreased from 68.1 percent to 56.3 percent. The share of Non-Hispanic Asian population in the city increased modestly, from 2.9 percent to 3.7 percent as did the share of the Non-Hispanic Black population (1.3 percent to 1.4 percent). There was a modest decline in the share of Non-Hispanic American Indian or Alaska Native population in the city from 0.6 percent to 0.4 percent.

Between 2000 and 2018, the total number of households in the City of San Buenaventura increased by 3,299 units, or 8.6 percent, lower than the county growth rate of 12.5 percent. As of 2018 the City's average household size was 2.6, lower than the county average of 3.1. Seventy seven percent of all city households had 3 people or fewer and about 29 percent of the households were single-person households. A small percentage of households, about 10 percent had 5 people or more. Between 2000 and 2018, homeownership rates decreased and the share of renters increased. In 2018 approximately 46.2 percent of households were renters and 53.8 owners. In 2018, the median home sales price in the city was \$583,000, the same as that in the county overall.

The housing stock consist primarily of single-family detached homes (approximately 89%) with limited amounts of multi-family housing (approximately 11%).

The majority of the City of San Buenaventura housing stock pre-dates 1980 as shown in Table 1-7.

**TABLE 1-7
HOUSING CHARACTERISTICS CITY OF SAN BUENAVENTURA (2018)**

Housing Age	Percent of Housing Stock	Housing Age	Percent of Housing Stock
1939 and earlier	7.6	1980 to 1989	13.2
1940 to 1949	4.2	1990 to 1999	8.0
1950 to 1959	15.2	2000 to 2009	8.5
1960 to 1969	22.4	2010 to 2018	4
1970 to 1979	20.0		

About 34 percent of households earned less than \$50,000 annually and approximately 33 percent of households earned \$100,000 or more. From 2000 to 2018, median household income increased by \$20,693, from \$52,166 to \$72,859. Housing costs are significant portion of income. In 2018 housing costs accounted for an average of 34.7 percent of total household income for renters and an average of 22.5 percent of total household income for homeowners.

Data shows a decreasing number of jobs in the city from 2007 to 2018 with a significant decline in jobs in the manufacturing sector (17.2 percent) and construction sector (declined of 37.7 percent), and a modest decline in administrative and professional jobs (6.1 percent).

1.9 Climate

The City has a climate that is similar to a Mediterranean coastal city. That is, the winters are cool, and the summers are mild. The average temperature range is in the 70s and it is uncommon for the temperature to drop below freezing. The area has an average rainfall of approximately 13.5 inches. Table 1-8 shows the average annual climate information by month.

**TABLE 1-8
ANNUAL CLIMATE INFORMATION**

	Jan	Feb	Mar	Apr	May	Jun
Standard Monthly Average ETo (in)	2.5	2.6	3.7	4.6	5.1	5.3

Source:

Evapotranspiration (ETo) data from Station #152 in the City of San Buenaventura as provided on the CIMIS website database at www.cimis.water.ca.gov for the period of record from January 2000 to November 2020.

The average rainfall data is from Ventura County Watershed Protection District's web site for Station 066E, https://www.vcwatershed.net/hydrodata/php/getstations.php?dataset=rain_hour&order=site_id, for the period October 2005 to September 2020.

The average temperature figures are from the Western Regional Climate Center web site at www.wrcc.dri.edu for Station 049285 VENTURA.

1.10 Potential Effects of Climate Change

A topic of growing concern for water planners and managers is climate change and the potential impacts it could have on California's future water supplies. Climate change models have predicted that potential effects from climatic changes will result in increased temperature, early snow melt, and a rise in sea level.

In the 2013 update of the *DWR California Water Plan*, the implications of future climate conditions are evaluated. These changing hydrological conditions could affect future planning efforts, which are typically based on historic conditions. The *California Water Plan* identifies the following probable impacts due to changes in temperature and precipitation:

- More winter runoff and less spring/summer runoff due to warmer temperatures.

- Greater extremes in flooding and droughts.
- Greater water demand for irrigation and landscape water due to increased temperatures and their impacts on plant water needs.
- Increased sea level rise, increased threat of coastal flooding, and salt water intrusion into coastal groundwater aquifers.

In the 2019 report of *Projected Changes in Ventura County Climate* (Oakley et. al. 2019), the implications of future climate conditions are evaluated. These changing hydrological conditions could affect future planning efforts, which are typically based on historic conditions. The report of *Projected Changes in Ventura County Climate* identifies the following probable impacts due to changes in temperature, precipitation, evaporative demand, and other variables:

- Increases in both maximum and minimum temperatures and heat extremes.
- More intense precipitation focused during the winter season.
- Increased evapotranspiration.
- Increased drought risk.
- Potential for longer wildfire season with more ignitions as population growth continues.
- Reduced marine stratus.
- Reduction in Sierra Nevada snowpack.
- Longer duration and more intense atmospheric rivers.

Even without population changes, water demand could increase. Precipitation and temperature influence water demand for outdoor landscaping and irrigated agriculture. It is typical that about half of the water used by residential development is for outdoor use and therefore it is assumed that outdoor water use is a large component of the City of San Buenaventura water demands.

1.11 Fundamental Findings of the Urban Water Management Plan

It is the stated goal of the City to deliver a reliable and high quality water supply for customers, even during dry periods. The analysis in this Plan documents that it is necessary for the City to implement planned water supply projects in order to meet normal and dry-year demands. In the near term (2021 to 2024) until such time as planned supplies come on-line, there is little buffer between supplies and demands and it may be necessary for the City to call on existing customers to undertake extraordinary conservation should drought persist. After planned water supplies are available the potential for a water supply shortage is lessened.

Section 2: Water Demands

2.1 Overview

This chapter describes historic and current water usage and the methodology used to project future demands within the City's service area. The City's water system provides potable water to residential, commercial, institutional, industrial, and irrigation customers. Untreated water is provided to an industrial user and a few irrigation customers in the vicinity of the raw water pipeline system in the North Ventura Avenue area. Recycled water is provided for general irrigation of two golf courses, a City park, and landscape irrigation along the existing distribution alignment. The City's water use sectors are described below⁸.

- **Residential Sector**
The residential sector of the City is comprised of single and multi-family residential customers. The residential accounts serve apartment and condominium complexes as well as mobile home parks. The residential sector represents approximately 66 percent of the City's total water consumption. Within the residential sector, single family accounts make up approximately 61 percent of the total residential demand.
- **Commercial/Institutional Sector**
The City contains several different types of commercial/institutional customers including retail establishments, office buildings, laundries, schools, prisons, hospitals nursing homes, churches, and campgrounds. The City includes several tourist-driven businesses such as hotels, which benefit from the high volume of tourist traffic. Currently, there are approximately 2,700 commercial/institutional accounts. The commercial/institutional sector accounts for approximately 25 percent of the City's water consumption.
- **Industrial Sector**
The City contains a relatively small industrial sector including manufacturing. Currently, there are two industrial accounts. The industrial sector utilizes approximately less than one percent of the City's water demand.
- **Landscape Irrigation Sector**
This sector only includes water usage from dedicated irrigation meters. Water used for irrigation on properties without separate irrigation meters is included in other sectors. The City's landscape metered uses include assessment districts, contract parks, City parks, cemeteries, median strips, golf courses and other irrigation areas. The landscape irrigation sector accounts for approximately three and a half percent of the City's water consumption.

⁸ Account quantities and consumption percentages are derived from the 2020 Water Deliveries Report.

- **Other Uses**
The City has other miscellaneous usage, which include the following: fireline consumption, temporary construction meters, fire training. This usage is estimated to be one percent of the total water demand.
- **Recycled Water**
The City provides recycled water delivered from the City's Water Reclamation Facility for general irrigation at two golf courses, a City park, and landscape irrigation along the existing distribution alignment. This usage accounts for approximately four percent of total water demand⁹.
- **Water Loss**
Water loss is estimated based on a comparison of billing records (consumption) versus production records and does not include recycled water in this report. Based on City historical information it is estimated at approximately 5 to 10 percent of total produced water since 2005. The City of San Buenaventura reviewed apparent loss (loss due to meter inaccuracies) and real loss (due to leaks or theft) from 2015 to 2019 using AWWA's Water Audit Software. The software estimates water loss average of 7.61%. The 2019 Water Loss Audit Report is provided in Appendix E.

2.2 Historical Water Use

Currently the City has approximately 32,285 service connections serving 113,500 people¹⁰. All service connections are metered. Water consumption within the City has decreased in recent years. The annual per capita usage from 1940 to 1970 averaged about 277 gallons per capita per day (GPCD). In the period 1985 through 1989, the annual per capita use averaged about 196 GPCD. In the period 1994 through 2010, the per capita figure dropped to an average of 166 GPCD. This decrease in per capita consumption is the result of plumbing code changes such as low flow fixtures and low water consuming appliances in some existing and all new housing; and an active water conservation program adopted by the City in 1975 and further strengthened with regulations in 1990. As detailed in Section 2.4, the baseline GPCD for the 10-year period was 176 and the baseline GPCD for the 5-year period was 167. In 2015 the reported GPCD was 159. In 2020 the reported GPCD was 104.

⁹ Recycled water consumption percentage from the 2021 CWRR.

¹⁰ This population estimate is based on input from the 2021 Comprehensive Water Resources Report. Current (2020) population as estimated by the DWR Population Tool (described in section 2.3.20) 115,815. Calculations for compliance with gpcd targets uses the DWR Population Tool estimates.

**TABLE 2-1
DEMANDS - ACTUAL 2020**

Use Type	Level of Treatment	Volume (AF)
Single family	Drinking Water	5,489
Multi-family	Drinking Water	3,443
Commercial/Institutional	Drinking Water	3,219
Irrigation	Drinking Water, Untreated	380
Other	Drinking Water	160
Water Loss ¹	Drinking Water, Untreated	865
<i>Total Potable and Untreated Water Production</i> ²		13,556
Recycled Water	Recycled Water	564
Total Water Demand		14,120

Notes:

2020 demand from billing records = 12,746 AF (excludes recycled water)

2020 production from production report = 13,556 AF (excludes recycled water)

¹ 2020 production minus 2020 demand (excludes recycled water)

² From production source report (does not include recycled water)

2.3 Water Loss

Distribution system water losses is the physical potable water losses from the pressurized water distribution system. Ventura Water estimates its distribution system loss using the American Water Works Association Method, annually. As required, Ventura Water reports information on water losses annually to the State. Table 2-2 reports water loss estimates 2015 to 2019. The Water Loss Audit Reports submitted to the State for these years is provided in Appendix E.

**TABLE 2-2
ESTIMATED WATER LOSS 2015-2019**

Period Covered	Estimated Water Loss (AF) (volume of apparent and real water losses)	% of Water Produced
Calendar Year 2015	1,449	10.1
Calendar Year 2016	933	6.8
Calendar Year 2017	1,122	8.4
Calendar Year 2018	620	4.6
Calendar Year 2019	1,079	8.3

At the current time a water loss standard has not been adopted by the State of California. Future UWMPs prepared by Ventura Water will report on compliance with any State water loss standards.

2.4 Existing and Target Per Capita Water Use

As required by SB X7-7, the Water Conservation Bill of 2009, this section identifies the water use targets in 2015 and 2020 to demonstrate a 20% reduction in per capita water use by 2020. Included are calculations of the baseline gross water use expressed as per capita daily water use (gallons per capita per day, or GPCD), baseline and target population, and year 2020 urban

water use target. This section includes a description of how Ventura Water calculated its baseline and target per capita water demands, in accordance with Method No. 1 described in "Methodologies for Calculating Baseline and Compliance Urban Per Capita Water Use" (DWR Methodologies, 2011). Ventura Water has completed the SB X7-7 Verification Form, attached as Appendix F, and summarized in Tables 2-4 and 2-5 of this chapter.

2.4.1 Base Daily Per Capita Water Use for SBX7-7 Reduction

Two baseline periods are to be determined during the calculation of the base daily per capita water use. The first is a continuous 10- to 15-year period used to calculate baseline per capita use, and the second is a continuous 5-year period used to determine whether the 2020 per capita water use target meets the legislation's minimum water use reduction requirements of at least a 5% reduction per capita water use.

The legislation allows the first continuous baseline period to increase from a 10-year to a 15-year base period if the amount of recycled water delivered in 2008 was 10% or greater of total water demand. Ventura Water's recycled water use in 2008 did not meet 10% or greater total water demand; therefore, under the legislation, Ventura Water may not use anything greater than a 10-year base period.

Tables 2-3 and 2-4 summarize the Base Daily Water Use calculation for Ventura Water. As a part of the SB X7-7 requirements, both a 10-year base period and a 5-year base period were selected in the 2010 UWMP, and were not able to be altered after having been selected. Years 1995 to 2004 were selected for calculation of the 10-year base period while years 2003 to 2007 were selected for calculation of the 5-year base period.

**TABLE 2-3
BASELINE PERIOD RANGES**

Baseline	Parameter	Value	Units
10 to 15 year baseline period	2008 total water deliveries	19,234	AFY
	2008 total volume of delivered recycled water	625	AFY
	2008 recycled water as a percent of total deliveries	3.2 %	Percent
	Number of years in baseline period ¹	10	Years
	Year beginning baseline period range	1995	-
	Year ending baseline period range ²	2004	-
5 year baseline period	Number of years in baseline period	5	Years
	Year beginning baseline period range	2003	-
	Year ending baseline period range ³	2007	-

Notes:

Data is for Calendar Year

¹If the 2008 recycled water percent is less than 10 percent, then the first baseline period is a contiguous 10-year period. If the amount of recycled water delivered in 2007 is 10 percent or greater, the first baseline period is a contiguous 10 to 15 year period.

² The ending year must be between December 31, 2004 and December 31, 2010.

³ The ending year must be between December 31, 2007 and December 31, 2010.

As shown in the top portion of Table 2-4, the Ventura Water Baseline GPCD is estimated to be 176. As shown in the second portion of Table 2-4, the Ventura Water 5-year Baseline GPCD is 167.

**TABLE 2-4
GALLONS PER CAPITA PER DAY**

Year	Service Area Population ¹	Gross Water Use (AFY)	Gross Water Use (million gallons a day)	Daily Per Capita Water Use (GPCD)
10 to 15 Year Baseline GPCD				
1	1995	96,334	18,060	16.12
2	1996	97,634	19,489	17.40
3	1997	98,950	19,851	17.72
4	1998	100,285	18,568	16.58

Compliance Year GPCD				
2020	115,815	13,557	12.1	104

¹ From DWR Population Tool

2.4.2 2015 and 2020 Targets

The year 2020 target was established in the 2015 UWMP. To assist the reader, this section reviews how the 2020 Target was established.

The City chose to meet SBX7-7 targets as an individual agency rather than as part of a regional alliance. Ventura Water selected Method 3, achieving 95% of the applicable South Coast Hydrologic Region target. The South Coast Hydrologic Region target is 149 GPCD, 95% of this target is 142 GPCD.

The Maximum Allowable GPCD is 95 percent of the 5-year Baseline GPCD or 159. The Compliance Water Use Target, under Method 3 (142 GPCD) is less than the Maximum Allowable GPCD and therefore no adjustments to the Compliance Water Use Target were needed. This makes Ventura Water’s Compliance (2020) Water Use Target 142 GPCD. These calculations are summarized in Table 2-5.

**Table 2-5
2020 Target Compliance**

10-yr Base Daily Per Capita Water Use (GPCD)	2020 Target Calculated with Method 3 (95% of South Coast Hydrologic Region)	5-yr Base Daily Per Capita Water Use (GPCD)	Maximum Allowed GPCD Target (95% of 5-Year Base)	Confirmed 2020 Target (GPCD)
176	142	167	159	142

2.4.3 Achievement of Target

As shown in Table 2-6, the Ventura Water is in compliance with the 2020 Target, with an actual 2020 GPCD of 104. DWR has allowed for optional adjustments to the 2020 GPCD, including extraordinary events, economic adjustments, and weather normalization. Ventura Water made no such adjustments to the 2020 GPCD, as compliance was achieved without these factors.

**Table 2-6
SBX7-7 2020 Compliance**

Actual 2020 GPCD	Target GPCD	Total Adjustments	Adjusted 2020 GPCD	Did Supplier Achieve Targeted Reduction for 2020?
104	142	0	142	Yes

2.5 Projected Water Use

The earliest codes and standards for water fixtures and appliances came from the Federal Energy Policy Act of 1992 (taking effect in 1994). Besides Department of Energy (DOE) regulations, the codes and standards affecting water use in California are contained primarily in the CALGreen Building Code, the California Plumbing Code, California Water Code, and California Appliance Efficiency Standards.

The 2010 California Green Building Standards Code (CALGreen) set new standards for the flow rates of plumbing fixtures in new construction. The 2010 CalGreen Code went into effect on January 1, 2011 and its purpose was to reduce indoor water use in California buildings by 20%. The code also required that for buildings over 50,000 sq ft separate water meters be provided (e.g., required that multifamily dwellings have individual rather than master meters). The 2010 CalGreen Building code did have some provisions for outdoor water use including a

requirement for automatic irrigation systems utilizing weather and/or soil moisture-based irrigation controllers and a requirement that new landscapes of a given size conform to water budgets of either local ordinance or the State Model Water Efficient Landscape.

Updates to the CALGreen code in 2012 expanded the scope of CALGreen to include not just new construction but additions and alterations to buildings.

During the 2015-2016 drought, CALGreen was amended to require that new landscapes of a given size conform to water budgets of either local ordinance or the State Model Water Efficient Landscape, whichever is more stringent. In addition, the Code was amended to further reduce the allowable flow rate of faucets and urinals. Subsequently the CALGreen Code was revised to reduce the maximum flow rate of showerheads to align with Appliance Efficiency Regulations. This included a requirement that for all newly constructed residential developments, including hotels and motels, where disinfected tertiary recycled water was available from a municipal source, include provisions for potable water supply and a recycled water supply.

Starting January 1, 2017, California regulation required that upon sale, all single-family, multifamily, and commercial real property disclose all noncompliant plumbing fixtures. Effectively, as a condition of sale, all residential and commercial properties built prior to January 1, 1994, will need to replace all noncompliant plumbing fixtures with water conserving plumbing fixtures including toilets, shower heads, and faucets.

Unlike showerheads, faucets, and toilets, clothes washers are not covered by the California Plumbing Code, but rather regulated by the DOE. The current standards for residential clothes washers took effect in 2018. The standards, which were based on a consensus agreement between manufacturers and efficiency advocates, specify minimum energy and water efficiency levels. The metric for water efficiency is the integrated water factor (IWF), which is expressed in terms of gallons of water consumed per cubic foot of washer capacity. A lower IWF indicates better water efficiency. The standards specify an IWF of 6.5 for top-loading machines and 4.7 for front loading machines. Standard residential clothes washers have a capacity of approximately 4 cubic feet.

The table below summarizes appliance standards over time.

Fixture and Appliance Standards Over Time

	1975	1980	1992	2009	2011	2013	2016	2018
Shower (gpm)	3.5	2.5	2.5	2.5	2.0	2.0	2.0	1.8
Toilets (gpf)	5.0	3.6	1.6	1.6	1.28	1.28	1.28	1.28
Kitchen Faucet/ Lavatory Faucet (gpm)	2.5	2.5	2.5	2.2	1.8	1.8/1.5	1.8/1.2	1.8/1.2
Clothes Washers (gal/cycle/cubic ft)	15.0	15.0	15.0	9.5	9.5	9.5	9.5	6.5/4.7*

Data for 1975 to 2013 from Consol and California Homebuilding Foundation. 2014. Codes and Standards Research Report, California's Residential Indoor Water Use.

Data for 2016 and 2018 from Appliance-Standards.org.

*top loading machine/front-loading machine

The table above illustrates that there is limited water savings potential in new California homes; existing homes, particularly those built prior to 1980 represent a huge source of potential water savings. Conversely, the age of the housing stock is an indication of the affect that codes and

standards likely have on water demands. If the majority of the housing stock is older, the effect of the codes and standards is limited. If the growth rate of the service area is slow, the effect of codes and standards is also limited.

The City has approximately 42,000 housing units; 70% of which were built before 1980. Since 2014 it is estimated that certificates of occupancy have been issued for less than 1,600 housing units. This means new housing meeting the newest water efficiency standards makes up less than 4% of the residences. However, with rebate programs, natural replacement of old or malfunctioning appliances, retrofit upon resale, or remodels, some of the older housing is likely water efficient.

The water demands for this UWMP utilize water demand factors developed in April 2020, which were used in the 2021 CWRR. These water demand factors have been applied to the existing and anticipated land uses in the Ventura Water service area. The water demand factors looked at billing data for the City, for various uses, for the period 2013 through 2018, a water loss factor was applied to the raw factor, and a planning-level contingency factor was applied to account for variability due to weather and drought. The water demand factors capture changes in demand due to aggressive water conservation and codes and standards that have occurred over time. Because growth in the Ventura Water service area is minimal (approximately 0.54% a year) it is not necessary to apply a different water demand factor to new dwellings. Applying an optimistically “low” water demand factor on new development could skew demand trends when it is uncertain if (a) the development will truly occur and (b) the development will have a truly low water demand.

2.5.1 Normal Year

The normal/average year is a year in the historical sequence that most closely represents median runoff levels and patterns. Projected water demands in a normal year are shown in Table 2-7. Table 2-7 provides estimates of demands in each year from 2025 to 2045 assuming growth in the service area consistent with the City General Plan (see Section 1.6) and assuming water demand grows at a similar rate to population. Projections assume similar customer water use as occurred 2015 to 2019.

The water projections in Table 2-7 are based on the City’s annual CWRR. The 2021 CWRR includes demand estimates based only on approved projects that would be fully vested by year 2025 and estimates demands to year 2030 using a growth rate of 0.54 percent. In addition, drought years are included in the baseline demand used in the CWRR. After year 2030 this UWMP assumes growth in demand of 0.54 percent. The projections in Table 2-7 assume a “normal” water year. In a normal water year, it is assumed that Drought Water Rates are no longer in effect and that various drought shortage restrictions are lifted. Demand in dry years is considered in the section below.

**TABLE 2-7
PROJECTED WATER USE 2025 TO 2045 - NORMAL YEAR (AF)**

Use Type	2025	2030	2035	2040	2045
Potable and Untreated Water Demand					
Single family	5,761	5,919	6,080	6,246	6,416
Multi-family	3,614	3,712	3,814	3,918	4,025

Total Water Demand	14,804	15,193	15,591	16,001	16,422

Notes:

a Other category includes authorized consumption for miscellaneous uses that do not fit the definition of the above (i.e., oil industry use, temporary construction water, and fire training).

b Water Loss assumed to grow at the same rate as water overall demands

2.5.2 Dry Years

2.5.3 Weather Effects on Water Usage

Historically, when the weather is hot and dry, water usage increases. The amount of increase varies according to the number of consecutive years of hot, dry weather and the conservation activities imposed. During cool-wet years, historical water usage has decreased to reflect less water usage for external landscaping.

California faces the prospect of significant water management challenges due to a variety of issues including regulatory restrictions, climate change, and population growth. Climate change is of special concern because of the range of possibilities and their potential impacts on water supplies. The most likely scenarios involve accelerated sea level rise and increased temperatures, which will shift more runoff to winter months. The other much-discussed climate scenario or impact is an increase in precipitation variability, with more extreme drought and flood events posing additional challenges to water managers¹¹.

However, the probability that water use will increase during dry conditions is countered by conservation actions, including drought rates, that may be implemented by Ventura Water, as has been done in the recent drought events. Over the past decade the water use per person (in GPCD) in the City's service area has seen a consistent decline. Ventura Water has experienced

¹¹ Final California Water Plan Update 2009 Integrated Water Management: Bulletin 160.

great success in water conservation after implementing multiple customer outreach and customer rebate programs and applying drought rates, as were first implemented in 2014 following a request for a 10 percent voluntary conservation by customers and a subsequent 20% mandatory conservation by customers. In 2015, drought rates were implemented. More information on Ventura Water’s demand management programs can be found in Chapter 6 of this UWMP. Table 2-8 projects demands during dry years and it is assumed that demands will increase by 10% in dry periods (Table 2-7).

**TABLE 2-8
PROJECTED WATER USE 2025 TO 2045 - DRY YEAR (AF)**

Use Type	2025	2030	2035	2040	2045

a Other category includes authorized consumption for miscellaneous uses that do not fit the definition of the above (i.e., oil industry use, temporary construction water, and fire training).

b Water Loss assumed to grow at the same rate as water overall demands

2.6 Low Income Projected Water Demands

Senate Bill 1087 requires that water use projections of an UWMP include the projected water use for single-family and multi-family residential housing for lower income households as identified in the housing element of any city, county, or city and county in the service area of the supplier. The City of San Buenaventura last updated its Housing Element in September 2013 for the 2014-2021 5th cycle of Regional Housing Needs Assessment (RHNA). The City Housing Element projects that 44 percent of households to be low-income (extremely low/very low/low) (City of San Buenaventura 2013). Despite this, the Housing Element does not provide any information that can be used to develop trends to calculate the associated water demand specific to low -income households in the Ventura Water service area.

Table 2-9 makes an estimate of future low-income household water demands in the Ventura Water service area. Table 2-8 assumes a similar occurrence of low-income households in the water service area as in the City of San Buenaventura (i.e., 40 percent). These demands are included (and are not in addition to) the water demands described in Tables 2-7 and 2-8.

Ventura Water will not deny or condition approval of water services, or reduce the amount of services applied for by a proposed development that includes housing units affordable to lower income households unless one of the following occurs:

- The City specifically finds that it does not have sufficient water supply.
- The City is subject to a compliance order issued by the Division of Drinking Water Services that prohibits new water connections.
- The applicant has failed to agree to reasonable terms and conditions relating to the provision of services.
- The City finds it is not in compliance with the City’s current Water Shortage Event Contingency Plan.

**TABLE 2-9
PROJECTED WATER USE LOW INCOME HOUSEHOLDS (AF)**

Water Use ^a	2025	2030	2035	2040	2045
Estimated Low-Income Household Water Use - Normal Year	4,125	4,238	4,353	4,472	4,594
Estimated Low-Income Household Water Use - Dry Years	4,537	4,662	4,788	4,919	5,053

Note:

a Assumes 44 percent all future households in Ventura Water service area qualify as “low” income per the definition provided in Senate Bill 1087.

Pursuant to Government Code Section 65589.7 the City is to grant priority for the provision of water and sewer services to proposed developments that include housing units affordable to lower income households.

Section 3: Water Resources

3.1 Overview

This section describes the water resources available to the City for the 25-year period covered by the Plan. Both currently available and planned supplies are discussed.

There are presently six distinct water sources providing water to the City water system.

- Casitas Municipal Water District (Casitas)
- Ventura River Foster Park Area (Foster Park)
- Mound Groundwater Basin (Mound Basin)
- Oxnard Plain Groundwater Basin (Oxnard Plain Basin)
- Santa Paula Groundwater Basin (Santa Paula Basin)
- Reclaimed water and reuse from the Ventura Water Reclamation Facility.

In addition, the City has a 10,000 AFY contract amount from the California State Water Project, which is not utilized within the City service area because currently there are no facilities to deliver the water to the City, but it is a planned supply (see Section 3.7.1 below).

3.1.1 Management of Supplies

The City operates its water supply system by utilizing a conjunctive use operating procedure. The procedure involves utilizing surface water (such as the Ventura River) during wet years, to the fullest extent possible, while letting groundwater sources rest. During dry years when the surface water source is reduced, the groundwater sources are pumped to meet demands.

Conjunctive use of the City's existing groundwater sources is limited by the requirement to maintain long-term production from the groundwater basins within their safe or operational yield. Conjunctive use of groundwater requires treatment and blending ratios to meet water quality goals.

Conjunctive use of potential future supply sources may include potable reuse or California State Water Project (SWP) water.

In the future, the City will continue delivering recycled water as occurs now (~576 AFY). The remainder of available recycled water will be delivered to the planned potable reuse facility, VenturaWaterPure.

3.1.2 Consideration of Supplies in Different Hydrologic Conditions

A primary purpose of an UWMP is to identify and quantify water supplies in a normal, single-dry, and multiple-dry years as follows.

- Normal year supply represents the supplies Ventura Water considers available during normal, long-term average conditions.
- The single dry-year supply is the supply anticipated to be available should there be a repeat of past dry conditions. In this UWMP Ventura Water has considered the driest year (for which data is available), by supply source, to estimate the overall single-dry year supply.
- The multiple dry year drought supply considers a five-consecutive-year drought. In this UWMP Ventura Water has evaluated the driest 5-year sequence (for which data is available), by supply source, to estimate supplies in year 1 through year 5 of a drought.

The UWMP Act requires that a supplier compare supplies and demands for these different hydrologic conditions. The UWMP does not try to anticipate specific hydrologic conditions in any particular year, however, the Act does require that a supplier compare supplies and demands assuming a drought extending from year 2021 to 2025. This section of the UWMP goes into details about supplies available in different hydrologic year types, the reader is directed to Section 6 for the comparison of supplies and demands for different hydrologic year types.

3.2 Local Surface Water

3.2.1 Casitas Municipal Water District (Casitas)

Casitas operates and maintains the Ventura River Project, a part of which is the 238,000 AF capacity storage reservoir known as Lake Casitas. Casitas diverts and stores storm water runoff to Lake Casitas for subsequent filtration treatment and supply of potable water to agricultural and urban uses in western Ventura County. The Casitas service area includes the Ojai Valley, the western part of the City, Oak View, Upper Ojai Valley, and the coastal area between the City and Santa Barbara County.

In July 1995, the City signed an operating agreement with Casitas, establishing the City's minimum annual purchase at 6,000 AFY, which was subject to the allocation program described below during drought periods. In May 2017, the City Council and Casitas Board of Directors approved a new Water Services Agreement between the City and Casitas that establishes that Casitas shall supply the City with sufficient water to meet its in-district projected water demand (this agreement is provided as Appendix G). The present five-year (FY 09-10 to FY 13-14) average normal (non-drought) water supply from Casitas is estimated to be 5,062 AFY.

The demand from the proposed development projects that are anticipated to be utilizing water by Fiscal Year 2020 are added to the five-year average normal (non-drought) water supply from Casitas of 5,062 AFY. Projects completed since fiscal year 2014 and projects expected to be completed within calendar year 2020 are assumed to be utilizing water in Fiscal Year 2020. The supply from Casitas is estimated to be 5,425 AFY.

Over the last two years, Casitas has been working to develop its Comprehensive Water Resources Plan and update the yield model for Lake Casitas to incorporate more recent data related to storage capacity, diversion efficiency, hydrology, climate change, and other factors. On April 21, 2021, the Casitas Board of Directors directed staff to reduce the available supply yield for the Casitas System from 20,840 acre-feet per year (AFY) to

15,010 AFY for planning purposes. The Board also directed staff to use a planned demand of 15,525 AFY, which is based on average water production for the Casitas System over the last 10 years (Calendar Year 2011-2020). Based on these actions, Casitas plans to adjust the baseline allocations for its customers and update its Water Event Action Plan (WEAP) ahead of the 2022/2023 Fiscal Year. The City of Ventura will coordinate with Casitas-after its WEAP has been updated, to determine if revisions to the 2017 Water Services Agreement are warranted. If adjustments are made to the City's allocation, then this document will be amended at that time.

3.2.1.1 Reliability – Water Quality

Treated surface water from Lake Casitas has historically had levels of disinfection by-products that occasionally exceeded the respective maximum contaminant levels (MCLs) for total trihalomethanes (TTHMs) and haloacetic acids (HAAs). In cases when the levels of TTHMs and HAAs are exceeding or near exceeding the respective MCLs, the City will typically reduce the intake of Casitas water until the issue passes.

Casitas will be implementing potential treatment options to reduce the formation of disinfection by-products in their finished water. In the interim the City will be exploring options at its treatment facility to further reduce the level of disinfection by-products detected in the delivered water.

3.2.1.2 Reliability – Other

No infrastructure issues that may limit planned use of water from Lake Casitas have been identified.

3.2.1.3 Reliability – Water Year Type

The 2017 Water Services Agreement between the City and Casitas indicates that, in the event that Casitas must enact its Water Efficiency and Allocation Program (2015 WEAP) due to a water shortage, Casitas may adjust the City's allocation consistent with the percentage reduction for the WEAP stage.

Casitas has assigned five stages of water storage in Lake Casitas that serve as a guidance to triggering the implementation of water use reduction goals and measures.

Stage Conditions from Casitas Municipal Water District's "Water Efficiency and Allocation Program" dated May 9, 2018

Stage	Stage Title	Lake Casitas Storage (%)	Demand Reduction
1	Water Conservation	100% to 50%	0%
2	Water Shortage Warning	50% to 40%	20%
3	Water Shortage Imminent	40% to 30%	30%
4	Severe Water Shortage	30% to 25%	40%
5	Critical Water Shortage	25% to 0%	50%

As of February 2020, Casitas was in a Stage 3 water supply condition per Casitas Resolution No. 16-00. The lake level as of February 19, 2020 was 41.6 percent full. The Casitas Board of Directors made the decision to remain in a Stage 3 water supply condition in June of 2020.

The Water Services Agreement between Casitas and the City specifies that the City's Stage 1 Allocation shall be the average of the City's Projected Water Demand during the five (5) most recent years during which neither the City nor Casitas are implementing their water shortage contingency plans. The projected water demand from the past five non-drought fiscal years (FY 09-10 to FY 13-14) certification letters from the City to Casitas including demand associated with land use change is 5,425 AFY. A Stage 3 demand reduction of 30% would result in a supply of 3,798 AFY.

Although the Lake is currently slightly above 40% capacity, it is likely that Casitas will remain in a Stage 3 water supply condition. In order to be conservative, this report assumes a reduction of 30% to the City's Casitas supply for the 2021 Supply Drought Impact and a 40% reduction for 2022.

Consistent with the DWR Guidebook, this UWMP evaluates supplies and demands in different hydrologic year types based on past years. For the average year, supply available in 2013 was used; 2014 was selected for the single-dry year; and a repeat of the multi-dry period from 2014-2018 is used to approximate supplies for future long-term droughts. This information is used in coordination with the anticipated WEAP stage and anticipated water demand growth in the portion of the City within Casitas to estimate supply, as reflected in Table 3-1.

**TABLE 3-1
ESTIMATED SUPPLY FROM CASITAS MUNICIPAL WATER DISTRICT (AFY)**

	2025	2030	2035	2040	2045
Normal Year ¹	5,805	5,963	6,126	6,293	6,465
Single-Dry Year	5,805	5,963	6,126	6,293	6,465
Multi-Year Drought					
Year 1	5,805	5,963	6,126	6,293	6,465
Year 2	4,644	4,771	4,901	5,035	5,172
Year 3	4,064	4,174	4,288	4,405	4,526
Year 4	4,064	4,174	4,288	4,405	4,526
Year 5	4,064	4,174	4,288	4,405	4,526

¹ Given the current level of Lake Casitas, Normal supplies may not be available even if average rainfall occurs in a specific year.

3.2.2 Ventura River

Production from the Ventura River is a function of several factors including diversion capacity, local hydrology, environmental impacts, and the storage capacity of the Ventura River alluvium and upstream diversions. Currently all Ventura River water is collected using surface diversion, subsurface collectors, and shallow wells. A surface intake structure at Foster Park is unused due to the natural channeling of the active river system bypassing the structure.

3.2.2.1 Reliability – Water Quality

Surface water from the Ventura River contains natural organics, which results in the formation of disinfection by-products during the treatment and disinfection processes. Turbid water and high levels of organics, such as after heavy rainstorms, can result in treatment issues and high levels of disinfection by-products in the finished water. During these times, which typically occur during rainy months, water from the Ventura River may be significantly reduced until the water quality improves. The City will be implementing potential treatment options to reduce the formation of disinfection by-products in the finished water.

3.2.2.2 Reliability – Other

Production wells at Foster Park were destroyed during 2001 and 2005 storm events. These events have reduced the City's ability to extract water from Foster Park to a maximum capacity of 4,200 AFY. The 2020-2026 Capital Improvement Program includes the Foster Park Wellfield Production Restoration project. The project involves the replacement of the destroyed wells and construction of new facilities to restore historical production capabilities of 6,700 AFY during wet years. Therefore, the projected future water supply from the Ventura River / Foster Park is 4,200 AFY.

3.2.2.3 Reliability – Water Year Type

Due to continued drought conditions and heightened environmental requirements, the City's ability to draw water from the Ventura River continues to be significantly challenged and impacted. The City entered into a settlement with Santa Barbara Channelkeeper in 2019, which was amended in 2020, which requires the City to modify its pumping based on reduced flows in the Ventura River. The current agreement requires the City to turn off the Nye Wells 7 and 8 when the daily average flow rate in the River drops below 4 cubic feet per second (cfs) (for three consecutive days), and to cease operations at the intake facility when flows drop below 3 cfs (for three consecutive days) as measured at the City's stream gauge upstream of Foster Park (VR1). The intake may be shutdown sooner if flows in the River recede quickly.

To evaluate supply into the future, in different year types, historic supply from past years has been evaluated. For the normal year, supply available after 2005 was used; 2015 was selected for the single-dry year; and a repeat of the multi-dry period from 2015-2019 is used to approximate supplies in for future long-term droughts. These supplies have been modified as necessary to reflect assumptions about regulatory and environmental requirements into the future. See Table 3-2.

**TABLE 3-2
ESTIMATED SUPPLY FROM VENTURA RIVER (AFY)**

	2025	2030	2035	2040	2045
Normal Year	4,200	4,200	4,200	4,200	4,200
Single-Dry Year	1,298	1,298	1,298	1,298	1,298
Multi-Year Drought					
Year 1	1,298	1,298	1,298	1,298	1,298
Year 2	1,298	1,298	1,298	1,298	1,298
Year 3	1,298	1,298	1,298	1,298	1,298
Year 4	1,298	1,298	1,298	1,298	1,298
Year 5	1,298	1,298	1,298	1,298	1,298

3.3 Groundwater

The City obtains water from three groundwater basins, which have historically provided roughly an average of 8,750 AFY (from 2016 to 2020), or 65 percent of the City’s total supply. Table 3-3 shows the historical production from these basins. These groundwater basins are described below.

**TABLE 3-3
HISTORIC GROUNDWATER PRODUCTION (AFY)**

Basin Name	Metered or Unmetered	2016	2017	2018	2019	2020
Mound Basin	Metered	2,671	1,397	2,529	3,286	2,371
Oxnard Plain Basin	Metered	3,702	3,825	3,317	3,323	3,691
Santa Paula Basin	Metered	2,898	2,593	3,096	2,509	2,544
	<i>Total</i>	9,271	7,815	8,942	9,118	8,605
Groundwater as a % of Total Supply		67%	57%	66%	70%	63%

3.3.1 Mound Groundwater Basin

The Mound Groundwater Basin is identified in DWR Bulletin 118¹², 2003 Update as the Mound Subbasin of the Santa Clara River Valley Groundwater Basin (Basin No. 4-4.03). The basin

¹² Bulletin 118 describes the occurrence and nature of groundwater in California. The publication officially defines groundwater basin boundaries and provides information for each of the State’s hydrologic regions. For more information, please see: <https://water.ca.gov/Programs/Groundwater-Management/Bulletin-118>

underlies the northern part of the Ventura coastal plain and is bounded on the north by the Santa Ynez and Topa Topa Mountains, on the south by the Oak Ridge and Saticoy faults, the northeast by the Santa Paula Subbasin, and the west by the Pacific Ocean.

The Mound Basin is designated high-priority by DWR and the Mound Basin Groundwater Sustainability Agency (MBGSA) has been recognized by DWR as the GSA for the basin. The MBGSA was formed through a Joint Exercise of Powers Agreement (JPA) by and among the United Water Conservation District (UWCD), the City, and the County of Ventura. In addition to representatives from each of the 3 member agencies, the Board of Directors includes an agricultural stakeholder director and environmental stakeholder director. The Mound Basin GSA is required to develop a Groundwater Sustainability Plan that establishes the sustainable yield of the Mound Basin by January 2022.

The Mound Groundwater Basin has historically provided water for overlying beneficial uses and satisfies agricultural, municipal, and industrial demands. Historical use has been documented to temporarily exceed the yield of the basin and result in water levels that have fallen below sea level and created a threat of seawater intrusion. To abate this threat the City abandoned its historical coastal well facilities and located groundwater extraction near the center of the Mound Basin. A report (Fugro 1997) compiled as part of a 1996 study of the basin indicated that historical data supports a basin yield of at least 8,000 AFY during drought conditions as long as pumping is reduced during wet years to allow water levels to recover. The City's average annual extraction from 2000 to 2009 was approximately 4,000 AFY. The remainder of the available yield is utilized by other basin users.

3.3.1.1 Reliability – Water Quality

The Mound Groundwater Basin has elevated total dissolved solids (TDS) and sulfate. Ventura Water blends Mound Basin groundwater with other sources to reduce TDS. While City of San Buenaventura water meets all applicable primary standards, City water does have TDS concentrations that exceed secondary standards (standards set for aesthetic, taste, and odor rather than protection of public health). Water quality is not considered a limitation for using supplies from the Mound Groundwater Basin, but the City continues to look for ways to improve the quality, such as blending with future water supply sources.

3.3.1.2 Reliability – Other

Currently, two City wells withdraw water from the Mound Groundwater Basin: Victoria Well No. 2, which was installed in 1995, and Mound Well No. 1, which began production in April 2003. Pumping from Victoria Well No. 1, which was installed in 1982, was discontinued due to maintenance and water quality issues. The City recently reached an agreement with the County on deeding to the County its interest in Victoria Well No. 1 and leasing land for drilling of Mound Well No. 2. Construction of Mound Well No. 3 is currently in progress and is scheduled to be in production in 2021. Design of Mound Well No. 2 is also in progress and scheduled to be in production in 2022. Mound Well No. 2 will serve as a replacement well for Victoria Well No. 1; Mound Well No. 3 will serve as a backup well.

Due to operational constraints, recent production from the Mound Basin has been lower than the historical 10-year average. Victoria Well No. 2 was not operational in 2020, so the only well producing water from Mound Basin in 2020 was Mound Well No.1. The City's current water supply from the Mound Basin is the current average production rate of Mound Well No. 1 or

2,400 AFY. In the near future, once Mound Wells No. 2 and 3 are operational, production from the Mound Basin will increase.

3.3.1.3 Reliability – Water Year Type

The City finalized a study in March to review the perennial yield of the Mound Basin and determine if the annual average yield of the basin is still believed to be accurate. The Report concludes that the perennial yield of the Mound Basin is between 6,600 and 7,400 AFY. While this is consistent with the long-term average production, it is lower than the average production from 2000-2009 (which is used to determine the City's capacity of 4,000 AFY). The Mound Basin GSA will utilize this analysis in conjunction with other information to determine the Sustainable Yield of the Mound Basin as defined by SGMA. This analysis will not be complete until the Groundwater Sustainability Plan is submitted in 2022.

The groundwater basin is managed over the long-term and variations in year-to-year supply are not anticipated at this time. For this reason, the City's anticipated basin yield, in all hydrologic years, is based on "Fugro West, Inc. June 1997. Mound Groundwater Basin Annual Report" and set at 4,000 AFY.

3.3.2 Oxnard Plain Groundwater Basin

The Oxnard Plain Groundwater Basin is identified in DWR Bulletin 118, 2003 Update as the Oxnard Subbasin of the Santa Clara River Valley Basin (Basin No. 4-4.02), located in southern Ventura County. The basin is bounded on the north by the Oak Ridge fault, the south by the Santa Monica Mountains, the east by the Pleasant Valley and Las Posas Valley Basins, and the west by the Pacific Ocean.

Wells near the Buenaventura Golf Course pump from the Fox Canyon Aquifer of the Oxnard Plain Groundwater Basin. Currently, three wells, Golf Course Wells No. 5, 6, and 7 produce potable water for the City's system. Average annual yield from the City's Golf Course wells over the past 5 years has been about 3,500 AFY.

There are limited carryover provisions provided by the FCGMA in the Oxnard Plain Basin that do allow the City to pump less water in wet years and more water in dry years, but all water must be pumped within five years

3.3.2.1 Reliability – Water Quality

The Oxnard Plain Groundwater Basin has elevated TDS. Ventura Water blends Oxnard Plain Basin groundwater with other sources to reduce TDS. While City of San Buenaventura water meets all applicable primary standards, City water does have TDS concentrations that exceed secondary standards (standards set for aesthetic, taste, and odor rather than protection of public health). Water quality is not considered a limitation for using supplies from the Oxnard Plain Groundwater Basin, but the City continues to look for ways to improve the quality, such as blending with future water supply sources.

3.3.2.2 Reliability – Other

No infrastructure issues that may limit planned use of water from the Oxnard Plain Groundwater Basin have been identified.

3.3.2.3 Reliability – Water Year Type

The Oxnard Plain Groundwater Basin is managed by the Fox Canyon Groundwater Management Agency (FCGMA), which was created by state legislation in an effort to reduce overdraft and stop seawater intrusion. The FCGMA is the Groundwater Sustainability Agency (GSA) for the Oxnard Plain. The Groundwater Sustainability Plan for the Oxnard Subbasin, provided in Appendix H, was completed in December 2019.

At the October 23, 2019 meeting of the FCGMA Board of Directors, there was a unanimous vote to adopt the ordinance for a new pumping allocation system for the Oxnard and Pleasant Valley basins, effective October 1, 2020. The new well-based allocation will be the average pumping for the base period of 2005-2014. On December 12, 2019, the FCGMA Board voted to repeal portions of some past drought ordinances and this set the City's pumping allocation in the Oxnard Plain Basin to 4,827 AFY effective January 1, 2020.

Neither the allocation ordinance nor the GSP establish the pumping reductions that will take place to meet the sustainable yield for the Oxnard Plain Basin. However, the GSP suggests a linear ramp down from current pumping to the estimated sustainable yield by 2040. Based on these estimates, the City can expect (without additional projects being implemented) its allocation to decrease by 44% by 2040. Therefore, the projected future supply for the Oxnard Plain Basin are projected to decline from 5,304 AFY to 2,970 AFY.

3.3.3 Santa Paula Groundwater Basin

The Santa Paula Groundwater Basin is identified in DWR Bulletin 118, 2003 Update as the Santa Paula Subbasin (Basin No.4-4.04). The basin is bounded on the north by the Topa Topa Mountains, the south by the Oak Ridge and South Mountain, the Oak Ridge fault, and the Saticoy fault, the east by a bedrock constriction, and the west by the Oxnard Plain and Mound subbasins. Water from the Santa Paula Basin is extracted through Saticoy Wells No. 2 and No. 3, with a peak pumping capacity of 3,000 GPM.

The management of the Santa Paula Basin was established under a court stipulated judgment entered in 1996 and amended and restated in 2010 (provided in Appendix I). United, the Santa Paula Basin Pumpers Association and the City are all parties to the Judgement. In summary, the Judgment adjudicates groundwater rights, regulates individual and collective pumping, provides for basin management through a Technical Advisory Committee (TAC), and reserves jurisdiction in the Superior Court to resolve future disputes and provide for supplementary orders as necessary. Because the Santa Paula Basin is already managed per a stipulated judgment, it is exempt from most provisions of SGMA.

The Santa Paula Basin Judgment allows the City to utilize 3,000 AFY. The City is not limited to this allocation in any single year but may produce seven times its average annual allocation (21,000 AF) over any running seven-year period. In addition, the City has acquired water rights in the amount of 126 AFY, bringing its current total allocation to 3,126 AFY.

3.3.3.1 Reliability – Water Quality

The Santa Paula Groundwater Basin has elevated TDS and requires treatment for iron and manganese. Water quality is not considered a limitation for using supplies from the Santa Paula

Basin, but the City continues to look for ways to improve the quality, such as blending in the future with SWP water.

3.3.3.2 Reliability – Other

The City currently relies on Saticoy Well No. 3 for production and utilizes Saticoy Well No. 2 as an occasional back-up supply due to decline in production. The estimated annual production capacity for Well No. 3 is 2,450 AFY. The City is planning to construct replacement well Saticoy Well No. 4, which is anticipated to be producing water in 2025.

3.3.3.3 Reliability – Water Year Type

If the monitoring performed by the TAC determines that groundwater safe yield is being exceeded, then the City may have its pumping allocation reduced. Upon and motion and hearing as prescribed in the Judgment, if the Court finds that the safe yield of the Basin is less than the total pumping allocations, the Judgment describes six “Overdraft” stages and requires reduced production at each stage.

- Stage 1: Affects the pumping allocation of the Santa Paula Basin Pumpers Association and not the City.
- Stage 2: City of San Buenaventura pumping limited to 1,141 AFY.
- Stage 3: City of San Buenaventura pumping limited to 641 AFY.
- Stage 4: City of San Buenaventura pumping limited to 481 AFY.
- Stage 5: City of San Buenaventura allocation is reduced to zero.
- Stage 6: Affects the pumping allocation of the Santa Paula Basin Pumpers Association.

If the above Stages were to go into effect, the City’s allocation from acquired water rights would be reduced proportionally by the same percentage reduction then required by the members of the Santa Paula Basin Pumpers Association. There is also an exception in the Judgment for emergency conditions for the City to reasonably supply public needs.

Based on recent work completed by the technical working group regarding conditions in the Basin, it is projected that no Stage reductions will be implemented even if the drought remains in effect through 2021. It is also projected that under normal conditions, that the allocation will remain at 3,000 AFY with the addition of water rights equaling 126 AF.

The groundwater basin is managed over-long term and variations in year to year supply are not anticipated. For this reason, anticipated basin yield, in all hydrologic years, is based on the original City allocation plus 126 AFY for City acquired water rights.

3.4 Groundwater Supplies Normal, Single-Dry and Multiple Dry Year

Table 3-4 depicts the anticipated groundwater supplies during Normal, Single-Dry, and Multiple Dry Years, by groundwater source.

**TABLE 3-4
PROJECTED GROUNDWATER SUPPLIES FOR DIFFERENT YEAR TYPES (AFY)**

	2025	2030	2035	2040	2045
Normal Year					
Mound Basin	4,000	4,000	4,000	4,000	4,000
Oxnard Plain Basin	4,813	4,199	3,584	2,970	2,970
Santa Paula Basin	3,126	3,126	3,126	3,126	3,126
<i>Total Normal Year</i>	<i>11,939</i>	<i>11,325</i>	<i>10,710</i>	<i>10,096</i>	<i>10,096</i>
Single-Dry Year					
Mound Basin	4,000	4,000	4,000	4,000	4,000
Oxnard Plain Basin	4,813	4,199	3,584	2,970	2,970
Santa Paula Basin	3,126	3,126	3,126	3,126	3,126
<i>Total Single-Dry Year</i>	<i>11,939</i>	<i>11,325</i>	<i>10,710</i>	<i>10,096</i>	<i>10,096</i>
Multiple-Dry Years					
Mound Basin	4,000	4,000	4,000	4,000	4,000
Oxnard Plain Basin	4,813	4,199	3,584	2,970	2,970
Santa Paula Basin	3,126	3,126	3,126	3,126	3,126
<i>Total Multiple-Dry Year</i>	<i>11,939</i>	<i>11,325</i>	<i>10,710</i>	<i>10,096</i>	<i>10,096</i>

Note:

In multiple dry years additional groundwater may be utilized to meet demands when surface water supplies are reduced (conjunctive use).

3.5 Recycled Water and Reuse

Recycled water is a current and future source for Ventura Water. Recycled water is detailed in Chapter 4.

3.6 Transfers, Exchanges and Groundwater Banking Programs

Water supplies may be purchased from other water agencies and sources, and the City may explore these opportunities in the future.

As described in Section 3.7.1, the City of San Buenaventura has participated in the SWP turnback pool and exchanged SWP with other State Water Contractors (San Geronio Pass Water Agency). Participation in the turnback pool could be considered a transfer.

City does not participate in any official groundwater banking programs. The City has limited ability to bank groundwater. The limited carryover provisions provided by the FCGMA in the Oxnard Plain Basin does allow the City to pump less water in wet years and more water in dry years, but all water must be pumped within five years. In the Santa Paula Basin, the allocation is based on a seven-year running average, so the City can also pump more in dry years and less in wet years as long as the 7-year total is not exceeded in any given 7-year period.

3.7 Planned Water Supply Projects and Programs

Continued new and infill development that is already entitled, along with anticipated future entitlements, will continue to increase overall demand for water in the service area, despite developer contributions to future water supplies through dedication of water rights, implementing extraordinary conservation measures, and/or payment of Water Resource Net Zero fees. Consequently, combined with legal and regulatory requirements on both groundwater and surface water supplies and impacts of climate change, the City has recognized that consumption is nearing available supply and new supply projects need to be implemented. Consistent with Article X, Section 2 of the California Constitution, in order to mitigate the water resource impacts of new or intensified development, it is necessary and desirable for new or intensified development to provide supplemental water resources to the City water system in an amount proportional to the new demand, implement extraordinary conservation measures to offset demand, and/or to pay a water resource fee based upon the cost of obtaining water supplies to meet the demand of new or intensified development. Upon direction from City Council, Ventura Water prepared and evaluated a Water Rights Dedication and Water Resources Net Zero Policy (Net Zero Policy). The Net Zero Policy was developed after months of review and input from the Ventura Water Commission. The City Council adopted the Net Zero Policy in Ordinance 2016-004 and Resolution 2016-027. Revenues from the Net Zero Policy will provide funding for new water supply projects, such as the VenturaWaterPure Program.

Revenues from rates, grants, and loans will finance the following planned supply projects:

- SWP Water
- VenturaWaterPure

Ventura Water has conceptually studied ocean desalination. However, in the Ventura Water Supply Projects Environmental Impact Report (EIR), it was only evaluated at the programmatic level and not the project level of detail. Further evaluation would be required if ocean desalination were pursued as a future supply source.

3.7.1 SWP Water

The City does not physically take SWP Water because it lacks the facilities to do so. However, since at least 1999 has sold, transferred, or exchanged the water to other SWP Contractors. The City has a 10,000 acre-foot per year entitlement from the SWP. The base contractual agreements concerning the City's annual entitlement to 10,000 acre-feet of SWP are: (1) the 1963 State Water Supply Contract of 20,000 acre-feet entitlement of SWP water between the Department of Water Resources (DWR) and Ventura County Watershed Protection District (VCWPD) known formerly as Ventura County Flood Control District (VCFCD); (2) the 1970 agreement between VCFCD and Casitas known formerly as the Ventura Municipal Water District that assigned the 20,000 acre-feet entitlement to Casitas; and (3) the 1971 agreements between Casitas and the City providing the City with an annual entitlement of 10,000 acre-feet and Casitas and United with an annual entitlement of 5,000 acre-feet each.

In the contract with Casitas, the City retains full authority and responsibility for determining the point and method of delivery of the allocation. To date, the City has not constructed the improvements necessary to receive direct delivery of its allocation.

The City pays annual SWP Table A water fees to DWR, which cover construction costs for SWP facilities and administration to deliver allotments of water throughout the state. In addition, the citizens of Ventura participated in an advisory vote on November 3, 1992 and selected desalinating seawater over importing water through the SWP, as the preferred supplemental water supply option. However, based on the City Attorney Office's review of the City's SWP Table A water, the City cannot unilaterally end its involvement in the SWP's financial obligations and SWP Table A water without great risk.

The Monterey Amendment to the State Water Contract in 1999 provided the City a formal mechanism to allow the City to place their SWP water into a "turn back" pool to be purchased by other SWP contractors. The City has taken part in the SWP "turn back" pool over the past several years which has provided a small annual revenue offset. Since 2018, the City has participated in exchanges with San Geronio Pass Water Agency which allows the City to receive revenue to offset current SWP fixed costs and receive additional SWP in the future. The City has also worked recently with United who requested to receive the City's allocation at the "turn back" pool rate which provided water benefits to the County area as a whole.

On January 23, 2017, City Council authorized an alignment study to determine how the interconnection project could be designed and operated to supply water to serve the regional needs of the City, Calleguas, Casitas Municipal Water District, and United Water Conservation District (United). The final alignment study was completed in 2018, and the environmental review process pursuant to CEQA was commenced.

On August 5, 2019, the City of San Buenaventura City Council voted to certify the State Water Interconnection Project Final Environmental Impact Report. As stated in the Final EIR, the project will enable delivery of SWP water by wheeling through Metropolitan Water District of Southern California and Calleguas to the City. The connection will also facilitate direct delivery of SWP water to United and direct or in-lieu delivery of SWP water to Casitas. In addition, the interconnection would allow the City to deliver water to Calleguas during an outage of its imported water supplies and for Calleguas to deliver water to the City during an outage of the City's water supplies. In both outage scenarios, water delivered would be returned by the receiving party to the providing party following the outage. The interconnection will be a pipeline used to transport water between Calleguas' and the City's distribution systems. The pipeline will be approximately 7 miles in length originating in the eastern portion of the City, traversing southerly and easterly through unincorporated Ventura County, to the southwestern end of the City of Camarillo. Final design on the Interconnection began in mid-2020 and construction is anticipated to start the end of 2022.

Benefits to the City include making up for losses in annual yield from existing supply sources (Lake Casitas, Ventura River, and groundwater), improving water quality, and providing a backup supply for the City's other potential, long-term water supply options. Operational details will be developed through the project design and planning process and negotiations with project partners. These details will be reflected in future CWRRs and UWMPs when available.

While the City's water supply contract for SWP water provides the City with a maximum annual allocation of 10,000 AF, the actual allocation of available water is set DWR annually. DWR allocations are finalized in the Spring of each year and consider the following:

- hydrologic conditions

- existing storage in reservoirs
- operational and regulatory constraints
- contractor demands

To improve system water quality, Ventura Water anticipates using approximately 1,300 AF of SWP in any year it is available, but this amount may increase to compensate for deficiencies in other supply sources or decrease based on the amount of SWP that might be available.

While the City of San Buenaventura’s SWP entitlement (Table A Entitlement) is 10,000 AFY this amount is not the long-term average supply expected. According to Department of Water Resources, Technical Addendum to the State Water Project Final Delivery Capability Report 2019 (August 26, 2020) Table B-32. Ventura County Watershed Protection District Future Conditions:

- The Long-Term Average delivery of SWP to the City of San Buenaventura will be 54% of the Table A Entitlement (5,400 AFY). So, 5,400 AFY is the assumed SWP Normal Year Supply. The City estimates it will need 1,300 AFY to blend with groundwater to improve water quality. Additional water may be used to rest groundwater sources in wet years or if other sources are unavailable.
- The State Water Project Final Delivery Capability Report is based on hydrology from 1922 to 2003 (e.g., the current modeling does not consider years past 2003, including 2015). The single-dry year delivery was in year 1977 and (had the City of San Buenaventura had a means to take the water) delivery would have been 9% of Table A or 900 AFY – this is the Single-Dry Year Supply, according to the 2020 SWP Delivery Capability Report.
- The driest 5-year period would be if years 1930-1934 were replicated.
 - In 1930 about 20% of allocation was available, or about 2,000 AF
 - In 1931 about 33% of allocation was available, or about 3,300 AF
 - In 1932 about 13% of allocation was available, or about 1,300 AF
 - In 1933 about 38% of allocation was available, about 3,800 AF
 - In 1934 about 11% of allocation was available, about 1,100 AF

These amounts may be supplemented based on an agreement with San Geronio Pass Water Agency (SGPWA). In 2018 and 2019, the City executed agreements with SGPWA to exchange its State Water Project Allocation. As a result of these agreements, SGPWA is obligated to return 2,075 AF of water to City by 2030 (Ventura Water 2021).

3.7.1.1 Delta Reliance

In the future, a small portion of the water received by Ventura Water may come from the Sacramento-San Joaquin Delta (Delta). The 2020 UWMP Guidebook describes how urban water suppliers that anticipate participating in or receiving water from a “covered action” related to the Delta should provide information in their 2020 UWMPs to demonstrate consistency with *Delta Plan Policy WR P1, Reduce Reliance on the Delta Through Improved Regional Water*

Self-Reliance (Reduced Reliance Policy). DWR has suggested that any entity receiving imported water from the SWP should anticipate being part of a “covered action”.

DWR suggests suppliers do the following to demonstrate consistency with WR-P1:

- *Establish a base period for evaluation of Delta water.* Ventura Water has not taken Delta water directly in the past. Rather Ventura Water has paid for participation in the SWP and in some years participated in the “turnback pool” to recoup some costs or sold/exchanged/transferred to others.
- *Provide data on State Water Project Water received in the past.* No SWP water has been received directly in the past.
- *Provide information on supplier contribution to regional self-reliance (local supplies brought online 2010-2045 in 5-year increments).* Ventura Water has been locally self-reliant for its entire history. To improve local supplies, starting in 2010 Ventura Water developed a recycled water system capable of delivering 700 AFY. Starting in 2025 Ventura Water anticipates producing and utilizing 2,800 AFY advanced treated water (VenturaWaterPure, see section 3.7.2). This has been accompanied with aggressive measures to reduce demand, including public outreach and drought rates. There has been a consistent decline in gallons per capita per day, demonstrating the success of water use efficiency for improving local self-reliance.
- *Project SWP water that will be received by Ventura Water through 2045.* Ventura Water anticipates taking an average of 1,300 AFY SWP starting in year 2025.

Data related to Delta reliance is provided in Appendix J.

3.7.2 VenturaWaterPure

The City of San Buenaventura is currently in the planning phases for the proposed VenturaWaterPure Program which includes additional diversion of tertiary treated effluent discharge from the Santa Clara River Estuary to a new proposed Advanced Water Purification Facility (AWPF) for potable reuse. Potable reuse is the proven use of recycled water to supplement drinking water supplies. After years of special studies, environmental assessment, demonstration facility testing, and stakeholder meetings, the City determined the best way to enhance environmental protection while improving local water quality and supply reliability is to divert highly treated wastewater discharges for potable reuse. The final product of this state-of-the-art AWPF would be a new, locally owned source of highly purified drinking water that provides the City of San Buenaventura with a long-term drought resilient water supply solution. On October 14, 2019, the City of San Buenaventura City Council unanimously voted to certify the EIR for the Ventura Water Supply Projects, which included a project level environmental review of the VenturaWaterPure Program. The City is currently working on the next steps on this Program including land acquisition, permitting, final design, and bidding for construction.

Based on the completion of the Special Studies and additional assessments detailed in the Final EIR, the future water supply provided by the VenturaWaterPure Program is projected to be at least 2,800 AFY in Phase 1a and 4,000 AFY in Phase 1b.

3.7.3 Ocean Desalination

In 2013, City staff was engaged in discussions with local water agencies in regard to potential regional desalination projects. In the City's 2015 UWMP, seawater desalination was included as a potential future part of the City's long term water supply portfolio and as an additional emergency water supply during times of drought. The desalination facility would be designed with a delivery capacity of up to 2.7 million gallons per day or 3,000 AFY.

According to the Ventura Water Supply Projects EIR certified on October 14, 2019, if sufficient water supply is not available from the VenturaWaterPure Program, then the City may need to develop desalination facilities to meet future water supply needs. Phase 2 of the proposed projects would augment water supplies to meet future water needs, including the accommodation of planned growth, either through increasing the amount of recycled water produced, or construction of an ocean desalination facility. This would be accomplished through either the expansion of the AWP as a first option pending regulatory approvals, or, if this option is not approved or does not meet the City's water supply needs, through construction of an ocean desalination facility. Since ocean desalination was only evaluated at a program level in the Ventura Water Supply Projects EIR and environmental impacts were not evaluated in detail, ocean desalination is not quantified as a potential additional future supply source.

3.8 Anticipated Water Supply Sources in Normal, Single Dry, and Multiple Dry Years

Table 3-5 shows Ventura Water supplies in 2020. Tables 3-6, 3-7, and 3-8 provide details on supplies anticipated to be available to Ventura Water in average/normal, single-dry, and multiple dry years given existing and planned supplies.

**TABLE 3-5
WATER PRODUCTION CALENDAR YEAR 2020 (AF)**

Water Supply Source	Volume (AF)	Type
Casitas Municipal Water District ^a	2,533	Drinking Water
Ventura River ^b	2,417	Drinking Water
Groundwater ^c	8,606	Drinking Water
Recycled Water ^d	564	Recycled Water
Total Supplies	14,120	

Notes:

- a City records
- b See Section 3.2.2.
- c See Section 3.3
- d See Section 4.1.1

**TABLE 3-6
WATER SUPPLY ESTIMATES - AVERAGE/NORMAL YEAR (AF)**

Water Supply Source	2025	2030	2035	2040	2045
Casitas Municipal Water District ^a	5,805	5,963	6,126	6,293	6,465
Ventura River ^b	4,200	4,200	4,200	4,200	4,200
Groundwater ^c	11,939	11,325	10,710	10,096	10,096
Recycled Water ^d	576	576	576	576	576
SWP Water ^e	1,300	1,300	1,300	1,300	1,300

c See Table 3-4	g Maximum supplies do not account for reduction to meet water quality objectives.				
d See Section 4.1					

3.9 Energy Intensity of the City of San Buenaventura's Water System

Water energy intensity is the amount of energy, calculated on a whole-system basis, required for use of water in a specific location, such as the Ventura Water service area. DWR provides guidance for calculating the operational energy intensity of water, defined as the total amount of energy expended by the urban water supplier on a per AF basis to take water from the location where the urban water supplier acquires the water to its point of delivery. DWR requires that urban water suppliers only report the energy intensity associated with water management processes occurring within their operational control and not include energy embedded in water supplies purchased from a wholesale water agency. Table 3-9 below provides an estimate, using the total utility approach, of the water energy intensity of Ventura Water's potable water system. DWR's Energy Intensity spreadsheet is provided in Appendix K.

**Table 3-9
Energy Intensity Ventura Water Potable Water Supply -Total Utility Approach**

	Sum of All Water Management Processes	Non-Consequential Hydropower	
Start Date for Reporting	10/1/2017		
End Date for Reporting	9/30/2018	<i>Total Utility</i>	<i>Hydropower</i>
Volume of Water Entering Process (AF)	13850.54	0	<i>Net Utility</i>
Energy Consumed (kWh)	10,042,668	0	10,042,668
Energy Intensity (kWh/MG)	2225.2	0	2225.2

Section 4: Recycled Water and Reuse

This section of the Plan describes the existing and future recycled water opportunities available to the City service area. The description includes estimates of potential supply and demand for 2020 to 2045 in five-year increments, as well as the City's incentives and optimization plan.

4.1 Recycled Water Planning

The City has access to recycled water supply through the Ventura Water Reclamation Facility (VWRF). The City has sole ownership in the wastewater treatment and water recycling facilities in its service area. Currently, the VWRF discharges most of its tertiary treated effluent to the Santa Clara River Estuary with approximately 576 AFY diverted as recycled water for landscape irrigation.

The City has been planning a potable reuse facility to increase their recycled water supply. The City began planning for the VenturaWaterPure facility in 2015 and has since nearly completed the planning phase. As such, the City is not planning to expand their recycled water system beyond this but will continue to deliver the recycled water that they have historically delivered from the VWRF.

4.1.1 Wastewater Collection and Treatment

The VWRF is permitted at 14 million gallons per day (MGD) and discharges up to 9 MGD. The VWRF currently discharges an average of 6.6 MGD. The VWRF provides wastewater collection and treatment service for approximately 98 percent of City residences as well as McGrath State Beach Park and the North Coast Communities (County Service Area No 29). In February 2016, the City took over sewer service for the formerly unincorporated Montalvo community served by Montalvo Community Services District. The VWRF produces recycled water that is treated to tertiary Title 22 standards through tertiary filtration and disinfection. Currently, approximately 6 percent of the treated effluent is reused as recycled water; the rest is discharged to the SCRE.

The City's wastewater collection system consists of approximately 290 miles of sewer pipelines ranging in size from 4 to 42 inches, 11 wastewater lift stations, and the VWRF, a tertiary treatment plant. In addition, the City has recently taken over the 7.5 miles of sewer mains formerly owned by the Montalvo Community Services District. The collection system conveys flows generally from east to west and north to south, culminating at the VWRF for treatment.

The City first provided a municipal sewer system more than a century ago. In 1888, this system extended from Crimea Street west to the Ventura River and from the Pacific Ocean north to Ramona Street. The City later built and operated a primary treatment facility that included an ocean outfall at the foot of Figueroa Street between 1929 and 1959. At that time the outfall was abandoned, and the treatment plant replaced with a pump station, which delivered all wastewater flow from the western portion of Ventura through a 3-mile force main to the VWRF. The VWRF, at 1400 Spinnaker Drive, was constructed in 1958 as a 4 MGD secondary treatment facility utilizing trickling filters. The facility is located on the north bank of, and discharges treated effluent to the SCRE. The facility has provided reclaimed water since the

1970's to the City owned Olivas Park Municipal Golf Course approximately one-quarter mile east of the treatment plant. In 1972 the facility was expanded with the addition of a 10 MGD Activated Sludge treatment process. At that time tertiary filters were also constructed to provide filtered effluent for both reclamation and discharge to the SCRE. Subsequent facility construction projects have added solids treatment, nutrient removal, improved chloramine contact and expanded reclamation pumping and distribution facilities.

Table 4-1 documents wastewater collection in 2020; Table 4-2 documents wastewater treatment and discharge in 2020.

**TABLE 4-1
WASTEWATER COLLECTED WITHIN SERVICE AREA 2020 (AF)**

Name of Wastewater Collection Agency	Wastewater Volume Metered or Estimated?	Volume of Wastewater Collected in 2020	Name of Agency Receiving Collected Wastewater	Treatment Plant Name	Is WWTP Located Within UWMP Area?	Is WWTP Operation Contracted to a Third Party?
City of San Buenaventura	Metered	8,108	City of San Buenaventura	Ventura Water Reclamation Facility	Yes	No

Note: Currently, approximately 6% of the treated effluent is reused as recycled water, the remaining is discharged to the Santa Clara River Estuary.

**TABLE 4-2
WASTEWATER TREATED AND DISCHARGED WITHIN SERVICE AREA 2020**

Wastewater Treatment Plant Name	Discharge Location/ Method of Disposal	Does the Plant Treat Wastewater Generated Outside the Service Area?	Treatment Level
Ventura Water Reclamation Facility	Discharge to Santa Clara River Estuary	No	Tertiary

Wastewater Treated (AF)	Discharged Treated Wastewater (AF)	Recycled Within Service Area (AF)	Recycled Outside of Service Area (AF)
8,108	7,544	564	0

Current Recycled Water Uses

Recycled water from the VWRP is used for general irrigation of two public golf courses, a City park and nearby landscape areas. After the VenturaWaterPure facility is constructed and

operational, the City still plans to provide recycled water from the VWRP for the same irrigation purposes. Existing recycled water uses include:

- Golf courses - Olivas Links Golf Course and Buenaventura Golf Course irrigation
- Parks - Marina Park irrigation
- Others - Landscape irrigation near Olivas Drive and in the Harbor area.

The two golf course customers, Olivas Links Golf Course and the Buenaventura Golf Course, account for approximately 90 percent of the total recycled water. In addition, discharge to the Estuary is also considered a beneficial use of the recycled water. Table 4-3 provides a summary of existing actual recycled water uses compared to the projected values in the 2015 UWMP.

In 2016, in response to the drought, the City increased its efforts to replace potable demand with recycled water demand. The City implemented a program, referred to as the mobile reuse program, whereby commercial and industrial entities and City residents can use a recycled water filling station at the VWRP. The filling station is used by multiple entities such as AERA Energy, the Ventura County Transportation Department, the City of San Buenaventura City Parks Department, and the San Buenaventura State Park, in addition to City residents, for the self-hauling of recycled water for irrigation and dust control. The mobile reuse program was in operation through part of 2020, however, was paused due to the COVID-19 pandemic.

**TABLE 4-3
2015 UWMP RECYCLED WATER USE PROJECTION
COMPARED TO 2020 ACTUAL (AF)**

Beneficial Use Type	2015 Projection for 2020 (AF)	Actual 2020 Use (AF)
Agriculture	0	0

Recreational Impoundment	0	0
Wetlands or Wildlife Habitat	0	0
Groundwater Recharge	0	0
Surface Water Augmentation	0	0
Direct Potable Reuse	0	0
Other	0	0
Total	700	564

4.1.2 Potential and Projected Use

Recycled water could be put to potable reuse at the VenturaWaterPure facility. In 2015, the City initiated a pilot project to test the feasibility of constructing an advanced water purification facility (AWPF) to maximize quantity and reliability of potable supplies by purifying tertiary treated effluent produced by the VWRP and optimizing its potable reuse, rather than discharging into the SCRE. The pilot facility operated for 9 months and produced favorable results, indicating highly reliable purification technologies, providing information on operational needs and costs, and the absence of risk to public health and safety. As a result, the City is proceeding with the design of a full-scale AWPF.

Other Methods to Expand Recycled Water Use

The City will expand their recycled water use significantly via the VenturaWaterPure facility and is not planning to further expand traditional recycled water use.

Projected Recycled Water Demand

Table 4-4 shows the projected recycled water uses including the historic uses for golf course, park, and landscape irrigation (excluding the VenturaWaterPure facility).

**TABLE 4-4
PROJECTED RECYCLED WATER USES**

Beneficial Use Type	2025	2030	2035	2040	2045
Agriculture	0	0	0	0	0

Direct Potable Reuse ^a	0	0	0	0	0
Other	0	0	0	0	0
Total	576	576	576	576	576

Notes:

a VenturaWaterPure accounted for in Tables 3-6 through 3-8.

4.1.3 Methods to Encourage Recycled Water Use

Ventura Water is focusing efforts on potable reuse through the VenturaWaterPure facility but will encourage customers to continue to participate in the mobile reuse program and will require new construction projects to utilize recycled water for landscape irrigation if located adjacent to a recycled water pipeline.

Section 5: Water Quality

The quality of any natural water is dynamic in nature. This is true for surface water and local groundwater. During periods of intense rainfall or snowmelt, routes of surface water movement are changed; new constituents are mobilized and enter the water while other constituents are diluted or eliminated. The quality of water changes over the course of a year. These same basic principles apply to groundwater. Depending on water depth, groundwater will pass through different layers of rock and sediment and leach different materials from those strata. Water depth is a function of local rainfall and snowmelt. During periods of drought, the mineral content of groundwater increases. Water quality is not a static feature of water, and these dynamic variables must be recognized.

The City's water sources are within current and anticipated Environmental Protection Agency (EPA) and State Water Resources Control Board Division of Drinking Water (DDW) levels for primary water quality standards. Based on current conditions and knowledge, water quality is not anticipated to affect water supply reliability. However, water quality issues are constantly evolving. It is well recognized water quality treatment can have significant costs.

The City's east side receives its water from groundwater wells and has significantly higher levels of TDS and minerals (hardness) compared to the water delivered to the City of San Buenaventura's west end. As such, TDS levels in excess of 1,000 parts per million (ppm) are experienced on a daily basis in the eastern portions of the system. To meet secondary water quality standards, the DDW encourages the City to explore ways to limit TDS levels to 1,000 ppm. At this time, groundwater from multiple wells in both the Mound and Oxnard Plain basins are treated and blended at the Bailey Treatment Plant to achieve the lowest TDS levels possible without sacrificing supplies. Groundwater in the Mound Basin is high in TDS and sulfate. Some portions of the groundwater exceed the sulfate maximum contaminant level (MCL) of 500 ppm, with conditions between 421 and 790 ppm in the distribution system (Ventura Water 2020). To improve TDS water quality additional westside water supplies or treatment of eastside sources will be required (Ventura Water 2020). The initial target is to lower TDS levels in the eastern portion of the system to 1,000 ppm by 2025 with possible further reduction in the future. The City continues to monitor for regulated as well as unregulated contaminants, in the event they are added to the contaminants list in future drinking water standards.

The City is also planning a blending strategy to improve groundwater quality. Some of the City's SWP allocation would help mitigate water quality issues via blending at the Saticoy Conditioning Facility. Water from the VenturaWaterPure facility would also be used to blend water at the Bailey Treatment Plant.

Section 6: Reliability Planning

6.1 Overview

The Act requires urban water suppliers to assess water supply reliability that compares total projected water use with the expected water supply over the planning period in five-year increments. The Act also requires an assessment for a single dry year and a multiple year drought lasting 5 years. This chapter presents the reliability assessment for the Ventura Water service area.

6.2 Normal Water Year

The normal/average year is a year in the historical sequence that most closely represents median runoff levels and patterns. This section summarizes Ventura Water supplies available to meet demands over the 25-year planning period during an average/normal year and compares them to demands for the same period. Assumptions about supplies and demands are provided in Chapters 2 and 3. Table 6-1 demonstrates that with planned supplies (see section 3.7) the City anticipates adequate supplies for years 2025 to 2045 under Normal conditions.

**TABLE 6-1
COMPARISON OF SUPPLY CAPACITY AND PROJECTED DEMANDS IN
AVERAGE/NORMAL YEAR (AF)**

	2025	2030	2035	2040	2045
Supplies

Difference (Supply - Demand)	9,016	10,972	11,321	10,465	10,216
Difference as % of Demand	61%	72%	73%	65%	62%

Notes:

a See Table 3-6

b Maximum supplies do not account for potential reductions to meet water quality objectives.

During the Water Commission Meeting on October 27, 2015 the Water Commission determined that it was appropriate to use a supply surplus buffer of 20% for normal hydrological years. The buffer has been used for the purpose of determining water supply needs and capital cost estimates for building or attaining new supply sources that will meet the surplus buffer. Table 6-1 demonstrates that, per Water Commission policy and as a result of the water supply planning conducted over the last 5 years, City water supplies after 2025 will be adequate.

6.2.1 Single-Dry Year

The water supplies and demands for the Ventura Water service area over the 25-year planning period were analyzed in the event that a single-dry year occurs. Table 6-2 summarizes the existing and planned supplies available to meet demands during an assumed single-dry year. Table 6-2 anticipates that with the planned supplies coming online after 2025, supplies will be sufficient to meet demands in a single-dry year.

**TABLE 6-2
COMPARISON OF SUPPLIES AND DEMANDS IN SINGLE-DRY YEAR (AF)**

	2025	2030	2035	2040	2045
Supplies					
Casitas Municipal Water District ^a	5,805	5,963	6,126	6,293	6,465
Ventura River ^a	1,298	1,298	1,298	1,298	1,298

<i>Difference as % of Demand</i>	26%	37%	38%	32%	30%

Notes:

a See Table 3-7

b Maximum supplies do not account for potential reductions to meet water quality objectives.

6.2.2 Multiple-Dry Year

The water supplies and demands for Ventura Water's service area over the 25-year planning period were analyzed in the event that a five-year multiple-dry year event occurs. Table 6-3 summarizes the existing and planned supplies available to meet demands during multiple-dry years. Table 6-3 documents that with planned supplies, Ventura Water should be able to meet demands in a multiple-dry year period.

**TABLE 6-3

Notes:

a See Table 3-8

b Maximum supplies do not account for potential reductions to meet water quality objectives.

6.2.3 Summary of Comparisons

As shown in the analyses above, with planned supplies, Ventura Water has adequate supplies to meet demands during average, single-dry, and multiple-dry years.

6.3 Drought Risk Assessment

The Water Code requires that every urban water supplier include in its UWMP, a drought risk assessment for its water service to its customers. This is to benefit and inform the demand management measures and water supply projects and programs to be included in the urban water management plan.

Annually Ventura Water prepares a CWRR. This report will form the basis for the Annual Assessment of shortage (see Appendix L). As part of preparing the CWRR, Ventura Water looks in detail at anticipated supplies and demands for the current year and two future years and also provides longer term projections.

6.3.1 Data and Methodologies Used

6.3.1.1 Water Demands

The water demands for this UWMP utilize water demand factors developed in April 2020, used in the 2021 CWRR. These water demand factors have been applied to the existing and anticipated land uses in the Ventura Water service area. The water demand factors looked at billing data for the City, for various uses, for the period 2013 through 2018, a water loss factor was applied to the raw factor, and a planning-level contingency factor was applied to account for variability due to weather and drought. The water demand factors capture changes in demand due to water conservation and codes and standards that have occurred overtime. Because growth in the Ventura Water service area is minimal (approximately 0.54% a year) it is not necessary to apply a different water demand factor to new dwellings. The current water demand factors are used and have been adjusted to account for new dwellings. Applying an optimistically “low” water demand factor on new development could skew demand trends when it is uncertain if (a) the development will truly occur and (b) the development will have a truly low water demand.

To evaluate water demand, Ventura Water has examined current and projected land uses. The land use evaluation started with the current general plan and a summary of built dwelling-units (residential) and square footage (non-residential). Using known development projects constructed since the adoption of the general plan, a summarized total of the existing land use within the City service area through the end of the recent calendar year was developed.

The City of San Buenaventura maintains a database of projects that are in the City’s planning process and categorizes the projects as: “In Planning Process,” “In Plan Check,” “Under Construction,” or have “All Planning Approvals.” Ventura Water has evaluated the database for projects that are either “Under Construction,” or have “All Planning Approvals.” In coordination with City Planning, Ventura Water has created a table of the “Under Construction and Approved Projects” anticipated to utilize water in the near term, which is defined as the next five years.

Using the anticipated land uses and the water demand factors Ventura Water has estimated water demands 2021 through 2025 shown in Table 6-11 below.

6.3.1.2 Water Supplies

This Drought Risk Assessment looks at all the water supplies anticipated to be available 2021 through 2025, including any limitations due to infrastructure, regulations, and assuming drought conditions.

Casitas Municipal Water District

As of February 2020, Casitas is currently in a Stage 3 water supply condition per Casitas Resolution No. 16-00. The current lake level as of February 19, 2020 was 41.6 percent full. The Casitas Board of Directors made the final decision to remain in a Stage 3 water supply condition in June of 2020. The City’s calendar year 2020 supply from Casitas was 3,794 AF.

Although the Lake is currently slightly above 40% capacity, it is likely that Casitas will remain in a Stage 3 water supply condition. To be conservative, a reduction of 30% to the City’s Casitas supply for 2021 and a 40% reduction for 2022, and a 30% reduction 2023 to 2025 are assumed. However, due to growth in the Casitas service area, there is a slight increase in the amount of water the City is eligible to receive from Lake Casitas. This growth is also accounted for in the anticipated drought supplies shown in Table 6-4.

**TABLE 6-4
ANTICIPATED SUPPLIES FROM CASITAS CONSECUTIVE DRY YEARS 2021-2025 (AF)**

2021	2022	2023	2024	2025
3,798	3,864	3,369	2,864	2,185

Notes:

Assumes 30% reduction in supply Years 2021, 2023, 2024, and 2025

Assumes 40% reduction in supply Year 2022

Ventura River

Production from the Ventura River is limited by infrastructure, the settlement with Santa Barbara Channelkeeper, and low-flow hydrology as detailed in section 3.2.2 and summarized in Table 6-5 below.

**TABLE 6-5
ANTICIPATED SUPPLIES FROM VENTURA RIVER
CONSECUTIVE DRY YEARS 2021-2025 (AF)**

2021	2022	2023	2024	2025
736	1,298	1,298	1,298	1,298

Notes:

Assumes repeat of the average two driest years (2015-2016) for year 2021

Assumes repeat of single-driest year (2015) for years 2022-2025

Groundwater

As described in Sections 3.3 and 3.4, groundwater supplies are anticipated to be reliable sources of supply for the City. Table 6-6 reflects the anticipated supplies. In Table 6-6 a gradual turn-down of supply from the Oxnard Plain subbasin is assumed to account for pumping reductions anticipated as part of implementation of the GSP.

**TABLE 6-6
ANTICIPATED GROUNDWATER SUPPLIES
CONSECUTIVE DRY YEARS 2021-2025 (AF)**

	2021	2022	2023	2024	2025
Mound	3,270	4,000	4,000	4,000	4,000
Oxnard Plain	5,304	5,181	5,058	4,936	4,813
Santa Paula Basin	2,661	2,661	2,661	2,661	3,126
<i>Total</i>	<i>11,235</i>	<i>11,842</i>	<i>11,719</i>	<i>11,597</i>	<i>11,939</i>

State Water Project

SWP water is not anticipated to be available in the Ventura Water service area until 2025. For the purposes of the Drought Risk Assessment, it is assumed the SWP is also experiencing a 5-year drought and supply is assumed to be similar to year 1935 hydrology (State Water Project Final Delivery Capability Report 2019 (August 26, 2020) Table B-32), see Table 6-7.

**TABLE 6-7
ANTICIPATED SWP SUPPLIES
CONSECUTIVE DRY YEARS 2021-2025 (AF)**

2021	2022	2023	2024	2025
-	-	-	-	1,100

Notes:

No delivery infrastructure until 2025. Assumes year 1934 hydrology based on State Water Project Final Delivery Capability Report 2019 (August 26, 2020) Table B-32

VenturaWaterPure

The VenturaWaterPure Project is planned to be operable in 2025, but may not be producing regular supply until after 2025. Therefore, Table 6-8 does not include supply from VenturaWaterPure. For subsequent years, supply from VenturaWaterPure is estimated to be 2,800 AFY after 2025 and 4,000 AF after year 2030, in all hydrologic year types.

**TABLE 6-8

Section 7: Demand Management Measures

7.1 Demand Management

The purpose of the Demand Management Measures (DMM) section of this UWMP is to (a) provide a description of the past water conservation programs that Ventura Water has implemented since 2016 to meet its urban water use reduction targets and (b) describe the activities and actions Ventura Water plans to use in the future to meet its urban water use reduction targets. For the purposes of this UWMP the DMMs are categorized as “Foundational” and “Other”. Foundational DMMs, listed below, are those DMMs that the UWMP Act and Water Code specifically mention:

- a. Water waste prevention ordinances
- b. Metering
- c. Conservation pricing
- d. Public education and outreach
- e. Programs to assess and manage distribution system real loss
- f. Water conservation program coordination and staffing support

Activities outside of the Foundational DMMs that encourage less water use in the City service area fall in the “Other DMM” category.

This chapter discusses the DMMs that Ventura Water undertakes as part of normal business. However, given the extraordinary and continuing drought, this chapter also describes those measures that were undertaken specifically to address dry conditions.

7.1.1 Foundational DMMs

7.1.1.1 Water Waste Prohibition

Ventura Water prohibits water waste through its Water Conservation Ordinance (Division 22 – Public Utilities, Chapter 22.170). Specifically, Section 22.170.010 states:

“Water waste prohibited.

A. Prohibited uses. No person shall use or permit the use of water:

1. For the watering of turf, ornamental landscape, open ground crops and trees, including agricultural irrigation, in a manner or to an extent which allows water to run to waste;
2. Such that the escape of water through leaks, breaks or malfunction within the water user's plumbing or distribution system occurs for any period of time beyond which such break or leak should reasonably have been discovered and corrected. It shall be presumed that a period of 48 hours after the water user discovers such leak, break or malfunction, or receives notice from the city of such

condition, whichever occurs first, is a reasonable time within which to correct such condition;

3. In conjunction with use of a handheld hose to wash automobiles, trucks, trailers, boats, or other types of mobile equipment without the use of a workable positive shutoff nozzle;
4. For the operation of any ornamental fountain, or similar structures, unless water for such use is recycled for lawful reuse without substantial loss;
5. For washing of sidewalks, walkways, driveways, parking lots or any other hard-surfaced areas by hose or flooding, except as otherwise necessary to prevent or eliminate conditions dangerous to the public health and safety or for other legitimate necessity;
6. For serving of water by a restaurant to its customers without first being requested by the customer;
7. The application of potable water to outdoor landscaped during and within 48 hours of measurable rainfall; or
8. Knowingly for any indiscriminate running of water or washing with water not otherwise prohibited above which is wasteful and without reasonable purpose.”

7.1.1.2 Metering

All existing services and new service connections in the City are metered and billed volumetrically

Efforts in 2020

In March 2016, the City Council adopted the Meter Upgrade Project to replace all manually-read water meters with advanced metering infrastructure (AMI) that automatically relay water usage to the City’s billing system through a secured network. The project launched in October 2018, with plans to replace all 32,000 Ventura Water meters by October 2021. To date, the project is 75 percent complete with over 25,000 meters installed.

In April 2020, Ventura Water launched Home Connect, a new online portal that allows Ventura Water customers to track their hourly water usage, set water-use budgets, and receive leak detection notifications for improved water use management. Upon completion, the Meter Upgrade Project is projected to save more than 600 acre-feet of water per year.

7.1.1.3 Conservation Pricing

All of the City’s retail customers are metered and billed with commodity rates for both water and sewer service. The City does not have any unmetered services and all new connections are metered and billed volumetrically.

Efforts in 2020

Every five years, a Cost of Service and Rate Design Study is conducted for the water and wastewater enterprises to ensure fair and equitable rates for all City customers and to generate sufficient revenue to meet operating and capital costs. In response to seasonal drought conditions, the City has periodically adopted and implemented new rate structures. These

events occurred in Fiscal Year (FY) 2012-2013, FY 2014-2015, and FY 2015-2016, in response to water shortage events. New rates were established to achieve full revenue recovery during drought and non-drought years. In May 2020, the City declared a Stage 2 Water Shortage Event, shifting from the Stage 3 Water Shortage Event declared in September 2015 that remained in effect through June 30, 2020. The City is currently conducting a new Water and Wastewater Rate Design Study. If adopted by City Council, new rates will be implemented in July 2021.

7.1.1.4 Public Education and Outreach

Ventura Water has consistently and actively encouraged water conservation through an extensive public education and outreach campaign. Outreach has utilized multiple venues including social media, printed media (bill inserts, handouts), outdoor advertising (billboards), radio, television, hosting of water conservation workshops, participation in community events (parades and street fairs). These outreach activities are summarized in Table 7-1.

**TABLE 7-1
VENTURA WATER OUTREACH PROGRAMS**

Action	Description	2016	2017	2018	2019	2020
Monthly E-Newsletter	The monthly Pipeline Newsletter provides information on capital improvement projects, conservation programs, public meetings, workshops, and special events.	X	X	X	X	X
Website	Ventura Water regularly updates the website with FAQs, public notices, water quality data, water conservation information, public meeting information, project updates, and more.	X	X	X	X	X
Outreach Events	15-20 public outreach events per year, consisting of job fairs, City-sponsored events, Chamber of Commerce events, with giveaways and informational handouts.	X	X	X	X	X
Social Media	Ventura Water maintains an active and engaged presence on Facebook, Twitter, YouTube, and Instagram.	X	X	X	X	X
Public Engagement Materials	Water quality Consumer Confidence Report. Brochures "Protecting our Pipes"; "Understanding Water and Wastewater Charges"; "Customer Assistance Program"; "Water Disaster Preparedness"; and "Fats, Oils, and Grease".	X	X	X	X	X
Targeted Outreach	Brochures, annual mailer, postcards, and door hangers.	X	X	X	X	X
Conservation Giveaways	Ventura Water continues to offer customers water conservation giveaways including materials such as "Doing Our Part to Save Water" yard signs, low-flow showerheads, faucet aerators, toilet leak detection kits, shower times, dish squeegees, and more.	X	X	X	X	X

Table 7-1 cont.

Action	Description	2016	2017	2018	2019	2020
WaterWise Gardening Series	Ventura Water, in partnership with the city's Environmental Sustainability Department, offers monthly workshops that cover water wise and sustainable gardening practices.	X	X	X	X	X
Townhall Meetings/ Public Informational Meetings	Ventura Water plans, attends, and hosts public meetings to share water shortage rates information, ordinance changes, and customer programs to provide an opportunity for residents to voice concerns	X	X	X	X	X
Customer Water Waste Hotline	Hotline where customers can report water waste.	X	X	X	X	X
Water Take 1	A home grown international short film contest that brings awareness to the value of water.	X	X	X	X	X

Between September 2016 and July 2018, Ventura Water held nine water conservation contests to bring awareness of saving water during drought periods to the community.

The Ventura Water Outreach team, an assembly of Ventura Water staff who represent the laboratory, the wastewater collections system, the wastewater plant operations, water distribution, and the General Managers office host and attend multiple events to perform face to face public engagement related to drought messaging (see Table 7-2).

7.1.1.5 Programs to Assess and Manage Distribution System Real Loss

Consistent with Senate Bill 555, Ventura Water conducts a water loss audit each year and provides a report to DWR. For the January to December 2019 period, Ventura Water utilized the Water Audit Methodology (Appendix L of the Guidebook) to estimate both real and apparent water loss. Based on this recent audit, the City estimates that apparent losses (meter inaccuracies) account for about one percent of total water loss; real losses are estimated to be about 7 percent of production. The Water Loss Audit Reports for 2015-2019 are provided in Appendix E.

7.1.1.6 Water Conservation Program Coordination and Staffing Support

The conservation program is managed by Ventura Water's Management Analyst, who oversees water resources management for the City. Program activities are managed by various City staff as part of their regular assignment, which equates to one full time employee.

**TABLE 7-2
DROUGHT SPECIFIC OUTREACH PROGRAMS**

Monthly class March – October 2016 - 2019	Water Wise Gardening Class
March 2016 - 2018	Wild and Scenic Film Festival
March 2016 - 2019	Water Take 1 Event
April 2016 - 2019	AWA Water Symposium
April 2016 - 2019	Earth Day Ecofest
March 2017 – December 2018	Channel Islands Native Garden Plant Sale
April 2017	Pierpont Elementary Earth Day Event
April 2017	E.P. Foster Earth Day Event
May 2016 - 2018	Surf N Suds
July 2017	Smart Sprinkler Controller Workshop
April 2018	Walk for Water
May 2018	Ocean Friendly Garden/Water Conservation Workshop
May 2019	Water Wise Workshop with WDCD
August 2019	Summer Open House Event at Ventura Water Reclamation Facility

7.1.2 Other DMMs

7.1.2.1 Wholesale Agency Assistance Programs

Ventura Water will continue to work cooperatively with Casitas Municipal Water District to participate in regional DMM programs, informational groups and projects, determination of the most cost-effective DMMs, and tailoring programs specific to the City. Ventura Water customers that are within the Casitas service area qualify for many conservation incentives, including water audits, free low flow showerheads and aerators, and rebates for high efficiency toilets and washing machines. These conservation opportunities are described at Casitas' website (www.casitaswater.org). Water conservation activities undertaken by Casitas in the Ventura Water area are summarized in Table 7-3.

An example of coordination between Ventura Water and Casitas is the Water Wise Incentive Program. The Water Wise Incentive Program is a new regional water conservation program that provides outdoor water use efficiency incentives to customers of Ventura Water, the City of Santa Paula and Casitas Municipal Water District. Starting in 2016, the Water Wise Incentive Program began offering rebates for turf removal, weather-based irrigation controllers, high-efficiency nozzles, and rainwater harvesting and reuse. The City, Casitas, and the City of Santa Paula cooperatively designed the program and successfully pursued grant funding for the project.

**TABLE 7-3
VENTURA WATER PARTICIPATION IN WHOLESALE AGENCY PROGRAMS**

Description	2016	2017	2018	2019	2020
Water Efficiency Surveys	72	81	116	94	98
High Efficiency Toilets (1.1 gpf)	-	-	-	21	33
High Efficiency Washing Machine Rebates	29	56	14	53	106
Weather-Based Irrigation Controllers	14	134	130	113	82
High Efficiency Sprinkler Nozzles	873	1,629	4,465	2,578	1,205
Instant Hot Water Recirculating Pump	-	-	-	227	241
Rain Barrel Voucher	295	122	92	109	62

To date, Ventura Water’s Water-Wise program has resulted in an estimated water savings of 104 AFY.

7.1.2.2 Ventura Water Partnerships with Ventura Unified School District

Since 2009, the City of San Buenaventura Water Department and Environmental Sustainability Division have provided environmental educational programming to Ventura Unified School District in the form of classroom presentations, assemblies, special event participation, special projects and equipment (i.e. recycle bins, composting bins, gardening supplies). Over 30,000 students have received education on water conservation, stormwater pollution prevention and waste reduction.

In 2017, Ventura Water provided financial support and technical staff support to Juanamaria Elementary School and ATLAS Elementary schools for projects and programs that increase recycling, build wildlife habitats, and reduce waste and water consumption.

In 2017, Ventura Water provided financial support and technical staff support to Ventura High School Greener World Action Team for replacing 1,100 square feet of turf with a water wise landscape at Ventura High School.

In 2018, Ventura Water provided financial support and technical staff support to ATLAS Elementary School for implementing a water wise garden on campus.

Green School Program

Ventura Water offers free education classroom presentations to students in Kindergarten through 12th grade. Lesson plans are grade-specific and aligned with Next Generation Science Standards. All lesson plans included hands-on activities, covering topics such as water conservation, water resource management, watershed protection, and more. This program aims to bring awareness of the importance of local water resource management and water conservation as a way of life.

Table 7-4 summarizes the school outreach metrics.

**TABLE 7-4
SCHOOL OUTREACH METRICS**

	2016	2017	2018	2019	2020
# of students	-	6,210	5,800	4,150	*
# of presentations	-	240	234	125	-

*Postponed due to COVID-19.

Field Trips

Beginning in 2016, Ventura Water partnered with MERITO Foundation, a local-based nonprofit organization dedicated to providing meaningful watershed experiences to multicultural youth and their community. Students, parents, and educators were invited to visit the Ventura Water Reclamation Facility for a day of hands-on science-based learning. Students tour the Ventura Water Reclamation Facility, conduct water quality testing out of Ventura Water’s on-site wildlife ponds and assess ecosystem health through bird species identification. Through this field experience, students are exposed to careers in water science and the many roles and responsibilities necessary to sustain a safe and healthy environment. Ventura Water offers free field trips to the reclamation and drinking water treatment plants throughout the school year. Teachers and educators can schedule a field trip on Ventura Water’s website. Since 2016, Ventura Water has provided field trips for over 1,600 students.

7.1.2.3 Efforts In 2020

WaterWise Turf and Replacement Program

Since 2015, the City has offered \$2 per square foot rebates to qualifying customers that replace their lawn with a water wise landscape. To date, approximately 633 projects have been completed with more than 520,000 square feet of turf removed, resulting in a project water savings of 21 AFY. This program continues to be offered to Ventura Water customers.

Mobile Reuse Program

In June 2016, the City launched a Residential Mobile Reuse Program which provides high-quality recycled water for local residents and commercial businesses. The recycled water can be picked up at the Fill Station located at the Ventura Water Reclamation Facility. Residents, City Parks, and State Parks utilize the water for landscape irrigation while AERA Energy and the Ventura County Transportation Department utilize the water for dust control mitigation. Benefits of the program include expanded recycled water usage in the City and conservation of potable water. To date, the Residential Mobile Reuse Program has provided over 51 acre-feet in recycled water.

Enforcement of Water Waste Prohibition

Ventura Water staff continues to monitor and respond to water waste incidents. Residents are encouraged to anonymously report water waste through a website form or by calling Ventura Water Customer Care. City staff investigates an average of 10 water waste incidents per month.

7.2 Planned DMMs to Meet Water Use Targets

Ventura Water customers have already achieved demand reductions sufficient to meet SBX7-7 water use targets. Ventura Water will continue to perform Foundational DMMs. These DMMs, expanding opportunities for new recycled water use customers in the service area, as well as potable reuse, will help the City to keep its GPCD within or lower than the SBX7-7 water use targets.

Section 8: Water Shortage Event Contingency Plan

Ventura Water has prepared a separate standalone Water Shortage Event Contingency Plan (WSECP), contained in Appendix L. The WSECP was adopted by the City Council on April 26th, 2021. This section includes a brief summary of the WSECP and includes the drought risk assessment required by the UWMP Guidelines.

8.1 Purpose of the WSECP

The City of San Buenaventura has developed a WSECP to provide guidance if triggering events occur — whether from reduced supply, increased demand, or an emergency declaration — and to identify corresponding actions to be taken during the various stages of a water shortage. The plan includes voluntary and mandatory stages which are intended to be fair to all water customers and users while having the least impact on business, employment, and quality of life for residents.

8.2 Annual Assessment

New provisions in Water Code Section 10632.1. require that an urban water supplier such as Ventura Water, conduct an annual water supply and demand assessment (“Annual Assessment”), on or before July 1 of each year, to be submitted to DWR. As part of the WSECP Ventura Water has identified the timeline, staff and outside agency coordination, and other actions necessary to conduct the Annual Assessment.

8.3 Shortage Stages

The WSECP describes six water shortage stages corresponding to progressive ranges of up to 10, 20, 30, 40, and 50 percent shortages and greater than 50 percent shortage.

8.4 Water Shortage Response Actions

The WSECP identifies water shortage response actions, including:

- Communication with customers
- Public outreach
- Supply augmentation
- Operational changes
- Customer demand reduction measures (including enforcement)
- Monitoring of production and demand

Wastewater

- About
- Fats, Oils, Grease
- Private Sewer Lateral

Treatment Facility

The Ventura Water Reclamation Facility is a tertiary treatment plant, located in the Ventura Harbor area near the mouth of the Santa Clara River, where the river meets the Pacific Ocean.

It provides treatment services to approximately 98% of City residences, with a total population of over 109,000.

- Treats 8 to 9 million gallons of wastewater per day,
- More than 300 miles of sewer mains
- 14 lift stations

Currently, following a 3-step treatment process at the facility, most of the treated wastewater is discharged into the Estuary after flowing through a series of wildlife ponds for about four days or delivered to reclaimed water customers.

"F.O.G."

See our [F.O.G. page](#) for more details.

✕ Hello 🙋. How can we help you?

Select Language ▼

Google Translate

Bacon Grease, Butter, Margarine, Cooking Oil, Mayonnaise, Salad Dressings, Sour Cream, Food Scraps, Gravy, Lard, Meat Fats and Shortening

When "FOG" is poured down kitchen drains, it accumulates inside sewer system pipes. As FOG builds up, it restricts the flow in the pipes and can cause untreated wastewater to back up into homes, businesses and streets, resulting in high costs for clean-up and restoration.

Your Connection to the Collection

See our [Inspection Program](#) for more details.

A private sewer lateral is the pipe that connects a business or home's plumbing system to the City's wastewater collection main pipeline. The lateral is considered the "private" segment when it is located on private property and serves the purposes of an individual, privately-owned building. The property owner is responsible for entire pipe length, including the wye or saddle at the point of connection to the City's mainline.
